

A checklist of the bryophytes of the Pelorus Bridge Scenic Reserve,  
Marlborough

Allan J. Fife and John E. Braggins

A bryological foray, organized under the auspices of Botany Division, DSIR, was held between 23 September - 2 October 1983 at the Pelorus Bridge Scenic Reserve in western Marlborough. Twenty-seven amateur and professional botanists attended. The purpose of the foray was to facilitate the exchange of knowledge concerning bryophytes, rather than the accumulation of an exhaustive catalogue of the species within the Reserve. Nevertheless, the aggregation of many collectors at a single locality yielded a substantial sampling of the bryophytes of the Reserve; the list following includes 134 mosses, 85 hepatics, and 4 hornworts. Some of the determinations presented in this list, particularly for hepatics, are tentative. Despite this, we believe that the list will be of some value to collectors working in the Marlborough region. With diligent collecting, we have no doubt that this list could be expanded.

Pelorus Bridge Scenic Reserve is located on the main highway between Nelson and Blenheim, 55 km north-west of Blenheim, at 41°18'S, 173°34'E. The Reserve encloses 1008 hectares, ranges in elevation from less than 30 m to 564 m above sea level, and incorporates outstanding examples of lowland forest. The lower terraces are dominated by rimu and kahikatea with tree-ferns (especially *Cyathea dealbata*) conspicuous in the lower strata. The upper river terraces and mid-elevation slopes are covered by a mosaic of forest communities, with an overstory of scattered large podocarps and a main canopy of such species as tawa (here approaching its southern limit), kamahi, black beech, and mahoe. At higher elevations this mixed podocarp-broadleaved forest gives way to beech forest consisting mainly of hard beech, but including black and red beech and scattered rimu. An informative, popular account of the vegetation of the Reserve is provided by G.C. Kelly (undated).

The Reserve has a rich bryophyte flora, although in general bryophytes are not as conspicuous a component of the vegetation as they are in areas of higher rainfall. Among the hepatics, many taxa which are common in New Zealand rainforests are conspicuously absent - e.g. *Schistochilae*, *Trichocoleae*, larger species of *Lepidozia*, and *Plagiochila gigantea*.

While more of these taxa may eventually be located in damp, sheltered habitats in the Reserve, the general bryological impression is of a forest subject to occasional drought. The more common species of hepatics within the Reserve, belonging to such groups as *Lepidolaena*, *Frullania*, and *Lejeunea* sensu lato, are ones capable of surviving drought.

Within the Reserve bryophytes were collected primarily at the following localities : the vicinity of the suspension footbridge over the Rai River, in the vicinity of the track leading from the highway bridge to the suspension bridge, on the "Falls Track" between the highway and Elvy Stream, and along the "Trig K Track". Two species (*Pseudoscleropodium purum*, *Triquetrella papillata*), collected from roadside areas adjacent to the Reserve, are included. No attempt has been made to incorporate older reports, although Sainsbury (1955) recorded some species from Pelorus Bridge (e.g. *Ephemeropsis trentepohlioides*) which are not recorded here. Some species are included on the basis of collections made by the first author during a preliminary trip to the Reserve on 1-3 September 1982.

The first author is primarily responsible for the moss list, while the second author is primarily responsible for the hepatics and hornworts. Jessica Beever collected and determined a large number of moss specimens, referring some to the first author for confirmation. Many moss specimens are cited, with thanks, on her authority. Patrick Brownsey and Philippa Horn submitted specimens for examination by the first author, and thus made the list more complete; their help is gratefully acknowledged. We thank the Commissioner of Crown Lands (Ian Mitchell; Blenheim) for permission to collect within the Reserve, as well as Morris and Margaret James for "on site" assistance. Margaret Bulfin and Susan Noseworthy provided invaluable assistance with the organization of the foray. Voucher specimens for each species are cited by accession numbers in AKU, CHR, or WELT, except for a few cases in which only a sight record (indicated by an asterisk) was obtained. Three species of hepatics and three of hornworts are cited on the authority of Ella Campbell. Of these, the authors have not seen material; these species are indicated by a double asterisk (\*\*).
