

Moehringia jankae

Annex	II, IV
Priority	No
Species group	Vascular plants
Regions	Continental, Steppic

Moehringia jankae is a perennial plant with white flower growing in Bulgaria (Continental region) and Romania (Steppic region). The species occurs on steep rocks on limestone and possibly also on silicates. It is very rare as it can be found only on limited number of localities. Because of the lack of information on the population size or trend for the Romanian population, the species is considered Data Deficient (DD) in the IUCN European Red list. On the contrary, this report brings evidence on the small but existent Romanian population.

The overall conservation status in Steppic region (Romania) was assessed "Unfavourable Inadequate" due to small population, future prospects and habitat for species. It is hard to interpret the fact that there is very small number of individuals reported in Romania but the habitat for species counts as much as 1200 square kilometres. The overall conservation status in Bulgaria (Continental region), resulted "Unknown" due to the population and future prospects. Trend unknown in both regions.

Droughts are reported as a threat of high importance followed by species composition change (succession) of medium importance in Bulgaria (Continental region). On the other hand, mining is identified as a main threat imposed on this species in the Steppic region.

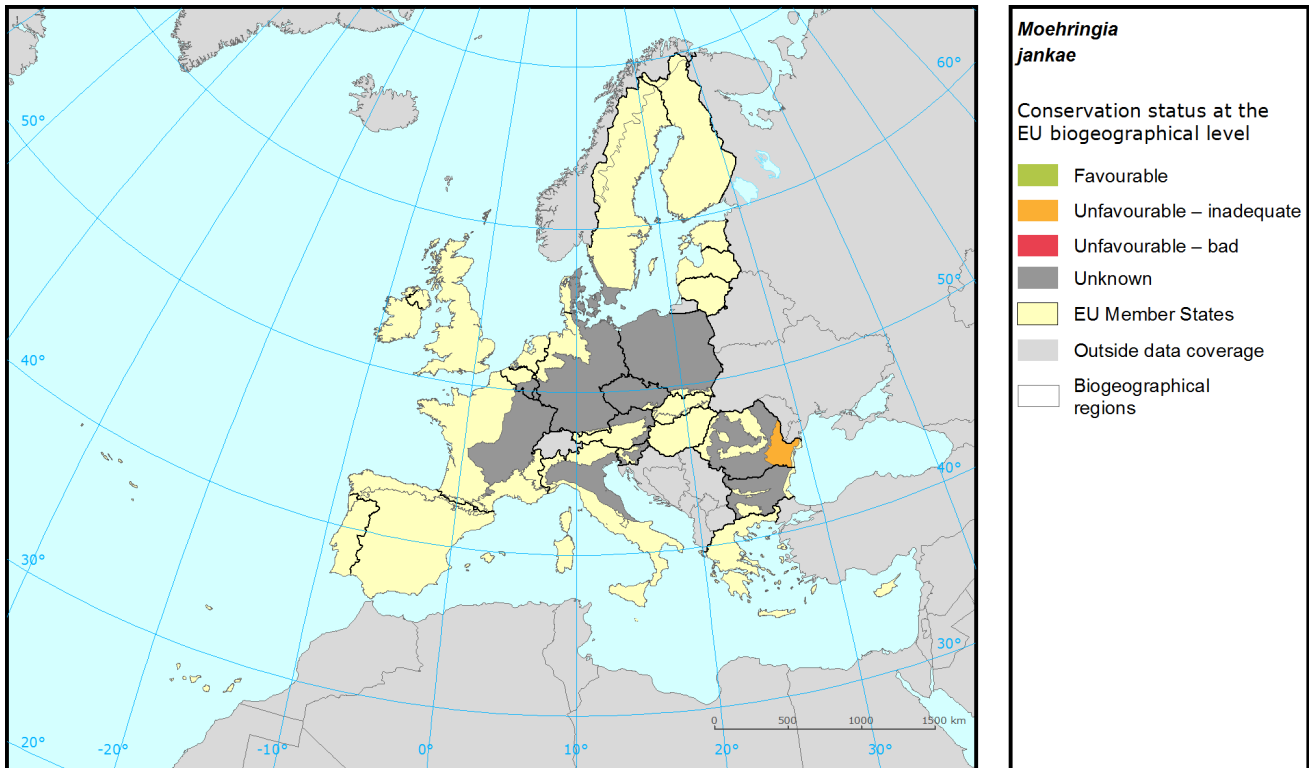

The species was not reported from Continental and Steppic region 2001-06.

Better data required from Bulgaria.

Species: *Moehringia jankae*

Report under the Article 17 of the Habitats Directive

MS	Region	Conservation status of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
		Range	Population	Habitat	Future prospects					
BG	CON	FV	XX	FV	XX	XX	100.0			
RO	STE	FV	U1	U1	U1	U1	100.0			

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the [Article 17 Reference Portal](#). Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
No 'highly important' pressures were reported.		

Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
M01	Abiotic changes (climate change)	100

Proportion of population covered by the Natura 2000 network

For species listed in the Annex II of the Directive Member States were asked to report the population size within the Natura 2000 network. The percentage of species population covered by the network was estimated by comparing the population size within the network and the total population size in the biogeographical/marine region.

Percentage of coverage by Natura 2000 sites in biogeographical/marine region

Species: *Moehringia jankae*

Report under the Article 17 of the Habitats Directive

Most frequently reported conservation measures

For species listed in the Annex II of the Directive Member States were asked to report up to 20 conservation measures being implemented for this species using an agreed list which can be found on the Article 17 Reference Portal. Member States were further requested to highlight up to five most important ('highly important') measures; the table below only shows measures classed as 'high', for many species there were less than ten measures reported as highly important.

Ten most frequently reported 'highly important' conservation measures

Code	Measure	Frequency
6.1	Establish protected areas/sites	40
6.3	Legal protection of habitats and species	40
9.1	Regulating/Management exploitation of natural resources on land	20

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at:

Species: *Moehringia jankae*

Report under the Article 17 of the Habitats Directive

i Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.

ii Percentage of coverage by Natura 2000 sites in biogeographical/marine region: In some cases the population size within the Natura 2000 network has been estimated using a different methodology to the estimate of overall population size and this can lead to percentage covers greater than 100%. In such case the value has been given as 100% and highlighted with an asterisk (*). The value 'x' indicates that the Member State has not reported the species population and/or the coverage by Natura 2000. No information is available for Greece. The values are only provided for regions, in which the occurrence of the species has been reported by the Member States.
