## Abstract

The minimum criterion PHS (phylogenetic similarity)  $\leq 0.928$  (inter genera) for genus classification by CPCG (chloroplast complete genomes) of Fructophyta D.L.Fu & H.Fu is initially proposed. As a result, 34 current synonyms of the genus *Phyllostachys* Sieb. & Zucc. (Bambusaceae Burnett) have been identified, including *Acidosasa* C.D.Chu & C.S.Chao, *Ampelocalamus* S.L.Chen, T.H.Wen & G.Y.Sheng, *Arundinaria* Michx., *Bashania* Keng f. & T.P.Yi, *Bergbambos* Stapleton, *Chimonobambusa* Makino, *Drepanostachyum* Keng f., *Fargesia* Franch., *Ferrocalamus* Hsueh & P.J.Keng, *Gaoligongshania* D.Z.Li, Hsueh & N.H.Xia, *Gelidocalamus* T.H.Wen, *Himalayacalamus* Keng f., *Indocalamus* Nakai, *Indosasa* McClure, *Kengiochloa* Y.H.Tong & N.H.Xia, *Khoonmengia* N.H.Xia, Y.H.Tong & X.R.Zheng, *Kuruna* Attigala, Kathr. & L.G.Clark, *Oldeania* Stapleton, *Oligostachyum* Z.P.Wang & G.H.Ye, *Pleioblastus* Nakai, *Pseudosasa* Makino ex Nakai, *Ravenochloa* D.Z.Li & Y.X.Zhang, *Sarocalamus* Stapleton, *Sasa* Makino & Shibata, *Sasaella* Makino, *Sasamorpha* Nakai, *Semiarundinaria* Makino ex Nakai, *Shibataea* Makino ex Nakai, *Sinobambusa* Makino ex Nakai, *Sinosasa* L.C.Chia ex N.H.Xia, Q.M.Qin & Y.H.Tong, *Thamnocalamus* Munro, *Tongpeia* Stapleton, *Vietnamocalamus* T.Q.Nguyen and *Yushania* Keng f.. Additionally, 82 new specific names such as *Phyllostachys aristiformis* D.L.Fu & H.Fu and *Phyllostachys hackelii* Ohrnb. ex D.L.Fu, along with 454 new specific combinations like *Phyllostachys abietina* (T.P.Yi & L.Yang) D.L.Fu and *Phyllostachys actinotricha* (Merr. & Chun) D.L.Fu have been scientifically and validly published. These publications will effectively resolve taxonomic nomenclature confusion in a scientific manner and establish a solid foundation for evolutionary system research within the family Bambusaceae.

## Keywords

*Phyllostachys*, New Combination, CPCG (Chloroplast Complete Genome), Genus Minimum Criterion, Typical Algorithm

Bamboo plants, the subfamily Bambusoideae Luerss. (1893) of the family Bambusaceae Burnett (1835), are closely intertwined with human production and daily life, exerting a profound influence on culture as well. However, due to the unpredictable flowering period and substantial variation in flowering patterns, classifying this subfamily, particularly the genus *Phyllostachys* Sieb. & Zucc., poses greater challenges [1-7]. Therefore, the distinctive characteristics of the subfamily, such as culm, rhizome, branch, and culm sheath, have traditionally been employed in taxonomic classification [1-3, 7-28]. However, further research is necessary to validate this classification from a scientific perspective. It is evident that relying solely on these features can potentially lead to taxonomic ambiguity. For instance, the taxonomic name *Phyllostachys naibunensis* (Hayata) D.L.Fu has undergone original publication and successive combinations, including *Arundinaria naibunensis* Hayata (1911), *Pseudosasa naibunensis* (Hayata) Makino & Nemoto (1931), *Bambusa naibunensis* (Hayata) Nakai (1932), *Pleioblastus naibunensis* (Hayata) Kaneh. & Sasaki (1932), *Leleba naibunensis* (Hayata) Nakai (1933), *Chimonobambusa naibunensis* (Hayata) McClure & W.C.Lin (1974), *Arthrostylidium naibunense* (Hayata) W.C.Lin (1978), *Drepanostachyum naibunense* (Hayata) Keng f. (1986) and *Ampelocalamus naibunensis* (Hayata) T.H.Wen (1987), by different nomenclators or the same one.

The modern phylogeny is based on Darwin's theory of evolution, which includes the concepts of the 'tree of life,' 'common ancestor,' and 'germogenesis' [29-30]. However, due to its subjective and partial nature, this system fails to scientifically demonstrate the evolutionary relationships among different organisms [31-33], leading to taxonomic confusions. For example, the classification confusion within Bambusoideae remains largely unresolved in the phylogenetic system [4-6]. *Phyllostachys pubiflora* (Keng) D.L.Fu was incorrectly combined as *Pseudosasa pubiflora* (Keng) Keng f. ex D.Z.Li & L.M.Gao [3] and even established as a new genus called *Kengiochloa* Y.H.Tong & N.H.Xia [23].

To overcome these shortcomings, the new science evolutionomy has been developed with the publications of the evolutionary continuity principle, the evolutionary particularity principle and the theoretical monograph as *the Theory and Practice of Evolutionomy* [31-33]. Based on the new science, we can analyze the evolutionary relationships among different taxa and establish a scientific evolutionary system, and scientifically resolve the taxonomic nomenclature confusion. For instance, the evolutionary system of genera, subgenera, and sections within the Magnoliaceae family has been scientifically established using chloroplast complete genome (CPCG) sequences. The boundary for genus classi-

## 1. Introduction

fication is PHS (phylogenetic similarity, 17bp)  $\geq 0.9234$  (in-tragenera) or PHS (17bp)  $\leq 0.9232$  (inter genera). Magnoliaceae are the most primitive taxa among fruit plants and hold significant implications for evolutionary studies [34-35]. Therefore, we propose that the minimum criterion for classifying Fructophyta D.L.Fu & H.Fu [31] at the genus rank using CPCG data should be set as PHS  $\leq 0.928$  (inter genera), considering that two species of *Liriodendron* L. have a PHS value of 0.929 [34-35].

In order to resolve the taxonomic confusion of the genus *Phyllostachys* in a scientifically rigorous manner, we downloaded 35 relevant CPCG sequences from the NCBI (National Center for Biotechnology Information, USA) database and conducted an evolutionary analysis on these sequences. Based on our findings, we propose the following amendments to the taxonomy of this genus.

## 2. Materials and Methods

### 2.1. CPCG of Bambusaceae

Total 35 CPCG of representative species of Bambusaceae were selected from the NCBI database. Their current names, scientific names and CPCG numbers of NCBI are listed in Table 1.

### 2.2. Evolutionary Analyses of CPCG

The evolutionary analyses of CPCG mainly use the typical algorithm [33-35] to determine the relative evolutionary relationships between different taxa by comparing the phylogenetic similarity (PHS) between the designated type and target taxa. The formula is as follows:

$$PHS = \frac{SPHL}{APHL}$$

PHS = phylogenetic similarity between the type and objective taxon; SPHL = the number of same phylogenetic loci between the type and objective taxon; APHL = the number of all phylogenetic loci of the type; statistics of phylogenetic loci using Nucleotide Barcodes (17bp).

## 3. Results

The PHS of CPCG of 35 species of Bambusaceae were analyzed using the type *Phyllostachys edulis* (Carrière) J.Houz. and the results are shown in Table 1.

**Table 1.** PHS of CPCG between *Phyllostachys edulis* and some representative species of *Bambusaceae* Burnett.

No.	Scientific Names and Numbers of CPCG in NCBI	Current Names	PHL/17bp	PHS
1	<i>Phyllostachys edulis</i> _NC015817.1	<i>Phyllostachys edulis</i>	117396	1

From Table 1, it is evident that using the type of *Phyllostachys edulis* (Carrière) J.Houz., there are 31 synonyms of

the genus *Phyllostachys*, including *Bashania*, *Fargesia*, *Tongpeia*, *Chimonobambusa*, *Sarocalamus*, *Borinda*, *Yushania*, *Gelidocalamus*, *Drepanostachyum*, *Himalayacalamus*, *Indosasa*, *Oligostachyum*, *Acidosasa*, *Indocalamus*, *Sinobambusa*, *Sasa*, *Thamnochalamus*, *Oldeania*, *Shibataea*, *Kengiochloa*, *Pleioblastus*, *Sasaella*, *Bergbambo*, *Pseudosasa*, *Ferrocalamus*, *Sinosasa*, *Ravenochloa*, *Ampelocalamus*, *Arundinaria*, *Gaoligongshania* and *Kuruna*, owing to their evolutionary relationships with *Phyllostachys* all surpassing a threshold value of 0.939, not meeting the minimum criterion PHS(17bp) ≤ 0.928 (inter genera) for genus evolution.

Although *Khoonmengia* N.H.Xia et al., *Sasamorpha* Nakai and *Vietnamocalamus* T.Q.Nguyen currently lack CPCG, based on Table 1 and previous research results [3, 5, 7, 15, 24], it can also be confirmed that they are the synonyms of *Phyllostachys*. Therefore, it is scientific to combine the genus *Phyllostachys* as follows.

*Phyllostachys* Siebold & Zucc., Abh. Math.-Phys. Cl. Königl. Bayer. Akad. Wiss. 3(3): 745, t. 4. 1843, nom. cons. Type: *Phyllostachys bambusoides* Sieb. et Zucc. — *Acidosasa* C.D.Chu & C.S.Chao, J. Hunan Teacher's Coll. (Nat. Sci. Ed.) (2): 54. 1981. ## 5. Conclusion

The utilization of the minimum criterion first proposed by the authors in the paper for the genus classification by CPCG can effectively overcome the subjectivity and partiality of traditional taxonomy and modern phylogeny, and scientifically identify the genus synonyms and resolve the taxonomic nomenclature confusion in Fructophyta D.L.Fu & H.Fu.

## Abbreviations

CPCG: Chloroplast Complete Genomes

PHL: Phylogenetic Loci

PHS: Phylogenetic Similarity

## Conflicts of Interest

The authors declare no conflicts of interest.
