Acknowledgements

We acknowledge the assistance of the National Science Foundation, program for Systematic Biology, given to the principal investigator, Louis O. Williams, over a period of many years. This most welcome assistance made possible both the field work and the research necessary to complete this work. The Museum and the principal investigator are most appreciative of this financial aid.

COMPREHENSIVE INDEX TO THE FLORA OF GUATEMALA

INTRODUCTION

This comprehensive index covers the 12 parts of Volume 24 of *Fieldiana: Botany* which consists of 5,697 pages with many plates. The index does not cover the orchids, mosses or ferns of the flora since these are or will be separately indexed. The numbers following an entry refer first to the part number of the flora and second to the page or pages where the entry occurs.

The index is intended to include all accepted names (in roman), all synonyms (*in italics*), and all common names of plants (in roman). Specific names of plants occasionally will appear in roman and in italics; the italic entry indicates a synonym while the roman entry indicates that the name appears in a discussion. Hyphenated words are treated in alphabetical order as one word. Names of persons, when considered potentially useful to the reader, have been indexed.

Vernacular names, wherever available, have been used in the text and are indexed here. Languages are those of the informant and, if known, the dialect is given when names were supplied by indigenous peoples. Most dialects are Mayan in origin and the names usually transcribed by persons speaking English, Spanish or German. Consequently, the same Mayan name may have been transcribed differently. For example, the common names *bisib* and *t'isib* apply to the same plant. Indian languages of Guatemala were all unwritten and only in recent years have attempts been made to reduce them to writing. This work has been done by professional linguists. Botanical collectors have not been versed in the phonetic signs used by linguists, except in rare cases. Vernacular names often duplicate generic names and the two names do not necessarily refer to the same plant.

The letters of the Spanish alphabet, ch, ll, and ñ are not given separately at the end of c, l, and n as they would be in a Spanish index.

This volume will serve quite well as a check list of scientific names of plants for a much wider geographical area than Guatemala and Belize since a very large number of the plants in our floristic area occur over a much greater geographical range.
