Dichanthelium curtifolium (Nash) LeBlond, Short-leaved Witchgrass. Bogs, sphagnum streamhead swamps, mountain streams, marl meadows. Apr-Sep. Disjunctly distributed in w. VA, w. NC and e. TN, e. SC, FL, and MS. The combination of characters is quite distinctive for the genus in our region. [= V; = *Panicum curtifolium* Nash – RAB, HC, S; = *D. ensifolium* (Baldwin ex Elliott) Gould ssp. *curtifolium* (Nash) Freckmann & Lelong – FNA; < *D. acuminatum* (Swartz) Gould & C.A. Clark var. *implicatum* (Scribner) Gould & C.A. Clark – K, Z; = *Panicum ensifolium* Baldwin ex Elliott var. *curtifolium* (Nash) Lelong – X]

Dichanthelium depauperatum (Muhlenberg) Gould, Starved Witchgrass. Dry soils of grasslands and open woods, often on disturbed soils of roadsides and ditches. May-Sep. NL (Newfoundland) and MN south to GA and TX. [= FNA, K, Pa, Va, Z; = *Panicum depauperatum* Muhlenberg – C, HC, RAB, S, WV; > *P. depauperatum* var. *depauperatum* – F, G; > *P. depauperatum* var. *psilophyllum* Fernald – F, G]

Dichanthelium dichotomum (Linnaeus) Gould var. *dichotomum*, Forked Witchgrass. Wet-mesic to dry woods, thickets, and woodland openings. May-Oct. S. Canada and MI south to FL and TX. Plants with bearded nodes and larger leaves are referable to *Panicum dichotomum* var. *barbulatum* (here included) but intermediates abound. [= Q, Va; < *Panicum dichotomum* Linnaeus – C, GW, RAB; > *P. dichotomum* var. *dichotomum* – F, WV; > *P. dichotomum* var. *barbulatum* (Michaux) Wood – F, WV; = *D. dichotomum* ssp. *dichotomum* – FNA; = *P. dichotomum* – G; > *P. dichotomum* – HC, S; > *P. barbulatum* Michaux – HC, S; < *D. dichotomum* var. *dichotomum* – K, Z; < *D. dichotomum* – Pa; = *P. dichotomum* var. *dichotomum* – X]

Dichanthelium dichotomum (Linnaeus) Gould var. *glabrifolium* (Nash) Gould & Clark, Smooth-leaved Witchgrass. Endemic to peninsular FL, mostly near the west coast. Like *D. chamaelonche* ssp. *breve*, this taxon appears to be more closely related to *D. chamaelonche* than to *D. dichotomum* or *D. ensifolium*. [= K, Z; = *Panicum glabrifolium* Nash – HC, S; < *P. chamaelonche* Trinius var. *chamaelonche* – X] {not mapped; not considered part of our flora}

Dichanthelium dichotomum (Linnaeus) Gould var. *nitidum* (Lamarck) LeBlond, Shining Witchgrass. Moist sandy or peaty soil of wet pine savannas and pocosin ecotones, wet meadows near the coast, swamps, and marshes. PA and NJ south to FL, west to MO and TX; also the Bahamas (Sorrie & LeBlond 1997) and West Indies, and Mexico to Venezuela. [= Q, Va; < *Panicum dichotomum* Linnaeus – C, GW, RAB; = *P. nitidum* Lamarck – F, HC, S; = *D. dichotomum* ssp. *nitidum* (Lamarck) Freckmann & Lelong – FNA; = *P. nitidum* var. *nitidum* – G; < *D. dichotomum* var. *dichotomum* – K, Z; < *D. dichotomum* – Pa; = *P. dichotomum* var. *nitidum* (Lamarck) Wood – X]

Dichanthelium dichotomum (Linnaeus) Gould var. *ramulosum* (Torrey) LeBlond, Branched Witchgrass. Floodplain forests, swamps, openings, and borders of streams and ponds, and occasionally in dry upland woods. May-Oct. MA and MI south to FL and TX. All nodes usually densely retrorsely bearded. [= Q, Va; < *Panicum dichotomum* Linnaeus – C, GW, RAB; = *P. microcarpon* Muhlenberg ex Elliott – F, HC, S, WV; = *D. dichotomum* ssp. *microcarpon* (Muhlenberg ex Elliott) Freckmann & Lelong – FNA; = *P. nitidum* Lamarck var. *ramulosum* Torrey – G; < *D. dichotomum* var. *dichotomum* – K, Z; = *D. microcarpon* (Muhl. ex Elliott) Mohlenbrock – Pa; = *P. dichotomum* var. *ramulosum* (Torrey) Lelong – X]

Dichanthelium dichotomum (Linnaeus) Gould var. *roanokense* (Ashe) LeBlond, Roanoke Witchgrass. Wet pine savannas, swamp openings, and wet peaty meadows. May-Sep. DE south to FL, west to e. TX; also in Jamaica. See note under *D.*

caerulescens regarding FNA treatment. [= Q, Va; < *Panicum dichotomum* Linnaeus – C, GW, RAB; = *P. roanokense* Ashe – F, HC, S; < *D. dichotomum* ssp. *roanokense* (Ashe) Freckmann & Lelong – FNA; < *P. roanokense* – G; < *D. dichotomum* var. *dichotomum* – K, Z; < *P. dichotomum* var. *roanokense* (Ashe) Lelong – X]

Dichanthelium ensifolium (Baldwin ex Elliott) Gould, Small-leaved Witchgrass. Wet to mesic peaty, sandy, or mucky soils, often in open pinelands or with sphagnum. May-Oct. NJ south to FL, west to e. TX and AR. Plants with pubescent spikelets are frequent. [= Va; < *Panicum ensifolium* Baldwin ex Elliott – C, G, GW, RAB; = *D. ensifolium* ssp. *ensifolium* – FNA; = *P. ensifolium* – F; > *P. flavovirens* Nash – HC, S; > *P. vernale* A.S. Hitchcock & Chase – HC, S; < *D. dichotomum* (Linnaeus) Gould var. *ensifolium* (Baldwin ex Elliott) Gould & Clark – K, Z; < *P. ensifolium* var. *ensifolium* – X]

Dichanthelium erectifolium (Nash) Gould & Clark, Erect-leaved Witchgrass. Limesink ponds, depression meadows, cypress savannas, pine savannas. May-Aug. Se. NC to FL, west to LA; Cuba. [= FNA, K, Z; = *Panicum erectifolium* Nash – RAB, GW, HC, S]

Dichanthelium fusiforme (A.S. Hitchcock) Harvill, Spindle-fruited Witchgrass. Dry to moist sand of open pine and pine/oak woods and clearings. May-Nov. Se. VA south to FL, west to MS, also in West Indies, Mexico, Central America, and Venezuela; perhaps most abundant in FL. Autumnal blades often flat. The autumnal form of *D. oligosanthes* var. *oligosanthes* can be very similar to *D. fusiforme* if the vernal blades of the former are missing. They are best separated by ligule length (0.5-1 mm in *fusiforme*, 1.5-3 mm in *oligosanthes*) and the more attenuated ends of the *fusiforme* spikelet. [= Va; = *Panicum fusiforme* A.S. Hitchcock – F, G, HC, RAB, S; < *P. aciculare* Desvaux ex Poiret – C; = *D. aciculare* ssp. *fusiforme* (A.S. Hitchcock) Freckmann & Lelong – FNA; < *D. aciculare* – K, Z]

Dichanthelium hirstii (Swallen) Kartesz, Hirst Brothers' Witchgrass. Pond-cypress savannas and limesink depressions. Jun-Sep. This distinctive species is known from only seven sites: two in NC, one in DE, two in NJ (one not seen since 1992), and two populations in GA (one considered historical, the other rediscovered in 2015; see McAvoy, Patrick, & Kruse 2015). Described in 1961 (Swallen 1961), it is treated by some taxonomists as part of the *D. aciculare* group and by others as part of the *D. dichotomum* group; its affinities appear to lie with the former. See Schuyler (1996) for a discussion of the taxonomic distinctiveness of this species. The occurrence of this species in NC is documented in LeBlond & Sorrie (2001). [= K; < *Panicum aciculare* Desvaux ex Poiret – C; < *D. dichotomum* ssp. *roanokense* (Ashe) Freckmann & Lelong – FNA]

Dichanthelium latifolium (Linnaeus) Harvill, Broad-leaved Witchgrass. Open or shady well-drained forests. Late May-Sep. ME south to n. GA, west to WI and MS. [= FNA, Pa, Va; = *Panicum latifolium* Linnaeus – C, F, G, HC, RAB, S, WV; = *D. latifolium* (Linnaeus) Gould & Clark – K, Z, a later combination]

Dichanthelium laxiflorum (Lamarck) Gould, Open-flower Witchgrass. Open or shaded woodlands, often in moist soil. Apr-Sep. MD south to FL, west to TX, north to IN, also in Mexico, Central America, and West Indies. Included in this concept of *D. laxiflorum* are plants formerly known as *Panicum xalapense* var. *strictirameum*. They have strict panicles, smaller leaves, shorter culms, and spikelets as short as 1.4 mm. The known range of these plants is South Carolina to Texas. A few *D. laxiflorum* populations in South Carolina and Florida have spikelets to 2.5 mm long. [= FNA, K, Pa, Va, Z; = *Panicum laxiflorum* Lamarck – C, F, G, RAB; > *P. laxiflorum* – HC, S; > *P. xalapense* Humboldt, Bonpland, & Kunth var. *xalapense* – HC, S; > *P. xalapense* var. *strictirameum* A.S. Hitchcock & Chase – HC, S; > *P. xalapense* – WV]

Dichanthelium leibergii (Vasey) Freckmann, Leiberg's Witchgrass. Prairies and sandy woodlands. QC and MB south to PA and KS. [= FNA, K, Z; = *Panicum leibergii* (Vasey) Scribner – C, F, G, HC]

Dichanthelium leucothrix (Nash) Freckmann, Roughish Witchgrass. Wet sandy, peaty, or mucky soil of pinelands. May-Oct. S. NJ south to FL, west to TX, also in TN, West Indies and n. South America. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, *D. meridionale*, and *D. wrightianum* from other members of the *D. acuminatum* group. [= K, Y; = *Panicum leucothrix* Nash – F, G, HC, RAB, S; < *P. leucothrix* – C; = *D. acuminatum* ssp. *leucothrix* (Nash) Freckmann & Lelong – FNA; < *P. spretum* J.A. Schultes – GW; = *P. acuminatum* Swartz var. *leucothrix* (Nash) Lelong – X; < *D. acuminatum* (Swartz) Gould & Clark var. *implicatum* (Scribner) Gould & Clark – Z; = *P. spretum* var. *leucothrix* (Nash) D.B. Ward]

Dichanthelium linearifolium (Scribner) Gould, Low White-haired Witchgrass. Dry open woods. May-Oct. Se. Canada and MN south to GA and TX. [= FNA, K, Pa, Va, Z; = *Panicum linearifolium* Scribner – C, RAB, S; > *P. linearifolium* var. *linearifolium* – F, G, WV; > *P. linearifolium* var. *wernerii* (Scribner) Fernald – F, G, WV; > *P. linearifolium* – HC; > *P. wernerii* Scribner – HC]

Dichanthelium longiligulatum (Nash) Freckmann, Long-ligule Witchgrass. Limesink ponds, depression meadows, cypress savannas, pine savannas, bogs, swamps. May-Sep. NJ and PA south to FL, also in TN, e. TX, and Central America. Intermediate forms between this taxon and *D. spretum* occur. [= K, Va, Y; = *Panicum longiligulatum* Nash – HC, RAB, S; < *P. lanuginosum* Elliott var. *lindheimeri* (Nash) Fernald – C, G; = *D. acuminatum* ssp. *longiligulatum* (Nash) Freckmann & Lelong – FNA; < *P. spretum* J.A. Schultes – GW; = *P. acuminatum* Swartz var. *longiligulatum* (Nash) Lelong – X; = *D. acuminatum* (Swartz) Gould & Clark var. *longiligulatum* (Nash) Gould & Clark – Z; = *P. spretum* var. *longiligulatum* (Nash) D.B. Ward]

Dichanthelium lucidum (Ashe) LeBlond, Bog Witchgrass. Wet meadows, sphagnous swamps, bogs, wet woods, sphagnous streamhead pocosins, baygalls. May-Oct. MA and MI south to FL and TX. Vernal culms soon recline, producing a tangled mass. The papillose fertile lemma is diagnostic. Rarely, entire populations of *D. lucidum* can have eciliate ligules composed of a membrane 0.1-0.3 mm long. Even rarer are plants within these populations with retrorsely bearded nodes. Both conditions may reflect intergradation with another taxon, possibly within the *dichotomum* complex, or with *D. cryptanthum* in section *Clandestina*. [= Pa, Q, Va; < *Panicum dichotomum* Linnaeus – C, GW, RAB; = *P. lucidum* Ashe – G, S; > *P. lucidum* var. *lucidum* – F, HC; > *P. lucidum* var. *opacum* Fernald – F, HC; < *D. dichotomum* ssp. *lucidum* (Ashe) Freckmann & Lelong – FNA; < *D. dichotomum* var. *dichotomum* – K, Z; < *P. dichotomum* var. *lucidum* (Ashe) Lelong – X]

Dichanthelium malacophyllum (Nash) Gould, Soft-leaf Witchgrass. KY and TN west to KS and TX. Primarily a plant of cedar glades and dry calcareous soils. Reported from SC by FNA, but source of record has not been identified. [= FNA, K, Z; = *Panicum malacophyllum* – F, G, HC, S]

Dichanthelium mattamuskeetense (Ashe) Mohlenbrock, Mattamuskeet Witchgrass. Wet savannas, meadows, borders of pocosin shrub swamps, thickets. May-Oct. Se. MA south to ne. SC. Typically a robust plant, often richly tinged with dark purple-maroon. [= Q, Va; < *Panicum dichotomum* Linnaeus – C, GW, RAB; > *P. mattamuskeetense* var. *mattamuskeetense* – F; > *P. mattamuskeetense* var. *clutei* (Nash) Fernald – F; < *D. dichotomum* (Linnaeus) Gould ssp. *mattamuskeetense* (Ashe) Freckmann & Lelong – FNA; > *P. mattamuskeetense* Ashe – G, HC, S; > *P. annulum* Ashe var. *glabrescens* Gleason – G; > *P. clutei* Nash – HC, S, WV; < *D. dichotomum* var. *dichotomum* – K, Z; < *P. dichotomum* var. *mattamuskeetense* (Ashe) Lelong – X]

Dichanthelium meridionale (Ashe) Freckmann, Matting Witchgrass. Dry to damp sand of shores and woods. May-Oct. Sw. NS and MA to MN, south to e. NC, n. GA, and n. AL. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, *D. leucothrix*, and *D. wrightianum* from other members of the *D. acuminatum* group. [= K, Pa, Va, Y; < *Panicum lanuginosum* Elliott – RAB; < *P. leucothrix* Nash – C; > *P. meridionale* var. *meridionale* – F; > *P. meridionale* var. *albemarlene* (Ashe) Fernald – F; = *D. acuminatum* (Swartz) Gould & Clark ssp. *implicatum* (Scribner ex Nash) Freckmann & Lelong – FNA; = *P. meridionale* Ashe – G; > *P. meridionale* – HC, S, WV; > *P. albemarlene* Ashe – HC, S, WV; > *P. columbianum* var. *thinium* A.S. Hitchcock & Chase – HC; > *P. oricola* A.S. Hitchcock & Chase – HC; < *P. acuminatum* Swartz var. *unciphyllum* (Trinius) Lelong – X; < *D. acuminatum* var. *implicatum* (Scribner) Gould & Clark – Z]

Dichanthelium neuranthum (Grisebach) LeBlond, Nerved Witchgrass. Maritime wet grasslands, Piedmont prairie-like barrens. May-Nov. Disjunct in se. and central NC, se. SC, GA, FL, MS, e. TX, AR, Bahamas, Cuba, and Belize. Can occur with the similar-appearing *D. caerulea*, from which it differs by having spikelets that are longer (1.8-2.2 mm vs. 1.4-1.8), rounded summits vs. obtuse to sub-acute, and pubescent vs. glabrous; longer first glumes (0.8-1.0 mm vs. 0.3-0.8); leaves 15× or more as long as wide vs. 10-15×; and a nearly strict panicle. The plants from the Piedmont of NC match descriptions of *Panicum ovinum*, known from dry to moist open ground and prairies in e. TX, MS, and AR when last recognized (HC). It is treated here as a synonym of *D. neuranthum*. [= *D. aciculare* (Desvaux ex Poirlet) Gould & C.A. Clark ssp. *neuranthum* (Grisebach) Freckmann & Lelong – FNA; = *Panicum neuranthum* Grisebach – RAB; > *P. neuranthum* Grisebach – HC, S; > *P. ovinum* Scribner & J.G. Smith – HC, S; < *D. aciculare* – K, Z]

Dichanthelium nudicaule (Vasey) B.F. Hansen & Wunderlin. Bogs, wet pine savannas. W. FL Panhandle and s. AL west to MS. [= Q; = *Panicum nudicaule* Vasey] {add synonymy}

Dichanthelium oligosanthes (J.A. Schultes) Gould var. ***oligosanthes***, Few-flowered Witchgrass. Sandy fields and open woods. Apr-Oct. MA and MN south to FL and TX. See note under *D. fusiforme*. [= K, Va, Z; = *Panicum oligosanthes* J.A. Schultes – HC, RAB, S; < *P. oligosanthes* – C, G; = *P. oligosanthes* var. *oligosanthes* – F; = *D. oligosanthes* ssp. *oligosanthes* – FNA; < *D. oligosanthes* – Pa]

Dichanthelium oligosanthes (J.A. Schultes) Gould var. ***scribnerianum*** (Nash) Gould, Scribner's Witchgrass. Calcareous maritime forests, dry thin woods and openings, dry prairies, usually in basic soil. Apr-Nov. Sw. ME to s. BC, south to se. NC, n. GA, and CA, also in n. Mexico. [= K, Va, Z; < *Panicum oligosanthes* J.A. Schultes – C, G, RAB; = *P. oligosanthes* var. *scribnerianum* (Nash) Fernald – F; = *D. oligosanthes* ssp. *scribnerianum* (Nash) Freckmann & Lelong – FNA; = *P. scribnerianum* Nash – HC, S; < *D. oligosanthes* – Pa]

Dichanthelium ovale (Elliott) Gould & Clark var. ***addisonii*** (Nash) Gould & Clark, Low Stiff Witchgrass. Dry to damp sandy woods and fields. May-Oct. MA and MN south to FL and TX, also in n. Mexico. See note under *D. ovale* var. *ovale* and *D. aciculare* ssp. *aciculare*. [= K, Va, Z; = *Panicum commonsianum* Ashe – C, RAB; > *P. commonsianum* var. *commonsianum* – F, G, Pa; > *P. commonsianum* var. *addisonii* (Nash) Fernald – F, G; > *P. mundum* Fernald – F, G, HC; < *D. ovale* ssp. *pseudopubescens* (Nash) Freckmann

& Lelong – FNA; > *P. commonsianum* – HC, S; > *P. addisonii* Nash – HC, S; > *P. wilmingtense* Ashe – HC, S; = *P. ovale* Elliott var. *pseudopubescens* (Nash) Lelong – X; > *D. commonsianum* (Ashe) Freckmann]

Dichanthelium ovale (Elliott) Gould & Clark var. *ovale*, Oval-flowered Witchgrass. Dry to damp sandy pinelands. May-Oct. NY to WI, south to FL and e. TX. Infrequent over most of its range except FL. In our region, the *D. ovale* double ligule character is more evident in var. *ovale*, with var. *addisonii* often having only a single ligule about 1 mm long. Also see note under *D. consanguineum* regarding *D. ovale*. [= K, Va, Z; = *Panicum ovale* Elliott – RAB, X; = *D. ovale* ssp. *ovale* – FNA; > *P. ovale* – HC, S; = *P. ovale* var. *ovale* – X]

Dichanthelium ovale (Elliott) Gould & Clark var. *ovale*, Oval-flowered Witchgrass. Dry to damp sandy pinelands. May-Oct. NY to WI, south to FL and e. TX. Infrequent over most of its range except FL. In our region, the *D. ovale* double ligule character is more evident in var. *ovale*, with var. *addisonii* often having only a single ligule about 1 mm long. Plants referable to *Panicum malacon* have spikelets 3-3.2 mm long with a first glume attached conspicuously below the second glume and sterile lemma, and half or more as long as the spikelet; leaves 3-5 mm wide, puberulent beneath, and puberulent to glabrous above. It needs further study. Also see note under *D. consanguineum* regarding *D. ovale*. [= K, Va, Z; = *Panicum ovale* Elliott – RAB, X; = *D. ovale* ssp. *ovale* – FNA; > *P. ovale* – HC, S; > *P. malacon* Nash – HC, S; = *P. ovale* var. *ovale* – X]

Dichanthelium polyanthes (J.A. Schultes) Mohlenbrock, Small-fruited Witchgrass. Damp to dry soil of open woods and ditches. Jun-Oct. VA to s. IL, south to GA and e. TX. [= FNA, Pa, Va; = *Panicum polyanthes* J.A. Schultes – C, F, G, GW, HC, RAB, S, WV; = *D. sphaerocarpon* (Elliott) Gould var. *isophyllum* (Scribner) Gould & Clark – K, Z]

Dichanthelium portoricense (Desvaux ex Hamilton) B.F. Hansen & Wunderlin ssp. *patulum* (Scribner & Merrill) Freckmann & Lelong, Nash's Witchgrass. Moist pine savannas and flatwoods, moist to dry openings in maritime forests, dry pine and oak sandhills. May-Sep. Se. VA to FL, west to e. TX; West Indies and Central America. This and *D. portoricense* ssp. *portoricense* appear to intergrade in our region. [= Va; = *Panicum lancearium* Trinius – C, G, RAB; > *P. lancearium* var. *lancearium* – F; > *P. lancearium* var. *patulum* (Scribner & Merrill) Fernald – F; < *D. portoricense* (Desvaux ex Hamilton) B.F. Hansen & Wunderlin ssp. *patulum* (Scribner & Merrill) Freckmann & Lelong – FNA; > *P. lancearium* – HC, S; > *P. patentifolium* Nash – HC, S; > *P. patulum* (Scribner & Merrill) A.S. Hitchcock – HC, S; < *D. sabulorum* (Lamarck) Gould & Clark var. *patulum* (Scribner & Merrill) Gould & Clark – K, Z; < *P. portoricense* Desvaux ex Hamilton var. *nashianum* (Scribner) Lelong – X]

Dichanthelium portoricense (Desvaux ex Hamilton) B.F. Hansen & Wunderlin ssp. *portoricense*, Puerto Rican Witchgrass. Moist pine savannas and flatwoods. May-Sep. NC south to FL, west to TX, also in West Indies. [= *Panicum portoricense* Desvaux ex Hamilton – HC, RAB, S; = *D. portoricense* ssp. *portoricense* – FNA; < *D. sabulorum* (Lamarck) Gould & Clark var. *thinium* (A.S. Hitchcock & Chase) Gould & Clark – K, Z; = *P. portoricense* var. *portoricense* – X]

Dichanthelium ravenelii (Scribner & Merrill) Gould, Ravenel's Witchgrass. Dry sandy or rocky thin woods and openings, sometimes in moist soils. May-Oct. NJ south to FL, west to e. TX, north to IA. [= FNA, K, Va, Z; = *Panicum ravenelii* Scribner & Merrill – C, F, G, HC, RAB, S]

Dichanthelium scabriusculum (Elliott) Gould & Clark, Tall Swamp Witchgrass. Moist, low, open or shaded woodlands, often along streams or ditches. May-Oct. Se. MA south to FL, west to e. TX and AR. [= Va; < *Panicum scabriusculum* – C, GW, RAB; > *P. scabriusculum* – F, HC, S; > *P. aculeatum* A.S. Hitchcock & Chase – F, G, HC, S; < *D. scabriusculum* – FNA, K, Z; > *P. scabriusculum* var. *scabriusculum* – G]

Dichanthelium scoparium (Lamarck) Gould, Velvet Witchgrass. Moist sandy soil of woodland openings and ditches. May-Oct. MA and MI south to FL and TX, also in Mexico and West Indies. The dense, velvety pubescence of the internodes, sheaths, and blades of this taxon, combined with the viscid band below the nodes, are diagnostic. See note under *D. acuminatum* var. *fasciculatum* regarding *Panicum glutinoscabrum*. [= FNA, K, Pa, Va, Z; = *Panicum scoparium* Lamarck – C, F, G, GW, HC, RAB, S]

Dichanthelium species 1 (=arenicoloides), Sandy Woods Witchgrass. Open sandy soil of pinelands and dunes, primarily near the coast; probably occasional to frequent, but long overlooked. May-Nov. NC south to FL and west to TX and AR; also in West Indies, Central America, and n. South America. Vernal form intermediate between *D. aciculare* and *D. angustifolium*. Vernal cauline leaves are longer than those of *D. aciculare* but of similar width. Panicle branches often ascending. Autumnal form strongly resembling *D. aciculare* but with larger, attenuate spikelets, longer first glumes, and both glumes attached 0.3-0.5 mm below expansion of fertile lemma. [= *Panicum arenicoloides* Ashe – HC, S; < *D. aciculare* (Desvaux ex Poiret) Gould & C.A. Clark ssp. *angustifolium* (Elliott) Freckmann & Lelong – FNA; < *D. aciculare* – K, Z]

Dichanthelium species 12 (=filirimum). Hairy Needle-leaved Witch Grass. Dry to moist sandy pinelands. May-Oct. Ranging from DE south to FL, west to TX and AR; also in West Indies. This species has the longitudinally wrinkled leaves 15-20+ times as long as wide plus the strongly nerved spikelets associated with the *D. aciculare* group. The villous nodes and longer ligules lead it towards the *D. acuminatum* group. The Ashe type for *Panicum filirimum* was treated as a synonym of *P. aciculare* by Hitchcock & Chase (1910), but it is the same as Nash's *P. chrysopsidifolium* published three years later. Lower leaves of the Florida type of *P. chrysopsidifolium* are up to 10 mm wide, but no plants have been seen outside of Florida with leaves wider than 5 mm. The specific epithet *filirimum* was changed to *filirameum* by Hitchcock & Chase, but Ashe's original spelling has been determined to be legitimate. [= *Panicum chrysopsidifolium* Nash – G, HC, S; < *P. consanguineum* Kunth – RAB; < *P. aciculare* Desvaux ex Poiret – F; < *P. lanuginosum* Elliott var. *lanuginosum* – C; < *D. acuminatum* (Swartz) Gould & C.A. Clark var. *acuminatum* – K, Z]

Dichanthelium species 13 (=mundum), Elegant Witchgrass. Sandy and peaty meadows, edge of swamps, low moist acid soil. Probably spring to fall (known collections are Jul and Aug). Se. VA, north-central NC, e. TN. Known from five collection sites, the most recent 1965. Not treated by RAB, and regarded as a possible putative hybrid by Freckmann & Lelong in FNA. [= *Panicum mundum* Fernald – F, G, HC; < *D. scoparium* (Lamarck) Gould – FNA; < *D. ovale* (Elliott) Gould & C.A. Clark var. *addisonii* (Nash) Gould & C.A. Clark – K, Z; = *Dichanthelium mundum* (Fernald) LeBlond in prep.]

Dichanthelium species 14, Bath County Witchgrass. Shale barrens. So far as is known, restricted to an area of shale barrens in Bath County, VA.

Dichanthelium species 15, Difficult Creek Witchgrass. Piedmont oak barrens over mafic and ultramafic rock. So far as is known restricted to the type site.

Dichanthelium species 16, Sandy Run Witchgrass. Calcareous wet savannas. So far as is known, restricted to the type site in Onslow County, NC.

Dichanthelium species 17 (=pinetorum), Pineland Witchgrass. Open sandy pine and pine/oak woodlands. Apr.-Nov. Endemic to central and south FL, as far north as Hillsborough County, FL. This rarely collected species is distinguished by its 2-3 mm-wide leaves, narrow vernal panicles, spikelets 2.3-3.2 mm long, with blunt to pointed second glumes and sterile lemmas exceeding fertile lemma. Plants are often nearly glabrous. [= *Panicum pinetorum* Swallen – HC, S; < *D. aciculare* – FNA, K, Z]

Dichanthelium species 18 (=malacon), Dehiscent Witch Grass. Cp (AL, DE, FL, GA, NC, NJ, SC). Dry pine/scrub oak woodlands; uncommon (rare north of FL). April-Dec. Ranging somewhat disjunctly from NJ south to FL and AL; reported from TX. The basally attenuate spikelets, first glumes 1/2 or more as long as the spikelets, and dehiscent glumes and sterile lemmas distinguish this wide-ranging but local and uncommon species. RAB recognized the name *P. malacon*, but misapplied it to specimens referable to *D. oligoanthes* (Schultes) Gould and *D. fusiforme* (Hitchcock) Harvill. [= *Panicum malacon* Nash – HC, S; < *P. malacon* – RAB, misapplied; < *D. ovale* (Elliott) Gould & C.A. Clark var. *ovale* – FNA, K, Z; < *P. ovale* Elliott var. *ovale* – X]

Dichanthelium species 19 (=bicknellii), Bicknell's Witch Grass. Cp (DE, MD, NC, NJ, VA), Pd (DC, MD, NC, TN, VA), Mt (GA, MD, NC, VA, WV). Shaded to open woodlands, sometimes on shale in the Piedmont and Mountains, and sandy soils of the Coastal Plain. Drier soils appear to be characteristic, but it has also been found on moist soils. Apr.-Nov. CT to MI, s. to n. GA and n. LA, w. to MO and AR. It is distinguished by blades 20× or more as long as wide, increasing in length on the culm distally, and with a usually strongly scabrous adaxial surface. [= *Panicum bicknellii* Nash – F, HC, RAB, S; = *P. bicknellii* var. *bicknellii* – G; < *Dichanthelium boreale* (Nash) Freckmann – K, Z]

Dichanthelium sphaerocarpon (Elliott) Gould, Round-fruited Witchgrass. Moist or dry thin woods, meadows, and ditches, often in dry sandy soil. May-Oct. MA, VT, OH, and KA south to FL and TX, also in Mexico. Nodes are infrequently bearded, but internodes remain glabrous. [= FNA, K, Pa, Va, Z; = *Panicum sphaerocarpon* Elliott – C, RAB, WV; > *P. sphaerocarpon* var. *sphaerocarpon* – F, G, HC, S; > *P. sphaerocarpon* var. *inflatum* (Scribner & J.G. Smith) A.S. Hitchcock & Chase – F, G, HC, S]

Dichanthelium sphagnicola (Nash) LeBlond, Peaty Witchgrass. Edges of cypress swamps, in sphagnum bogs, moist shady places. May-Oct. GA (Chatham, Camden, Lanier counties) (Carter, Baker, & Morris 2009) to FL; should be sought in se. SC. Treated in synonymy with *Panicum dichotomum* by RAB, but no specimen is known from the Carolinas. This species is similar to *D. lucidum* in appearance, and differs most readily by its larger pubescent spikelets with smooth fertile lemma and palea. [= Q;

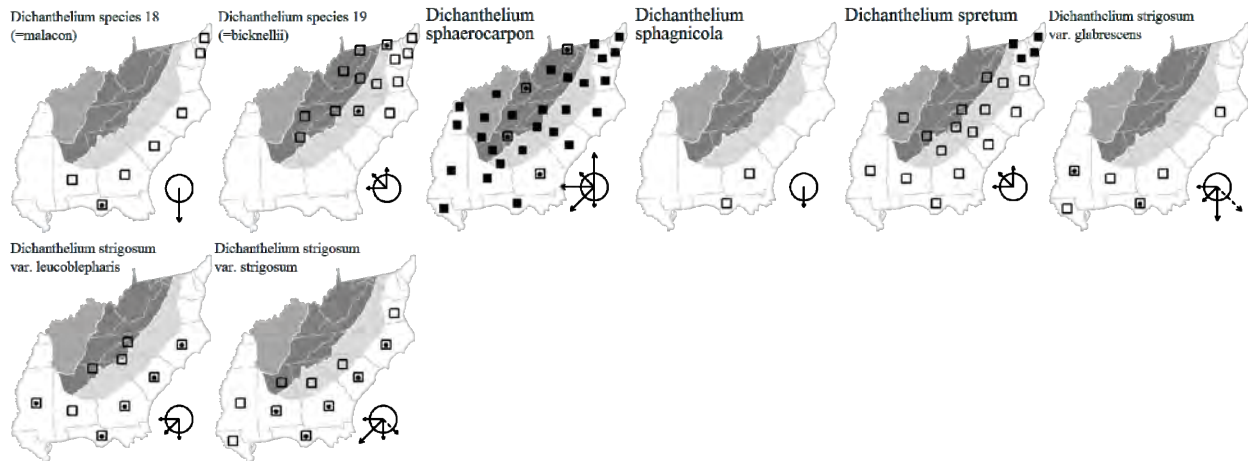

< *Panicum dichotomum* Linnaeus – RAB; < *D. dichotomum* (Linnaeus) Gould ssp. *lucidum* (Ashe) Freckmann & Lelong – FNA; = *P. sphagnicola* Nash – HC, S; < *D. dichotomum* var. *dichotomum* – K, Z; < *P. dichotomum* var. *lucidum* (Ashe) Lelong – X]

Dichanthelium spretum (J.A. Schultes) Freckmann, Eaton's Witchgrass. Wet sands and peats of bogs, savannas, meadows, and shores. May-Sep. ME south to n. FL, LA and e. TX. Intermediate forms between this taxon and *D. longiligulatum* occur. [= K, Pa, Va, Y; = *Panicum spretum* J.A. Schultes – C, F, G, HC, RAB, S; = *D. acuminatum* (Swartz) Gould & Clark ssp. *spretum* (J.A. Schultes) Freckmann & Lelong – FNA; < *P. spretum* – GW; = *P. acuminatum* Swartz var. *densiflorum* (Rand & Redfield) Lelong – X; = *D. acuminatum* var. *densiflorum* (Rand & Redfield) Gould & Clark – Z]

Dichanthelium strigosum (Muhlenberg) Freckmann var. ***glabrescens*** (Grisebach) Freckmann, Hairless Witchgrass. Low, open sandy pinelands and hammocks, bogs. May-Oct. S. GA and FL west to LA; disjunct in se. NC; also in West Indies, Belize. Included in synonymy with *Panicum strigosum* by RAB, but no specimen from the Carolinas had been found prior to discovery of a population in Onslow County in 2009. [= K; = *D. strigosum* ssp. *glabrescens* (Grisebach) Freckmann & Lelong – FNA; < *Panicum strigosum* Muhlenberg – GW, RAB; = *P. polycaulon* Nash – HC, S; = *D. leucoblepharis* (Trinius) Gould & Clark var. *glabrescens* (Grisebach) Gould & Clark – Z]

Dichanthelium strigosum (Muhlenberg) Freckmann var. ***leucoblepharis*** (Trinius) Freckmann, Dwarf Witchgrass. Sandy, acidic soils of pinelands. May-Oct. NC south to FL, west to TX, also in Mexico. [= K; = *Panicum ciliatum* Elliott – HC, RAB, S; = *D. strigosum* ssp. *leucoblepharis* (Trinius) Freckmann & Lelong – FNA; = *P. strigosum* Muhlenberg var. *leucoblepharis* (Trinius) Lelong – X; = *D. leucoblepharis* (Trinius) Gould & Clark var. *leucoblepharis* – Z]

Dichanthelium strigosum (Muhlenberg) Freckmann var. ***strigosum***, Rough-hairy Witchgrass. Moist soils of pine flatwoods, savannas, and pocosins, also in boggy situations. May-Sep. Se. VA south to FL, west to TX, also in TN, e. Mexico, Mesoamerica, n. South America, and West Indies. [= K, Va; = *Panicum strigosum* Muhlenberg – C, F, G, HC, S; = *D. strigosum* ssp. *strigosum* – FNA; < *P. strigosum* – GW, RAB; = *P. strigosum* var. *strigosum* – X; = *D. leucoblepharis* (Trinius) Gould & Clark var. *pubescens* (Vasey) Gould & Clark – Z]

Dichanthelium tenue (Muhlenberg) Freckmann & Lelong, White-edged Witchgrass. Wet peaty or sandy soil pineland savannas, flatwoods, bogs, and meadows. May-Oct. NJ south to FL, west to TX; also in Mesoamerica and Cuba. This treatment of *D. tenue* includes plants from n. Alabama formerly recognized as *Panicum concinnius*, with spikelets 1.2-1.4 mm long but otherwise possessing the characters of *D. tenue*. [= FNA, Va; = *Panicum tenue* Muhlenberg – C, RAB; > *P. tenue* – F, HC, S; > *P. albomarginatum* Nash – F, HC, S; > *P. trifolium* Nash – F, G, HC, S; < *P. ensifolium* Baldwin – G; > *P. concinnius* A.S. Hitchcock & Chase – HC, S; < *D. dichotomum* (Linnaeus) Gould var. *tenue* (Muhlenberg) Gould & Clark – K, Z]

Dichanthelium villosissimum (Nash) Freckmann var. ***villosissimum***, White-haired Witchgrass. Dry sandy soil of open woods and prairies. Apr-Sep. MA south to FL, west to TX, also in Mexico and Mesoamerica. Appearing to be related to *D. ovale* based on such characters as the double ligule. [= K, Va, Y; = *Panicum villosissimum* Nash – C, HC, RAB, S, WV; > *P. villosissimum* var. *pseudopubescens* (Nash) Fernald – F, G; > *P. villosissimum* var. *villosissimum* – F, G; > *D. ovale* (Elliott) Gould & Clark ssp. *villosissimum* (Nash) Freckmann & Lelong – FNA; > *P. pseudopubescens* Nash – HC, S; > *P. villosissimum* Nash – HC, S; = *P. ovale* Elliott var. *villosum* (A. Gray) Lelong – X; < *D. acuminatum* (Swartz) Gould & Clark var. *villosum* (A. Gray) Gould & Clark – Z; < *D. villosissimum* – Pa]

Dichanthelium webberianum (Nash) LeBlond, Webber's Witchgrass. Moist pine savannas and flatwoods. May-August. Disjunct in se. NC and SC from GA and FL. [= V; = *Panicum webberianum* Nash – HC, RAB, S; < *D. portoricense* (Desvaux ex Hamilton) B.F. Hansen & Wunderlin ssp. *patulum* (Scribner & Merrill) Freckmann & Lelong – FNA; < *D. sabulorum* (Lamarck) Gould & Clark var. *patulum* (Scribner & Merrill) Gould & Clark – K, Z; < *P. portoricense* Desvaux ex Hamilton var. *nashianum* (Scribner) Lelong – X]

Dichanthelium wilcoxianum (Vasey) Freckmann is shown as occurring in SC and MS on the range map in FNA, but the source of these records is not known for this plant primarily of dry prairies in the Upper Midwest. [= FNA] {rejected as a component of our flora; not keyed; not mapped}

Dichanthelium wrightianum (Scribner) Freckmann, Wright's Witchgrass. Limesink ponds and meadows, cypress savannas, pine savannas, bogs. May-Sep. MA south to FL, west to TX, also in Cuba and Mesoamerica. A micrometer is needed to measure the very short puberulence (0.1 mm long) that distinguishes this taxon, *D. meridionale*, and *D. leucothrix* from other members of the *D. acuminatum* group. [= FNA, K, Va, Y; = *Panicum wrightianum* Scribner – C, F, G, HC, RAB, S; < *P. spretum* J.A. Schultes – GW; = *D. acuminatum* (Swartz) Gould & Clark var. *wrightianum* (Scribner) Gould & Clark – Z]

Dichanthelium xanthophysum (A. Gray) Freckmann, Slender Witchgrass. Sandy or rocky open woodlands. NS and ME west to SK, south to PA, ne. WV, and SD. [= FNA, K, Pa, Z; = *Panicum xanthophysum* A. Gray – C, F, G, HC, WV]

Dichanthelium yadkinense (Ashe) Mohlenbrock, Spotted-sheath Witchgrass. Floodplain forests, thickets, bottomlands, and swamps, often on alluvial deposits. May-Oct. NJ and MI south to GA and TX, also in Mexico. Sheaths often with wart-like glands. This taxon resembles *D. species 9 (=cryptanthum)*, from which it differs most readily by its hairy ligule (vs. membranous) and smooth peduncle (vs. antrorsely scabrous). [= Pa, Q, Va; < *Panicum dichotomum* Linnaeus – GW, RAB; = *P. yadkinense* Ashe – C, F, G, HC, S, WV; = *D. dichotomum* ssp. *yadkinense* (Ashe) Freckmann & Lelong – FNA; < *D. dichotomum* var. *dichotomum* – K, Z; = *P. dichotomum* var. *yadkinense* (Ashe) Lelong – X]

Digitaria Haller 1768 (Crab Grass)

A genus of about 200 species, primarily in the tropics and subtropics. Most of our species occur primarily in disturbed situations; their original distributions and habitats are now obscure. References: Wipff in FNA (2003a); Webster (1987)=Z; Wipff & Hatch (1994)=Y; Wipff (1996b)=X; Webster (1980).

- 1 Inflorescence an open panicle; spikelets long-pedicellate, borne singly at the ends of long panicle branches; [section *Pennatae*] *D. cognata* var. *cognata*
- 1 Inflorescence of 2-several spikelike racemes borne digitately or in close proximity near the summit of the culm; spikelets sessile or short-pedicellate, borne more-or-less closely spaced along the racemes.
 - 2 Rachis of each raceme narrow, trigonous, only slightly (if at all) winged.
 - 3 Spikelets 4.2-5.9 mm long *D. insularis*
 - 3 Spikelets 1.3-3.6 mm long.
 - 4 Spikelets in 2s on the middle portions of the primary branches, the pedicels not adnate; upper lemmas gray, yellow, and/or purple-tinged when immature, purple at maturity *D. texana*
 - 4 Spikelets in groups of 2-5 on the middle portions of the primary branches, the longer pedicels often adnate to the primary branch for a portion of their lengths; upper lemmas brown when immature, dark brown at maturity.
 - 5 Spikelets 1.7-2.2 mm long; plants 3-10 dm tall; racemes to 10 cm long; upper sheaths glabrous, lower sheaths glabrous to sparsely pilose *D. filiformis* var. *filiformis*
 - 5 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose *D. villosa*
 - 2 Rachis of each raceme broad (0.5-1 mm wide), winged, the wings as wide as or wider than the rachis proper.
 - 6 Lower sheaths glabrous; second glume 0.75-1× as long as the first glume (which may be ; fertile lemma dark brown or black at maturity (or pale brown or gray in *D. longiflora*).
 - 7 Hairs of the spikelet minutely capitate; second glume ca. 1× as long as the first glume; spikelets 1.7-2.3 mm long *D. ischaemum*
 - 7 Hairs of the spikelet not minutely capitate; second glume ca. 0.75× as long as the first glume; spikelets 1.2-1.7 mm long *D. violascens*
 - 6 Lower sheaths pilose; second glume 0.3-0.6× as long (to 0.8× as long in *D. ciliaris*) as the first glume; fertile lemma white, tan, or grayish-brown at maturity.
 - 8 Spikelets 1.5-1.8 mm long, villous with crinkled hairs; pedicels glabrous, terete in cross-section *D. serotina*
 - 8 Spikelets (1.7-) 2.4-4.1 mm long, glabrous, scabrous, or pubescent with straight hairs; pedicels scabrous, 3-angled in cross-section; [section *Digitaria*].
 - 9 Spikelets (1.7-) 2.5-3.4 mm long, averaging 3.0 mm long or shorter; leaf blades pilose over the upper surface *D. sanguinalis*
 - 9 Spikelets 2.6-4.1 mm long, averaging 3.1 mm long or longer; leaf blades glabrous except for a few hairs on the upper surface at the base.
 - 10 Lower lemma of the sessile spikelet with 5 equidistant nerves; lowermost inflorescence node glabrous or pubescent with hairs < 0.4 mm long; apex of the first glume rounded to truncate *D. bicornis*
 - 10 Lower lemma of sessile spikelet with the lateral nerves crowded to the margins; lowermost inflorescence node pubescent with hairs > 0.4 mm long; apex of the first glume acute *D. ciliaris*

*? **Digitaria bicornis** (Lamarck) Roemer & J.A. Schultes. Sandy fields, lawns, roadsides, disturbed places. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K1, K2, WH3, Z]

* **Digitaria californica** (Bentham) Henrard var. *californica*, Cottontop, California Crab Grass. Disturbed areas; apparently introduced from sw. United States and adjacent Mexico, south through Central America to South America. [= FNA; < *D. californica* – K2; < *Trichachne californica* (Bentham) Chase – HC] {not yet keyed; add to synonymy}

Digitaria ciliaris (Retzius) Köler, Southern Crab Grass. Sandy fields, roadsides, and disturbed areas. Aug-Oct. [= C, FNA, K1, K2, Pa, Va, WH3, Z; = *D. sanguinalis* var. *ciliaris* (Retzius) Parlatores – F, HC]

Digitaria cognata (J.A. Schultes) Pilger, Fall Witchgrass. Sandy fields and roadsides. Jul-Oct. NH and MN south to FL, TX, and n. Mexico. Wipff & Hatch (1994) discuss the reasons for including *Leptoloma* in *Digitaria*. [= FNA, K2, Va, WH3; =

Digitaria cognata var. *cognata* – K1; = *Leptoloma cognatum* (J.A. Schultes) Chase – RAB, C, F, G, HC, S; = *Digitaria cognatum* – Pa, orthographic variant; = *D. cognatum* ssp. *cognatum* – Y]

* *Digitaria eriantha* Steudel ssp. *pentzii* (Stent) Kok, Pangola Grass. Pastures; native of Africa. Introduced in n. FL (Wunderlin & Hansen 2003, 2006). [= FNA; < *D. eriantha* – K1, K2, WH3; = *D. pentzii* Stent] {not yet keyed; add to synonymy}

* *Digitaria filiformis* (Linnaeus) Köler var. *dolichophylla* (Henrard) J. Wipff. Pinelands, disturbed areas; native of s. FL, Cuba, and PR. The disjunct occurrence in St. Johns County, FL may be adventive. See Wipff (1996) for additional discussion. [= FNA, K2, WH3; = *dolichophylla* Henrard – K1] {not yet keyed}

Digitaria filiformis (Linnaeus) Köler var. *filiformis*. Fields, roadsides, disturbed areas. Sep-Oct. Var. *filiformis*, with pubescent spikelets, is widespread in e. North America. Var. *laevigulumis* (Fernald) J. Wipff, with glabrous spikelets, occurs in New England. [= C, F, FNA, G, K2, RAB, Va, WH3, X; = *D. filiformis* – HC, K1; = *Syntherisma filiformis* (Linnaeus) Nash – S; < *D. filiformis* – Pa, W, WV]

Digitaria floridana A.S. Hitchcock, Florida Crabgrass. Sandy, mesic hammocks. Supposedly endemic to only Hernando County, FL (FNA, HC, WH3); also reported for Marion and Highlands counties FL (K2). [= FNA, HC, K2, WH3; = *Syntherisma floridanum* (A.S. Hitchcock) A.S.W. Hitchcock – S] {not yet keyed}

Digitaria gracillima (Scribner) Fernald, Longleaf Crabgrass. Florida scrub, sandhills. Endemic to FL peninsula, from Flagler, Putnam, and Alachua counties south. [= HC, K2, W3; = *Syntherisma gracillimum* (Scribner) Nash – S; > *D. bakeri* (Nash) Fernald; > *Syntherisma bakeri* Nash] {not yet keyed}

* *Digitaria horizontalis* Willdenow, Jamaican Crabgrass. Reported for SC on the basis of a specimen at NCU (Kartesz 1999). {check specimen} [= FNA, K, WH3] {not yet keyed; add to synonymy}

Digitaria insularis (Linnaeus) Mez ex Ekman, Sourgrass. Moist areas. FL, AL, and MS west to TX; West Indies; Mexico, Central America, South America. [= FNA, K, WH3; = *Trichachne insularis* (Linnaeus) Nees – HC; = *Valota insularis* (Linnaeus) Chase – S]

* *Digitaria ischaemum* (Schreber) Muhlenberg, Smooth Crab Grass. Fields, lawns, disturbed areas; native of Eurasia. Jul-Oct. Two varieties have sometimes been recognized. Var. *ischaemum* has racemes (1-) 2-6, 1-9 (-10) cm long, mostly curved and plants mostly to 4 dm tall. Var. *mississippiensis* (Gattinger) Fernald has racemes 5-7, 6-15 cm long, mostly stiff and straight and plants to 10 dm tall. [= C, FNA, K, Pa, Va, W, WH3, WV; > *D. ischaemum* var. *ischaemum* – F, G, HC; > *D. ischaemum* (Schreber) Muhlenberg var. *mississippiensis* (Gattinger) Fernald – F, G, HC; = *D. ischaemum* var. *ischaemum* – RAB; = *Syntherisma ischaemum* (Schreber) Nash – S]

* *Digitaria longiflora* (Retzius) Persoon, Indian Crabgrass. Lawns, roadsides, pastures; native of Asia and Africa. Alachua, Dixie Duval, and Holmes counties southward to s. FL. [= FNA, K, WH3] {not yet keyed}

* *Digitaria nuda* Schumacher. Disturbed areas; native of Africa. In our area, known only from Columbia County, FL. [= FNA, K, WH3; = *Syntherisma nuda* (Schumacher) A.S. Hitchcock] {not yet keyed; add to synonymy}

* *Digitaria sanguinalis* (Linnaeus) Scopoli, Northern Crab Grass. Fields, roadsides, disturbed areas. Jul-Oct. [= FNA, C, G, K, Pa, RAB, Va, W, WV, Z; = *D. sanguinalis* var. *sanguinalis* – F, HC; = *Syntherisma sanguinalis* (Linnaeus) Dulac – S]

Digitaria serotina (Walter) Michaux, Dwarf Crab Grass. Sandy woodlands. Oct. [= C, F, FNA, G, GW, HC, K, Pa, RAB, Va, WH3; = *Syntherisma serotina* Walter – S]

- * *Digitaria texana* A.S. Hitchcock, Texas Crabgrass. Disturbed areas; native of coastal Texas. Established in City of Virginia Beach, VA (VBA 2007). Also reported for St. Johns County, FL, adjacent to our area. [= FNA, HC, K, Va, WH3] {add to synonymy}
- Digitaria villosa* (Walter) Persoon, Shaggy Crabgrass. Sandy fields, roadsides. Sep-Oct. [= HC, K, Va; = *D. filiformis* var. *villosa* (Walter) Fernald – C, F, FNA, G, RAB, X; = *Syntherisma villosa* Walter – S]
- * *Digitaria violascens* Link. Sandy fields, roadsides, and woodland borders. Sep-Oct. [= C, FNA, G, HC, K, WH3; = *D. ischaemum* var. *violascens* (Link) Radford – RAB; ? *Syntherisma floridana* (A.S. Hitchcock) A.S. Hitchcock – S]

Dinebra Jacquin 1809 (Viper Grass)

A genus of ca. 25 species, annuals, of the tropics and subtropics. The circumscription of *Dinebra* here follows the greatly expanded course of Peterson et al. (2012). References: Snow & Peterson (2012)=Y; Peterson et al. (2012)=Z; Barkworth in FNA (2003a); Snow in FNA (2003a).

- * *Dinebra decipiens* (R. Brown) P.M. Peterson & N. Snow var. *peacockii* (Maiden & Betche) P.M. Peterson & N. Snow. Waif at wool-combing mill, probably not established; native of Australia. [= Y; = *Dinebra decipiens* (R. Brown) P.M. Peterson & N. Snow ssp. *peacockii* (Maiden & Betche) P.M. Peterson & N. Snow – Z; = *Leptochloa decipiens* (R. Brown) Stapf ex Maiden ssp. *peacockii* (Maiden & Betche) N. Snow – K] {not keyed}
- * *Dinebra divaricatissima* (S.T. Blake) P.M. Peterson & N. Snow, Spreading Sprangletop. Waif at wool-combing mill, probably not established; native of Australia. [= *Leptochloa divaricatissima* S.T. Blake – K] {not keyed}
- Dinebra panicea* (Retzius) P.M. Peterson & N. Snow ssp. *brachiata* (Steudel) P.M. Peterson & N. Snow, Red Sprangletop. Disturbed areas. Jun-Oct. Widespread in the Western Hemisphere. The more familiar name, *L. filiformis*, must be replaced for reasons of nomenclatural priority. [= Y; = *Dinebra panicea* (Retzius) P.M. Peterson & N. Snow ssp. *brachiata* (Steudel) P.M. Peterson & N. Snow – Z; = *Leptochloa panicea* (Retzius) Ohwi ssp. *brachiata* (Steudel) N. Snow – FNA, K, Pa; < *L. filiformis* (Lamarck) Palisot de Beauvois – RAB, C, F, G, GW, HC, K, S, W]
- Dinebra panicea* (Retzius) P.M. Peterson & N. Snow ssp. *mucronata* (Michaux) P.M. Peterson & N. Snow. Disturbed areas. [= Y; = *Dinebra panicea* (Retzius) P.M. Peterson & N. Snow ssp. *mucronata* (Michaux) P.M. Peterson & N. Snow – Z; = *Leptochloa panicea* (Retzius) Ohwi ssp. *mucronata* (Michaux) Nowack – FNA, K, WH3] {not yet keyed; add to synonymy}
- * *Dinebra panicoides* (J. Presl) P.M. Peterson & N. Snow, Amazon Sprangletop. Drawdown habitats on lake margins; native of South America. Belden et al. (2004) discuss the VA occurrences along the banks of the Roanoke (Staunton) River at Kerr Reservoir. Also reported for e. GA in the Coastal Plain (Sorrie, pers. comm.). [= Z; = *Leptochloa panicoides* (J. Presl) A. Hitchcock & Chase – C, FNA, G, GW, HC, K; ? *Diplachne halei* Nash – F; ? *Leptochloa floribunda* Doell – S; = *Diplachne panicoides* (J. Presl) McNeill]
- * *Dinebra retroflexa* (Vahl) Panzer, Viper Grass. Disturbed areas, probably just a waif; native of Africa and s. Asia. This species has been collected as a waif in Mecklenburg County, NC (Mellichamp, Matthews, & Smithka 1987). [= FNA, K, Z] {not keyed}

- * *Dinebra scabra* (Nees) P.M. Peterson & N. Snow. Disturbed areas; native of the Neotropics. [= Z; = *Leptochloa scabra* Nees – FNA, K2]

Diplachne Palisot de Beauvois 1812

A genus ... References: Snow & Peterson (2012)=Y; Peterson et al. (2012)= Z; Snow in FNA (2003a); Snow (1998); Weakley et al. (2011); Cronquist (1991).

- 1 Lemmas 2-3 mm long, the apex obtuse to truncate, with the midrib often extended as a mucro ***D. uninervis***
- 1 Lemmas 3-5 mm long, the apex acuminate or awned.

- 2 Low sprawling grasses, < 5 dm tall; lemma awns (1-) 2.5-5 mm long; first glume 2.5-3.5 mm long; second glume 4-7 mm long..... *D. maritima*
- 2 Taller grasses, usually 5-10 dm tall; lemma awns 0.5-2.5 mm long; first glume 1.3-3.4 mm long; second glume 2.2-5 mm long.
- 3 First glume 2.3-3.4 mm long; second glume 3.4-5.0; lemmas 4-5 mm long, with an awn 0.5-2.5 mm long..... [*D. acuminata*]
- 3 First glume 1.3-2 mm long; second glume 2.2-3.5; lemmas 3-4 mm long, with an awn 0.5-1 mm long..... *D. fascicularis*

* *Diplachne acuminata* Nash. Along salted highways; native of w. North America. Reported as adventive in PA and along highways in WV from halophytic habitats of w. United States (Cusick 1994). [= F; = *Leptochloa fascicularis* (Lamarck) A. Gray var. *acuminata* (Nash) Gleason – C, G; = *Diplachne acuminata* Nash – F; < *Leptochloa fascicularis* – HC; < *Leptochloa fusca* (Linnaeus) Kunth ssp. *fascicularis* (Lamarck) N. Snow – FNA, K; = *Leptochloa acuminata* (Nash) Mohlenbrock; < *Diplachne fusca* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes var. *fascicularis* (Lamarck) P.M. Peterson & N. Snow – Y, Z] {not yet keyed}

Diplachne fascicularis (Lamarck) Palisot de Beauvois, Bearded Sprangletop. Bed of artificial impoundment, brackish habitats, disturbed areas. Sep. Widespread in e. North America, primarily west of the Appalachians (adventive farther east), and extending into South America. Reported (as *L. fascicularis*) for SC by Nelson & Kelly (1997). [= F; = *Leptochloa fascicularis* (Lamarck) A. Gray var. *fascicularis* – C, G; < *Leptochloa fascicularis* – RAB, GW, HC, S; < *Leptochloa fusca* (Linnaeus) Kunth ssp. *fascicularis* (Lamarck) N. Snow – FNA, K, Pa, WH3; = *Diplachne fascicularis* (Lamarck) Palisot de Beauvois – F; < *Diplachne fusca* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes var. *fascicularis* (Lamarck) P.M. Peterson & N. Snow – Y, Z]

Diplachne maritima E.P. Bicknell, Salt-meadow Grass. Fresh to brackish marshes, overwash flats, other disturbed brackish habitats. Aug-Oct. Along the coast from s. NH south to se. NC. This taxon appears to warrant status as a species separate from *D. fascicularis*; see Weakley et al. (2011) for discussion of the rationale for recognition. [= F; = *Leptochloa fascicularis* (Lamarck) A. Gray var. *maritima* (E.P. Bicknell) Gleason – C, G; < *Leptochloa fascicularis* – RAB, GW, HC, S; < *Leptochloa fusca* (Linnaeus) Kunth ssp. *fascicularis* (Lamarck) N. Snow – FNA, K; = *Leptochloa maritima* (E.P. Bicknell) LeBlond & Sorrie, nom. illeg. ; < *Diplachne fusca* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes var. *fascicularis* (Lamarck) P.M. Peterson & N. Snow – Y, Z]

* *Diplachne uninervia* (J. Presl) Parodi. Disturbed areas; adventive from farther west in much of our area. Jul-Aug. Widespread in the Western Hemisphere, the native range obscure, but not likely native in our area. Reported for SC by Nelson & Kelly (1997). [= *Leptochloa uninervia* (J. Presl) A. Hitchcock & Chase – C, G, GW, HC, K, RAB, S; = *Leptochloa fusca* (Linnaeus) Kunth ssp. *uninervia* (J. Presl) N. Snow – FNA, K, WH3; = *Diplachne fusca* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes var. *uninervia* (J. Presl) P.M. Peterson & N. Snow – Y, Z]

Disakisperma Steudel 1854

A genus of 3 species of warm temperate, subtropical, and tropical America and Africa. References: Snow & Peterson (2012)=Y; Peterson et al. (2012)=Z; Snow in FNA (2003a); Snow (1998).

* *Disakisperma dubium* (Kunth) P.M. Peterson & N. Snow, Green Sprangletop. Waif at wool-combing mill and ballast sites, probably not established; native of sw. United States south through Central America and South America. Also reported for NC by Kartesz (1999), but the documentation indicates that it was cultivated at a Soil Conservation Service test nursery in Chapel Hill, Orange County. [= Y; = *Disakisperma dubia* (Kunth) P.M. Peterson & N. Snow – Z, orthographic variant; = *Leptochloa dubia* (Kunth) Nees – FNA, HC, K2, WH3] {not keyed}

Distichlis Rafinesque 1819 (Saltgrass)

A genus of about 10 species, of North, Central, and South America, and Australia. Bell & Columbus (2008) recircumscribe *Distichlis* to include *Monanthochloe* Engelman and *Reederochloa* Soderstrom & H.F. Decker. References: Bell & Columbus (2008)=Z; Thieret in FNA (2003a); Barkworth in FNA (2003a). [including *Monanthochloe*]

Identification notes: When sterile, *Distichlis spicata* is easily confused with *Sporobolus virginicus*, with which it sometimes occurs. *Distichlis spicata* is generally a coarser plant, and lacks long hairs around the collar of the sheath; *Sporobolus virginicus* is more delicate, and typically has long hairs on either side of the collar.

- 1 Leaf blades < 1.5 cm long, subulate; plant colonial by surficial stolons (rarely rhizomatous); pistillate and staminate inflorescence with 1 spikelet; [FL and other subtropical shores]..... *D. littoralis*
- 1 Leaf blades 2.5-14 cm long, flat (though often involute when dry); plants colonial by subterranean rhizomes; pistillate and staminate inflorescences with > 1 spikelet; [widespread]..... *D. spicata*

Distichlis littoralis (Engelmann) H.L. Bell & Columbus, Shoregrass, Key Grass. Brackish shores. From n. peninsular FL (Taylor and Dixie cos. on the west coast and Volusia County on the east coast) southward. Also known from coastal sw. LA (Cameron Parish) and TX southward. [= *Monanthochloe littoralis* Engelmann – FNA, K, S, WH3]

Distichlis spicata (Linnaeus) Greene, Saltgrass, Spike Grass. Coastal marshes and shores, especially common in hypersaline flats (where infrequent tidal inundation is followed by evaporation). Jun-Oct. Two varieties (or subspecies or species) have often been recognized: var. *spicata* ranging along the Atlantic coast from NS and PE south to tropical America, and on the Pacific coast of North America, and var. *stricta* (Torrey) Scribner widespread in saline situations in western North America. These do not appear to warrant taxonomic recognition (Barkworth in FNA 2003a). [= FNA, GW, K, Pa, RAB, S, Va, WH3; > *D. spicata* var. *spicata* – C; > *D. spicata* – F, G, HC; > *D. spicata* ssp. *spicata*]

Echinochloa Palisot de Beauvois 1812 (Barnyard-grass, Jungle-rice)

A genus of 4-5- species of the tropics and warm temperate regions. References: Michael in FNA (2003a). Key based in part on C.

- 1 Panicle elongate, the branches few, distant, unbranched, and short, to 2 (-3) cm long; spikelets awnless; leaves 3-6 (-9) mm wide *E. colonum*
- 1 Panicle broader, the branches numerous, approximate, often further branched, short to long, some (at least) exceeding 2 cm long; spikelets awnless or awned; leaves 5-30 mm wide.
 - 2 Lower sheaths usually papillate-pubescent; fertile lemma 2.5-4× as long as wide *E. walteri*
 - 2 Lower sheaths glabrous; fertile lemma 1.5-2.5× as long as wide.
 - 3 Inflorescence nodding; awns 4-29 mm long *E. cruspavonis* var. *cruspavonis*
 - 3 Inflorescence erect, stiff; awns 0-25 mm long.
 - 4 Second glume and sterile lemma hairy or scabrous to nearly glabrous, the hairs usually not papillose-based; fertile lemma obtuse or broadly acute, with a thin, membranous (later withering) tip set off from the body by a line of minute hairs.
 - 5 Panicle fairly open, the branches erect, appressed, or spreading; spikelets green or purple-tinged, awnless or with a well-developed awn (to 25 mm long); leaves 5-15 mm wide; plants mostly 3-7 dm tall *E. crusgalli* var. *crusgalli*
 - 5 Panicle very crowded, the branches appressed to slightly spreading, the tips often incurved; spikelets purplish-brown, awnless (or with awn to 2 mm long); leaves mostly 15-30 mm wide; plants mostly 7-15 dm tall [*E. frumentacea*]
 - 4 Second glume and sterile lemma usually with stout, papillose-based hairs on the veins; fertile lemma acuminate, abruptly narrowed to a firm, persistent tip.
 - 6 Spikelets < 3.5 mm long, not including the awn (if present); sterile lemma awnless or with an awn to 6 (-10) mm long *E. muricata* var. *microstachya*
 - 6 Spikelets > 3.5 mm long, not including the awn (if present); sterile lemma usually awned (rarely awnless), the awn 6-25 mm long *E. muricata* var. *muricata*

* *Echinochloa colonum* (Linnaeus) Link, Jungle-rice. Fields, ditches, disturbed wet areas; native of the Old World tropics. Jul-Oct. The debate over the appropriate grammatical treatment and therefore spelling of the epithet is discussed in detail in Ward (2005b). [= C, F, G, GW, HC, RAB, Va; = *E. colona* – FNA, K, Pa, S, WH3, orthographic variant]

* *Echinochloa crusgalli* (Linnaeus) Palisot de Beauvois var. *crusgalli*, Barnyard-grass. Disturbed areas; native of Eurasia. Jul-Oct. [= C, G, Pa, Va; < *E. crusgalli* – GW, RAB, WV (also see *E. muricata*); = *E. crus-galli* – K, WH3, orthographic variant; < *E. crusgalli* – F, FNA; < *E. crus-galli* ssp. *crus-galli* – S (also see *E. muricata*)]

* *Echinochloa cruspavonis* (Kunth) J.A. Schultes var. *cruspavonis*. {habitats} Jul-Oct. [< *E. crus-pavonis* – HC, WH3; = *E. crus-pavonis* var. *crus-pavonis* – FNA, K, orthographic variant]

Echinochloa cruspavonis (Kunth) J.A. Schultes var. *macera* (Wiegand) Gould. {add info}

* *Echinochloa esculenta* (A. Braun) H. Scholtz, Japanese Millet. Cultivated for grain, fodder, and birdseed, rarely persistent; of garden origin from *E. crusgalli*, and arguably better regarded as a cultivated form. [= FNA, K2, Va] {not yet keyed; add to synonymy}

* *Echinochloa frumentacea* Link, Japanese Millet, Billion-dollar Grass, White Panic, Siberian Millet. Disturbed areas; native of Asia. Jul-Oct. [= F, FNA, K, WV; < *E. crusgalli* – RAB, GW; = *E. crusgalli* (Linnaeus) Palisot de Beauvois var. *frumentacea* (Link) W. Wight – C, G, Pa; = *E. crus-galli* ssp. *edulis* A.S. Hitchcock – S]

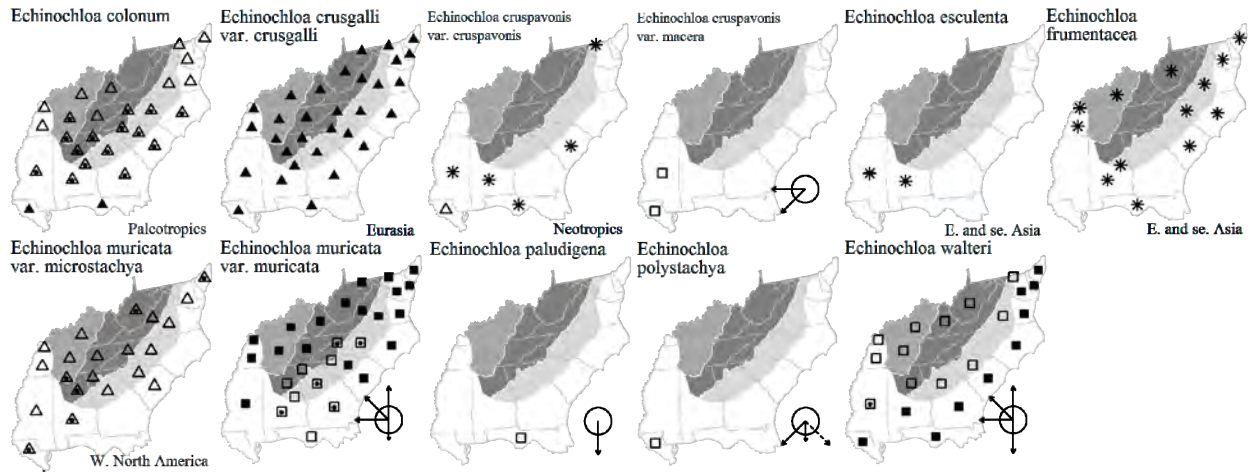

Echinochloa muricata (Palisot de Beauvois) Fernald var. *microstachya* Wiegand, Rough Barnyard-grass. Alluvial swamps, river shores and bars, depression ponds, impoundments, interdune swales, low fields, beaver impoundments, other moist to wet disturbed habitats. Jul-Oct. [= C, FNA, K, Va, WH3; < *E. crusgalli* – GW, RAB, WV; = *E. pungens* (Poiret) Rydberg var. *microstachya* (Wiegand) Fernald & Griscom – F; = *E. microstachya* (Wiegand) Rydberg – G; < *E. crus-galli* ssp. *crus-galli* – S]

Echinochloa muricata (Palisot de Beauvois) Fernald var. *muricata*, Rough Barnyard-grass. Interdune wetlands, various other wet to damp habitats. Jul-Oct. [= C, FNA, K, Va; < *E. crusgalli* – GW, RAB, WV; > *E. pungens* (Poiret) Rydberg var. *pungens* – F; > *E. pungens* var. *ludoviciana* (Wiegand) Fernald & Griscom – F; > *E. pungens* var. *coarctata* Fernald & Griscom – F; = *E. muricata* – G, Pa; < *E. crus-galli* ssp. *crus-galli* – S]

Echinochloa paludigena Wiegand, Florida Barnyard-grass. Swamps, riverbanks. [= FNA, K2, WH3] {not yet keyed; add to synonymy}

Echinochloa polystachya (Kunth) A.S. Hitchcock. {add info}

Echinochloa walteri (Pursh) Heller, Swamp Barnyard-grass. Marshes of many kinds. Jul-Oct. MA south to FL, west to TX on the outer Coastal Plain; also inland from OH west to WI, south to w. WV, MO, and AR. [= C, F, FNA, GW, HC, K, Pa, RAB, S, Va, W, WH3]

Eleusine Gaertner 1788 (Yard Grass)

A genus of about 9 species, native to Africa and South America. References: Hilu in FNA (2003a). Key based on FNA.

- 1 Panicles with 1-3 branches, attached in a single digitate cluster..... [*E. tristachya*]
- 1 Panicles with 4-20 branches, 1-2 of these attached below the terminal digitate cluster.
 - 2 Lower glumes 2-3-veined; panicle branches 5-7 mm wide; ligule 1-2 mm long, ciliate with hairs 1-2 mm long..... [*E. coracana* ssp. *africana*]
 - 2 Lower glumes 1-veined; panicle branches 3-5.5 mm wide; ligule 0.2-1 mm long, erose..... *E. indica*

- * *Eleusine coracana* (Linnaeus) Gaertner ssp. *africana* (Kennedy & O'Byrne) Hilu & de Wet, Finger Millet. Disturbed areas; native of Africa. There remains some doubt about the identity of the population discovered. Reported by Werth, Zeng, & Baird (1997). [= FNA, K; = *E. africana* Kennedy & O'Byrne]
- * *Eleusine indica* (Linnaeus) Gaertner, Yard Grass, Goose Grass. Lawns, roadsides, gardens, disturbed areas; native of Old World. Jun-Oct. [= C, F, FNA, G, HC, K, Pa, RAB, S, Va, W, WH3, WV]
- * *Eleusine tristachya* (Lamarck) Lamarck. Waste areas of wool-combing mills, other disturbed areas, perhaps only a waif; native of South America. Reported as introduced in additional, scattered states in e. United States, including VA (Kartesz 1999, but apparently in error), NJ (Hilu 1980) and AL (Small 1933). [= FNA, K, S]

Elionurus Humboldt & Bonpland ex Willdenow 1805 (Balsamscale)

A genus of about 15 species, native to tropical and subtropical parts of Africa and the Americas. References: Barkworth in FNA (2003a).

Elionurus tripsacoides Humboldt & Bonpland ex Willdenow, Pan-American Balsamscale. Wet savannas. S. GA south to s. FL, west to s. and w. TX, and south through Central America to s. South America. Reported for sw. GA by Jones & Coile (1988), for s. MS and FL (Sorrie & Leonard 1999). [= FNA, K, WH3; = *Elionurus tripsacoides* – GW, HC, S, orthographic variant]

Elymus Linnaeus 1753 (Wild-rye, Rye Grass)

A genus of about 150 species, semicosmopolitan in temperate regions. The genus, as now circumscribed, includes all allopolyploid taxa with at least one chromosome complement contributed from *Pseudoroegneria*. North American *Elymus* are allopolyploids of *Pseudoroegneria* and *Hordeum* (Helfgott & Mason-Gamer 2004). Reference: Barkworth, Campbell, & Salomon in

FNA (2007a); Campbell (2000); Church (1967); Tucker (1996)=Z; Barkworth (1997)=X. This treatment largely follows Barkworth, Campbell, & Salomon in FNA (2007a).

Identification notes: Measurements of the spike include the awns, but measurements of spikelets and its components do not. Rachis internodes should be measured near the middle of the spike. Glume widths are measured at the widest point, or if the widest point is not apparent, at about 5 mm above the glume base.

- 1 Spikelets solitary at each node (occasionally paired at the lowest nodes); glumes and lemmas awned or unawned; plants cespitose to strongly rhizomatous.
 - 2 Plants strongly rhizomatous; [common and weedy introduced species]; [section *Elytrigia*].....*E. repens*
 - 2 Plants cespitose; [rare natives and introductions]; [section *Gouardia*].
 - 3 Spikelets 20-30 mm long; anthers 3-6 mm long; rachis internodes hirtellous below the spikelets; [very rare introduction, reported for c. GA].....*E. semicostatus*
 - 3 Spikelets 8-25 mm long; anthers 0.8-3 mm long; rachis internodes glabrous below the spikelets; [rare natives of glades and barrens].
 - 4 Lemma awns 15-40 mm long, longer than the body of the lemma*E. trachycaulus* ssp. *subsecundus*
 - 4 Lemma awns 1-13 mm long, shorter than the body of the lemma.....*E. trachycaulus* ssp. *trachycaulus*
- 1 Spikelets 2-3 (-5) at each node; glumes and lemmas usually awned; plants usually cespitose, occasionally short-rhizomatous.
 - 5 Both glumes (including their awn) either 0-3 mm long and subulate or 1-20 mm long and differing in length by > 5 mm, 0.1-0.6 mm wide, tapering from the base, with 0-1 distinct veins, persistent; rachis internodes 4-12 mm long, ca. 0.5 mm thick at the narrowest section.
 - 6 Spikelets appressed; lemma awns straight or curving; glumes sometimes absent, but usually 1-20 mm long, 0.1-0.6 mm wide, with a distinct vein; spikes erect or nodding.....*E. svensonii*
 - 6 Spikelets widely spreading to horizontal; lemma awns straight (rarely slightly curving); glumes 0-3 mm long, with no distinct veins (rarely 1 glume to 20 mm long, 0.2 mm wide); spikes usually erect.
 - 7 Lemmas pubescent.....*E. hystrix* var. *bigelovianus*
 - 7 Lemmas glabrous to scabrous.....*E. hystrix* var. *hystrix*
 - 5 Both glumes (including the awns) 10-40 mm long, usually differing in length by < 5 mm, 0.2-2.3 mm wide, lanceolate to setaceous, usually widest above the base, with 2-8 veins, persistent or disarticulating; rachis internodes slender (as above) or stout (2-5 mm long and ca. 1 mm thick at the narrowest section).
 - 8 Glume bases flat, thin, and evidently veined, or indurate for < 1 mm, the bodies not exceeding the adjacent (usually 8-15 mm long) lemmas; lemma awns usually curving outward; spikes usually nodding to pendent; internodes (2-) 4-12 mm long.
 - 9 Glumes 0.5-1.6 mm wide; lemma awns 15-40 (-50) mm long; paleas acute; rachis internodes 2-5 (-7) mm long; blades (3-) 4-15 (-20) mm wide, pale green, usually glabrous or scabridulous above*E. canadensis* var. *canadensis*
 - 9 Glumes 0.3-0.8 mm wide; lemma awns 15-25 (-35) mm long; paleas narrowly truncate; rachis internodes 5-8 (-12) mm long; blades 8-24 mm wide, dark green, usually thinly pilose above*E. wigandii*
 - 8 Glume bases terete, indurate, and lacking evident veins for 0.5-4 mm, the bodies (unless indistinct from the awns) exceeding the adjacent (usually 6-12 mm long) lemmas; lemma awns straight; spikes erect or nodding; internodes 2-5 mm long (to 7 mm in *E. sp. 1*).
 - 10 Glumes persistent, 0.2-1 mm wide, with 2-4 veins, the basal 0.5-2 mm essentially straight; lemmas rarely glabrous; spikelets with 1-3 (-4) florets; spikes nodding, exserted.
 - 11 Blades glabrous to scabrous, pale dull green; spikes 7-25 cm long; internodes usually 3-5 mm long; spikelets with 2-3 (-4) florets; lemmas usually scabrous, 7-14 mm long, 1-5 mm longer than the acute paleas; flowering usually late Jun to late Jul.....*E. riparius*
 - 11 Blades villous to pilose, dark glossy green; spikes 4-12 cm long; internodes usually 2-3 mm long; spikelets with 1-2 (-3) florets; lemmas usually villous, 5.5-9 mm long, 0-1.5 mm longer than the obtuse paleas; flowering usually early Jun to early Jul.....*E. villosus*
 - 10 Glumes disarticulating with the lowest floret, 0.7-2.3 mm wide, with (2-) 3-5 (-8) veins, the basal 1-4 mm clearly bowed-out; lemmas often glabrous; spikelets with (2-) 3-5 (-6) florets; [*Elymus virginicus* complex].
 - 12 Spikes (including the awns) 2.5-6 cm wide, exserted; lemma awns 15-40 mm long; blades glabrous, scabrous, or villous.
 - 13 Spikes with 9-18 nodes; internodes 4-7 mm long; blades usually lax, dark glossy green under the glaucous bloom; auricles 2-3 mm long, blackish at maturity; flowering usually in mid-May to mid-Jun.....*E. macgregorii*
 - 13 Spikes with 15-30 nodes; internodes 3-5 mm long; blades lax, or often ascending and involute, pale dull green; auricles 0-2 mm long, brownish at maturity; flowering usually in mid-Jun to late Jul.
 - 14 Spikelets (and usually also the foliage) pubescent; spikes usually 6-12 cm long; lemmas 6-10 mm long.....*E. glabriflorus* var. *australis*
 - 14 Spikelets (and usually also the foliage) glabrous to scabrous; spikes usually 9-16 cm long; lemmas 7-13 mm long.....*E. glabriflorus* var. *glabriflorus*
 - 12 Spikes (including the awns) 0.7-2 cm wide, exserted or sheathed; lemma awns 1-15 (-20) mm long; spikelets appressed to slightly spreading; blades usually glabrous to scabridulous.
 - 15 Lemma awns 1-3 (-5) mm long; blades often ascending, somewhat involute, those higher on the stiffly erect culms broader and more persistent; flowering usually in early Jul to mid-Aug.....*E. curvatus*
 - 15 Lemma awns 5-15 (-20) mm long; blades usually spreading or lax, not markedly broader or more persistent toward the culm summit; flowering usually in mid-Jun to late Jul.
 - 16 Spikes glaucous, hispidulous to villous-hirsute, often intermediate in exsertion; glumes indurate in the lowest 1-2 mm; ligules and auricles usually absent; flowering usually early Jul to mid-Aug.....*E. virginicus* var. *intermedius*
 - 16 Spikes green to glaucous, usually glabrous to scabrous, partly included in the sheath to fully exserted; ligules and auricles often present; flowering usually mid-Jun to mid-Jul.
 - 17 Spikes partly sheathed; glumes 1-2.3 mm wide, strongly indurate and bowed-out in the lowest 2-4 mm; plants usually green to yellowish-brown; nodes mostly covered.....*E. virginicus* var. *virginicus*
 - 17 Spikes usually exserted; glumes (0.5-) 0.7-1.5 (-1.8) mm wide, moderately indurate and bowed out in the lowest 1-2 mm; plants usually glaucous, sometimes reddish-brown at maturity; nodes often exposed.
 - 18 Culms usually 3-8 dm tall, with 4-6 nodes; blades 2-9 mm wide, becoming involute; spikes 3.5-11 cm long, strongly glaucous; glumes usually indurate in the lowest 1-2 mm.....*E. virginicus* var. *halophilus*

18 Culms usually 7-10 dm tall, with 6-8 nodes; blades 3-15 mm wide, flat; spikes 4-20 cm long, pale green or glaucous; glumes indurate only in the lowest 1 mm..... *E. virginicus* var. *jejunus*

Elymus canadensis Linnaeus var. *canadensis*, Great Plains Wild-rye, Nodding Wild-rye. Mt (NC, VA), Pd (NC, VA), Cp? (SC?): moist forests; uncommon (rare in NC, VA, and SC?). Jul-Aug. NS, QC, and YT south to NC, SC (?), OK, NM, and AZ. [= FNA, Pa, Va; < *E. canadensis* - C, F, G, GW, K, RAB, W, WV]

Elymus churchii J.J.N. Campbell, Church's Wild-rye. Calcareous bluffs and slopes. Interior Highlands; disjunct in n. AL (Schotz & Dattilo 2012). [= FNA] {not yet keyed}

Elymus curvatus Piper, Awnless Wild-rye. Ip (KY, TN): moist bottomlands and slopes; rare. NY and QC west to BC and WA, south to s. OH, KY, c. TN, OK, and n. TX. [= FNA; < *E. virginicus* Linnaeus - C, Pa; = *E. submuticus* (Hooker) Smyth & Smyth - K; = *E. virginicus* Linnaeus var. *submuticus* Hooker - F, G; < *E. virginicus* var. *virginicus* - S]

* *Elymus elymoides* (Rafinesque) Swezey ssp. *brevifolius* (J.G. Smith) Barkworth. Mt (KY): {habitat}; rare. [= FNA] {synonymy incomplete}

Elymus glabriflorus (Vasey) Scribner & C.R. Ball var. *australis* (Scribner & C.R. Ball) J.J.N. Campbell, Southeastern Wild-rye. Pd (DE), {Cp (FL, GA, NC, SC, VA), Pd, Mt (GA, NC, SC, VA): } {*glabriflorus* as a whole: ME, WV, IN, IL, and IA, south to n. FL, and c. TX} [< *E. glabriflorus* - FNA, Va; < *E. virginicus* - C, GW, Pa, RAB, W, WH3, WV; < *E. virginicus* var. *glabriflorus* (Vasey) Bush - F, "forma *australis*"; < *E. virginicus* var. *virginicus* - G, K; = *E. virginicus* var. *australis* - S]

Elymus glabriflorus (Vasey) Scribner & C.R. Ball var. *glabriflorus*, Southeastern Wild-rye. Cp (DE), Pd (DE), {Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): } {*glabriflorus* as a whole: ME, WV, IN, IL, and IA, south to n. FL, and c. TX} [< *E. glabriflorus* - FNA, Va; < *E. virginicus* - C, GW, Pa, RAB, W, WV; < *E. virginicus* var. *glabriflorus* (Vasey) Bush - F, "forma *glabriflorus*"; < *E. virginicus* var. *virginicus* - G, K; = *E. virginicus* var. *glabriflorus* - S]

Elymus churchii

Elymus hystrix Linnaeus var. *bigelovianus* (Fernald) Bowden, Northern Bottlebrush Grass. Mt (NC): high elevation forests; rare. [< *Elymus hystrix* - C, FNA, Pa, Va; = *Hystrix patula* var. *bigeloviana* (Fernald) Deam - F; < *Hystrix patula* Moench - G, RAB, WV; = *E. hystrix* var. *bigeloviana* - K, orthographic variant; < *Hystrix hystrix* (Linnaeus) Millspaugh - S]

Elymus hystrix Linnaeus var. *hystrix*, Common Bottlebrush Grass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (VA): moist forests, dry forests especially over more fertile soils; common (rare in DE). [= K; < *Elymus hystrix* - C, FNA, Pa, Va; = *Hystrix patula* var. *patula* - F; < *Hystrix patula* Moench - G, RAB, WV; < *Hystrix hystrix* (Linnaeus) Millspaugh - S]

Elymus macgregorii R. Brooks & J.J.N. Campbell, Early Wild-rye. Rich mesic forests, especially bottomlands. ME west to SD, south to Panhandle FL and s. TX. See Campbell (2000). [= FNA, Va; < *E. virginicus* - C, GW, Pa, RAB, W, WV; < *E. virginicus* var. *virginicus* - F, G, K, S]

* *Elymus repens* (Linnaeus) Gould, Quackgrass, Dog-grass, Witchgrass. Roadsides, disturbed areas, pastures; probably introduced from Europe (sometimes considered to be partially native along the coast). Jun-Aug. [= FNA, K, Pa, Va, X; = *Elytrigia repens* (Linnaeus) Nevski - C, Z; > *Agropyron repens* var. *repens* - F; > *Agropyron repens* var. *subulatum* (Schreber) Roemer & J.A. Schultes - F; = *Agropyron repens* (Linnaeus) Palisot de Beauvois - G, HC, RAB, S, W, WV]

Elymus riparius Wiegand, Eastern Riverbank Wild-rye. Moist forests. Jul-Sep. ME, QC, ON, and MN south to GA and AR. [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, WV]

* *Elymus semicostatus* (Nees ex Steudel) Melderis. Reported for c. GA by Jones & Coile (1988), as *Agropyron semicostatum* Nees ex Steudel, but FNA states that known reports from North America are based on misidentifications. [= FNA, K; = *Agropyron semicostatum* Nees ex Steudel]

Elymus svensonii G.L. Church, Svenson's Wild-rye. Limestone river bluffs. Nc. KY south to c. TN and n. AL. [= FNA, K]

Elymus trachycaulus (Link) Gould ex Shinners ssp. *subsecundus* (Link) A. & D. Löve, Bearded Wheatgrass. Glades, barrens, open woodlands. Jun-Aug. NL (Newfoundland) west to AK, south to MD, WV, KY, MO, NM, AZ, and CA. [= FNA, K; < *E. trachycaulus* - C, Pa; ? *Agropyron trachycaulum* (Link) Malte ex H.F. Elymus wiegandii Fernald, Northern Riverbank Wild-rye. South to sc. PA and NJ; reported for nc. KY (Kartesz 2010). [= C, F, FNA, K; < *E. canadensis* – G; = *E. canadensis* var. *wiegandii* (Fernald) Bowden – Pa]

Elymus villosus Muhlenberg ex Willdenow, Downy Wild-rye. Moist forests, dry calcareous forests. QC, ON, MN, ND, and WY south to GA, AL, MS, and TX. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WV; = *E. striatus* Willdenow – S]

Elymus virginicus Linnaeus var. *halophilus* (E.P. Bicknell) Wiegand, Salt-marsh Wild-rye. Brackish marshes, maritime forests and hammocks. Along the Atlantic Coast, from NS to NC. [= F, FNA, G, K; < *E. virginicus* – C, GW, RAB, Va; < *E. virginicus* var. *virginicus* – S]

Elymus virginicus Linnaeus var. *intermedius* (Vasey) Bush. [= FNA, G; < *E. virginicus* – C, GW, RAB, Va, W, WV; < *E. virginicus* var. *virginicus* – F, K; < *E. virginicus* var. *hirsutiglumis* (Scribner) A.S. Hitchcock – S]

Elymus virginicus Linnaeus var. *jejunus* (Ramaley) Bush. [= F, FNA, G; < *E. virginicus* – C, GW, RAB, Va, W, WV; < *E. virginicus* var. *virginicus* – K; < *E. virginicus* var. *virginicus* – S]

Elymus virginicus Linnaeus var. *virginicus*, Common Eastern Wild-rye, Terrell Grass. Cp (DE, FL, GA, NC, SC, VA), Mt (DE, NC, SC, VA, WV), Pd, Cp (NC, SC, VA): moist forests; common. [= FNA; < *E. virginicus* – C, GW, RAB, Va, W, WV; < *E. virginicus* var. *virginicus* – F, G, K; < *E. virginicus* var. *virginicus* – S; ? *E. striatus* Willdenow – S]

Enteropogon Nees 1836

A genus of about 17 species, tropical. References: Barkworth in FNA (2007a).

* *Enteropogon prieurii* (Kunth) W.D. Clayton. On ballast at Wilmington, New Hanover County, NC and Mobile, AL, probably only a waif, native of Africa. Reported from Mobile, Baldwin County, AL (Hitchcock & Chase 1950). [= FNA, K; = *Chloris prieurii* Kunth – S]

Eragrostis Wolf 1776 (Lovegrass)

A genus of about 350 species of temperate and tropical areas. References: Peterson in FNA (2003a); Koch (1978). Key adapted from FNA.

- 1 Plants caespitose or rhizomatous perennials, with innovations near the base, and with or without buds in the basal sheaths.
 - 2 Plants with short, knotty, thick rhizomes; florets articulating whole..... *E. spectabilis*
 - 2 Plants without short or thick rhizomes; florets usually disarticulating.
 - 3 Caryopsis with a deep to shallow groove along the adaxial surface.
 - 4 Caryopsis dorso-ventrally compressed, flattened parallel to the side of the embryo, translucent, light brownish..... *E. curvula*
 - 4 Caryopsis laterally compressed, flattened on the side perpendicular to the embryo, or cylindrical, opaque (rarely translucent), usually reddish brown.
 - 5 Lateral veins of the lemmas conspicuous, often greenish, the lemmas strongly keeled..... *E. trichodes*
 - 5 Lateral veins of the lemmas inconspicuous and hardly evident, the lemmas sometimes weakly keeled.
 - 6 Lemmas 1.2-1.8 mm long; culms 30-70 cm tall..... *E. lugens*
 - 6 Lemmas 1.6-3.0 mm long; culms (30-) 40-110 (-120) cm tall.
 - 7 Spikelets 2-6-flowered, greenish with purple tinges; leaf blades 3-8 (-11) mm wide, 25-60 cm long; sheaths often densely papillose-hirsute..... *E. hirsuta*
 - 7 Spikelets (3-) 5-12-flowered, olive green to lead gray; leaf blades 1-3.8 mm wide, (4-) 10-35 cm long; sheaths never papillose-hirsute..... *E. intermedia*
 - 3 Caryopsis not grooved on the adaxial surface.
 - 8 Stamens 3.
 - 9 Spikelets 4-8.2 (-10) mm long..... *E. curvula*
 - 9 Spikelets 2-4.5 (-5) mm long.

- 10 Leaf blades 25-60 cm long, 3-8 (-11) mm wide; lemmas 1.6-2.4 mm long; spikelets 1.0-1.7 mm wide *E. hirsuta*
- 10 Leaf blades (4-) 8-22 cm long, 1-3.5 mm wide; lemmas 1.2-1.8 mm long; spikelets 0.5-1.0 (-1.3) mm wide *E. lugens*
- 8 Stamens 2.
- 11 Panicle 15-45 cm wide, open, diffuse, broadly ovate to obovate in outline, the panicle branches capillary; pedicels 0.5-35 (-50) mm long, longer than or shorter than the spikelets.
- 12 Spikelets with widely spreading pedicels, the lower pedicels all generally longer than the spikelets; disarticulation of the lemmas only, the paleas persistent *E. elliottii*
- 12 Spikelets with appressed pedicels, lower pedicels of each branch shorter than the spikelets; disarticulation usually of the whole floret *E. refracta*
- 11 Panicle (1-) 2-17 (-20) cm wide, contracted to open, narrowly ovate to oblong in outline, the panicle branches stiffly spreading; pedicels (0-) 0.3-6 mm long, always shorter than the spikelets.
- 13 Spikelets 0.7-2.4 mm wide; glumes 0.3-2.2 mm long; lemma 1.5-2.5 mm long, the apex acute (sometimes acuminate) *E. bahiensis*
- 13 Spikelets 2.4-5 mm wide; glumes 1.4-4 mm long; lemma 2-6 mm long, the apex acuminate to attenuate *E. secundiflora* ssp. *oxylepis*
- 1 Plants caespitose, geniculate or mat-forming annuals, lacking innovations or buds in the lower sheaths.
- 14 Paleas prominently ciliate-pectinate on the keels, the hairs 0.1-0.8 mm long.
- 15 Panicles contracted, narrow, spike-like, usually <1.5 cm wide *E. ciliaris* var. *ciliaris*
- 15 Panicles open, cylindrical to narrowly ovate, usually 1-8 cm wide.
- 16 Spikelets (1.0-) 1.5-3.5 mm long, 0.9-1.4 mm wide, 4-12-flowered; lemmas 0.7-1.1 mm long, membranous, the apex truncate to obtuse *E. amabilis*
- 16 Spikelets 5-12 (-18) mm long, 1.4-2.4 mm wide, 12-42-flowered; lemmas (1.3-) 1.5-2.0 mm long, chartaceous, the apex acute *E. cumingii*
- 14 Paleas smooth to scaberulous on the keels, the hairs (if present) <0.1 mm long.
- 17 Plants extensively stoloniferous, creeping and forming flat mats; inflorescences 1-3.5 cm long; culms (2-) 5-12 (-20) cm tall on the erect portions *E. hypnoides*
- 17 Plants not stoloniferous (sometimes creeping and forming flat mats); inflorescences 3-55 cm long; culms (2-) 6-130 cm tall.
- 18 Ligules membranous, glabrous *E. japonica*
- 18 Ligules ciliate, with a row of tiny white hairs.
- 19 Caryopsis with a deep to shallow groove along the adaxial surface.
- 20 Spikelets (4-) 5-10 (-11) mm long, 5-11 (-15)-flowered; pedicels ascending, somewhat appressed along the branches.
- 21 Spikelets ovate to oblong in outline, >1.4 mm wide; lower glume 1.2-2.3 mm long [*E. mexicana* ssp. *mexicana*]
- 21 Spikelets linear to linear-lanceolate, <1.5 mm wide; lower glume 0.7-1.7 mm long [*E. mexicana* ssp. *virescens*]
- 20 Spikelets (1.4-) 2-5 mm long, 2-6 (-7)-flowered; pedicels erect, spreading along the branches.
- 22 Panicle 10-45 (-55) cm long, 2/3 or more the height of the plant; pedicels (4-) 5-25 mm long; glandular pits absent below the nodes, branches, and rachis *E. capillaris*
- 22 Panicle 4-20 cm long, < 1/2 the height of the plant; pedicels 1.5-5 mm long; glandular pits often present below the nodes, branches, and rachis *E. frankii*
- 19 Caryopsis not grooved on the adaxial surface.
- 23 Plants with glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicels, and/or on the midveins of the lemma and palea.
- 24 Spikelets (1.7-) 2-4 mm long, 3-6-flowered *E. frankii*
- 24 Spikelets (2-) 3.5-20 mm long, (3-) 5-40-flowered.
- 25 Spikelets 0.6-1.3 mm wide; pedicels 1-10 mm long, flexuous and delicate, appressed or spreading *E. pilosa*
- 25 Spikelets 1.1-4 mm wide; pedicels 0.2-4 mm long, straight and rigid, mostly spreading.
- 26 Spikelets 6-20 mm long, 2-4 mm wide, 10-40-flowered; lemmas 2-2.8 mm long, with 1-3 crateriform glands along the keel; disarticulation of the entire florets from the persistent rachilla; anthers yellow *E. cilianensis*
- 26 Spikelets 4-7 (-11) mm long, 1.1-2.2 mm wide, 7-12 (-20)-flowered; lemmas 1.4-1.8 mm long, rarely with 1-2 crateriform glands along the keel; disarticulation of the lemmas only, the palea and rachilla usually persistent; anthers reddish-brown.
- 27 Inflorescence with glandular areas of spots or rings on the rachis below the panicle branch bases, the glands often shiny or yellowish; stamens 3; blade margins lacking crateriform glands *E. barrelieri*
- 27 Inflorescence sometimes with glandular areas of spots or crateriform pits on the rachis below the panicle branch bases, the glands usually dull and greenish-gray to straw-colored; stamens 2; blade margins sometimes with crateriform glands *E. minor*
- 23 Plants lacking glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicels, and/or on the midveins of the lemma and palea.
- 28 Spikelets (1.6-) 2-4 mm wide, 12-42-flowered; disarticulation of entire florets from a persistent rachilla [*E. unioides*]
- 28 Spikelets 0.6-2.5 mm wide, 3-22-flowered; disarticulation of the lemmas only, the paleas usually persistent (or deciduous), the rachilla persistent.
- 29 Spikelets 3-6-flowered *E. frankii*
- 29 Spikelets (3-) 5-42-flowered.
- 30 Lemmas with conspicuous lateral veins, these usually greenish; grains 0.3-0.6 mm long, ovoid, subglobose, or obovoid.
- 31 Spikelets 5-12 (-18) mm long, with 12-42 florets; primary branches 6-10 per culm; lemmas 1.3-2.0 mm long; anthers 3 *E. cumingii*
- 31 Spikelets 2-4.6 mm long, with 5-15 florets; primary branches (12-) 15-20 per culm; lemmas 1.0-1.3 mm long; anthers 2 [*E. gangetica*]
- 30 Lemmas with inconspicuous or moderately conspicuous lateral veins, these usually not greenish; grains 0.5-1.1 mm long, pear-shaped, obovoid, or prism-shaped.

- 32 First glume 0.3-0.6 (-0.8) mm long, <0.5× as long as the lowest lemma; spikelets 0.6-1.3 mm wide; panicle branches usually whorled at the lowest 2 nodes *E. pilosa*
- 32 First glume 0.5-1.5 mm long, >0.5× as long as the lowest lemma; spikelets 1.2-2.5 mm wide; panicle branches solitary or paired at the 2 lowest nodes.
- 33 Pedicels widely spreading *E. pectinacea* var. *miserrima*
- 33 Pedicels appressed or rarely diverging up to 20 degrees from the branches *E. pectinacea* var. *pectinacea*

- * *Eragrostis amabilis* (Linnaeus) Wright & Arnott ex Nees, Japanese Lovegrass, Feather Lovegrass. Disturbed areas; native of Old World. Jun. [= FNA, HC, RAB, S, WH3; ? *E. tenella* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes - K]
- * *Eragrostis atrovirens* (Desvaux) Trinius ex Steudel, Thalia Lovegrass. Disturbed areas; native of Africa. [= FNA, K, WH3] {add to key; add to synonymy}
- * *Eragrostis bahiensis* (Schrader ex J.A. Schultes) J.A. Schultes, Bahia Lovegrass. Disturbed areas; native of tropical America. Reported for SC (Kartesz 1999) and sw. GA (Jones & Coile 1988, GW, Kartesz 1999). [= FNA, GW, HC, K, S, WH3]
- * *Eragrostis barrelieri* Daveau, Mediterranean Lovegrass. Waste areas near wool-combing mills, other disturbed areas; native of Mediterranean Europe. Also reported for e. TN (Chester et al. 1993). [= FNA, HC, K, WH3]
- Eragrostis capillaris* (Linnaeus) Nees, Laceygrass. Fields, roadsides, disturbed areas. Jul-Oct. ME and WI south to GA and TX. [= C, F, FNA, G, HC, K, Pa, RAB, S, Va, W, WV]
- * *Eragrostis cilianensis* (Allioni) Vignolo ex Janchen, Stinkgrass. Fields, disturbed areas; native of Europe. Jul-Oct. [= C, FNA, G, HC, K, Pa, RAB, S, Va, W, WH3; ? *E. megastachya* (Koeler) Link - F, WV]

- Eragrostis ciliaris* (Linnaeus) R. Brown var. *ciliaris*. Sandy shores. S. SC south to TX, Central America, West Indies, South America, Africa, and Asia. [= FNA, HC; < *E. ciliaris* - G, K, RAB, S, WH3]
- * *Eragrostis cumingii* Steudel, Fortyflower Lovegrass, Cuming's Lovegrass. Disturbed areas; native of e. Asia, se. Asia, south to Australia. Reported for NC (Kartesz 1999) and sw. GA (Jones & Coile 1988, HC). [= FNA, K, WH3; ? *E. simplex* Scribner - HC]
- * *Eragrostis curvula* (Schrader) Nees, Weeping Lovegrass. Roadsides; native of s. Africa. May-Jun. Very commonly planted as a roadbank stabilizer. *E. curvula* is fire resistant and shows some capability to spread into adjacent natural habitats. [= C, FNA, HC, K, Pa, RAB, Va, WH3, WV; > *E. curvula* var. *conferta* Stapf]
- Eragrostis Elliottii* S. Watson, Elliott's Lovegrass. Ultisol wet pine savannas, maritime wet grasslands, inland edges of brackish marshes, inland edges of freshwater tidal marshes, calcareously-influenced wet pine savannas. Sep-Oct. NC south to FL, west to TX. [= FNA, GW, HC, K, RAB, S, WH3]
- * *Eragrostis elongata* (Willdenow) Jacquin f., Long Lovegrass. Waste areas near wool-combing mills; native of se. Asia and Australia. [= FNA, K, WH3] {not yet keyed}
- Eragrostis frankii* C.A. Meyer ex Steudel, Laceygrass. Rocky river shores, sand bars, floodplains of rivers in clearings. Sep. MA and MN south to GA and AR. [= C, FNA, G, GW, K, Pa, RAB, S, Va, W, WV; > *E. frankii* var. *frankii* - F, HC]

- * *Eragrostis gangetica* (Roxburgh) Steudel, Slimflower Lovegrass. Ditches, roadsides, pond margins; native of s. Asia. [= FNA, K2, WH3] {add to synonymy}
- Eragrostis hirsuta* (Michaux) Nees, Bigtop Lovegrass. Fields, roadsides, clearings, disturbed areas. Jul-Oct. MD south to FL, west to TX, north in the interior to TN, AR, and MO; Central America. [= C, FNA, K, RAB, S, Va, W, WH3, WV; > *E. hirsuta* var. *hirsuta* - F, G, HC; > *E. hirsuta* var. *laevivaginata* Fernald - F, G, HC]
- Eragrostis hypnoides* (Lamarck) Britton, Sterns, & Poggenburg, Creeping Lovegrass, Teal Lovegrass. Marshes, shores, riverbanks, shores, impoundments. Late Jun-Sep. ME and QC west to SK, south to FL, TX, and CA, and south to South America. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, Va, W, WH3, WV]
- Eragrostis intermedia* A.S. Hitchcock, Plains Lovegrass. Disturbed areas; native of sc. And sw. United States and Mexico, perhaps only introduced east of the Mississippi River. Reported for scattered locations as far east as NC and SC (Kartesz 1999), e. GA (Jones & Coile 1988), e. TN (Chester et al. 1993). [= C, F, FNA, G, HC, K, Va, WH3]

*? *Eragrostis japonica* (Thunberg) Trinius, Pond Lovegrass. Moist or wet sandy areas. SC and TN south to Central America, South America, and West Indies; Old World tropics. Perhaps introduced from the Old World. Reported for SC by HC, G, and Small (1933), sw. GA by Jones & Coile (1988), and for w. TN by Chester et al. (1993). [= FNA, K, WH3; ? *E. glomerata* (Walter) L.H. Dewey – G, GW, HC, S]

* *Eragrostis leptostachya* (R. Brown) Steudel, Australian Lovegrass. Reported for NC (Kartesz 1999, 2010); rejected by FNA as a component of the North American flora. [= FNA, K] {rejected; not mapped; not keyed}

Eragrostis lugens Nees, Mourning Lovegrass. Marshes, roadsides, low fields. Jun-Oct. Sw. and sc. United States south to Mexico. [= FNA, HC, K, RAB, S, W, WH3]

* *Eragrostis mexicana* (Hornemann) Link ssp. *mexicana*, Mexican Lovegrass. Disturbed areas, waste areas near wool-combing mills; native of w. North America and Mexico. Reported to be naturalized as far east and north as SC, DE, and MD (Kartesz 1999). [= FNA, K; > *E. neomexicana* Vasey – C, F, G, HC; > *E. mexicana* – C, F, G, HC]

* *Eragrostis mexicana* (Hornemann) Link ssp. *virescens* (J. Presl) S.D. Koch & Sánchez. Disturbed areas; native of South America and w. North America. Reported as an introduction on ballast in MD and FL. [= FNA, K, WH3; = *E. virescens* J. Presl – HC]

* *Eragrostis minor* Host, Little Lovegrass. Disturbed areas, compacted soils of pastures and fields, other disturbed areas, as in cinders along railroads; native of Europe. Late Jun-Sep. [= C, FNA, K, Pa, Va, WH3; ? *E. poaeoides* Palisot de Beauvois ex Roemer & J.A. Schultes – F, G, HC, RAB, W, WV; ? *E. eragrostis* (Linnaeus) Palisot de Beauvois – S]

Eragrostis pectinacea (Michaux) Nees ex Steudel var. *miserrima* (Fournier) J. Reeder. Disturbed habitats; rare. From FL and westward and southward. [= FNA, K, WH3; = *E. tephrosanthos* J.A. Schultes – HC, S; < *E. pectinacea* – GW]

Eragrostis pectinacea (Michaux) Nees ex Steudel var. *pectinacea*, Carolina Lovegrass. Fields, roadsides, disturbed areas. Jul-Sep. ME and WA south to Central America and West Indies. [= FNA, K, Va, WH3; < *E. pectinacea* – C, GW, Pa, W; = *E. pectinacea* – F, HC, S, WV; > *E. pectinacea* – G; > *E. diffusa* Buckley – G]

* *Eragrostis pilosa* (Linnaeus) Palisot de Beauvois var. *pilosa*, India Lovegrass. Fields, roadsides, disturbed areas; native of tropical regions of the Old and New World. Jul-Oct. Var. *perplexa* (L.H. Harvey) S.D. Koch is also introduced but is not known from our area. [= FNA, Va; = *E. pilosa* – RAB, S, W; > *E. multicaulis* Steudel – F, G, HC; > *E. pilosa* – F, G, HC; < *E. pilosa* – K, Pa, W, WH3]

* *Eragrostis plana* Nees, South African Lovegrass. Waste areas near wool-combing mills; native of South Africa. [= FNA, K] {not yet keyed};

Eragrostis polytricha Nees, Hairy sheath Lovegrass. Pinelands. From Alachua County, FL south to c. FL; s. Mexico, Central America, South America. [= FNA, K2, WH3] {not yet keyed; add to synonymy}

Eragrostis refracta (Muhlenberg) Scribner, Coastal Lovegrass. Pinelands, savannas, woodlands, bogs and seeps, marshes. Jul-Oct. DE south to FL, west to TX. Some authors (see synonymy) have taken up the older name *E. virginica* for this, but its application is uncertain. [= C, F, FNA, G, GW, HC, K1, RAB, S, Va; ? *E. virginica* (Zuccagni) Steudel – K2, WH3]

* *Eragrostis secundiflora* J. Presl ssp. *oxylepis* (Torrey) S.D. Koch, Red Lovegrass. Sandy roadsides, coastal dunes, and disturbed areas; native of sw. United States. First reported for SC by Nelson & Kelly (1997). [= FNA, K, WH3; = *E. oxylepis* (Torrey) Torrey – GW, HC; < *E. secundiflora* – S]

* *Eragrostis setifolia* Nees, Neverfail. Waste areas near wool-combing mills; native of Australia. [= FNA, K] {not yet keyed};

Eragrostis spectabilis (Pursh) Steudel, Purple Lovegrass, Tumblegrass. Sandy fields, roadsides, woodlands. Aug-Oct. ME west to ND, south to FL and TX. [= C, FNA, G, GW, HC, K, Pa, RAB, S, Va, W, WH3, WV; > *E. spectabilis* var. *spectabilis* – F; > *E. spectabilis* var. *sparsihirsuta* Farwell – F; ? *E. pectinacea*, misapplied]

* *Eragrostis tef* (Zuccagni) Trotter, Teff. Waste areas near wool-combing mills; native of Africa. This is the grain used in making Ethiopian bread. [= FNA, HC, K] {not yet keyed}

* *Eragrostis trichodes* (Nuttall) Wood. Disturbed areas; native of w. North America. [= C, FNA, K; > *E. trichodes* var. *trichodes* – F, HC]

* *Eragrostis uniolooides* (Retzius) Nees ex Steudel, Chinese Lovegrass. Cypress swamps, wet pine flatwoods, other wet disturbed areas; native of Asia. Reported for s. GA (Jones & Coile 1988, FNA, GW, HC). [= FNA, GW, HC, K, S, WH3]

***Eremochloa* Büse 1852 (Centipede Grass)**

A genus of about 11 species, native of Asia and Australia. References: Thieret in FNA (2003a).

Identification notes: In the autumn, the inflorescences make this grass readily recognizable at a distance: a short, tight lawn grass with a reddish aspect.

* *Eremochloa ophiuroides* (Munro) Hackel, Centipede Grass. Lawns, roadsides, sometimes weedy in more natural sites; native of se. Asia. Now very commonly planted as a lawn and roadside grass (especially in the Coastal Plain from se. NC southward). Stalter & Lamont (1996) report the VA occurrence of this species. [= FNA, HC, K1, K2, RAB, Va, WH3]

***Erianthus* Michaux 1803 (Plumegrass)**

A genus of uncertain circumscription at this time. Clayton & Renvoize (1986) pointed out that the "traditional division [of *Saccharum*] into awned (*Erianthus*) and awnless species seems wholly artificial;" Hodkinson et al. (2002) developed molecular evidence which suggests that our species are not congeneric with *Saccharum*, however. For now it seems best to retain our species in *Erianthus*. References: Webster in FNA (2003a); Webster & Shaw (1995)=Z; Gandhi & Dutton (1993); Hodkinson et al. (2002). [also see *Tripidium*]

- 1 Lowermost inflorescence node densely hairy; callus hairs (ring of hairs beneath the spikelet) (7-) 9-25 mm long, equal to or longer than the spikelet; stem appressed-pubescent below the inflorescence, on the internodes as well as the nodes.
- 2 Lemma awn flattened and spirally twisted at base; callus hairs 9-14 mm long, silvery or tinged with purple; leaves usually glabrous on the upper surface at maturity; [of moist to dry sites, rarely in wetlands] *E. alopecuroides*
- 2 Lemma awn nearly terete, straight or slightly flexuous; callus hairs (7-) 15-20 (-25) mm long, tawny or brown; leaves usually pilose on the upper surface at maturity; [of moist to wet sites, rarely in uplands]..... *E. giganteus*
- 1 Lowermost inflorescence node glabrous; callus hairs (ring of hairs beneath the spikelet) 0-6.5 mm long, shorter than or equal to the spikelet (or absent in *S. brevibarbe*); stem glabrous below the inflorescence, except sometimes on the nodes.
- 3 Callus hairs (ring of hairs beneath the spikelet) absent, or of few hairs 0-2 mm long (much shorter than the spikelet); panicle branches closely appressed, the panicle usually 1-3 cm broad; panicle branches glabrous *E. strictus*
- 3 Callus hairs (ring of hairs beneath the spikelet) present, dense, 3-6.5 mm long (from about half as long to nearly as long as the spikelet); panicle branches ascending, the panicle usually 4-10 cm broad; panicle branches pubescent.
- 4 Awn of the lemma of the upper floret terete at the base, and not spiraled; spikelets dark brown; spikelet pair dissimilar in size, the lemma of the upper floret 0.7-0.8× as long as the lemma of the lower floret; lemma of the lower floret typically 3-nerved *E. coarctatus*
- 4 Awn of the lemma of the upper floret flattened at the base, either spiraled or not; spikelets straw-colored or purplish; spikelet pair homomorphic, the upper lemma 0.9-1.0× as long as the lower lemma; lemma of the lower floret not distinctly nerved.
- 5 Awn of the lemma of the upper floret not basally spiraled, 10-18 mm long; lemma of the upper floret entire *E. brevibarbis*
- 5 Awn of the lemma of the upper floret basally spiraled, 15-22 mm long; lemma of the upper floret bifid, the tooth on either side of the lemma 2.0-2.5 mm long..... *E. contortus*

Erianthus alopecuroides (Linnaeus) Elliott, Silver Plume Grass. Fields, roadsides, woodland borders. Oct. NJ west to IN, IL, MO, and OK, south to FL and TX. [= C, F, G, GW, HC, RAB, W, WV; = *Saccharum alopecuroides* (Linnaeus) Nuttall – FNA, K2, WH3, Z; = *Saccharum alopecuroides* (Linnaeus) Nuttall – Z, orthographic variant; = *Saccharum alopecuroidum* – K, orthographic variant; = *Erianthus divaricatus* (Linnaeus) A.S. Hitchcock – S]

Erianthus brevibarbis Michaux, Short-bearded Plume Grass. Marshes, ditches. Sep-Oct. Se. VA south to n. FL, west to AR, e.OK, and e. TX; disjunct in s. IL. [= F; < *Erianthus brevibarbis* Michaux – C, G, GW, RAB, S; = *Saccharum brevibarbe* (Michaux)

Persoon var. *brevibarbe* – FNA, K2, Z; >> *Erianthus coarctatus* Fernald var. *coarctatus* – HC; >> *Erianthus coarctatus* var. *elliottianus* Fernald – HC]

Erianthus coarctatus Fernald, Brown Plume Grass. Marshes, ditches, clay-based Carolina bays, swamps. Sep-Oct. DE and MD south to FL, west to TX (Brown & Marcus 1998). [= F; < *Erianthus brevibarbis* Michaux – C, G, GW, RAB, S; = *Saccharum coarctatum* (Fernald) R.D. Webster – FNA, K2, WH3, Z; >> *Erianthus coarctatus* var. *coarctatus* – HC; >> *Erianthus coarctatus* var. *elliottianus* Fernald – HC]

Erianthus contortus Elliott, Bent-awn Plume Grass. Open woodlands and forests, woodland borders. Late Jul-Oct. DE and MD south to Panhandle FL, west to TX and AR, with scattered occurrences north to TN. [= C, F, G, GW, HC, RAB, S, W; = *Saccharum brevibarbe* (Michaux) Persoon var. *contortum* (Elliott) R. Webster – FNA, K2, WH3, Z; = *Saccharum contortum* (Elliott) Nuttall; = *Erianthus brevibarbis* Michaux var. *contortus* (Elliott) D.B. Ward]

Erianthus giganteus (Walter) Palisot de Beauvois, Sugarcane Plume Grass, Giant Plume Grass. Marshes, ditches. Sep-Oct. NY south to FL, west to se. TX and AR; inland in TN and KY. [= C, G, GW, HC, RAB, W; > *Erianthus giganteus* var. *giganteus* – F; > *Erianthus giganteus* var. *compactus* (Nash) Fernald – F; = *Saccharum giganteum* (Walter) Persoon – FNA, K2, Pa, WH3, Z; = *Erianthus saccharoides* Michaux – S]

Erianthus strictus Elliott, Narrow Plume Grass. Marshes, clay-based Carolina bays, ditches. Jul-Oct. E. VA south to FL, west to TX, AR, scattered northward inland to TN and MO. [= C, F, G, GW, HC, RAB, S; = *Saccharum baldwinii* Sprengel – FNA, K2, WH3, Z]

***Eriochloa* Kunth 1816 (Cup Grass)**

A genus of 320-30 species, of the tropical, subtropical, and warm temperate Old World and New World. References: Crins (1991)=Z; Shaw, Webster, & Bern in FNA (2003a); Shaw & Webster (1987)=Y.

- 1 Lemma of fertile floret with an awn >0.2 mm long; second glume awned; panicle compact, the raceme-like lateral branches close together and ascending-appressed, of irregular lengths; spikelets 8-16 on a typical, primary branch.....***E. contracta***
- 1 Lemma of fertile floret lacking an awn; second glume not awned; panicle open, the raceme-like lateral branches remote and divergent, the lowermost longest, the upper gradually reduced in length to the apex (*E. acuminata* var. *acuminata*, *E. michauxii* var. *michauxii*) or the panicle compact (*E. villosa*); spikelets 12-40 on a typical, primary branch.
 - 2 Spikelets 2.0-2.5 mm wide[***E. villosa***]
 - 2 Spikelets 1.1-1.8 mm wide.
 - 3 Annual, 3-12 dm tall; spikelets 1.1-1.4 mm wide.....***E. acuminata* var. *acuminata***
 - 3 Perennial, 5-25 dm tall; spikelets 1.3-1.8 mm wide.....***E. michauxii* var. *michauxii***

* ***Eriochloa acuminata*** (J. Presl) Kunth var. ***acuminata***. Disturbed areas, waste areas near wool-combing mills; presumably native of farther south and west. Reported for scattered locations in GA (Jones & Coile 1988, as *E. gracilis*). Reported for NC (Kartesz 1999), but the specimen basis is of cultivated material. [= FNA, K, Y, Z; < *E. acuminata* – C, WH3; = *E. gracilis* (Fournier) A.S. Hitchcock var. *gracilis* – HC]

* ***Eriochloa aristata*** Vasey, Bearded Cupscale. Disturbed areas; native of Mexico to South America. [= FNA, K2] {not yet keyed; add to synonymy}

* ***Eriochloa contracta*** A.S. Hitchcock, Prairie Cupgrass. Disturbed areas, waste areas around wool-combing mills; native of midwestern United States. [= C, F, FNA, G, GW, HC, K, WH3, Y, Z]

* ***Eriochloa fatmensis*** (Hochst. & Steudel) Clayton. Disturbed areas, perhaps only a waif; native of the paleotropics. [= FNA, K2] {not yet keyed; add to synonymy}

Eriochloa michauxii (Poiret) A.S. Hitchcock var. ***michauxii***, Longleaf Cupgrass. Coastal freshwater and slightly brackish marshes, flatwoods, disturbed areas. Se. SC south to FL. Var. *simpsonii* A.S. Hitchcock is endemic to the sw. FL peninsula. [= FNA, HC, K, WH3, Y, Z; < *E. michauxii* – GW, S]

* ***Eriochloa polystachya*** Kunth, Caribbean Cupgrass. Disturbed areas; native of the West Indies, Central America, and South America. [= FNA, K2, WH3] {not yet keyed; add to synonymy}

Eriochloa punctata (Linnaeus) Desvaux ex Hamilton, Louisiana Cupgrass. Marshes, creek banks. MS west to TX, and south into the New World Tropics; reported for e. GA (FNA). [= FNA, HC, K] {not yet keyed; synonymy incomplete}

* *Eriochloa villosa* (Thunberg) Kunth, Chinese Cupgrass. Fields, meadows, other disturbed areas (open edge of railroad bed); native of e. Asia. See Belden et al. (2004) for additional information about the first occurrence in Virginia. [= C, FNA, HC, K, Pa, Y]

***Eustachys* Desvaux 1810 (Finger-grass)**

A genus of ca. 12 species, of tropical and warm temperate regions. References: Aulbach in FNA (2003a). McKenzie, Urbatsch, & Aulbach-Smith (1987)=Z. Key based on FNA and Z.

- 1 Lateral nerves of the fertile lemma glabrous; culms stout, 7-15 dm tall; spikes 8-16 (-20), 7-12 cm long..... *E. glauca*
- 1 Lateral nerves of the fertile lemma pubescent; culms slender, 3-10 dm tall; spikes 1-20, 2.5-9 cm long.
 - 2 Keel of the fertile lemma glabrous; [aliens, in disturbed situations].
 - 3 Spikelets >2.4 mm long; sterile floret oblanceolate, acute..... *E. distichophylla*
 - 3 Spikelets <2.1 mm long; sterile floret widely cuneate, truncate *E. retusa*
 - 2 Keel of the fertile lemma pubescent; [natives and aliens].
 - 4 Spikelets 1.5-2.5 mm long; lowest lemma in each spikelet mucronate.
 - 5 Lowest lemma in each spikelet tawny to reddish-brown; lateral veins of the lowest lemma in each spikelet with spreading hairs > 0.5 mm long; [rare introduction] *E. caribaea*
 - 5 Lowest lemma in each spikelet dark brown; lateral veins of the lowest lemma in each spikelet with appressed hairs < 0.5 mm long; [common native from NC south to s. FL, west to LA and beyond our area] *E. petraea*
 - 4 Spikelets 2.6-3.7 mm long; lowest lemma in each spikelet awned the awns 0.4-1.2 mm long.
 - 6 Panicle branches 1-3; awns of the lowest lemma in each spikelet 0.4-0.6 mm long; spikelets 3.0-3.7 mm long *E. floridana*
 - 6 Panicle branches (3-) 4-9; awns of the lowest lemma in each spikelet 0.7-1.2 mm long; spikelets 2.6-3.0 mm long *E. neglecta*

* *Eustachys caribaea* (Sprengel) Herter, Chickenfoot Grass. Roadsides, other disturbed areas; native of South America. Reported for AL (Henry and Houston counties) by Diamond (2013b). [= FNA, K1; = *Chloris capensis* – HC, misapplied; = *E. paspaloides* (Vahl) Lanza & Mattei ssp. *caribaea* (Sprengel) Nowack – K2] {add to synonymy}

* *Eustachys distichophylla* (Lagasca y Segura) Nees, Weeping Finger-grass. Disturbed areas; native of South America. Reported for AL (Pike County) by Diamond (2013b). [= FNA, K, WH3, Z; = *Chloris distichophylla* Lagasca y Segura – HC]

Eustachys floridana Chapman, Florida Finger-grass. Sandhills, pine flatwoods. E. GA south to c. peninsular FL, west to w. Panhandle FL and s. AL. [= FNA, K, WH3, Z; = *Chloris floridana* (Chapman) Wood – HC, S] {add synonymy}

Eustachys glauca Chapman, Saltmarsh Finger-grass. Marshes and marsh edges. Jun-Oct. Se. NC south to FL and west to s. AL. [= FNA, K, WH3, Z; = *Chloris glauca* (Chapman) Wood – GW, HC, RAB, S]

Eustachys neglecta (Nash) Nash. Pinelands, sandy fields; uncommon. N. and peninsular FL, se. AL, and e. TX (where perhaps introduced). [= FNA, K, WH3; = *Chloris neglecta* Nash – HC, S] {synonymy incomplete}

Eustachys petraea (Swartz) Desvaux, Dune Finger-grass. Dune slacks and sand flats, sometimes in disturbed areas. (May-) Jun-Oct. NC (Dare County) south to FL and west to TX; Mexico to Panama. [= FNA, K, WH3, Z; = *Chloris petraea* Swartz – GW, HC, RAB, S]

* *Eustachys retusa* (Lagasca y Segura) Kunth, Argentine Finger-grass. Sandy fields, along railroads; native of Argentina. Jun. Reported for Bryan County, GA (Carter, Baker, & Morris 2009). [= FNA, K, WH3, Z; ? *Chloris argentina* (Hackel) Lillo & Parodi – G, HC, RAB]

Festuca Linnaeus 1753 (Fescue)

A genus of about 530 species, nearly cosmopolitan in temperate regions. Likely, given the complex phylogenetic relationships between several *Vulpia* clades and the “narrow-leaved *Festuca* clade” (= *Festuca* s.s.) it is best to include *Vulpia* in *Festuca*, even if *Festuca* is treated narrowly to consist only of the “narrow-leaved clade”. References: Darbyshire & Pavlick in FNA (2007a); Lonard in FNA (2007a); Darbyshire (1993)=X; Aiken & Darbyshire (1990)=Y; Tucker (1996)=Z; Soreng & Terrell (1998). Key based in part on C and Y. [also see *Lolium*]

- 1 Plant annual; stamen 1.
 - 2 First glume < ½ as long as the second glume..... *F. myuros*
 - 2 First glume > ½ as long as the second glume.
 - 3 Lemma pubescent; lowest lemma 2.5-3.5 mm long; grains 1.5-2 mm long *F. sciurea*
 - 3 Lemma glabrous or scabrous; lowest lemma 2.7-7 mm long; grains 1.7-3.3 mm long.
 - 4 First glume 1.7-4.5 mm long; lemma awns 3-12 mm long; spikelets with 4-7 loosely imbricate florets; rachilla internodes mostly 0.9-1.1 mm long *F. bromoides*
 - 4 First glume 3.5-5 mm long; lemma awns 0.3-6 (-9) mm long; spikelets with 5-11 (-more) closely imbricate florets; rachilla internodes mostly 0.5-0.7 mm long.
 - 5 Spikelets 5.5-10 (-13) mm long; awn of the lowest lemma 3-9 mm long..... *F. octoflora* var. *octoflora*
 - 5 Spikelets 4-5.5 (-6.5) mm long; awn of the lowest lemma 0.3-3 mm long..... *F. octoflora* var. *tenella*
- 1 Plant perennial; stamens 3.
 - 6 Leaves 0.2-3 mm wide, often involute.
 - 7 Plant loosely tufted, often rhizomatous; basal sheaths disintegrating into fibers; spikelets 6-13 mm long *F. rubra* ssp. *rubra*
 - 7 Plant tufted, lacking rhizomes; basal sheaths persistent, remaining firm and entire; spikelets 3-9 mm long.
 - 8 Lemmas 2.3-4.0 (-4.4) mm long, awnless, or with a minute projection to 0.4 mm long; anther 1.5-2.2 (-2.5) mm long; spikelets 3.0-6.0 (-6.5) mm long *F. filiformis*
 - 8 Lemmas 3.8-5.5 mm long, with an awn 0.5-2.5 mm long; anther (2.3-) 2.5-3.0 mm long; spikelets 5.5-9.0 mm long..... *F. trachyphylla*
 - 6 Leaves 3-12 mm wide, flat.
 - 9 Larger lemmas 5.5-10 mm long; leaf blades auriculate at the base; anthers 2-4 mm long..... [see *Lolium*]
 - 9 Larger lemmas 3.3-5.2 mm long; leaf blades not auriculate at the base; anthers 0.8-1.5 mm long; [subgenus *Subulatae*, section *Obtusae*].
 - 10 Ligules 2-9 mm long; [rare introduction]..... [*F. thurberii*]
 - 10 Ligules 0.1-1.5 (-2) mm long; [common natives].
 - 11 Principal lowermost panicle branches with 8-20 spikelets clustered at the end; spikelets broadly ovate, 4-6 mm wide *F. paradoxa*
 - 11 Principal lowermost panicle branches with 2-7 spikelets scattered along the outer half; spikelets narrowly ovate, 2-4 mm wide..... *F. subverticillata*

* *Festuca bromoides* Linnaeus, European Squirrel-tail Fescue, Brome Fescue. Sandy disturbed areas; native of Eurasia. [= *Vulpia bromoides* (Linnaeus) S.F. Gray – C, FNA, K1, K2, WH3, Z; = *Festuca bromoides* Linnaeus; = *Festuca dertonensis* (Allioni) Ascherson & Graebner – G, HC]

* *Festuca filiformis* Pourret, Hair Fescue, Fineleaf Sheep Fescue. Lawns, roadsides, disturbed areas; native of Eurasia. May-Jun. [= C, FNA, K, Va, Y, Z; ? *F. capillata* Lamarck – F, HC, RAB; ? *F. ovina* Linnaeus var. *capillata* (Lamarck) Alefeld – G; ? *F. tenuifolia* Sibthorp – W]

* *Festuca myuros* Linnaeus, Rat-tail Fescue. Roadsides, fields, disturbed areas; native of Eurasia. May-Jun. [= G, HC, RAB, S, W, WV; = *Vulpia myuros* (Linnaeus) C.C. Gmelin – C, F, FNA, K1, K2, Pa, WH3, Z]

Festuca octoflora Walter var. *octoflora*, Southern Six-weeks Fescue. Fields, roadsides, disturbed areas. Apr-Jun. S. NJ south to FL, west to TX, north in the interior to MO and OK. [= HC; = *Vulpia octoflora* (Walter) Rydberg var. *octoflora* – C, F, FNA, K1, K2; > *Festuca octoflora* var. *aristulata* Torrey ex L.H. Dewey – G; < *Festuca octoflora* Walter – GW, RAB, S, W, WV; < *Vulpia octoflora* – WH3, Z]

Festuca octoflora Walter var. *tenella* (Willdenow) Fernald, Northern Six-weeks Fescue. Fields, roadsides, disturbed areas. Apr-Jun. S. ME west to BC, south to GA, AR, TX, and CA. [= G, HC; = *Vulpia octoflora* (Walter) Rydberg var. *tenella* (Willdenow) Fernald – F, K2; = *Vulpia octoflora* (Walter) Rydberg var. *glauca* (Nuttall) Fernald – C, FNA, K1, Pa; < *Festuca octoflora* Walter – GW, RAB, S, W, WV; < *Vulpia octoflora* – Z]

Festuca paradoxa Desvaux, Cluster Fescue. Bottomlands, uplands over mafic rock. May-Jul. PA west to WI and IA, south to SC, c. GA, and e. TX. [= C, F, FNA, G, GW, HC, K, Pa, RAB, Va, W, Z; ? *F. shortii* Kunth ex Wood – S, misapplied]

Festuca rubra Linnaeus ssp. *rubra*, Red Fescue. Roadsides, fields, disturbed areas, pastures, grassy balds. Apr-Jul. In our area, this species is considered to be partly native and partly introduced. This species is circumboreal, extending south in North

America to GA and MO. Many varieties or subspecies have been described in the *F. rubra* complex. [= FNA, K; < *F. rubra* – C, G, HC, Pa, RAB, S, Va, WV, Y, Z; > *F. rubra* var. *rubra* – F; > *F. rubra* var. *commutata* Gaudin – F]

Festuca sciurea Nuttall, Squirrel-tail Fescue. Sandy roadsides, fields, disturbed areas. Apr-May. S. NJ south to n. peninsular FL, west to TX, and north in the interior to MO. There may be question whether the Rafinesquian epithet applies here; moreover, when transferred into *Festuca* may be blocked by the very similar *Festuca elliottii*. [= G, HC, RAB, S; = *Vulpia elliotea* (Rafinesque) Fernald – C, F, K1, K2, WH3; = *Vulpia sciurea* (Nuttall) Henrard – FNA, Z]

Festuca subverticillata (Persoon) Alexeev, Nodding Fescue. Moist to wet forests, woodlands, and disturbed areas. May-Jul. ME, QC, and MB south to FL and e. TX. [= C, FNA, K, Va, WH3, Y, Z; ? *F. obtusa* Biehler – F, G, GW, HC, Pa, RAB, S, W, WV]

* ***Festuca thurberi*** Vasey. Waste areas near wool-combing mills, probably only a waif; native of sw. United States (NM, CO, WY, and UT). [= FNA, K]

* ***Festuca trachyphylla*** (Hackel) Krajina, Hard Fescue. Meadows, pastures, disturbed areas; native of Eurasia. May-Jun. The nomenclatural debate about the application of the name *F. trachyphylla* is summarized in Darbyshire & Pavlick (1997). [= C, K, Pa, Va, Y, Z; < *F. ovina* var. *ovina* – F, G, HC; < *F. ovina* var. *duriuscula* (Linnaeus) W.D.J. Kock – F, G, HC, misapplied as to our material; < *F. ovina* – RAB, S, W, WV, in a broad sense (misapplied as to our material)]

Festuca versuta Beal, Texas Fescue. Native, east to TN according to K1, but not considered to be distributed east of the Mississippi River by FNA or K2. [= FNA, K1, K2] {rejected; not keyed; not mapped}

Gastridium Palisot de Beauvois 1812 (Nitgrass)

A genus of 2 species, annuals, of s. Europe, n. Africa, and w. Asia. References: Wipff in FNA (2007a).

* ***Gastridium phleoides*** (Nees & Meyen) C.E. Hubbard, Nitgrass. Disturbed areas; native of sw. Asia. [= FNA, K] {synonymy incomplete}

Gaudinia Palisot de Beauvois 1812

A genus of about 4 species, annuals or perennials, native of the Mediterranean region. References: Daniel in FNA (2007a).

* ***Gaudinia fragilis*** (Linnaeus) Palisot de Beauvois, Oatgrass. Ballast, probably only a waif; native of Mediterranean Europe. Reported from Mobile, AL. [= FNA, K1, K2; = *Avena fragilis* Linnaeus]

Glyceria R. Brown 1810 (Mannagrass)

A genus of about 40 species, nearly cosmopolitan. References: Barkworth & Anderton in FNA (2007a); Tucker (1996)=Z. [also see *Torreyochloa*]

- 1 Spikelets 10-40 mm long, linear, 5-15× as long as wide, terete or nearly so in cross-section; [section *Glyceria*].
- 2 Lemma (6-) 7-8.5 (-10) mm long, acute to acuminate; palea longer than the lemma, extending 1.5-3 mm beyond the lemma apex ***G. acutiflora***
- 2 Lemma 2.4-6.0 mm long, obtuse to notched; palea about as long as the lemma (ranging from shorter than the lemma and included, to projecting up to 1.5 mm beyond the lemma apex).
- 3 Lemma (3.5-) 4.0-6.0 mm long, the apex with 1-2 strongly developed lobes, and also often toothed between the lobes; leaf blades 2-12 cm long; primary panicle branches 1.5-9.5 cm long. ***G. declinata***
- 3 Lemma 2.4-4.8 mm long, the apex rounded or with a few poorly developed rounded teeth; leaf blades 18-32 cm long; primary panicle branches 3-17 cm long.
- 4 Culms 2.5-8 dm tall; pedicels 1-6 mm long ***G. notata***

- 4 Culms 7-18 dm tall; pedicels 0.7-1.7 mm long.
- 5 Lemmas hispidulous on the veins, the hairs ca. 0.1 mm long *G. arkansana*
- 5 Lemmas scabrous on the veins, the prickles ca. 0.05 mm long *G. septentrionalis*
- 1 Spikelets 2.5-8 mm long, ovate to oblong, 1.5-3× as long as wide, laterally compressed in cross-section.
- 6 Upper glumes 2.5-5 mm long, longer than wide; [w. VA and possibly NC northward]; [section *Hydropoa*] *G. grandis* var. *grandis*
- 6 Upper glumes 0.6-3.7 mm long, if > 3 mm long, then shorter than wide; [collectively widespread]; [section *Striatae*].
- 7 Inflorescence compact (at maturity), the branches stiffly ascending to appressed, the tips never nodding; ligule < 1 mm long.
- 8 Inflorescence branches elongate, appressed; lower internodes of the inflorescence 2-8 cm long; spikelets with 3-4 flowers, 3.5-4 mm long; lemma 1.9-2.8 mm long; leaves 2-5 mm wide; [Mountains, rarely elsewhere] *G. melicaria*
- 8 Inflorescence branches short, stiffly ascending; lower internodes of the inflorescence 0.8-2.0 (-2.5) cm long; spikelets with 4-7 flowers, 4-8 mm long; lemma 3.0-3.7 mm long; leaves 3-10 mm wide; [Coastal Plain, rarely disjunct inland to the Mountains of VA] *G. obtusa*
- 7 Inflorescence lax and diffuse (at maturity), the branches spreading to somewhat ascending, the tips often nodding or drooping; ligule 1-6 mm long.
- 9 Glumes tapering from below midlength to the narrowly acute (< 45 degree) tips; lemmas > 2× as long as wide; [endemic to seepage at high elevations in the Great Smoky Mountains, NC and TN and nearby] *G. nubigena*
- 9 Glumes narrowing from midlength or above to the acute or rounded (> 45 degree) tips; lemmas < 2× as long as wide; [collectively widespread].
- 10 Lemma 1.4-2.1 mm long, the veins prominently raised.
- 11 Leaf blades 6-15 mm wide; anthers 0.5-0.8 mm long; culms 2.5-8 mm thick; [rare introduction] *G. elata*
- 11 Leaf blades 2-6 mm wide; anthers 0.2-0.6 mm long; culms 1.5-3.5 mm thick; [common] *G. striata* var. *striata*
- 10 Lemma 1.8-4.0 mm long, the veins visible, but not raised; ligule 2-6 mm long.
- 12 Lemma 2.4-4.0 mm long, projecting conspicuously beyond the palea; spikelets 5-8 mm long, with (4-) 5-10 flowers *G. canadensis*
- 12 Lemma 1.8-2.5 mm long, more-or-less equal to the palea; spikelets 3-5 mm long, with 2-5 (-6) flowers *G. laxa*

Glyceria acutiflora Torrey. Shallow water and wet mucky soils in mountain ponds, wet pastures. Jun-Jul. ME west to MI, south to DE, VA, nw. GA (Jones & Coile 1988), e. TN, and MO; also in e. Asia. [= C, F, FNA, G, GW, HC, K, Pa, Va, W, WV, Z; = *Panicularia acutiflora* (Torrey) Kuntze – S]

Glyceria arkansana Fernald, Arkansas Mannagrass. Swamps. May-Jun. IL south to LA and AR; disjunct in w. NY. The VA report is in error. The appropriate treatment of this taxon needs further investigation. [= F, HC, K, Z; < *G. septentrionalis* – C, G; = *G. septentrionalis* A.S. Hitchcock var. *arkansana* (Fernald) Steyermark & Kučera – FNA]

Glyceria canadensis (Michaux) Trinius, Rattlesnake Mannagrass. Bogs, seepages, montane depression ponds, and wet meadows. Jun-Aug. NL (Newfoundland) west to MN, south to NJ, VA, nw. NC, and IL. [= C, F, G, K, Pa, Va, WV, Z; = *G. canadensis* var. *canadensis* – FNA, HC, W]

* *Glyceria declinata* de Brébisson. Disturbed moist areas; native of Europe. Documented for Alleghany County, NC (D. Poindexter, pers. comm. 2009) [= FNA] {check for additional synonymy}

* *Glyceria elata* (Nash) M.E. Jones. {habitat unknown}; native of w. North America. Reported for GA by FNA; presumably a chance introduction. [= FNA] {add synonymy}

Glyceria grandis S. Watson var. *grandis*, American Mannagrass. Wet, mucky soils of open wetlands. Jul. NS west to AK, south to VA, IA, NM, and OR. Attributed to w. NC by Tucker (1996). [= FNA, K, Va; < *G. grandis* – C, F, G, GW, HC, Pa, WV, Z; = *Panicularia grandis* (S. Watson) Nash – S; ? *G. maxima* (Hartman) Holmberg ssp. *grandis* (S. Watson) Hultén]

Glyceria laxa (Scribner) Scribner, Lax Mannagrass. Bogs, fens, and seeps. Jun-Aug. PE south to NC, mostly Appalachian. Though often described as a hybrid of *G. canadensis* and either *G. striata* var. *striata* and/or *G. grandis* var. *grandis*, *G. laxa* ranges south of the distribution of both *G. canadensis* and *G. grandis* var. *grandis*. It is best considered as a species, perhaps of hybrid origin. [= F, G, K, Va, WV; = *G. canadensis* (Michaux) Trinius var. *laxa* (Scribner) A.S. Hitchcock – FNA, HC, RAB; = *G. laxa* – C; < *G. canadensis* – GW; = *G. canadensis* × *grandis* – Pa]

Glyceria melicaria (Michaux) F.T. Hubbard, Slender Mannagrass, Melic Mannagrass. Bogs, seeps, mountain seepage swamps. Jun-Aug. NS west to QC, south to n. GA (Jones & Coile 1988) and KY. [= C, F, FNA, G, GW, HC, K, Pa, RAB, Va, W, WV, Z; = *Panicularia melicaria* (Michaux) A.S. Hitchcock – S]

* *Glyceria notata* Chevallier, Marked Mannagrass. Reported for TN (FNA). [= FNA] {add synonymy}

Glyceria nubigena W.A. Anderson, Smoky Mountain Mannagrass. Moderate to high elevation seepages in the Great Smoky Mountains, sometimes in areas appearing dry (such as heath balds), nearly endemic to Great Smoky Mountains National Park. Jun-Jul. Endemic to the Great Smoky Mountains of w. NC and e. TN. *G. nubigena* has nearly the same range as *Rugelia nudicaulis*, but is more restricted to seepage. The distinctions and relationship between this taxon and *G. grandis* need further investigation. [= FNA, HC, K, RAB, W, Z]

Glyceria obtusa (Muhlenberg) Trinius, Coastal Mannagrass. Blackwater swamp forests, wet meadows, freshwater marshes, in a wide variety of peaty, acidic soils. Jun-Sep. NS south to SC, on or near the Coastal Plain; disjunct to w. VA in Shenandoah Valley sinkhole ponds. [= C, F, FNA, G, GW, HC, K, Pa, RAB, Va, W, Z; = *Panicularia obtusa* (Muhlenberg) Kuntze – S]

Glyceria septentrionalis A.S. Hitchcock, Floating Mannagrass, Eastern Mannagrass. Shallow water, wet mucky soils, floodplain sloughs, cypress ponds. May-Jun. MA west to MN, south to SC, ne. GA, and TX. [= F, GW, HC, K, Pa, RAB, Va, W, WH3, WV, Z; < *G. septentrionalis* – C, G (also see *G. arkansana*); = *G. septentrionalis* var. *septentrionalis* – FNA; = *Panicularia septentrionalis* (A.S. Hitchcock) E.P. Bicknell – S]

Glyceria striata (Lamarck) A.S. Hitchcock var. *striata*, Fowl Mannagrass. Wet meadows, seepages, bogs, marshes, swamp forests, freshwater tidal marshes, bottomland forests in mesic soils. Apr-Jun. NL (Newfoundland) west to BC, south to FL and CA. Var. *stricta* (Scribner) Fernald is more northern. [= C, F, G, HC, Va, Z; < *G. striata* – FNA, GW, K, Pa, RAB, W, WH3, WV; = *Panicularia striata* (Lamarck) A.S. Hitchcock – S; = *G. striata* ssp. *striata*]

Gymnopogon Palisot de Beauvois 1812 (Skeleton Grass, Beard Grass)

A genus of about 15 species, in temperate and tropical areas of the Americas. References: Cialdella & Zuloaga (2011)=Y; Smith in FNA (2007b); Smith (1971)=Z.

Identification notes: When sterile, *Gymnopogon* is sometimes confused with *Dichanthelium*. *Gymnopogon* differs in having the sheaths conspicuously overlapping (vs. not overlapping in *Dichanthelium*) and leaves that are definitely cordate-clasping and of stiff texture (only a few *Dichanthelium* have this combination).

- 1 Awn of the lemma 4.5-12 mm long; inflorescence branches with spikelets distributed from the tip nearly to the base; leaves 5-15 mm wide; [Coastal Plain, Piedmont, and Mountains]..... ***G. ambiguus***
- 1 Awn of the lemma 0.8-1.6 (-3.5) mm long; inflorescence branches with spikelets distributed from the tip nearly to the base (*G. chapmanianus*) or to roughly the midpoint, the basal portion naked (or some branches rarely with a few spikelets) (*G. brevifolius*); leaves 2-8 mm wide; [Coastal Plain and lower Piedmont].
 - 2 Spikelets 1-flowered; first glume 2.3-3.7 mm long..... ***G. brevifolius***
 - 2 Spikelets 2-4-flowered; first glume 3.8-5 mm long..... ***G. chapmanianus***

Gymnopogon ambiguus (Michaux) Britton, Sterns, & Poggenburg, Eastern Skeleton Grass, Eastern Beard Grass. Prairies, glades, barrens, dry pinelands and woodlands, dry fields. Aug-Oct. S. NJ west to KY, OH, and MO, south to s. FL and TX. [= C, F, FNA, G, HC, K, Pa, RAB, S, Va, W, WH3, WV, Y, Z]

Gymnopogon brevifolius Trinius, Pineland Skeleton Grass, Pineland Beard Grass. Pine savannas, sandhills, dry woodlands, prairies, calcareous glades. Aug-Oct. S. NJ south to s. FL, west to LA and AR; disjunct in the Highland Rim of KY and TN. [= C, F, FNA, G, HC, K, RAB, S, WH3, Y, Z]

Gymnopogon chapmanianus A.S. Hitchcock, Chapman's Skeleton Grass, Chapman's Beard Grass. Sandhills and other xeric, sandy habitats. Se. GA south to s. FL. There remains some question as to whether *G. floridanus* should indeed be lumped into *G. chapmanianus*; additional study is warranted. [= FNA, K, S, WH3, Y; > *G. chapmanianus* – HC, Z; > *G. floridanus* Swallen – HC, Z]

Hainardia W. Greuter 1967 (Thintail)

A genus of 1 species, an annual, native of Europe. References: Smith in FNA (2007a); Tucker (1996)=Z.

* ***Hainardia cylindrica*** (Willdenow) W. Greuter, Thintail. Waste areas around wool-combing mills; native of the Old World. Apr-Jun. [= FNA, K, Z; = *Monerma cylindrica* (Willdenow) Cosson & Durieu – HC; = *Lepturus cylindricus* (Willdenow) Trinius – RAB]

Heteropogon Persoon 1806 (Tanglehead)

A genus of about 10 species, pantropical and extending into subtropical and warm temperate areas. References: Barkworth in FNA (2003a).

- 1 Glume eglandular, with long stiff hairs..... *H. contortus*
- 1 Glume glabrous, with a row of glandular depressions..... *H. melanocarpus*

* *Heteropogon contortus* (Linnaeus) Palisot de Beauvois ex Roemer, Tanglehead. Pine flatwoods, disturbed areas; native of the Old World tropics and subtropics. [= FNA, HC, K2, WH3]

* *Heteropogon melanocarpus* (Elliott) Elliott ex Bentham, Sweet Tanglehead. Sandy roadsides, disturbed areas; probably naturalized from the Old World. Sep-Oct. The species is widespread in the Old World and New World tropics, north in North America to se. NC. [= FNA, HC, K2, RAB, S, WH3]

Holcus Linnaeus 1753 (Velvet Grass, Soft Grass)

A genus of 8 species, usually perennial, native of Europe, n. Africa, and w. Asia. References: Standley in FNA (2007a); Tucker (1996)=Z.

- 1 Plant not rhizomatous; upper culm internodes velvety-villose; lemma awn 1-2 mm long, recurved as a hook *H. lanatus*
- 1 Plant strongly rhizomatous; upper culm internodes glabrous; lemma awn 3-5 mm long, straight or geniculate..... *H. mollis* ssp. *mollis*

* *Holcus lanatus* Linnaeus, Velvet Grass, Soft Grass, Yorkshire-fog. Moist to wet meadows, pastures, disturbed areas, roadsides, hedge-rows, sometimes invasive in bogs, fens, and other natural wetlands; native of Europe. May-Oct. [= C, F, FNA, G, HC, K, Pa, RAB, Va, W, WV, Z; = *Notholcus lanatus* (Linnaeus) Nash – S]

* *Holcus mollis* Linnaeus ssp. *mollis*, Creeping Soft Grass. Lawns; native of Europe. Sep. This European species is known from scattered sites in e. North America. The species was documented for our area by Clay (1995). [= FNA; < *H. mollis* – C, F, G, HC, K, Z]

Hordeum Linnaeus 1753 (Barley)

A genus of about 40 species, north temperate and in South America. Many recent authors place most of our species (other than *H. vulgare*) in *Critesion* Rafinesque. References: von Bothmer, Baden, & Jacobsen in FNA (2007a); Tucker (1996)=Z; Petersen & Seberg (2003); Blattner (2004).

- 1 Rachis remaining intact at maturity; leaves 5-12 mm wide, with well-developed auricles; [section *Hordeum*] *H. vulgare*
- 1 Rachis disarticulating at maturity; leaves 1-5 mm wide, not auriculate (except in *H. murinum* ssp. *leporinum*).
- 2 Perennial; glumes 25-150 mm long; [intersectional hybrid derivative of section *Sibirica* and section *Critesion*] *H. jubatum* ssp. *jubatum*
- 2 Annual; glumes 7-22 (-28) mm long.
- 3 Leaves auriculate; glumes of the central spikelet (in the triad) with ciliate margins; [section *Hordeum*] *H. murinum* ssp. *leporinum*
- 3 Leaves not auriculate; glumes of the central spikelet (in the triad) with scabrous margins; [section *Critesion*] *H. pusillum*

* *Hordeum brachyantherum* Nevski ssp. *brachyantherum*. Disturbed areas, perhaps only a waif; native of w. North America and ne. Asia. Reported for se. PA (Rhoads & Klein 1993) and also is apparently known from specimens from GA (Sorrie, pers. comm.), and scattered sites elsewhere in our area. A tetraploid taxon. [= FNA, K; ? *Critesion brachyantherum* (Nevski) Barkworth & D.R. Dewey] {not yet keyed; add synonymy HC}

* *Hordeum depressum* (Scribner & J.G. Smith) Rydberg, Low Barley. Waste areas around wool-combing mills; native of w. North America, probably only a waif. A tetraploid taxon. [= FNA, HC, K; = *Critesion depressum* (Scribner & J.G. Smith) A. Löve] {not yet keyed}

* ***Hordeum jubatum*** Linnaeus ssp. ***jubatum***, Foxtail Barley, Squirreltail Barley. Roadsides, other disturbed areas; native of w. North America, apparently introduced in our area. May-Aug. A tetraploid taxon. [= FNA, K, Va; < *H. jubatum* – C, F, G, HC, Pa, RAB, W, WV, Z; = *Critesion jubatum* (Linnaeus) Nevski]

* ***Hordeum murinum*** Linnaeus ssp. ***leporinum*** (Link) Arcangeli. Disturbed areas; native of Mediterranean Europe. May. A tetraploid taxon. [= FNA, K, Z; = *H. leporinum* Link – C, HC, RAB; < *Hordeum murinum* Linnaeus – G, Pa, S; = *Critesion murinum* (Linnaeus) Á. Löve ssp. *leporinum* (Link) Á. Löve]

Hordeum pusillum Nuttall, Little Barley. Roadsides, fields, pastures, ditches, disturbed areas. Apr-Jun. Se. NY west to MN, south to n. FL, s. TX, and s. AZ. A diploid taxon. [= C, F, FNA, G, HC, K, Pa, RAB, S, Va, W, WH3, Z; = *Critesion pusillum* (Nuttall) Á. Löve]

* ***Hordeum vulgare*** Linnaeus, Barley. Cultivated fields, commonly cultivated, rare as a waif; native of Eurasia. May-Jul. A diploid taxon. The original wild form is often treated as *H. vulgare* ssp. *spontaneum* and the cultivated, non-shattering derivative as ssp. *vulgare* (Hancock 2004). The wild form was used as a food source since at least 19,000 years ago, and “ssp. *vulgare*” developed by 8,500 years ago. [= C, F, K, Pa, RAB, WH3, Z; > *H. vulgare* ssp. *vulgare* – FNA; > *H. aegiceras* Nees ex Royle – G; > *H. vulgare* var. *vulgare* – G, HC; > *H. vulgare* var. *trifurcatum* (Schlechtendal) Alefeld – G, HC; > *H. vulgare* ssp. *spontaneum* (K. Koch) Thellung]

Hymenachne Palisot de Beauvois 1812 (Marsh-grass, Maidencane)

A genus of 5-10 species, perennials, of the Neotropics and Paleotropics. Acosta et al. (2014) show 2 clades of *Hymenachne*, rendering it non-monophyletic, and suggest that it may need to be split in the future. If it is split, it appears that our two species would be in separate genera, with *Hymenachne hemitomon* (the former *Panicum hemitomon*) moving to yet another new genus. *Hymenachne* has a C₃ photosynthetic pathway. References: Acosta et al. (2014); Barkworth in FNA (2007b); Grande Allende (2014)=Y; Lelong (1986)=Z; Hsu (1965); Freckmann & Lelong in FNA (2007b).

- 1 Spikelets 3.5-5.0 mm long; ligules 1-2.5 mm long; [rare introduction].....***H. amplexicaulis***
- 1 Spikelets 2.0-2.8 mm long; ligules < 1 mm long; [common native in the Coastal Plain, rare elsewhere].....***H. hemitomon***

* ***Hymenachne amplexicaulis*** (Rudge) Nees, Trompetilla. Disturbed wet ground; native from Mexico south to South America. Sep. Its additional discovery in w. LA (Urbatsch & Saichuk 2014) suggests this plant may be present in additional locations along the Gulf Coast. [= FNA, K2, WH3]

Hymenachne hemitomon (J.A. Schultes) C.C. Hsu, Maidencane. Lake, pond, and river shores, swamp borders, marshes, ditches, often in shallow water. Jun-Jul. Coastal Plain from s. NJ south to FL, west to TX; also TN; South America. Often forming dense colonies in the low margin and shallow waters of limesink ponds. [= Y; = *Panicum hemitomon* J.A. Schultes – C, F, FNA, G, GW, HC, K, RAB, S, W, WH3, Z]

Hypparrhenia Andersson ex E. Fournier 1886

A genus of ca. 55 species, annuals and perennials, mainly of Africa. References: Barkworth in FNA (2007b).

* ***Hypparrhenia rufa*** (Nees) Stapf, Jaragua Grass. Disturbed moist to wet areas; native of the Paleotropics. Reported north to Alachua County, FL. [= FNA, K2, WH3] {not yet keyed}

Imperata Cirillo 1792 (Cogongrass, Satintail)

A genus of about 8-9 species, of tropical, subtropical, and warm temperate areas of both hemispheres. References: Gabel in FNA (2003a); Burrell et al. (2015); Ward (2004c)=Z; Hall (1998)=Y.

- 1 Anther 1; filaments dilated at base; lower lemma often absent.....***I. brasiliensis***
- 1 Anthers 2; filaments not dilated at base; lower lemma rarely absent.....***I. cylindrica***

* ***Imperata brasiliensis*** Trinius, Brazilian Satintail. Pinelands, disturbed areas; native of Neotropics. Burrell et al. (2015) found evidence of this taxon only in s. FL, south of our area. [= FNA, HC, K, S; < *I. cylindrica* – Y; = *I. cylindrica* var. *mexicana* (Ruprecht) D.B. Ward – Z]

* ***Imperata cylindrica*** (Linnaeus) Palisot de Beauvois, Cogongrass. Pinelands, grassy roadsides; native of se. Asia, s. Asia, and possibly e. Africa. See Nelson (1993) for first report from SC. An extremely aggressive and dangerous weed, now well-established and rapidly invading fire-maintained Coastal Plain areas (such as longleaf pine and slash pine flatwoods and longleaf

pine clayhills) on the Gulf Coastal Plain of FL, AL, and MS. Hall (1998) argues that *I. cylindrica* and *I. brasiliensis* are not distinct. Ward (2004c) treats the 2 taxa at varietal level. Both putative taxa are present in the Gulf Coast area of FL, GA, AL, and LA. [= FNA, HC, K; < *I. cylindrica* – Y; = *I. cylindrica* var. *cylindrica* – Z]

Koeleria Persoon 1805 (Junegrass, Koeleria)

A genus of about 60 species, north and south temperate. References: Standley in FNA (2007a). [also see *Rostraria*]

Koeleria macrantha (Ledebour) J.A. Schultes, Junegrass. {habitats}. South to DE, MD, PA, KY, AL, LA, TX, and Mexico. [= FNA, K, Pa; < *K. pyramidata* (Lamarck) Palisot de Beavois – C]

Lachnagrostis Trinius 1820

A genus of about 20 species, annuals and perennials, of the Southern Hemisphere. References: Harvey in FNA (2007a); Soreng et al. (2003).

* **Lachnagrostis filiformis** (G. Forster) Trinius, Pacific Bentgrass. Waste areas around wool-combing mill, perhaps only a waif; native of Australia. [= FNA; = *Agrostis avenacea* J.F. Gmelin – K] {not keyed}

Lagurus Linnaeus 1753 (Hare's-tail Grass)

A monotypic genus, an annual, of the Mediterranean region. References: Tucker in FNA (2007a); Tucker (1996)=Z.

* **Lagurus ovatus** Linnaeus, Hare's-tail Grass. On ballast, other disturbed areas; native of Mediterranean Europe. Apr-Jun. [= FNA, HC, K, RAB, WH3, Z]

Leersia Swartz 1788 (Cutgrass)

A genus of about 17-18 species, tropical and warm temperate. References: Pyrah in FNA (2007a); Tucker (1988)=Z.

- 1 Lower panicle branches whorled or closely approximate; spikelets 4.0-5.5 mm long, 1.5-2.0 mm broad; stamens 3 **L. oryzoides**
- 1 Lower panicle branches alternate (rarely opposite); spikelets 2.2-5.0 mm long, 0.8-4.0 mm broad; stamens 2 or 6.
- 2 Spikelets suborbicular-falcate, 3.0-4.0 mm broad, < 2× as long as broad; principal leaf-blades 10-15 mm wide; stamens 2 **L. lenticularis**
- 2 Spikelets narrowly elliptic-falcate, 0.8-2.0 mm broad, > 2× as long as wide; principal leaf-blades usually < 7 mm wide; stamens 2 or 6.
- 3 Spikelets 3.8-4.7 mm long, 1.5-2.0 mm broad; panicle branches short, bearing spikelets nearly to their bases; stamens 6 **L. hexandra**
- 3 Spikelets 2.2-3.5 mm long, 0.8-1.2 mm broad; panicle branches long, filiform, the longer ones bearing spikelets only in their upper half; stamens 2 **L. virginica**

Leersia hexandra Swartz, Southern Cutgrass. Clay-based Carolina bays, limesink ponds, Florida wet prairies, lakes, pools, usually in places where periodically or seasonally inundated. Jun-Aug. Pantropical, ranging north in North America to MD, TN, and TX. This species is considered a serious weed in the Old World and New World tropics; in our area, however, it is uncommon and not weedy. [= C, F, FNA, G, GW, HC, K, RAB, Va, WH3, Z; = *Homalocenchrus hexandrus* (Swartz) Kuntze – S]

Leersia lenticularis Michaux, Catchfly Cutgrass. Floodplain forests and swamps, rarely in depression swamps and ponds. Sep-Oct. Se. VA south to ne. FL and Panhandle FL, west to e. TX, north in the interior to IN and MN. [= C, F, FNA, G, GW, HC, K, RAB, Va, WH3, Z; = *Homalocenchrus lenticularis* (Michaux) Kuntze – S]

Leersia oryzoides (Linnaeus) Swartz, Rice Cutgrass. Marshes, riverbanks, pond-shores, and a wide diversity of other wetlands. Aug-Oct. NS west to BC, south to Panhandle FL and CA; also in Europe and e. Asia. [= C, F, FNA, G, GW, HC, K, Pa, RAB, Va, WH3, WV, Z; = *Homalocenchrus oryzoides* (Linnaeus) Pollich – S]

Leersia virginica Willdenow, White Grass, White Cutgrass. Floodplain forests, swamps, streambanks. Aug-Oct. QC west to MN and SD, south to c. peninsular FL and TX. [= C, FNA, G, GW, HC, K, Pa, RAB, WH3, WV, Z; > *L. virginica* var. *virginica* – F; > *L. virginica* var. *ovata* (Poirlet) Fernald – F; = *Homalocenchrus virginicus* (Willdenow) Britton – S]

Leptochloa Palisot de Beauvois 1812 (Sprangletop, Feathergrass)

A genus of about 30 species, pantropical and extending into warm temperate areas. The circumscription of *Leptochloa* has been controversial; many earlier authors have preferred to separate *Diplachne* as a separate genus. Peterson et al. (2012, in press) present a comprehensive restructuring of the genera in this group, with (for our area) an expanded *Dinebra*, a much shrunk *Leptochloa*, recognition of a recircumscribed *Diplachne*, and recognition of *Disakisperma*. References: Peterson et al. (2012, in press)=Z; Snow in FNA (2003a); Snow (1998); Weakley et al. (2011); Cronquist (1991).

* ***Leptochloa digitata*** (R. Brown) Domin, Finger Sprangletop, Umbrella Canegrass. Waif at wool-combing mill, probably not established; native of Australia. [= K2] {not keyed}

* ***Leptochloa virgata*** (Linnaeus) Palisot de Beauvois, Tropical Sprangletop. Waif at wool-combing mill and on ballast at old seaports, probably not established; native of South America. [= FNA, HC, K2, WH3] {not keyed}

Limnodea L.H. Dewey 1894

A monotypic genus, and annual, of sc. United States and adjacent Mexico. References: Snow in FNA (2007a); Brandenburg & Thieret (2000)=Z; Tucker (1996)=Y.

Limnodea arkansana (Nuttall) L.H. Dewey. Hammocks, moist forests (Panhandle FL westward), waste at wool-combing mill, probably not established (SC). W. FL, c. and s. AL, west through MS, LA, and AR to OK, TX, and adjacent Mexico. [= FNA, HC, K, S, WH3, Z; = *Cinna arkansana* (Nuttall) G. Tucker – Y]

Lolium Linnaeus 1753 (Rye-grass, Darnel, Fescue)

A genus of about 5 species, annuals and perennials, native to Europe, n. Africa, and temperate Asia. Here interpreted to include *Schedonorus*, following Soreng et al. (2015); perhaps the two together are best included in an even-more expanded *Festuca*. The best generic placement of *Schedonorus arundinaceus* (= *Festuca elatior*; = *Festuca arundinacea*; = *Lolium arundinaceum*) and *S. pratense* is disputed. Articles and floras continue to place them variously in three genera: *Festuca* (Aiken et al. 1997; Baldwin et al. 2012, Mohlenbrock 2014), *Lolium* (Darbyshire 1993; Soreng et al. 2015), and *Schedonorus* (Soreng & Terrell 1998). References: Terrell in FNA (2007a); Darbyshire in FNA (2007a); Smith & Aikin (2012)=U; Soreng & Terrell (1998)=V; Darbyshire (1993)=Y; Aiken & Darbyshire (1990)=X; Inda et al. (2008); Tucker (1996)=Z. Key based in part on C and X.

- 1 Inflorescence paniculate (spikelets borne on branches off the central axis, not 2-ranked).
 - 2 Auricles ciliate (sometimes only very sparsely so – check several at 10-20× magnification); spikelets with 3-6 (-9) florets; old sheaths pale straw-colored, often remaining intact; internodes of the rachilla antrorsely scabrous ***L. arundinaceum***
 - 2 Auricles glabrous; spikelets with (2-) 4-10 (-12) florets; old sheaths brown, decaying to fibers; internodes of the rachilla glabrous (smooth) or nearly so ***L. pratense***
- 1 Inflorescence spikelike (spikelets sessile on the central axis, 2-ranked).
 - 3 Glumes (12-) 15-25 mm long, subcoriaceous, equaling or surpassing the uppermost lemma (therefore the length of the spikelet); florets 4-9 per spikelet; annual ***L. temulentum***
 - 3 Glumes 4-12 mm long, herbaceous, shorter than the lemmas (therefore shorter than the spikelet); florets (2-) 5-22 per spikelet; annual or perennial.
 - 4 Lemmas (at least the upper) awned, the awns to 15 mm long; florets 11-22 per spikelet; annual or perennial.... ***L. perenne* var. *aristatum***
 - 4 Lemmas awnless; florets (2-) 5-10 per spikelet; perennial..... ***L. perenne* var. *perenne***

* ***Lolium arundinaceum*** (Schreber) Darbyshire, Tall Fescue, Alta Fescue. Fields, roadsides, pastures, disturbed areas; native of Eurasia. May-Jul. [= K1, Y, WH3, Z; = *Schedonorus arundinaceus* (Schreber) Dumortier – FNA, Pa, V; < *Festuca elatior* Linnaeus – F, RAB, S, W, WV, misapplied; = *Festuca elatior* Linnaeus – C, misapplied; = *Festuca elatior* var. *arundinacea* (Schreber) Wimmer – G; < *Festuca pratensis* Hudson – GW; = *Festuca arundinacea* Schreber – HC, K2, X; ? *Schedonorus phoenix* (Scopoli) Holub]

* ***Lolium perenne*** Linnaeus var. ***aristatum*** Willdenow, Italian Rye-grass, Annual Rye-grass. Fields, roadsides, pastures, disturbed areas; native of Eurasia. Apr-Jul. [= C, Z; = *Lolium multiflorum* Lamarck – F, FNA, G, HC, Pa, RAB, S, WV; = *Lolium perenne* ssp. *multiflorum* (Lamarck) Husnot – K; < *Lolium perenne* – W; < ***Festuca perennis*** (Linnaeus) Columbus & J.P. Smith, Jr. – U]

* ***Lolium perenne*** Linnaeus var. ***perenne***, English Rye-grass, Perennial Rye-grass. Fields, roadsides, pastures, disturbed areas; native of Eurasia. Apr-Jul. [= C, Z; = *Lolium perenne* – F, FNA, G, HC, Pa, RAB, S, WH3, WV; = *Lolium perenne* ssp. *perenne* – K; < *Lolium perenne* – W; < ***Festuca perennis*** (Linnaeus) Columbus & J.P. Smith, Jr. – U]

* ***Lolium pratense*** (Hudson) Darbyshire, Meadow Fescue. Fields, roadsides, pastures, disturbed areas; native of Eurasia. May-Jul. [= K1, Y, Z; = *Schedonorus pratensis* (Hudson) Palisot de Beauvois – FNA, Pa, V; = ***Festuca pratensis*** Hudson – C, K2, X; < *Festuca elatior* Linnaeus – F, S, W, WV, misapplied; = *Festuca elatior* var. *pratensis* (Hudson) A. Gray – G; < *Festuca pratensis* Hudson – GW; = *Festuca elatior* – HC, misapplied]

* ***Lolium temulentum*** Linnaeus ssp. ***temulentum***, Darnel. Fields, roadsides, pastures, disturbed areas; native of Eurasia. May-Jun. [= FNA; < *Lolium temulentum* – C, F, HC, Pa, RAB, S, WH3, Z; > *Lolium temulentum* var. *leptochaetum* A. Braun – G; > *Lolium temulentum* var. *macrochaetum* A. Braun – G; > *Lolium temulentum* ssp. *temulentum* – K; = ***Festuca temulentum*** (Linnaeus) Columbus & J.P. Smith, Jr. – U]

Luziola Antoine Laurent de Jussieu 1789 (Southern Water Grass)

A genus of about 12 species, from s. North America south to tropical South America. References: Martínez-y-Pérez, Mejía-Saulés, & Sosa (2008)=X; Terrell in FNA (2007a); Tucker (1988)=Z; Judziewicz et al. (2000)=Y. Key based on Terrell in FNA (2007a).

- 1 Culms prostrate; leaves conspicuously clustered toward the apex of the culms, floating, 1-5 (-8) cm long; pistillate inflorescence an inconspicuous axillary raceme, 1.1-3.5 cm long, with 2-5 florets ***L. fluitans*** var. ***fluitans***
- 1 Culms suberect to erect; leaves scattered along the culm, not floating, > 6 cm long; pistillate inflorescence an axillary panicle, 2-21.5 (-58) cm long, with 18-250 (-350) florets.
 - 2 Pistillate florets 3-5 mm long; achenes striate ***L. bahiensis***
 - 2 Pistillate florets 2-2.5 mm long; achenes smooth ***L. peruviana***

*? ***Luziola bahiensis*** (Steudel) A.S. Hitchcock. Streams and riverbanks. Apparently native (Anderson & Hall 1993), but considered native of South America by some authors. [= FNA, HC, K1, K2, WH3, X]

Luziola fluitans (Michaux) Terrell & H. Robinson var. ***fluitans***, Southern Water Grass. Aquatic in water of natural lakes, slow-moving blackwater rivers, swamps, ponds, and other stagnant waters. Aug-Oct. Var. *fluitans* ranges from ne. NC to c. FL and west to e. TX; var. *oconnerii* (Guzman M.) G. Tucker occurs in the highlands of w. Mexico (Tucker 1988). A very unusual grass, truly aquatic, with flexuous stems and unwettable, floating leaves. In addition to floating leaves (helpful in the field but not in the herbarium!), other useful characters include two secondary blade nerves on either side of the midnerve and virtually as prominent as the midnerve, and which extend onto the sheath where they occur with another 5 or so strong nerves; often with cilia 0.5-1 mm long at the summit of the ventral face of the sheath (an unusual place); and a hyaline ligule about 1 mm long on the same plane as the sheath (i.e., free from the base of diverging blades). [= FNA, WH3, Y, Z; < *Hydrochloa carolinensis* Palisot de Beauvois – GW, HC, RAB, S; < *L. fluitans* – K1, K2, X]

* ***Luziola peruviana*** Jussieu ex J.F. Gmelin, Peruvian Water Grass. Disturbed wet areas; native of South America. FL Panhandle. Apparently an introduction, occurring in disturbed situations. See Anderson & Hall (1993). [= FNA, HC, K1, K2, WH3, X]

Megathyrsus (Pilger) B.K. Simon & S.W.L. Jacobs 2003 (Guinea Grass)

A genus of 3 species. References: Wipff & Thompson in FNA (2003a), amended in FNA (2007a).

* ***Megathyrsus maximus*** (Jacquin) B.K. Simon & S.W.L. Jacobs, Guinea Grass. Disturbed areas, pine plantations; native of Africa. Introduced in the Gulf states (GA, AL, FL) (FNA; Carter, Baker, & Morris 2009). [= FNA (2007a); = *Urochloa maxima* (Jacquin) R. Webster – FNA (2003a), K1, K2; = *Panicum maximum* Jacquin – HC, S, WH3]

**Melica** Linnaeus 1753 (Melic)

A genus of about 80 species, north temperate, s. Africa and s. South America. References: Barkworth in FNA (2007a); Tucker (1996)=Z.

- 1 First glume oblong, 6.5-10 mm long, 2-4× as long as wide, acute to obtuse at the apex, about the same length and width as the second glume; inflorescence with (0-) 1-5 branches from the lower nodes only; fertile lemmas 2; leaves 1-6 mm wide; [common, widespread in our area] **M. mutica**
- 1 First glume broadly ovate, 5-8 mm long, 1.5-2× as long as wide, obtuse to rounded at the apex, shorter and broader than the second glume; inflorescence with 2-10 (or more) branches from most nodes; fertile lemmas (2-) 3; leaves 3-12 mm wide; [rare, Mountains of NC and VA, northward and westward] **M. nitens**

Melica mutica Walter, Two-flower Melic. Forests and woodlands, including coastal fringe and maritime forests. Apr-May. MD west to IN and IL, south to FL and TX. [= C, F, FNA, G, HC, K1, K2, RAB, S, W, WH3, WV, Z]

Melica nitens (Scribner) Nuttall ex Piper, Three-flower Melic. Rocky upland woodlands, barrens, and glades, over calcareous rocks (such as limestone, calcareous shale). May-Jun. PA west to s. MN and NE, south to nw. GA and TX. [= C, F, FNA, G, HC, K1, K2, Pa, RAB, W, WV, Z]

Melinis Palisot de Beauvois 1812 (Natalgrass)

A genus of ca. 22 species, native to Africa and w. Asia. References: Wipff in FNA (2003a).

* **Melinis repens** (Willdenow) Zizka *ssp. repens*, Rose Natalgrass. Disturbed areas, roadsides, railroad embankments, other disturbed areas; native of Africa. Reported for several s. GA counties (Carter, Baker, & Morris 2009); the report for NC by Kartesz (1999) is an error. [= FNA; < *M. repens* – K1, K2, WH3; ? *Rhynchelytrum roseum* (Nees) Stapf & C.E. Hubbard ex Bews – HC; < *Rhynchelytrum repens* (Willdenow) C.E. Hubbard]

Microstegium Nees in Lindley 1836 (Sasa-grass, Japanese-grass)

A genus of about 15 species, of subtropical Asia and Africa. References: Barden (1987); Fairbrothers & Gray (1972); Winter, Schmitt, & Edwards (1982); Koyama (1987); Thieret in FNA (2003a).

* **Microstegium vimineum** (Trinius) A. Camus, Japanese Stilt-grass, Flexible Sasa-grass, Japanese-grass. Disturbed areas, colonizing moist, rich soil, especially in floodplains; native of tropical se. Asia. The following chronological synopsis of flora accounts of *Microstegium* is perhaps instructive: not treated by Small (1933), "local" (Fernald 1950), "rarely introduced and possibly not established" (Gleason & Cronquist 1952), "sporadically naturalized" (Godfrey & Wooten 1979), "a rapidly spreading pernicious invader on moist ground, too common" (Wofford 1989). RAB report it from fewer than 1/3 of the counties of the Carolinas (in 1968); it is now undoubtedly in every county, an abundant weed in most of them. This species has become a very serious pest, now ranking as one of the most destructive introduced plants in our area, forming extensive and dense patches, sprawling over and eliminating nearly all other herbaceous plants. Eradication is very difficult, and considering its obvious colonizing abilities, only temporary. Hunt & Zaremba (1992) document the continuing northern expansion of *Microstegium* into NY and CT. Redman (1995) discusses its habitat preferences in MD and DC. Koyama (1987) reports it as "common as undergrowth of forests" in Japan, part of its native distribution. [= C, FNA, GW, K, Pa, RAB, W, WH3; = *Eulalia viminea* (Trinius) Kuntze – G; > *Eulalia viminea* var. *viminea* – F; > *Eulalia viminea* var. *variabilis* Kuntze – F; > *M. vimineum* var. *vimineum* – HC; > *M. vimineum* var. *imberbe* (Nees) Honda – HC]

Milium Linnaeus 1753 (Wood-millet, Millet-grass)

A genus of 4 species, north temperate. References: Crins in FNA (2007a); Haines (2010)=X; Tucker (1996)=Z; Fernald (1950b)=Y.

Milium effusum Linnaeus var. **cisatlanticum** Fernald, American Wood-millet, Millet-grass. Forests at high (or rarely moderate) elevations. Mate May-Jul. A circumboreal species, ranging in North America south to w. NC (Swain County), e. TN (Sevier County), w. VA, WV, OH, IN, IL, and MN. The American plants are sometimes segregated as var. *cisatlanticum* Fernald (Fernald 1950b). Though considered "probably accidentally introduced and established" in NC by Radford, Ahles, & Bell

(1968), the native occurrence of this northern species is more plausible; the only known occurrence in NC (not recently seen) is in the Great Smoky Mountains National Park. [= FNA, K1, K2, Pa, Y; < *M. effusum* – C, F, G, HC, RAB, W, WV, Z; = *M. effusum* ssp. *cisatlanticum* (Fernald (A. Haines – X)

Miscanthus Andersson 1855 (Eulalia)

A genus of ca. 14 species, perennials, of Eurasia and s. Africa. References: Barkworth in FNA (2003a).

* **Miscanthus sinensis** Andersson, Eulalia, Chinese Silver Grass. Roadsides, powerline rights-of-way; native of e. Asia. Sep-Nov. This species is becoming aggressively weedy. Forms with leaves cross-variegated or linear-variegated with yellow are cultivated and sometimes escape or persist (in addition to the much more common green-leaved form). [= C, FNA, G, K1, K2, Pa, RAB, S, W, WH3, WV; > *M. sinensis* var. *variegatus* Beal – F, HC; > *M. sinensis* var. *zebrinus* Beal – F, HC]

Mnesithea Kunth 1829 (Jointgrass)

A genus of about 30 species, perennial and annual herbs, widespread in the tropics and subtropics of the Old and New World. Here circumscribed to include *Coelorachis* and *Hackelochloa*, based on Veldkamp, Koning, & Sosef (1986) and Soreng et al. (2015). References: Allen in FNA (2003a); Thieret in FNA (2003a); Soreng et al. (2015); Veldkamp, Koning, & Sosef (1986)=Z.

- 1 Annual; sessile spikelets hemispheric; lower glumes of the sessile spikelet alveolate; [alien weed]..... **M. granularis**
- 1 Perennial (cespitose or rhizomatous); sessile spikelets ovate; lower glumes of the sessile spikelet rugose or pitted; [native].
- 2 Culms round in cross-section..... **M. cylindrica**
- 2 Culms compressed-keeled in cross-section.
- 3 Lower glume with rectangular pits **M. tessellata**
- 3 Lower glume smooth or with transverse ridges.
- 4 Lower glume with transverse ridges..... **M. rugosa**
- 4 Lower glume smooth **M. tuberculosa**

Mnesithea cylindrica (Michaux) de Koning & Sosef, Carolina Jointgrass. Open woodlands and roadsides, probably in areas formerly prairie-like and fire-maintained, perhaps now extirpated in portions of our area (including NC). Jun-Aug. Fairly widespread in se. North America, north to NC and SC (at least formerly), MS, MO, and TX. [= Z; = *Coelorachis cylindrica* (Michaux) Nash – C, FNA, K, WH3; = *Manisuris cylindrica* (Michaux) Kuntze – F, G, GW, HC, RAB; = *Manisuris campestris* (Nuttall) A.S. Hitchcock – S]

* **Mnesithea granularis** (Linnaeus) de Koning & Sosef, Pitscale Grass. Disturbed areas; native of the Old World. Reported for sw. GA and other Gulf Coast states (Thieret in FNA 2003a, Jones & Coile 1988, Kartesz 1999). [= *Hackelochloa granularis* (Linnaeus) Kuntze – FNA, HC, K, WH3; = *Rytilyx granularis* (Linnaeus) Skeels – S]

Mnesithea rugosa (Nuttall) de Koning & Sosef, Wrinkled Jointgrass. Limesink ponds (dolines), depression meadows, clay-based Carolina bays, wet savannas, disturbed areas (such as seeps in powerline rights-of-way), always in places with a seasonally high water-table. Jun-Oct. A Southeastern Coastal Plain endemic: s. NJ south to FL and west to TX. [= Z; = *Coelorachis rugosa* (Nuttall) Nash – C, FNA, K, Va, WH3; = *Manisuris rugosa* (Nuttall) Kuntze – F, G, GW, HC, RAB, S]

Mnesithea tessellata (Steudel) de Koning & Sosef, Pitted Jointgrass. Wet savannas and bogs. Southeastern Coastal Plain endemic: sw. GA and FL west to e. LA. [= Z; = *Coelorachis tessellata* (Steudel) Nash – FNA, K, WH3; = *Manisuris tessellata* (Steudel) Scribner – GW, HC, S]

Mnesithea tuberculosa (Nash) de Koning & Sosef, Smooth Jointgrass. Pond margins. Southeastern Coastal Plain endemic: sw. GA (Mitchell County) (Sorrie 1998b) west to s. AL, and in the FL peninsula. [= Z; = *Coelorachis tuberculosa* (Nash) Nash – FNA, K, WH3; = *Manisuris tuberculosa* Nash – GW, HC, S]

Molinia Schrank 1789 (Moorgress)

A genus of 2-5 species, perennials, of temperate Eurasia. References: Barkworth in (FNA 2003a).

Molinia caerulea (Linnaeus) Moench, Purple Moorgress. Disturbed areas; native of Eurasia. Reported for the Coastal Plain of NJ (Kartesz 2010). [= FNA, K2] {not keyed; doubtfully naturalized}

Muhlenbergia Schreber 1789 (Muhly)

A genus of about 176 species, perennials and annuals, of North America south to Andean South America, and e. and se. Asia. *Muhlenbergia* is a large and diverse genus, recently reclassified by Peterson, Romaschenko, & Johnson (2010b); the subgenera used here follow that classification. References: Peterson, Romaschenko, & Johnson (2010b); Pohl (1969); Gustafson & Peterson (2007)=Y; Morden & Hatch (1989)=Z; Peterson in FNA (2003a).

- 1 Panicle open and diffuse, > 4 cm broad, the spikelets borne on slender or capillary pedicels longer than the lemmas.
 - 2 Plant with rhizomes, the rhizomes prominent, creeping, and covered with imbricate scales; culms and sheaths strongly compressed at base, the leaves distichous; spikelets 1.5-2 mm long; [subgenus "incertae sedis"]..... *M. torreyana*
 - 2 Plant without rhizomes, tufted with erect culms (a "bunchgrass"); culm and sheaths terete, the leaves not distichous; spikelets 1.5-5 mm long (excluding awns, if present).
 - 3 Spikelets 1.5-2 mm long, awnless; [subgenus *Pseudosporobolus*]..... *M. uniflora*
 - 3 Spikelets 2.5-5 mm long (excluding awns), awned or awnless; [subgenus *Trichochloa*].
 - 4 Lemma awn 0-1.5 (-4) mm long; glume bodies (1.1-) 2.0-3.3 (-3.6) mm long, < ½ as long as the lemma bodies, acuminate, not awned (rarely the second with a short awn < 0.6 mm long); spikelets usually brown or bronze (when fresh); basal sheaths usually very fibrous..... *M. expansa*
 - 4 Lemma awn (2-) 3-35 mm long; glume bodies (0.3-) 0.7-1.7 (-2.4) mm long, > ½ as long as the lemma body, one or both glumes sometimes awned; spikelets usually purple (when fresh); basal sheaths rarely strongly fibrous.
 - 5 Lemma awn (2-) 3-13 (-18) mm long, first glume awnless (or rarely with an awn to 3.2 mm long), second glume awnless (or rarely with an awn up to 5.0 mm long), palea awnless; lemma lacking setaceous teeth flanking the awn; flowering late Aug-Oct; [widespread in our area, particularly in rocky, clayey, or sandy glades, barrens, and woodlands with prairie affinities]..... *M. capillaris*
 - 5 Lemma awn (8-) 12-26 (-35) mm long, first glume awn (0.5-) 1-7 (-10) mm long, second glume awn (1-) 5-19 (-25) mm long, palea awn-tipped; lemma with two setaceous teeth flanking the awn, the teeth 0.5-2.5 (-4.7) mm long; flowering Oct-Nov; [sandy maritime situations on barrier islands of the outer Coastal Plain]..... *M. sericea*
- 1 Panicle slender, dense, < 2.5 cm broad, the spikelets sessile or on non-capillary pedicels shorter than the lemmas; [subgenus *Muhlenbergia*].
 - 6 Glumes minute, 0-0.5 mm long; plant lacking rhizomes; culms weak, decumbent and cespitously branching in their lower portions, rooting at the nodes, the upper portions erect and sparsely branched..... *M. schreberi*
 - 6 Glumes well-developed, 1-7 mm long; plant with scaly rhizomes (except for *M. cuspidata*); culms firm (rarely sprawling), few or solitary (rarely forming dense colonies).
 - 7 Glumes 5-7 mm long (tapered to arched or straight awns), about double the length of the lemma (excluding its awn); panicle dense and spike-like, 2-6 cm long and 3-10 mm broad..... *M. glomerata*
 - 7 Glumes 1.2-3 mm long, shorter than to barely exceeding the lemma; panicle usually slender, arching, generally less dense and not spike-like, often with some elongated (though appressed) branches, 4-50 cm long, 2-15 mm broad.
 - 8 Callus glabrous; plant lacking scaly rhizomes (with slender stolons and a hard, knotty crown); leaves 0.5-2 mm wide; [calcareous cliffs]..... *M. cuspidata*
 - 8 Callus bearded (sometimes only slightly so) (glabrous in *M. glabriflora*); plant with scaly rhizomes; leaves (1-) 2-14 mm wide; [various habitats].
 - 9 Panicle linear, loosely flowered, much exceeding the leaves; culm erect, simple or sparingly branched; glumes relatively broad, the body ovate, 1.2-2.5 mm long, abruptly narrowed to the acuminate tip; ligule obsolete or shorter than the elongate cartilaginous summit of the leaf sheath.
 - 10 Lemmas awnless or awn < 0.5 mm long; spikelets 1.5-2.5 mm long; leaf blades usually (1-) 2-6 mm wide..... *M. sobolifera*
 - 10 Lemma awn 1-11 mm long (rarely awnless); spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide)..... *M. tenuiflora*
 - 9 Panicle lanceolate, densely (rarely loosely) flowered, leaves often extending conspicuously into the inflorescence; culm geniculate, freely branched; glumes relatively narrow, the body lanceolate, 2-3 mm long, tapering from base to apex; ligule usually obvious above the short cartilaginous summit of the leaf sheath.
 - 11 Culm glabrous throughout (including below the nodes).
 - 12 Glumes 1.4-2.0 mm long; ligule 0.2-0.5 mm long..... *M. bushii*
 - 12 Glumes 2-4 (-5) mm long; ligule 0.8-1.5 mm long..... *M. frondosa*
 - 11 Culm pubescent, at least below the nodes.
 - 13 Lemma awn 7-12 mm long; spikelets loosely clustered, on pedicels 2-4 mm long..... *M. sylvatica*
 - 13 Lemma awnless or with a short awn tip (rarely to 9 mm long); spikelets densely clustered, on pedicels < 1 mm long.
 - 14 Lemma glabrous below, or with short basal bearding; ligule 0.5-1.5 mm long..... *M. glabriflora*
 - 14 Lemma pilose basally; ligule 0.5-1 mm long..... *M. mexicana*

Muhlenbergia asperifolia (Nees & Meyen ex Trinius) Parodi, Alkali Muhly, Scratchgrass. Alkaline soils, wetlands, lawns. Reported east and south to MD, PA, n. KY, and OH (Kartesz 1999, 2010). [= C, F, FNA, G, HC, K1, K2, Pa] {not yet keyed}

Muhlenbergia bushii Pohl, Bush's Muhly. Wet oak flatwoods, bottomlands, and other moist forests. IN west IA, south to NE and TX; apparently disjunct eastward in scattered localities, including in n. GA (Jones & Coile 1988) and VA. The habitat is variously given in floras as "dry woods" or "moist woods." [= C, FNA, K1, K2; = *M. brachyphylla* Bush – F, G, HC]

Muhlenbergia capillaris (Lamarck) Trinius, Hairgrass. In the Piedmont and Interior Low Plateau primarily in clayey or thin rocky soils (especially in areas which formerly burned and were prairie-like) and in open woodlands, in the Coastal Plain in savannas, dry woodlands, and coastal grasslands (where sometimes in close proximity with *M. sericea*), in the Mountains around calcareous rock outcrops. Late Aug-Oct. MA, NY, s. OH, s. IN, s. IL, MO, and e. KS south to s. FL, LA, and s. TX. *M. capillaris* and its relatives, *M. expansa* and *M. sericea*, have been the subject of an herbarium morphological study by Morden & Hatch (1989), who conclude that the three taxa are not sharply separable and should be recognized only at the varietal level. If one considers behavior in the field, ecology, and geography in conjunction with morphologic characters, however, there is little doubt that the three taxa are biological species. Distribution and typical habitat are different for the three species, but *M. capillaris* can be found growing with or in proximity to each of the other two (I have not seen *M. sericea* and *M. expansa* together). In such situations, the two taxa present are readily distinguishable at a glance, and there is no evidence of intermediates or hybrids. Gustafson & Peterson (2007) also concluded that the three taxa are separable as species. [= F, FNA, G, K2, Pa, W, Y; < *M. capillaris* – GW, RAB; = *M. capillaris* var. *capillaris* – C, HC, K1, S, WH3, Z]

Muhlenbergia cuspidata (Torrey ex Hooker) Rydberg, Plains Muhly. Dolomite and limestone palisade cliffs. MI, MN, MB, SK, and AB, south to nw. AR, OK, and NM; scattered eastward as disjuncts in TN, KY, OH, IN, PA, and VA. The VA occurrences are on dolomite and limestone palisade cliffs along the New, Roanoke, and Shenandoah rivers. [= C, F, FNA, G, HC, K1, K2, Pa]

* ***Muhlenbergia emersleyi*** Vasey, Bull Muhly. Reported as introduced in NC (Kartesz 1999) from its native range in TX, NM, AZ, and Mexico, based on a specimen at the UNC Herbarium. However, the specimen makes clear that it was cultivated at a Soil Conservation Service test nursery; there is no evidence that the species is established in our area. [= FNA, HC, K1, K2] {rejected; not keyed}

Muhlenbergia expansa (Poiret) Trinius, Savanna Hairgrass. Pine savannas, pine flatwoods, mesic areas in sandhill-pocosin ecotones. Sep-Oct. Se. VA south to FL, west to e. TX (nearly exactly the range of *Pinus palustris*). An important part of the grassy component of many longleaf pine savannas, *M. expansa*'s flowering is stimulated by fire, and, lacking fire, it may be found in large populations in solely vegetative condition. It can be distinguished in sterile condition from other savanna bunchgrasses (*Sporobolus teretifolius*, *S. pinetorum*, *S. floridanus*, *S. curtissii*, *Aristida stricta*, and *A. beyrichiana*) by the following characteristics: old leaf bases fibrous and curly (rather than hardened and cartilaginous) and ligules 1-3 mm long (rather than 0.2 to 0.5 mm long). The open panicle somewhat resembles that of several species of similar habitat which often co-occur with *M. expansa* – *Sporobolus teretifolius*, *S. pinetorum*, *S. curtissii*, *S. floridanus*, and *Calamovilfa brevipilis*, but the panicle of *M. expansa* is capillary, flexuous, and fragile, tending to break up over the winter (vs. fine-textured but not capillary, the branches rigid and ascending, more likely to persist over the winter in relatively intact condition). The vegetative characters listed above and under *Calamovilfa brevipilis* are also useful. See *M. capillaris* for a discussion of recent studies on the *M. capillaris* complex. [= F, FNA, GW, HC, K2, RAB, S, Y; = *M. capillaris* var. *trichopodes* (Elliott) Vasey – C, K1, WH3, Z]

Muhlenbergia frondosa (Poiret) Fernald, Smooth Wirestem Muhly. Moist forests and disturbed areas. Late Aug-Oct. This species is widespread in e. North America, south to ne. GA and west into the Plains. [= C, F, FNA, G, GW, HC, K1, K2, Pa, RAB, W, WV; = *M. mexicana* – S, misapplied]

Muhlenbergia glabriflora Scribner, Clay-pan Muhly. Open oak flatwoods, other open habitats, in clayey soils. Oct-Nov. VA and NC west to IA, MO, AL, and TX, local and apparently rare in all of that range. In NC, only known from one collection, that from Durham County in 1936, with vague habitat data. F describes the habitat as "dry exciccated or baked soils, prairies, gravels or rocky slopes," Pohl (1969) as "mostly on low ground, in shade on heavy clay soils." [= C, F, G, HC, K1; = *M. glabriflora* – FNA, K2, orthographic variant]

Muhlenbergia glomerata (Willdenow) Trinius, Spiked Muhly. Fens and seeps over mafic (amphibolite) or ultramafic (olivine) rocks; rare. Aug-Oct. This species is widespread in n. North America, from NL (Newfoundland west to TT, south to w. NC, OH, IL, IA, NE, n. NM, NV, and OR. [= C, F, FNA, GW, HC, K1, K2, Pa, RAB, W; < *M. racemosa* (Michaux) Britton, Sterns, & Poggenburg – G, S]

Muhlenbergia mexicana (Linnaeus) Trinius, Hairy Wirestem Muhly. Forest edges. Sep-Oct. The epithet is a misnomer; the species is largely northern, occurring from NS, ON, MB, SK, and YT, south to NC, TN, AR, TX, NM, AZ, and CA. [= C, F, G, HC, K1, K2, Pa, RAB, W, WV; > *M. mexicana* var. *filiformis* (Torrey) Scribner – FNA; > *M. mexicana* var. *mexicana* – FNA; = *M. foliosa* (Roemer & J.A. Schultes) Trinius – S]

Muhlenbergia schreberi J.F. Gmelin, Nimblewill, Dropseed. Bottomland and other moist forests, dry forests, disturbed areas. Aug-Oct. ME, NY, ON, MI, WI, MN, and SD, south to c. peninsular FL, LA, and c. TX. [= C, F, FNA, GW, HC, K1, K2, Pa, RAB, S, W, WH3, WV; > *M. schreberi* var. *schreberi* – G; > *M. schreberi* var. *palustris* (Scribner) Scribner – G; > *M. palustris* Scribner]

Muhlenbergia sericea (Michaux) P.M. Peterson, Dune Hairgrass, Sweet Grass. Maritime dry grasslands, maritime wet grasslands, interdune swales, low dunes, sometimes edges of freshwater or brackish marshes, apparently limited to the barrier islands (sometimes in close proximity with *M. capillaris*), sometimes locally abundant. Oct-Nov. NC (slightly north of Oregon Inlet, Dare County, south of Nags Head) south to s. FL and west to s. TX, primarily on barrier islands (some portions of the distribution on the Gulf Coast may be by introduction only). This species is a very conspicuous part of the Outer Banks flora in the autumn, especially showy and abundant between Rodanthe (Chicamacomico) and Avon (Kinnakeet), Dare County, NC, and also abundant on Ocracoke Island, Hyde County, NC. The capillary pedicels and awns of its purple inflorescences are so light as to be moved by the slightest breeze. By December or January they fade to tan, but remain showy. This grass is a major component of baskets made in the Low Country of SC by the Gullah, who call it "sweet grass." I agree with Curtis (1843), Blomquist (1948), Pinson & Batson (1971), Gould (1975), and others who consider *M. sericea* (as *M. filipes*) a species distinct from *M. capillaris*. In addition to a discussion of its relationship to *M. capillaris*, Pinson and Batson (1971) and Morden & Hatch (1989) provide descriptions, not elsewhere available. See *M. capillaris* for a discussion of recent studies on this complex. [= FNA, K2, Y; < *M. capillaris* – GW, RAB; = *M. capillaris* var. *filipes* (M.A. Curtis) Chapman ex Beal – HC, K1, S, WH3, Z; = *M. filipes* M.A. Curtis]

Muhlenbergia sobolifera (Muhlenberg ex Willdenow) Trinius, Rock Muhly. Dry wooded limestone slopes, rock outcrops and rocky forests; uncommon (rare in DE, GA, and NC, rare in VA Coastal Plain). Jul-early Oct. ME, WI, and KS south to n. GA, n. AL, n. MS, and c. TX. [= C, F, FNA, G, HC, K1, K2, Pa, RAB, S, W, WV]

Muhlenbergia sylvatica Torrey ex A. Gray, Woodland Muhly. Bbottomland and other moist forests, calcareous or mafic streambanks. Aug-Sep. ME and MN south to SC, ne. GA, AL, and TX. [= C, FNA, K1, K2, Pa, RAB, W, WV; > *M. sylvatica* var. *sylvatica* – F, G, GW, HC; = *M. umbrosa* Scribner – S]

Muhlenbergia tenuiflora (Willdenow) Britton, Sterns, & Poggenburg, Slender Muhly. Moist forests and disturbed areas, up to at least 1400 meters. Aug-Oct. NH, WI, and NE south to GA, AL, MS, and OK. Two varieties are sometimes recognized: var. *tenuiflora*, with lemma awn 4-11 mm long and the sheaths and stems retrorsely hirsute, especially around the nodes, and var. *variabilis* (endemic to the Southern Appalachians), with lemma awn 1-4 mm long or absent, and the sheaths and stems glabrous or nearly so. The validity of the varieties needs further assessment. [= F, FNA, G, HC, K1, K2, Pa, RAB, S, W, WV; > *M. tenuiflora* var. *tenuiflora* – C; > *M. tenuiflora* var. *variabilis* (Scribner) Pohl – C]

Muhlenbergia torreyana (J.A. Schultes) A.S. Hitchcock, Pinebarren Smokegrass. In the Coastal Plain in moist soils of depression meadows and clay-based Carolina bays, often under or near *Taxodium ascendens*, in the Interior Low Plateau and Cumberland Plateau in moist grassy oak savannas. Aug-Nov. NJ to GA in the Coastal Plain, and disjunct in KY (?) and TN; currently known to be extant only in NJ, NC, and TN. It was first discovered in NC in 1987. Although it rarely flowers except following fire, it can be recognized in sterile condition by its forming clonal patches with evenly spaced, upright, blue-green tufts, each tuft a flattened stem with 5-10 ascending-erect, rather stiff, usually conduplicate leaves, the summit of each sheath with a pronounced cartilaginous thickening, easily felt by running the flattened stem from base to apex between thumb and forefinger. [= C, F, FNA, G, HC, K1, K2; = *Sporobolus torreyanus* (J.A. Schultes) Nash – S]

Muhlenbergia uniflora (Muhlenberg) Fernald. Bogs, wet meadows. Aug-Sep. NL and ON south to s. NJ, MD, and se. PA (Rhoads & Block 2007). [= C, FNA, G, HC, K1, K2, Pa; > *M. uniflora* var. *uniflora* – F]

Nassella (Trinius) Desvaux 1846

A genus of ca. 116 species, mainly perennials, mainly of South America. References: Barkworth in FNA (2007a); Cialdella et al. (2014). Key based on Barkworth in FNA (2007a).

- 1 Florets 1.5-2.5 mm long; leaves 0.2-0.6 mm wide, stiff and tightly convolute *N. trichotoma*
- 1 Florets 3.4-13 mm long; leaves 1-8 mm wide, flat or convolute.
- 2 Crown (surrounding the base of the awn) as wide or wider than long, the rim with hairs <0.5 mm long; floret widest just below the crown..

-[*N. neesiana*]
- 2 Crown longer than wide, the rim with hairs 1-2 mm long; floret widest near or only slightly above the middle.
- 3 Florets 6.5-13 mm long; crown usually flaring at the tip; awns 40-90 mm long.....[*N. leucotricha*]
- 3 Florets 6-8 mm long; crown parallel-sided; awns 30-50 mm long.....[*N. manicata*]

- * *Nassella leucotricha* (Trinius & Ruprecht) Pohl, Texas Needlegrass. Waste areas near wool-combing mill; native of sc. United States and Mexico. [= FNA, K1, K2; = *Stipa leucotricha* Trinius & Ruprecht – HC]
- * *Nassella manicata* (É. Desvaux) Barkworth, Andean Tussockgrass. Disturbed areas; native of South America. Reported from MS; perhaps only a waif. [= FNA, K2; = *Stipa manicata* É. Desvaux]
- * *Nassella neesiana* (Trinius & Ruprecht) Barkworth, Uruguayan Tussockgrass. Disturbed areas; native of South America. Known only from old collections on ballast from Mobile, AL. [= FNA, K2; = *Stipa neesiana* Trinius & Ruprecht]
- * *Nassella trichotoma* (Nees) Hackel ex Arechavaleta, Serrated Tussockgrass. Fields; native of South America, perhaps successfully extirpated as a noxious weed. [= FNA, K2; = *Stipa trichotoma* Nees]

***Neeragrostis* Bush 1903**

A monotypic genus of warm temperate North America and tropical Central America and n. South America. References: Peterson & Harvey (in prep.)=Z.

Neeragrostis reptans (Michaux) Nicora. Shores and wet flats. Apr-Nov. WV, IL, IA, and SD south to sw. GA, Panhandle FL, AL, MS, LA, TX and n. Mexico. [= K1, K2, Z; = *Eragrostis reptans* (Michaux) Nees – C, F, FNA, G, GW, HC]

***Oplismenus* Palisot de Beauvois 1807 (Woods-grass, Basket-grass)**

A genus of about 5 species, widespread in the New World and Old World tropics, subtropics, and warm temperate areas. References: Wipff in FNA (2003a); Crins (1991)=Z; Scholz (1981)=Y; Peterson et al. (1999).

Identification notes: Superficially, *Oplismenus* resembles *Arthraxon*, but has the leaves only slightly cordate at the base (vs. strongly cordate-clasping).

- 1 Awns antrorsely scabrous.....*O. burmannii*
- 1 Awns glabrous.
- 2 Leaf sheaths and culm axis glabrate to pilose (usually sparsely, but dense at sheath summit) with hairs <1.5 mm long; hairs on leaf surfaces similarly long; leaves 1.5-6 cm long; longest leaves with acute to acuminate tip (but not long-acuminate); lemma (7-) 9-11-veined.....*O. setarius*
- 2 Leaf sheaths and culm axis pilose with hairs 3-5 mm long; hairs on leaf surfaces similarly long; leaves 2.5-10 cm long; longest leaves with long-acuminate tip; lemma 7-veined.....*O. undulatifolius*

* *Oplismenus burmannii* (Retzius) Palisot de Beauvois, Zacatillo, Burmann’s Basket-grass. Disturbed areas; native of New World and Old World tropics. Collected in peninsular FL just south of our area (Alachua Co.) and may eventually appear farther north (Davis, Judd, & Perkins 2006). [= K2, WH3] {not mapped}

Oplismenus setarius (Lamarck) Roemer & J.A. Schultes, Woods-grass. Hammocks, maritime forests, shell middens, moist forests. Aug-Oct. *O. hirtellus* is widespread in tropical and subtropical areas of the New and Old World; ssp. *setarius* ranges from e. NC south to FL, west to AR and TX, and south through the Caribbean and Central America to central South America. Scholz (1981) recognizes many other subspecies. This variety is undoubtedly native in our area, occurring in undisturbed habitats in natural communities entirely devoid of alien species; the basis of Gould’s (1975) assertion that *Oplismenus* is “introduced or adventive in the United States” is unknown. Crins (1991) favors treating *O. setarius* as a taxonomically unrecognized component within a polymorphic *O. hirtellus*. [= HC, RAB, S; = *O. hirtellus* (Linnaeus) Palisot de Beauvois ssp. *setarius* (Lamarck) Mez ex Ekman – FNA, K2, Y; = *O. setarius* (Lamarck) Roemer & J.A. Schultes – HC, RAB, S; < *O. hirtellus* (Linnaeus) Palisot de Beauvois – Z]

* *Oplismenus undulatifolius* (Arduino) Roemer & J.A. Schultes. Moist forests; native of the Eastern Hemisphere (Asia and perhaps also native in s. Europe). It has been reported as an introduction in Baltimore Co., MD (Peterson et al. 1999). It is considered a noxious invasive and can be expected to seriously spread. [= *O. hirtellus* (Linnaeus) Palisot de Beauvois ssp. *undulatifolius* (Arduino) U. Scholz – FNA, K2, Y; < *O. hirtellus* (Linnaeus) Palisot de Beauvois – Z]

Oryza Linnaeus 1753 (Rice)

A genus of about 20 species, native of tropical and warm temperate portions of the Old World. References: Barkworth & Terrell in FNA (2007a); Tucker (1988)=Z; Judziewicz et al. (2000)=Y; Nanda & Sharma (2003)=X.

* **Oryza sativa** Linnaeus, Rice. Marshes, impoundments, of only sporadic occurrence outside of cultivation; native of Asia. Oct. Perhaps the single most important food crop in the world, developed as a crop in Asia and cultivated at least since 10,000 years BP (Hancock 2004). Rice was an important crop before the Civil War in SC, GA, and extreme se. NC. Most rice planted today in our area is in waterfowl impoundments. [= C, FNA, G, GW, HC, K, RAB, S, X, Y, Z]

Oryzopsis Michaux 1803 (Ricegrass)

A monospecific genus, a perennial, of ne. North America. References: Barkworth in FNA (2007a). [also see *Piptatherum*]

Oryzopsis asperifolia Michaux, Rough-leaved Ricegrass, Whiteseed Mountain-ricegrass, Spreading Ricegrass. High elevation pine-oak/heath barrens and woodlands. NL (Newfoundland) west to BC, south to w. VA (Rockingham County), WV, n. IN, SD, NM, and UT. This grass forms large caespitose clumps, the leaves evergreen and somewhat bicolored (green on the upper surface, bluish on the lower). [= C, F, FNA, G, HC, K, Pa, WV]

**Panicum** Linnaeus 1753 (Panic Grass)
(contributed by Richard J. LeBlond)

{INTRODUCTION: Describe differences between *Panicum*, *Dichanthelium*, *Urochloa* (= *Brachiaria*), and *Paspalidium*, all of which are treated as *Panicum* in RAB. Describe collection methods and character analysis.} [also see *Dichanthelium*, *Megathyrsus*, *Phanopyrum*, *Setaria*, *Steinchisma*, and *Urochloa*]

There has been considerable controversy over the generic limits of *Panicum*. In its broader recent conceptions, it has been considered to include (in our area) taxa sometimes and variously segregated as *Brachiaria*, *Dichanthelium*, *Eriochloa*, *Paspalidium*, *Phanopyrum*, *Steinchisma*, and *Urochloa*. All were originally recognized based on morphological characteristics, to which have recently been added anatomical, chemical, and other evidence. Crins (1991) recognizes *Eriochloa*, *Urochloa* (including *Brachiaria*), *Paspalidium*, and *Panicum* as genera, with *Panicum* subdivided into subgenera *Panicum*, *Agrostoides*, *Dichanthelium*, *Phanopyrum*, and *Steinchisma*. We prefer to recognize most of the segregates as genera, pending further analyses, since there is little evidence that these groups are more closely related to one another than they are to other genera recognized in the Paniceae. *Phanopyrum* and *Dichanthelium* are the only segregate groups with C₃ photosynthesis. *Eriochloa* and *Urochloa* (including *Brachiaria*) have C₄ photosynthesis, with PEP-ck decarboxylation. *Panicum* and *Paspalidium* have C₄ photosynthesis, with NAD-me or NADP-me decarboxylation. *Steinchisma*, in addition to its unusual expansion of the palea, apparently has a peculiar photosynthetic pathway, described by Crins (1991) as "intermediate between" C₃ and C₄ photosynthesis; "the leaves have Kranz anatomy, but there are fewer organelles than usual in the outer sheath."

We agree with Hansen & Wunderlin (1988) that "*Dichanthelium* is as 'good' a grass genus as many others (e.g. *Brachiaria*, *Sacciolepis*, and many more in other tribes)." Despite arguments to the contrary, there is little doubt that *Dichanthelium* is a natural group. Zuloaga, Ellis, and Morrone (1993) argue against the recognition of *Dichanthelium* as a genus, preferring to treat it as a subgenus under *Panicum*. They state, however, "within *Panicum*, *Dichanthelium* can be distinguished at the subgeneric level by the following set of characters: lax inflorescences; ellipsoid to obovoid spikelets; upper glume and lower lemma usually 7-11 nerved; upper anthecium apiculate or shortly crested, and simple papillae on the lemma and palea. Anatomically, all species are non-Kranz or C₃, with the outer parenchymatous sheath lacking specialized chloroplasts", etc. The argument that *Phanopyrum* also has C₃ photosynthesis does not materially affect the issue of the taxonomic rank at which to recognize the groups.

We also agree with Hansen & Wunderlin (1988) that "the acceptance of *Dichanthelium* provides a more consistent generic classification." It offers conveniences, as well, in our area, where *Dichanthelium* and *Panicum* are readily distinguishable from each other, and the combined genus would be very large, indeed. References: Lelong (1986)=Z; Zuloaga & Morrone (1996)=Y; Freckmann & Lelong in FNA (2003a); Haines (2010)=X.

- 1 Spikelets tuberculate; [NOT *Panicum*].
 - 2 Lower lemmas tuberculate-hispid; spikelets 3.2-4.0 mm long; [of dry to mesic prairies and pinelands]..... *P. brachyanthum*
 - 2 Lower lemmas warty; spikelets 1.7-2.2 mm long; [of wetlands]..... *P. verrucosum*
- 1 Spikelets smooth, not tuberculate.
 - 3 Panicle < 2 cm wide at maturity.
 - 4 Spikelets > 4.5 mm long; first glume > 2.4 mm long; ligule 4-6 mm long; [of coastal dunes]; [*Panicum* section *Repentia*]..... *P. amarum* var. *amarum*
 - 4 Spikelets < 4 mm long; first glume < 2.1 mm long; ligule < 2 mm long; [not of coastal dunes].
 - 5 Blades involute, 1.5-4 mm wide; culms wiry..... [see *Coleataenia*]
 - 5 Blades flat, the larger 6-20 mm wide; culms stout.
 - 6 Panicles constricted, 0.3-1.6 cm wide; spikelets sessile to short-pedicel; summit of fertile palea not enclosed by fertile lemma; [NOT *Panicum*];..... [see *Hymenachne hemitonon*]
 - 6 Panicles > 1 cm wide; spikelets short to long-pedicel; summit of fertile palea enclosed by fertile lemma [see *Coleataenia*]
 - 3 Panicle > 2 cm wide at maturity.
 - 7 Lower primary panicle branches in whorls of 4-7 at the nodes, stiffly spreading, naked on the proximal ½, the axils strongly pilose; lower culm internodes appressed papillose-pubescent; first glume acuminate, ½ as long as spikelet; fertile lemma chestnut brown at maturity; [*Panicum* section *Panicum*]..... *P. bergii*
- 7 Plants without the above combination of characters.
 - 8 Plants from a cluster of fibrous roots, without rhizomes or hard knotty crowns, annual.
 - 9 First glume 1/5 to 1/3 length of spikelet, blunt to broadly rounded to truncate; sheaths usually glabrous (papillose-hispid in *P. dichotomiflorum* var. *bartowense*); nodes glabrous; [*Panicum* section *Dichotomiflora*].
 - 10 Spikelets ovoid to slenderly ellipsoid, 1.6-2.3 mm long, widest at middle with acute tips, second glume and sterile lemma thin, submembranous; some to many pedicels > 3 mm long and longer than spikelets; culms to 6 dm long; leaf blades 1-8 mm wide..... *P. dichotomiflorum* var. *puritanorum*
 - 10 Spikelets oblong-lanceolate, (2.0-) 2.4-3.6 mm long, widest below middle, tapering to acuminate tips, second glume and sterile lemma firm, subcoriaceous; most pedicels < 3 mm long and shorter than spikelets; culms to 20 dm long; leaf blades 4-20 mm wide.
 - 11 Sheaths conspicuously papillose-hispid; ligule 1.5-3 mm long; mature plant stout, erect, usually 10-20 dm long; spikelets 2.3-2.8 mm long..... *P. dichotomiflorum* var. *bartowense*
 - 11 Sheaths glabrous to sparsely pilose, the hairs not papillose-based; ligule 1-2 mm long; mature plant usually spreading to ascending, 5-10 (20) dm long; spikelets 2.3-3.8 mm long..... *P. dichotomiflorum* var. *dichotomiflorum*
 - 9 First glume 1/3 to 1/2 length of spikelet, acute to subacute; sheaths villous or hispid (except in the locally introduced *P. bisulcatum*); nodes often bearded.
 - 12 Spikelets 4.5-6 mm long; panicle branches often nodding or drooping at maturity; [*Panicum* section *Panicum*]..... *P. miliaceum*
 - 12 Spikelets 1.8-3.6 mm long; panicle branches ascending-spreading at maturity.
 - 13 Spikelets long-acuminate, (2.6-) 3.0-3.6 mm long; mature panicle slender, usually 2-3× as long as wide; [*Panicum* section *Panicum*]..... *P. flexile*
 - 13 Spikelets short-pointed to acuminate, 1.8-2.5 (-2.8) mm long; mature panicle usually 0.7-2× as long as wide.
 - 14 Sheaths glabrous except for the short-ciliate margins; culm nodes and internodes glabrous..... *P. bisulcatum*
 - 14 Sheaths hispid to villous; culm nodes usually pubescent to bearded, internodes hispid to glabrous; [*Panicum* section *Panicum*].
 - 15 Panicle usually equal to or longer than portion of culm below panicle, often basally included at maturity; panicle rachis, branches, and pedicels usually scabrous with barbs > 0.05 mm; pulvini usually pilose to villous, especially at lower primary branches (sometimes glabrous); culm usually not obviously zig-zag; larger blades usually more than 10 mm wide; spikelets 1.6-2.9 (-4) mm long, short- to long-acuminate, lanceolate, lance-ovoid, or lance-ellipsoid; first glume 0.6-1.5 (-2) mm long..... *P. capillare*
 - 15 Panicle usually not as long as portion of culm below panicle, usually exerted at maturity; panicle rachis and branches usually smooth, the pedicels often scabrous with barbs < 0.05 mm; pulvini glabrous to sparsely (-moderately) pilose; culm often zig-zag at least proximally; larger blades usually no more than 4-12 mm wide; spikelets 1.4-2.4 mm long, pointed to short-acuminate, lance-ellipsoid, ellipsoid, ovoid, or obovoid; first glume 0.4-0.9 (-1.2) mm long.
 - 16 Herbage usually purple-tinged (-yellowish-green); internodes glabrous to sparsely hispid; blades 2-6 mm wide, ascending; pulvini glabrous to sparsely pilose; spikelets 1.8-2.2 mm long, twice or more as long as wide; mature fertile lemma blackish (rarely stramineous); [plants of granite outcrops of NC, SC, and GA]..... *P. philadelphicum* ssp. *lithophilum*
 - 16 Herbage yellow-green to green or purple-tinged; internodes glabrate to densely hispid; blades 2-12 mm wide, spreading to ascending; pulvini glabrous to pilose; spikelets 1.4-2.4 mm long, < 2 to 2 × as long as wide; mature fertile lemma stramineous to blackish; [plants of a variety of open or wooded, dry or wet, and often disturbed sites].
 - 17 Culms to 1 m long; internodes sparsely to densely hispid; blades to 12 mm wide; blade of flag (inflorescence bract) usually > ½ as long as panicle; panicle ellipsoid to obovoid, moderately to densely flowered; pulvini glabrous to sparsely pilose; spikelets 1.7-2.4 mm long..... *P. philadelphicum* ssp. *gattingeri*
 - 17 Culms to 0.5 m long; internodes glabrate to hispid; blades to 6 mm wide; blade of flag (inflorescence bract) usually < ½ as long as panicle; panicle ovoid to deltoid, sparingly to moderately flowered; pulvini sparsely to moderately pilose; spikelets 1.4-2.2 (-2.4) mm long..... *P. philadelphicum* ssp. *philadelphicum*
 - 8 Plants with rhizomes or hard knotty crowns, perennial.
 - 18 Plants with hard crowns, lacking rhizomes; fertile lemma 1.2-2.4 mm long.
 - 19 Nodes sericeous, pilose, or glabrous; internodes often glaucous; spikelets usually appressed but not secund; pedicels 1-15 mm long; second glumes and sterile lemmas 7-11-veined; fertile lemmas 0.7-1.2 mm wide; [*Panicum* section *Panicum*]..... *P. hallii* ssp. *filipes*
 - 19 Nodes glabrous; internodes not glaucous; spikelets appressed, usually secund; pedicels 0.5-1.5 mm long; second glumes and sterile lemmas 5-veined; fertile lemmas 0.6-0.8 mm wide [see *Coleataenia*]
 - 18 Plants with rhizomes; fertile lemma 1.6-4 mm long.

- 20 Rhizomes about 1 cm thick with pubescent scale-like leaves; lower portion of culm hard, nearly woody; [section *Antidotale* {not *Panicum*}]..... *P. antidotale*
- 20 Rhizomes less than 1 cm thick with glabrous scale-like leaves; culms not woody.
- 21 First glume truncate apically; [*Panicum* section *Repentia*]..... *P. repens*
- 21 First glume acute to obtuse.
- 22 Culms slightly compressed below; ligules 0.5 mm long or less; spikelets sessile and subsecund, usually some obliquely bent above the first glume; fertile lemma 1.8-2.2 mm long [see *Coleataenia*]
- 22 Culms terete; ligules 1-6 mm long; spikelets pedicelled and not at all secund, essentially straight; fertile lemma 2-4 mm long; [*Panicum* section *Repentia*].
- 23 Panicle narrow, the branches erect; sheaths longer than internodes; spikelets 4.3-7.7 mm long; fertile lemma 3-4 mm long.
- 24 Rhizomes usually elongate; culms solitary to loosely tufted, 0.2-1.5 m tall; leaves 0.7-3.6 dm long; panicles 2-6 cm wide, the primary branches usually 1-2 per node, loosely flowered; spikelets 4.7-7.7 mm long; first glumes 2.5-5.5 mm long, $\frac{2}{3}$ - $\frac{3}{4}$ as long as the spikelet, 7-9 nerved, the nerves thickened and raised; fertile lemma 1.3-1.8 mm wide .. *P. amarum* var. *amarulum*
- 24 Rhizomes usually short; culms usually tufted, 1-2 (-3) m tall; leaves 2-5 dm long; panicles 3-10 cm wide, the primary branches usually 2 or more per node, densely flowered; spikelets 4.0-5.9 mm long; first glumes 2-3.5 mm long, $\frac{1}{2}$ - $\frac{2}{3}$ as long as the spikelet, 3-5 (-7) nerved, the nerves thin and wiry; fertile lemma 1.0-1.5 mm wide *P. amarum* var. *amarulum*
- 23 Panicle with divergent to spreading-ascending branches; upper sheaths shorter than internodes; spikelets 2.8-5 mm long; fertile lemma 2-2.6 mm long.
- 25 Spikelets 2.8-3.5 mm long; beak of sterile lemma exceeding fertile lemma by 0.2-0.5 mm; first glume (blunt-) acute, $\frac{1}{2}$ - $\frac{2}{3}$ × as long as spikelet *P. virgatum* var. *cubense*
- 25 Spikelets 3.2-5 mm long; beak of sterile lemma exceeding fertile lemma by 0.6-1.3 mm; first glume acuminate, $\frac{3}{5}$ - $\frac{3}{4}$ as long as spikelet.
- 26 Rhizomes short, densely interlocking, culms subascending at base, densely clumped *P. virgatum* var. *spissum*
- 26 Rhizomes elongate, or if short, then culms horizontally divergent at base, loosely clumped *P. virgatum* var. *virgatum*

Panicum amarum Elliott var. *amarulum* (A.S. Hitchcock & Chase) P.G. Palmer, Southern Seabeach Grass. Coastal dunes and shores, sandflats, and sandhills. Jul-Nov. NJ s. to FL and West Indies, w. to TX and Mexico; restricted to the Coastal Plain except for WV (where apparently introduced). Although well-marked individuals of var. *amarulum* and var. *amarum* are quite distinctive, only the number and structure of first glume nerves appears to be a constant over the range of the two taxa (Palmer 1975). Primarily a coastal plant, var. *amarulum* has been found in the Sandhills of NC (Richmond Co.). Blomquist 1948 says this taxon "does not seem to grow naturally in North Carolina." [= K, Pa, Z; = *P. amarulum* A.S. Hitchcock & Chase – C, F, G, HC, RAB, S, WV; = *P. amarum* ssp. *amarulum* (A.S. Hitchcock & Chase) Freckmann & Lelong – FNA; < *P. amarum* – WH3; not *Panicum*]

Panicum amarum Elliott var. *amarum*, Bitter Seabeach Grass. Coastal dunes and shores. Aug-Nov. CT s. to FL, w. to TX; restricted to the coast. See note under var. *amarulum*. [= K, Pa, Z; = *P. amarum* – C, F, G, HC, RAB, S; = *P. amarum* ssp. *amarum* – FNA; < *P. amarum* – WH3; not *Panicum*]

* *Panicum antidotale* Retzius, Blue Panic Grass. Open, disturbed areas and fields; native of India and c. Asia. Reported for NC and SC (FNA, Kartesz 1999). Established in NC, SC; AL; TX, west to CA. [= FNA, HC, K; not *Panicum*]

* *Panicum bergii* Arechavaleta, Berg's Panic Grass. Ditches and shallow, sporadically flooded depressions in grasslands; native of South America. Reported for sc. GA (HC), AL (Kartesz 1999), and se. TX. [= FNA, HC, K, S; > *P. pilcomayense* Hackel; *Panicum* s.s.]

* *Panicum bisulcatum* Thunberg, Blackseed Panic Grass. Wet, disturbed, open areas; native of Asia. Reported introduction in SC, GA, and PA (Kartesz 1999), and as a ballast plant for se. PA (Philadelphia) (Rhoads & Klein 1993, as *P. acroanthum* Steudel). [= FNA, K; > *P. acroanthum* Steudel]

Panicum brachyanthum Steudel, Prairie Panic Grass. Prairies and pinelands. W. LA, AR, OK, and e. TX; disjunct eastward in sc. MS and sw. GA. [= FNA, HC, K]

Panicum capillare Linnaeus, Old-witch Grass, Tumbleweed, Tickle Grass. Open sandy or stony soil, fields, roadsides, waste places, often weedy in cultivated soil. Aug-Nov. E. to c. Canada, s. to FL and TX; Bermuda. Plants formerly known as *P. capillare* var. *occidentale* Rydberg, ranging from Canada south to NJ, WV, KY, TX, and CA, are distinguished by long-acuminate spikelets 2.5-4 mm long that are mostly sessile or short-pedicelled. In our region, *P. capillare* has short-acuminate spikelets 1.8-2.9 mm long, mostly on longer pedicels. [= K, Pa, RAB, S, WH3, WV, Z; < *P. capillare* – C, Y (also see *P. gattingeri*); > *P. capillare* var. *capillare* – F, HC, W; = *P. capillare* ssp. *capillare* – FNA; = *P. capillare* var. *agreste* Gattinger – G; *Panicum* s.s.]

Panicum dichotomiflorum Michaux var. *bartowense* (Scribner & Merrill) Fernald, Bartow Panic Grass. Open, usually wet soils, often emergent in shallow water or on exposed shores. Jun-Dec. FL (unconfirmed reports northward); also in the Bahamas

and Cuba. [= K, WH3; = *P. bartowense* Scribner & Merrill – GW, HC, S; = *P. dichotomiflorum* ssp. *bartowense* (Scribner & Merrill) Freckmann & Lelong – FNA]

Panicum dichotomiflorum* Michaux var. *dichotomiflorum, Spreading Panic Grass, Fall Panic Grass. Marshy shores, exposed wet soils, alluvial deposits in floodplain forests, spoil banks, ditches. Jul-Oct. E. Canada west to BC, south to FL and TX; also in the Bahamas (Sorrie & LeBlond 1997). Plants with geniculate bases, enlarged lower nodes and sheaths, and panicles with included peduncles and divergent branches have been recognized as var. *geniculatum* (Alph. Wood) Fernald. [= K; < *P. dichotomiflorum* – C, GW, Pa, RAB, S, WV, Z; > *P. dichotomiflorum* var. *geniculatum* (Wood) Fernald – F, G, W; > *P. dichotomiflorum* var. *dichotomiflorum* – F, G, W; = *P. dichotomiflorum* ssp. *dichotomiflorum* – FNA; < *P. dichotomiflorum* var. *dichotomiflorum* – HC; ***Panicum* s.s.**]

Panicum dichotomiflorum* Michaux var. *puritanorum Svenson, Puritan Panic Grass. Wet sands and peats of seasonally exposed pond and lake shores. Jul-Oct. NS, NH, and NY south to DE (Sorrie & LeBlond 2008), VA, and NC; disjunct in IN and IL. Plants from DE northward typically have slender culms 0.3-6 dm long and leaves 1-8 mm wide. Plants with floral characters of var. *puritanorum* but with nominate-like stout culms 0.8-2 m long and leaves 7-25 mm wide occur in bottomlands in se. VA, and have been recognized as *P. dichotomiflorum* var. *imperatorum* Fernald. For the time being they are placed here based on floral characters (they will key here), but need further study. [= F, G, K; < *P. dichotomiflorum* – C, Pa; > *P. dichotomiflorum* var. *imperatorum* Fernald – F; = *P. dichotomiflorum* ssp. *puritanorum* (Svenson) Freckmann & Lelong – FNA; > *P. dichotomiflorum* var. *puritanorum* – HC; ***Panicum* s.s.**]

***Panicum flexile* (Gattinger) Scribner**, Wiry Panic Grass. Glades and openings over mafic or calcareous rocks, damp sandy meadows, open woods. Jul-Oct. NY, sw. QC, S. ON, and ND south to FL and TX. First reported for SC by Nelson & Kelly (1997). [= C, F, FNA, G, HC, K, Pa, RAB, S, W, WH3, WV, Y, Z; ***Panicum* s.s.**]

* ***Panicum hallii* Vasey ssp. *filipes*** (Scribner) Freckmann & Lelong. Waste ground near wool-combing mill (Berkeley County, SC), probably just a waif; native from w. LA to AZ, south to southern Mexico. [= FNA, K; = *Panicum filipes* Scribner – HC; ***Panicum* s.s.**] {add to key; X, Y, and Z may need to be added to synonymy}

* ***Panicum miliaceum* Linnaeus ssp. *miliaceum***, Broomcorn Millet, Proso Millet, Hog Millet. Planted in wildlife food plots, sometimes persistent or self-sowing; native of Eurasia. Jul-Oct. [= C, FNA, K; < *P. miliaceum* – F, G, HC, Pa, S, WH3, Y; ***Panicum* s.s.**]

Panicum philadelphicum* Bernhardt ex Trinius ssp. *gattingeri (Nash) Freckmann & Lelong, Gattinger's Panic Grass. Damp or dry, usually calcareous sandy soils of fields, roadsides, shores, and cultivated ground. Aug-Oct. NY, sw. QC, and MN south to NC, TN, GA, AL, and AR. [= FNA; = *P. gattingeri* Nash – F, HC, K, RAB, S, WV; < *P. capillare* Linnaeus – C, Y; = *P. capillare* var. *campestre* Gattinger – G, W; = *P. philadelphicum* var. *campestre* (Gattinger) A. Haines – X; ***Panicum* s.s.**]

Panicum philadelphicum* Bernhardt ex Trinius ssp. *lithophilum (Swallen) Freckmann & Lelong, Flatrock Panic Grass. Soil islands on granitic flatrocks and domes. Aug-Oct. Restricted to granite outcrops in NC, SC, and ec. GA. Zuloaga & Morrone (1996) did not consider ssp. *lithophilum* separable from ssp. *philadelphicum*. [= FNA; = *P. lithophilum* Swallen – HC, K, RAB; < *P. capillare* Linnaeus var. *sylvaticum* Torrey – W; < *P. philadelphicum* Bernhardt ex Trinius – Y; ***Panicum* s.s.**]

Panicum philadelphicum* Bernhardt ex Trinius ssp. *philadelphicum, Woodland Panic Grass. Glades, barrens, desiccated pondshores, riversides, and other rocky or dry sandy soil of open woods and roadsides. NS west to WI, south to GA and e. TX. Plants formerly known as *P. tuckermanii* Fernald, ranging from se. Canada south to n. VA and OH, are distinguished by included or short-exserted peduncles less than one-third as long as the panicles (the peduncle measured from the summit of the flag sheath). [= FNA; = *P. philadelphicum* – C, G, K, RAB, S, WV; > *P. philadelphicum* – F, HC; > *P. tuckermanii* Fernald – F, HC; < *P. capillare* Linnaeus var. *sylvaticum* Torrey – W; < *P. philadelphicum* – Y; = *P. philadelphicum* var. *philadelphicum* – X; ***Panicum* s.s.**]

*? ***Panicum repens* Linnaeus**, Torpedo Grass. Ditches, roadbanks, disturbed coastal sands, in areas where ship's ballast was deposited; probably native of Europe. First reported for NC by Leonard (1971b); reported for numerous counties in the GA Coastal Plain (Carter, Baker, & Morris 2009). [= FNA, GW, K1, K2, WH3; > *P. repens* – HC, S; > *P. gounii* Fournier – HC, S; ***Panicum* s.s.**]

Panicum verrucosum Muhlenberg, Warty Panic Grass. Wet pinelands, marshes, shores, ditches. Aug-Oct. MA and PA west to MI and IN, south to FL and se. TX. Spikelets deep green, the warty surface unique among *Panicum* in our region. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, W, WH3, Z; not *Panicum*]

Panicum virgatum Linnaeus var. ***cubense*** Grisebach, Blunt Panic Grass. Wet to dry sandy pinelands. Jun-Oct. Coastal Plain from MA to FL, west to MS; also in MI; West Indies. [= F, HC, S; < *P. virgatum* – C, FNA, G, GW, Pa, RAB, W, WH3, Z; < *P. virgatum* var. *virgatum* – K1, K2; not *Panicum*]

Panicum virgatum Linnaeus var. ***spissum*** Linder, Tufted Switchgrass. Gravelly or sandy fresh to brackish shores and swamps. E. Canada south to PA, MD, and DE (Kartesz 1999). [= F, HC, K1, K2; < *P. virgatum* – C, FNA, G, Pa; not *Panicum*]

Panicum virgatum Linnaeus var. ***virgatum***, Switchgrass. Dry or wet sandy soils of pinelands, fresh and brackish marshes, shores. Jun-Oct. Sw. QC and ND south to FL and TX, west to NV; Bermuda; Central and South America. [= F, HC, S; < *P. virgatum* – C, FNA, G, GW, Pa, RAB, W, WH3, WV, Z; < *P. virgatum* var. *virgatum* – K1, K2; not *Panicum*]

Parapholis C.E. Hubbard 1946 (Sickle Grass)

A genus of 6 species, annuals, of Eurasia. References: Worley in FNA (2007a); Tucker (1996)=Z.

* ***Parapholis incurva*** (Linnaeus) C.E. Hubbard, Sickle Grass, Hard Grass, Thin-tail. Sandy and muddy flats, brackish or salt marshes; native of Europe. [= C, FNA, HC, K, RAB, Z; = *Pholurus incurvus* (Linnaeus) Schinzii & Thellung – F, G; ? *Lepturus filiformis* (Roth) Trinius]

Pascopyrum A. Löve 1980 (Wheatgrass)

A monotypic genus, perennial, of e. and w. North America. *Pascopyrum* is octoploid, derived from *Elymus* and *Leymus*. References: Barkworth in FNA (2007a).

* ***Pascopyrum smithii*** (Rydberg) A. Löve, Western Wheatgrass. Disturbed areas; native of w. North America. Reported for ne. GA (Rabun County) by Jones & Coile (1988), as *Agropyron smithii* Rydberg. It is also reported for TN and KY (Kartesz 1999). [= FNA, K; = *Elytrigia smithii* (Rydberg) Nevski – C; = *Agropyrum smithii* Rydberg – F, G, W]

Paspalidium Stapf 1920 (Paspalidium)

A genus of about 40 species, tropical and subtropical. References: Webster (1993)=Z; Webster (1995)=Y; Crins (1991)=X; Webster (1988); Allen in FNA (2003a).

Paspalidium geminatum (Forsskål) Stapf, Alligator Grass, Paspalidium. In shallow water of swamps. Dec. S. SC south to FL, west to TX; also in Central and South America; also in Old World tropics. This taxon is sometimes considered an introduction from the Old World, but its occurrence in undisturbed wetlands remote from extensive human activity suggests that it is native. Two taxa are sometimes distinguished, at specific or varietal rank (see synonymy): “*geminatum* s.s.” with smaller spikelets and glumes and sterile lemma not papery, and “*paludivagum*” with larger spikelets (2.8-3.0 mm long) and glumes and sterile lemma papery. Additional study is needed. [= FNA, GW, K2, WH3, X; < *Panicum paludivagum* A.S. Hitchcock & Chase – HC, RAB, S; < *Panicum geminatum* Forsskål – HC, S; < *Paspalidium geminatum* (Forsskål) Stapf var. *paludivagum* (A.S. Hitchcock & Chase) Gould – K1; < *Paspalidium geminatum* (Forsskål) Stapf var. *geminatum* – K1; = *Setaria geminata* (Forsskål) Veldkamp var. *paludivaga* (A.S. Hitchcock & Chase) R.D. Webster – Y; < *Setaria geminata* (Forsskål) Veldkamp var. *geminata* – Y; = *Paspalidium paludivagum* (A.S. Hitchcock & Chase) Parodi]

Paspalum Linnaeus 1759 (Paspalum, Crown Grass, Beadgrass)
(by Alan S. Weakley & Richard J. LeBlond)

A genus of 300-400 species, of tropical and warm temperate regions. References: Allen & Hall in FNA (2003a); Banks (1966)=Z; Silveus (1942)=Y. Key based closely on FNA and on Banks (1966).

- 1 Spikelets solitary, not associated with rudimentary spikelets or naked pedicels.
 - 2 Panicles usually composed of a terminal pair of branches, sometimes with 1 (-5) additional branches below the terminal pair.
 - 3 Upper glumes pubescent on the back or margins.
 - 4 Spikelets 1.3-1.9 mm long; upper glumes pilose along the margins [*P. conjugatum*]
 - 4 Spikelets 2.4-3.2 mm long; upper glumes sparsely pubescent on the back *P. distichum*
 - 3 Upper glumes glabrous.
 - 5 Spikelets elliptic, acute or acuminate at the tip *P. vaginatum*
 - 5 Spikelets ovate to broadly elliptic, obtuse to broadly acute at the tip.
 - 6 Spikelets 1.9-2.3 mm long; leaf blades flat *P. minus*
 - 6 Spikelets 2.5-4.0 mm long; leaf blades flat or longitudinally folded *P. notatum*
 - 2 Panicles with 1-70 branches, if > 1, the branches arranged racemously.
 - 7 Panicle branches 7-70, the axes extending beyond the outermost spikelets; panicle branches disarticulating at maturity *P. fluitans*
 - 7 Panicle branches 1-6, terminating in a spikelet; panicle branches persistent.
 - 8 Upper florets olive to dark brown *P. scrobiculatum*
 - 8 Upper florets pale to tan.
 - 9 Axes of panicle branches not broadly winged, 0.6-1.3 mm wide.
 - 10 Spikelets orbicular, 2.8-3.2 mm wide *P. laeve* var. *circulare*
 - 10 Spikelets slightly longer than broad, 2.0-2.5 mm wide *P. laeve* var. *laeve*
 - 9 Axes of panicle branches broadly winged, 1.8-3.3 mm wide.
 - 11 Spikelets 3.2-4.0 mm long; upper lemmas with a few short hairs at their tips *P. acuminatum*
 - 11 Spikelets 1.7-2.1 mm long; upper lemmas glabrous *P. dissectum*
 - 1 Spikelets paired, or at least the second nonfunctional spikelet represented by a naked pedicel.
 - 12 Spikelets 1.0-1.3 mm long [*P. paniculatum*]
 - 12 Spikelets 1.3-4.1 mm long
 - 13 Margins of upper glumes and lower lemmas pilose.
 - 14 Panicle branches 2-7; spikelets 2.3-4.0 mm long *P. dilatatum* ssp. *dilatatum*
 - 14 Panicle branches (4-) 10-30; spikelets 1.8-2.8 mm long *P. urvillei*
 - 13 Margins of upper glumes and lower lemmas glabrous or pubescent (if pubescent, the hairs not pilose), but neither ciliate-lacerate, winged, nor pilose.
 - 15 Upper florets olive to dark brown.
 - 16 Panicle branches 10-28 (or more).
 - 17 Plants annual; axes of panicle branches broadly winged, the wings about as wide as the central portion; [common native] *P. boscianum*
 - 17 Plants perennial; axes of panicle branches narrowly winged, the wings narrower than the central portion; [rare exotics].
 - 18 Axes of panicle branches 0.5-1.2 mm wide; spikelets 1.1-1.8 mm wide *P. conspersum*
 - 18 Axes of the panicle branches 1.0-1.7 mm wide; spikelets 1.8-2.4 mm wide *P. virgatum*
 - 16 Panicle branches 1-10 (or to 28 in *P. boscianum*, keyed under both leads).
 - 19 Plants annual.
 - 20 Spikelets 1.3-1.8 mm wide, broadly elliptic to orbicular, glabrous; panicles with 1-10 (-28) branches, the axes 0.7-2.3 mm wide *P. boscianum*
 - 20 Spikelets 1.7-2.4 mm wide, broadly obovate, shortly pubescent; panicles with 1-5 branches, the axes 0.8-1.3 mm wide [*P. convexum*]
 - 19 Plants perennial.
 - 21 Plants caespitose, rhizomes poorly developed; culms 10-20 dm tall; panicle branches ascending, divaricate, or reflexed.
 - 22 Leaves 7-18 mm wide *P. conspersum*
 - 22 Leaves 2.5-4 mm wide *P. plicatulum*
 - 21 Plants not caespitose, rhizomatous; culms 1-15 dm tall; panicle branches ascending.
 - 23 Rhizomes long, evident *P. nicorae*
 - 23 Rhizomes short, indistinct *P. plicatulum*
 - 24 Lower lemmas with well-developed cross-ribs over the veins; upper glumes absent *P. malacophyllum*
 - 24 Lower lemmas not ribbed over the veins; upper glumes present.
 - 25 Panicles with 15-100 branches.
 - 26 Plants annual; upper glumes and lower lemmas rugose [*P. racemosum*]
 - 26 Plant perennial; upad/weakleyper glumes and lower lemmas smooth.
 - 27 Plant rhizomatous; panicle branch axes 0.9-1.2 mm wide; panicle branches often arcing *P. intermedium*
 - 27 Plant caespitose; panicle branch axes 0.3-0.6 mm wide; panicle branches straight.
 - 28 Panicle branches spreading to reflexed (rarely ascending); leaf blades 10-23 mm wide; axes of panicle branches 0.3-0.4 mm wide *P. coryphaeum*
 - 28 Panicle branches erect to ascending; leaf blades 4.9-6.1 mm wide; axes of panicle branches 0.5-0.6 mm wide [*P. quadrifarium*]
 - 25 Panicles with 1-15 branches.
 - 29 Spikelets 1.3-2.5 mm long.
 - 30 Upper glumes (and usually also the lower lemmas) shortly pubescent.
 - 31 Lower glumes present [*P. langei*]

- 31 Lower glumes absent.
 - 32 Panicles both terminal and axillary, the axillary panicles partially or completely enclosed by the subtending leaf sheath [see Key A]
 - 32 Panicles all terminal *P. caespitosum*
- 30 Upper glumes and lower lemmas glabrous.
 - 33 Panicles both terminal and axillary, the axillary panicles partially or completely enclosed by the subtending leaf sheath [see Key A]
 - 33 Panicles all terminal.
 - 34 Upper panicle branches erect *P. monostachyum*
 - 34 Upper panicle branches spreading to ascending.
 - 35 Upper glumes and lower lemmas 5-veined *P. caespitosum*
 - 35 Upper glumes and lower lemmas 3-veined.
 - 36 Lower sheaths villous or hirsute; spikelets 2.6-3.5 mm long *P. praecox* var. *curtisianum*
 - 36 Lower sheaths glabrous or sparsely papillose pubescent; spikelets 2.2-2.8 mm long *P. praecox* var. *praecox*
- 29 Spikelets 2.5-4.1 mm long.
 - 37 Spikelet pairs barely if at all imbricate; lower glumes usually present *P. bifidum*
 - 37 Spikelet pairs imbricate; lower glumes absent or present.
 - 38 Upper glumes pubescent; lower lemmas usually pubescent.
 - 39 Lower glumes present [*P. langei*]
 - 39 Lower glumes absent *P. pubiflorum*
 - 38 Upper glumes glabrous; lower lemmas usually glabrous.
 - 40 Upper florets golden brown *P. floridanum*
 - 40 Upper florets pale to tan.
 - 41 Terminal panicle branches erect *P. monostachyum*
 - 41 Terminal panicle branches spreading to ascending.
 - 42 Plants decumbent, rooting at the lower nodes; spikelets obovate to elliptic *P. pubiflorum*
 - 42 Plants rhizomatous; spikelets orbicular to elliptic.
 - 43 Spikelets 2.9-4.1 mm long; 1.9-3.1 mm wide, suborbicular to elliptic; upper glumes 5-veined; leaf blades flat *P. floridanum*
 - 43 Spikelets 2.1-3.1 mm long, 2.0-2.8 mm wide, orbicular or nearly so; upper glumes 3-veined; leaf blades laterally folded.
 - 44 Lower sheaths villous or hirsute *P. praecox* var. *curtisianum*
 - 44 Lower sheaths glabrous or sparsely papillose pubescent *P. praecox* var. *praecox*

Key A: *Paspalum setaceum* complex

(by Richard J. LeBlond)

- 1 Blades glabrous to pubescent or sparsely pilose (the margins often ciliate and/or scabrous).
 - 2 Blades glabrous, crowded toward the base, often recurved, 3-10 mm wide; rachis of panicle branches 0.2-0.6 mm wide; spikelets 1.4-1.8 mm long, 0.9-1.3 mm wide, glabrous (-few glandular hairs); sterile lemma without a midvein *P. setaceum* var. *longepedunculatum*
 - 2 Blades glabrous, sometimes pubescent or sparsely pilose, more strongly cauline, not recurved (though sometimes spreading), 3-18 mm wide; rachis of panicle branches 0.6-1.2 mm wide; spikelets 1.7-2.6 mm long, 1.2-2.1 mm wide, pubescent to glabrous; sterile lemma with or without a midvein.
 - 3 Blades conspicuously rigid, 2.5-6 (-8) mm wide; spikelets 2.0-2.6 mm long, 1.5-1.8 mm wide *P. setaceum* var. *rigidifolium*
 - 3 Blades lax to firm (if firm, then more than 6 mm wide); spikelets 1.7-2.4 mm long, 1.2-2.1 mm wide.
 - 4 Sterile lemma with a midvein; blades dark green to purple; spikelets elliptic to obovate, 1.7-2.0 mm long, 1.2-1.5 mm wide *P. setaceum* var. *ciliatifolium*
 - 4 Sterile lemma without a midvein; blades yellow-green to dark green; spikelets obovate to suborbicular, 1.7-2.4 mm long, 1.5-2.1 mm wide *P. setaceum* var. *stramineum*
- 1 Blades densely pubescent, hirsute, or long pilose.
 - 5 Blades crowded toward the base, recurved; spikelets 1.4-1.9 mm long, often purple-spotted *P. setaceum* var. *villosissimum*
 - 5 Blades more strongly cauline, not recurved (though sometimes spreading); spikelets 1.4-2.5 mm long, not purple-spotted.
 - 6 Plants prostrate to widely spreading; rachis of panicle branches 0.6-1.5 mm wide.
 - 7 Blades 3-8 mm wide, grayish green, densely pubescent with hairs < 1.5 mm; panicle branches 3-6 cm long, rachis 0.7-1.0 mm wide; spikelets 1.8-2.2 mm long, 1.6-1.8 mm wide, suborbicular to orbicular, pubescent; sterile lemma without a midvein *P. setaceum* var. *psammophilum*
 - 7 Blades 2-19 mm wide, yellow-green, pilose with hairs 1.5-4 mm long; panicle branches 2-10 cm long, rachis 0.6-1.5 mm wide; spikelets 1.7-2.1 mm long, 1.2-1.6 mm wide, elliptic to obovate (-suborbicular), glabrous or pubescent; sterile lemma with or without a midvein *P. setaceum* var. *supinum*
 - 6 Plants erect to spreading; rachis of panicle branches 0.3-1.0 mm wide.
 - 8 Spikelets 1.4-1.9 mm long, 1.1-1.6 mm wide; sterile lemma without a midvein; blades grayish green, 1.5-7 mm wide *P. setaceum* var. *setaceum*
 - 8 Spikelets 1.7-2.5 mm long, 1.5-2.1 mm wide; sterile lemma with or without a midvein; blades light green or yellow-green to dark green, 2-16 mm wide.
 - 9 Sterile lemma usually with a midvein; blades 2-10 mm wide, hirsute with hairs to 5.5 mm long, light to dark green; spikelets glabrous to sparsely pubescent *P. setaceum* var. *muhlenbergii*
 - 9 Sterile lemma without a midvein; blades 2-16 mm wide, pubescent with hairs < 1.5 mm long to glabrous, yellow-green to dark green; spikelets pubescent to glabrous *P. setaceum* var. *stramineum*

Paspalum acuminatum Raddi, Brook Paspalum, Canoe Grass. Wet areas, often disturbed; possibly only adventive in our area. C. GA and ne. TX south to s. FL and s. TX, south through the New World tropics to s. South America. [= FNA, HC, K, WH3]

Paspalum bifidum (Bertoloni) Nash, Pitchfork Paspalum, Pitchfork Crown Grass. Mesic to wet longleaf pine savannas and mesic swales in sandhills. Aug-Oct. Se. VA south to s. FL, west to se. MO, se. OK, and e. TX. [= C, GW, HC, K, RAB, S, WH3, Y; > *P. bifidum* var. *bifidum* – F, G; > *P. bifidum* var. *projectum* Fernald – F, G]

Paspalum boschianum Flügge, Bull Paspalum. Marshes, cypress domes, low fields, ditches. Jul-Oct. MD, KY, and TX south through tropical America. [= C, F, FNA, G, GW, HC, K, RAB, S, W, WH3, Y]

Paspalum caespitosum Flügge, Pinelands, hammocks. S. AL and n. FL south to s. FL; West Indies, Mexico and Central America. [= FNA, GW, HC, K, S, WH3]

Paspalum conjugatum Bergius, Sour Paspalum. Disturbed areas, forest edges. Ne. FL, FL Panhandle, and s. AL west to e. TX, south in the New World tropics; Old World tropics. [= FNA, HC, K, S, WH3] {synonymy incomplete}

* ***Paspalum conspersum*** Schrad., Scattered Paspalum. Roadsides, other disturbed areas; native of Mexico south to South America. [= FNA] {synonymy incomplete}

* ***Paspalum convexum*** Flügge, Mexican Paspalum. Disturbed areas. MS, LA, and e. TX, native of tropical America. [= FNA, K] {synonymy incomplete}

* ***Paspalum coryphaeum*** Trinius, Emperor Crown-grass. Disturbed areas; native of South America. [= FNA, K, WH3] {synonymy incomplete}

Paspalum denticulatum Trinius. Wet disturbed areas. {Distribution}. {synonymy incomplete; not yet keyed}

* ***Paspalum dilatatum*** Poiret ssp. *dilatatum*, Dallis Grass. Roadsides, fields, disturbed areas; native of tropical America. May-Oct. Other subspecies occur in the native range in South America. [< *P. dilatatum* – C, F, FNA, G, GW, HC, K, RAB, S, W, WH3, Y]

Paspalum dissectum (Linnaeus) Linnaeus, Mudbank Crown Grass, Walter Paspalum. Mud flats, drawdown zones. Sep. NJ, IL, and KS south to c. FL and e. TX; Cuba. [= C, F, FNA, G, GW, HC, K, RAB, S, WH3, Y]

Paspalum distichum Linnaeus, Joint Paspalum, Knotgrass. Brackish and freshwater marshes. Jun-Aug. NJ, KS, and WA south to s. FL, s. TX, s. CA and through the New World and Old World tropics. [= C, F, FNA, G, HC, K, Pa, RAB, S, W, WH3, Y; < *P. distichum* – GW (also see *P. vaginatum*); = *P. paspaloides* (Michaux) Scribner]

* ***Paspalum fimbriatum*** Kunth. [= K2] {not yet keyed; add to synonymy}

Paspalum floridanum Michaux, Florida Paspalum. Wet forests, pine savannas. Aug-Oct. NJ, IL, and KS south to s. FL and e. TX. [= C, FNA, GW, K, Pa, RAB, W, WH3; > *P. floridanum* – G; > *P. difforme* Le Conte – G, HC, S, Y; > *P. floridanum* var. *floridanum* – F, HC, S, Y; > *P. floridanum* var. *glabratum* Engelman ex Vasey – F, HC, S, Y; > *P. giganteum* Baldwin ex Vasey – HC, S, Y]

Paspalum fluitans (Elliott) Kunth, Water Paspalum, Horsetail Crown Grass. Mucky soils in swamp forests, moist riverbanks. Oct. MD, IL, and KS south to s. FL and s. TX, and south through tropical America to c. South America. [= C, F, G, HC, K, RAB; = *P. repens* P.J. Bergius – FNA, GW, S, WH3, Y]

* ***Paspalum intermedium*** Munro ex Morong. Drainage canals; native of South America. Escaped in sc. GA (Tift County, where growing along drainage canals in Tifton) (Jones & Coile 1988). [= FNA, HC, K]

Paspalum laeve Michaux var. *circularae* (Nash) Stone. Mt (WV), {FL?, GA, NC, VA}: {need additional herbarium work to fully determine range and abundance of varieties} Jun-Aug. [= F; < *P. laeve* – C, FNA, G, GW, K, Pa, RAB, W, WH3; = *P. circularae* Nash – HC, S, WV, Y]

Paspalum laeve Michaux var. *laeve*. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): forest edges and disturbed areas; common. {need additional herbarium work to fully determine range and abundance of varieties} Jun-Aug. Overall distribution of *P. laeve* s.l.: MA, NY, MI, and KS south to s. FL and e. TX. [< *P. laeve* – C, FNA, G, GW, K, Pa, RAB, W, WH3; > *P. laeve* var. *laeve* – F; > *P. laeve* var. *pilosum* Scribner – F; > *P. laeve* – HC, S, WV, Y; > *P. longipilum* Nash – HC, S, WV, Y]

Paspalum langei (E. Fournier) Nash, Rustyseed Paspalum. Calcareous hardwood hammocks. N. peninsular FL (Alachua County) and Panhandle FL (Jackson County) west to se. TX, and south through the New World tropics to South America. [= FNA, K1; ? *P. botteri* (E. Fournier) Chase – K2, WH3] {synonymy incomplete}

* *Paspalum malacophyllum* Trinius, Ribbed Paspalum. Old fields, disturbed areas; rare, native of s. FL, Mexico to South America. [= FNA, HC, WH3]

Paspalum minus E. Fournier, Matted Paspalum. Disturbed areas. FL Panhandle (Escambia County) and s. AL west to e. TX. [= FNA, K, WH3] {synonymy incomplete}

Paspalum monostachyum Vasey, Gulfdune Paspalum. Coastal dunes, wet prairies. S. FL peninsula; s. MS; sw. LA west to TX and Tamaulipas. [= FNA, HC, K, S, WH3] {synonymy incomplete}

* *Paspalum nicorae* Parodi, Brunswickgrass. Disturbed areas; native of Brazil. Also reported for peninsular FL (Wunderlin & Hansen 2006) and Baldwin County, AL (Barger et al. 2012). [= FNA, HC, K, WH3]

* *Paspalum notatum* Flüggé, Bahia Grass. Roadsides and disturbed areas, sometimes planted as a coarse turfgrass or a pasture grass; native of tropical America. Jun-Oct. [= FNA, G, GW, Y; > *P. notatum* var. *notatum* – HC, K, WH3; > *P. notatum* Flüggé var. *saurae* Parodi – RAB, HC, K, WH3]

* *Paspalum paniculatum* Linnaeus, Arrocillo. Disturbed areas; native of tropical America. Ec. MS and s. FL. [= FNA, K, WH3] {synonymy incomplete}

Paspalum plicatulum Michaux, Brownseed Paspalum. Pine savannas, fields. May-Jul. Se. SC south to s. FL, west to s. TX, and south through tropical America to s. South America. [= FNA, GW, HC, K, RAB, S, WH3, Y]

Paspalum praecox Walter var. *curtisianum* (Steudel) Vasey, Curtis's Crown Grass. Pine savannas. Jun-Oct. NC south to s. FL, west to e. TX. The variety was named for the Rev. Moses Ashley Curtis (of Hillsborough, NC), not Allen Hiram Curtiss (of Jacksonville, FL); the correct spelling of the epithet is therefore "*curtisianum*." [= F, G, RAB; = *P. praecox* var. *curtisianum* – C, orthographic error; < *P. praecox* – FNA, GW, K, WH3; = *P. lentiferum* Lamarck – HC, S, Y]

Paspalum praecox Walter var. *praecox*, Early Crown Grass. Pine savannas. May-Jul. [= C, F, G, RAB; < *P. praecox* – FNA, GW, K, WH3; = *P. praecox* – HC, S, Y]

Paspalum pubiflorum Ruprecht var. *glabrum* Vasey, Hairyseed Crown Grass. Disturbed areas Sep-Oct. PA west to KS and CO, south to FL and s. TX and Mexico; Cuba. [= C, F, G, HC, S, Y; < *P. pubiflorum* – FNA, GW, K, RAB, W, WH3]

* *Paspalum quadrifarium* Lamarck, Tussock Paspalum. Disturbed areas. S. MS. Native of South America. [= FNA] {synonymy incomplete}

* *Paspalum racemosum* Lamarck, Peruvian Paspalum. Disturbed areas. MS and other widely scattered localities in North America, native of n. South America. [= FNA, K] {synonymy incomplete}

* *Paspalum scrobiculatum* Linnaeus, Indian Paspalum. Disturbed areas; native of India. [= FNA, HC, K]

Paspalum setaceum Michaux var. *ciliatifolium* (Michaux) Vasey. Dry open areas and woodlands, disturbed areas. Jun-Sep. S. NJ south to s. FL, west to e. TX, interior to s. WV, se. KY, e. TN, n. AL, n. MS, c. AR, and e. OK. [= FNA, Z; < *P. setaceum* – GW, K, RAB, W, WH3; < *P. setaceum* var. *longepedunculatum*]; = *P. ciliatifolium* Michaux var. *ciliatifolium* – F, G; > *P. ciliatifolium* Michaux – HC, S; > *P. propinquum* Nash – HC, S; = *P. ciliatifolium* Michaux – WV, Y]

Paspalum setaceum Michaux var. *longepedunculatum* (LeConte) Alph. Wood. Pine flatwoods and pine savannas. Jun-Sep. Se. NC south to s. FL, west to s. MS. [= F, FNA, Z; < *P. setaceum* – GW, K, RAB, W, WH3; < *P. setaceum* var. *ciliatifolium* – C; = *P. longepedunculatum* LeConte – G, HC, S, Y]

Paspalum setaceum Michaux var. *muhlenbergii* (Nash) Fernald. Dry or moist soils. Jun-Sep. NH west to MI, c. IL, s. IA, and c. KS, south to n. FL, s. AL, s. MS, s. LA, and c. TX. [= C, FNA, Pa, Z; < *P. setaceum* – GW, K, RAB, W, WH3; > *P. setaceum* var. *calvescens* Fernald – F; > *P. ciliatifolium* Michaux var. *muhlenbergii* (Nash) Fernald – F; = *P. ciliatifolium* Michaux var. *muhlenbergii* (Nash) Fernald – G; = *P. pubescens* Muhlenberg ex Willdenow – HC, S, WV, Y]

Paspalum setaceum Michaux var. *psammophilum* (Nash) D. Banks. Maritime grasslands, sandy disturbed areas. Jun-Sep. MA south to DC (VA?) in the Coastal Plain. [= C, FNA, Pa, Z; < *P. setaceum* – K; = *P. psammophilum* Nash – F, G, HC, Y]

Paspalum setaceum Michaux var. *rigidifolium* (Nash) D. Banks. Sandhills. Jun-Sep. Ne. GA, immediately adjacent to SC (and reported for NC by HC) south to s. FL; Cuba. [= FNA, Z; < *P. setaceum* – GW, K, RAB, W, WH3; = *P. rigidifolium* Nash – HC, S, Y]

Paspalum setaceum Michaux var. *setaceum*, Thin Paspalum. Sandhills, savannas, dry soils. Jun-Sep. MA and CT south to s. FL, west to e. TX, inland to w. VA, s. WV, s. MO and AR; Cuba. [= C, FNA, Pa, Z; < *P. setaceum* – GW, K, RAB, W, WH3; > *P. setaceum* – G, HC, S, WV, Y; > *P. debile* Michaux – F, HC, S, Y; > *P. setaceum* var. *setaceum* – F]

Paspalum setaceum Michaux var. *stramineum* (Nash) D. Banks, Yellow Sand Paspalum. Dry sandy soils. Jun-Sep. MI west to MT, south to LA, and NM; scattered eastward, especially near the coast, perhaps at least in part as introductions. [= C, FNA, Z; < *P. setaceum* – RAB, GW, K, W, WH3; = *P. ciliatifolium* Michaux var. *stramineum* (Nash) Fernald – F, G; = *P. stramineum* Nash – HC, Y]

Paspalum setaceum Michaux var. *supinum* (Bosc ex Poiret) Trinius. Sandy soils, old fields. Jun-Sep. E. NC (e. VA?) south to s. FL, west to s. MS. Also reported for the Coastal Plain of Virginia by Tatnall (1946); needing confirmation of the specimen identification. [= F, FNA, Pa, Z; < *P. setaceum* – GW, K, RAB, W, WH3; = *P. supinum* Bosc ex Poiret – HC, S]

Paspalum setaceum Michaux var. *villosissimum* (Nash) D. Banks. Sandy pine flatwoods and fields. N. FL (very near GA) south to s. FL; Cuba. [= FNA, Z; < *P. setaceum* – GW, K, WH3; < *P. debile* Michaux – HC; = *P. villosissimum* Nash – S]

* *Paspalum urvillei* Steudel, Vasey Grass. Roadsides, fields, and disturbed areas; native of South America. May-Jul. [= C, F, FNA, G, GW, HC, K, RAB, S, WH3, Y]

Paspalum vaginatum Swartz, Sand Knotgrass, Seashore Crown Grass. Brackish marshes, rarely inland in disturbed places. Jul. NC south to s. FL, west to s. TX, southward through the New World tropics; Old World tropics. [= FNA, HC, K, RAB, S, WH3, Y; < *P. distichum* – GW, misapplied]

* *Paspalum virgatum* Linnaeus, Talquezal. Disturbed areas; native of Mexico, Central America, and South America. [= FNA, K] {synonymy incomplete}

Patis Ohwi 1942

A genus of 3 species, perennial herbs, of e. Asia (2 species) and e. North America (1 species). References: Romaschenko et al. (2011)=Z; Barkworth in FNA (2007a).

Patis racemosa (Smith) Romaschenko, P.M. Peterson, & Soreng, Blackseed Ricegrass, Mountain Ricegrass. Calcareous woodlands and forests. Late Jun-Aug. QC and ON west to ND, south to w. VA, e. TN (FNA, Kartesz 2010), se. KY, se. MO,

and e. NE. [= Z; = *Piptatherum racemosum* (Smith) Barkworth – FNA, K; = *Oryzopsis racemosa* (Smith) Ricker ex A.S. Hitchcock – C, F, G, HC, W, WV; = *Piptatherum racemosus* – Pa, orthographic variant]

Phalaris Linnaeus 1753 (Canary-grass)

A genus of about 16-22 species, north temperate and South American. References: Barkworth in FNA (2007a); Tucker (1996)=Z.

- 1 Perennial, with scaly rhizomes; inflorescence **either** obviously paniculate, 7-25 cm long, with ascending to appressed branches, the main branches of the inflorescence apparent, the inflorescence outline thus appearing lobed, **or** densely spikelike, 1.5-15 cm long.
- 2 Glumes broadly winged; fertile lemmas ovate-lanceolate, densely pubescent.....[*P. aquatica*]
- 2 Glumes not winged; fertile lemmas narrowly lanceolate, glabrous to sparsely pubescent*P. arundinacea*
- 1 Annual, without rhizomes; inflorescence densely spikelike or almost capitate, 1-9 cm long, the branches not apparent, the inflorescence outline a single ovoid, ellipsoid, or lanceolate form.
- 3 Spikelets borne in clusters, the lower 4-7 spikelets in each cluster with a staminate terminal floret..... [*P. paradoxa*]
- 3 Spikelets borne singly; all spikelets with a bisexual terminal floret.
- 4 Keels of the glumes broadly winged (the wing ca. 1 mm wide); sterile florets 2.0-4.5 mm long.....*P. canariensis*
- 4 Keels of the glume narrowly winged (the wing < 0.5 mm wide); sterile florets 0.5-2.5 mm long.
- 5 Sterile floret 1 [*P. minor*]
- 5 Sterile florets 2.
- 6 Nerves of the glumes scabrous; panicle cylindric in outline, 6-18 cm long; glumes 3.5-4.0 mm long; sterile florets 0.5-1.5 mm long.....*P. angusta*
- 6 Nerves of the glumes not scabrous; panicle narrowly ovate in outline, usually 2-6 cm long; glumes 5-6 mm long; sterile florets 1.5-2.5 mm long *P. caroliniana*

* **Phalaris angusta** Nees ex Trinibus. Waterfowl impoundments, marshes; native of tropical America, perhaps native in LA and TX. [= GW, FNA, HC, K, WH3, Z]

* **Phalaris aquatica** Linnaeus, Bulbous Canary-grass. Disturbed areas; native of Europe. [= K, Z; ? *P. tuberosa* Linnaeus var. *stenoptera* (Hackel) A.S. Hitchcock – HC]

*? **Phalaris arundinacea** Linnaeus, Reed Canary-grass, Ribbon Grass. Moist forests, moist disturbed areas, bogs. Jun-early Jul. NL (Newfoundland) west to AK, south to NC, TN, AR, NM, CA; Mexico; Eurasia. A variegated form, *P. arundinacea* forma *variegata* (Parnell) Druce, is cultivated for ornament, as Ribbon Grass. [= C, F, FNA, GW, K, Pa, RAB, S, W, WV, Z; > *P. arundinacea* var. *arundinacea* – G, HC; > *P. arundinacea* var. *picta* Linnaeus – G, HC]

* **Phalaris canariensis** Linnaeus, Birdseed Grass, Canary-grass. Disturbed areas; native of Mediterranean Europe. Jul-Aug. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, WH3, WV, Z]

* **Phalaris caroliniana** Walter, Maygrass. Ditches, roadsides, disturbed areas. May-Jun. NC west to OR, south into Mexico, the original distribution now obscured. [= C, F, FNA, G, GW, HC, K, RAB, S, WH3, Z]

* **Phalaris minor** Retzius, Lesser Canary Grass. Waste areas near wool-combing mills, other disturbed sites; native of Mediterranean Europe. Also reported for other scattered states in e. North America, including peninsular FL (Kartesz 1999). [= FNA, HC, K, WH3] {synonymy incomplete}

* **Phalaris paradoxa** Linnaeus, Mediterranean Canary Grass. {habitat}. Reported for NC, MD, NJ, and PA (Barkworth in FNA 2007a; Kartesz 1999). [= FNA, K; > *P. paradoxa* var. *paradoxa* – HC; > *P. paradoxa* var. *praemorsa* (Lamarck) Coss. & Durieu – HC] {synonymy incomplete}

Phanopyrum (Rafinesque) Nash 1903 (Phanopyrum)

Circumscription of this genus is currently in flux. *Phanopyrum* is variously treated as a distinct genus or as a subgenus of *Panicum*. References: Crins (1991)=Z; Webster (1988)=Y; Freckmann & Lelong in FNA (2003a).

Phanopyrum gymnocarpon (Elliott) Nash, Swamp Phanopyrum, Savanna Phanopyrum. Swamps, seasonally flooded soils of cypress-gum sloughs, tidal (freshwater) cypress-gum swamps, disturbed wet soils, low woods, ditches, muddy banks of streams and lakes, sinks, floodplains, and marshes. Aug-Oct. Se. VA south to FL, west to TX and AR. [= K, WH3, Y; = *Panicum gymnocarpon* Elliott – FNA, GW, HC, RAB, S, Z]

Phleum Linnaeus 1753 (Timothy)

A genus of about 15 species, annuals and perennials, mainly native to Eurasia. References: Barkworth in FNA (2007a); Tucker (1996)=Z; Stace (2010)=Y. Key based on Stace (2010).

- 1 Spikelets 2.0-3.6 (-3.8) mm long, including the 0.2-1.0 (-1.2) mm long awns; panicle 3-6 (-6.7) mm wide; leaves 2-6 mm wide; ligule usually acute..... ***P. pratense* ssp. *bertolonii***
 1 Spikelets (3.5-) 4-5.5 mm long, including the (0.8-) 1.0-2.0 mm long awns; panicle 5-10 mm wide; leaves 3-9 mm wide; ligule usually obtuse..... ***P. pratense* ssp. *pratense***

* ***Phleum pratense*** Linnaeus ssp. ***bertolonii*** (A.P. de Candolle) Bornm., Small Timothy. (NC) {included based on Fernald's report – corroboration and additional information needed} [= FNA; < *P. pratense* – RAB, C, G, HC, K, Pa, S, W, Z; = *P. pratense* var. *nodosum* (Linnaeus) Hudson – F; = *P. bertolonii* A.P. de Candolle – Y]

* ***Phleum pratense*** Linnaeus ssp. ***pratense***, Timothy. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): meadows, pastures, roadsides, disturbed areas; common, native of Europe. Jun-Oct. The American common name comes from the name of the man who is believed to have introduced it into the United States in 1720, Timothy Hanson; in England, *Phleum* is called "cat's-tail." [= FNA; < *P. pratense* – RAB, C, G, HC, K, Pa, S, W, WH3, WV, Z; = *P. pratense* var. *pratense* – F; = *P. pratense* – Y]

* ***Phleum subulatum*** (Savi) Ascherson & Graebner, Italian Timothy. Waif on ballast, reported for MD and Philadelphia, PA. [= FNA, K, Y] {not keyed}

Phragmites Adanson 1763 (Common Reed)

A genus with 3-5 species, nearly worldwide in distribution. References: Haines (2010)=V; Ward (2010)=X; Allred in FNA (2003a), revised in FNA (2007a); Saltonstall & Hauber (2007)=Y; Ward & Jacono (2009); Saltonstall, Peterson, & Soreng (2004)=Z; Saltonstall (2002). Key based on Z and Y.

- 1 Panicle diffuse and partially drooping, with lower lateral branches naked for 1-4 cm; leaf blades of lower stem leaves abscising from the sheaths by mid-season; leaves lightly scabrous on lower surface; culms stout, to 20 mm in diameter, smooth and glossy; [native on the Gulf Coast, from FL and GA westward, and southward into the tropics]..... ***P. karka***
 1 Panicle erect and relatively compact, with lower lateral branches spikelet-bearing to base
 2 Ligules 1.0-1.7 mm long; lower glumes 3.0-6.5 mm long; upper glumes 5.5-11.0 mm long; lemmas 8.0-13.5 mm long; leaf sheaths caducous with age; culms exposed in the winter, smooth and shiny; [native south to WV and VA]..... ***P. americanus***
 2 Ligules 0.4-0.9 mm long; lower glumes 2.5-5.0 mm long; upper glumes 4.5-7.5 mm long; lemmas 7.5-12.5 mm long; leaf sheaths not caducous with age; culms not exposed in the winter, minutely ridged and not shiny; [introduced and weedy]..... ***P. australis***

Phragmites americanus (Saltonstall, P.M. Peterson, & Soreng) A. Haines, American Reed. Freshwater marshes, fens. New England westward. [= V; = *P. australis* ssp. *americanus* Saltonstall, P.M. Peterson, & Soreng – FNA, Pa, X, Y, Z; < *P. australis* – C, K; < *P. communis* Trinius – G, HC, RAB; < *P. communis* var. *berlandieri* (Fournier) Fernald – F]

* ***Phragmites australis*** (Cavanilles) Trinius ex Steudel, Common Reed. Brackish and freshwater Marshes, dredge-spoil deposit islands, ditches. Aug-Oct. Nearly worldwide in distribution. Fox, Godfrey, & Blomquist (1950) report its first collection in NC (in 1948). In most of our area, reed is of relatively recent introduction, reported from only nine counties in RAB, but now becoming a serious weed in coastal areas, where it aggressively colonizes freshwater and brackish marshes, excluding the native species. [= V; = *P. australis* ssp. *australis* – Pa, X, Y; = *Phragmites australis* (Cavanilles) Trinius ex Steudel var. *australis* – FNA, Z; < *P. australis* – C, GW, K; < *P. communis* Trinius – G, HC, RAB, WV; = *P. communis* var. *communis* – F; < *P. phragmites* (Linnaeus) Karsten – S]

Phragmites karka (Retzius) Trinius ex Steudel, Tropical Reed. Marshes. Sep-Dec. Ne. FL south to s. FL, west across the Gulf Coast to sw. United States, south into tropical America. Sep-Oct. Reported for Seminole County, GA (Carter, Baker, & Morris 2009). [= X; = *P. australis* (Cavanilles) Trinius ex Steudel ssp. *berlandieri* (E. Fournier) C.F. Reed – Y; = *P. australis* (Cavanilles) Trinius ex Steudel var. *berlandieri* (E. Fournier) C.F. Reed – FNA, Z; < *P. australis* – C, GW, K, WH3; < *P. communis* Trinius – RAB, G, HC; < *P. communis* var. *berlandieri* (Fournier) Fernald – F; < *P. phragmites* (Linnaeus) Karsten – S]

Phyllostachys Siebold & Zuccarini 1843 (Bamboo)

A genus of about 50 (or more) species, native of mainly temperate e. Asia. References: Stapleton & Barkworth in FNA (2007a); Duncan & Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.

Identification notes: In addition to the species keyed below, a number of other species are sometimes cultivated in our area, and may be encountered. Bamboos are seriously under-represented in herbaria, since they rarely flower and are impractical to press. All of the species should be anticipated in other physiographic provinces and states than those listed.

- 1 Internodes at the base of principal culms dissimilar in length, the lowermost internode 1-12 cm long, the next 3 internodes distinctly longer, with nodal junctions mostly straight across *P. aurea*
- 1 Internodes at the base of principal culms all similar in length, mostly 4-8 cm, with nodal junctions oblique.
 - 2 Groove on internode (above the branch) yellowish-green, the rest of the culm dull greenish *P. aureosulcata*
 - 2 Groove on internode (above the branch) the same color as the rest of the culm.
 - 3 Internodes of principal culms densely velvety; outer surface of culm sheaths with abundant erect brown hairs; lowest internode of principal culms ca. 5 cm long; culms pale green at first, becoming gray with accumulated waxy powder in age *P. heterocycla*
 - 3 Internodes of principal culms glabrous or slightly hairy; outer surface of culm sheaths lacking erect brown hairs; lowest internode of principal culms ca. 8.5-12 cm long; culms various (see below, but not as described in first lead).
 - 4 Largest culms to 15 cm in diameter and 25 m tall; upper culm sheaths with auricles; outer surface of culm sheaths usually with a green streak down the middle, flanked by streaks of purple and buff; culms medium to dark glossy green at first (some cultivars golden yellow or yellow streaked), remaining so in age *P. bambusoides*
 - 4 Largest culms to 3.2 (-4) cm in diameter and 10 m tall (rarely taller); upper culm sheaths with or without auricles; outer surface of culm sheaths variously streaked, spotted, or mottled with brown or red (but not as above); culms pale green to green at first, usually becoming purple spotted, gray, or yellow in age.
 - 5 Lowest internode of principal culms ca. 8.5 cm long; culm sheaths with auricles, usually sparsely pubescent with erect, pale hairs, usually pinkish-brown at maturity, marked with numerous brown spots near the tip; culms green at first, usually becoming speckled and then more-or-less completely darkened with purplish spots (remaining green in some cultivars) *P. nigra*
 - 5 Lowest internode of principal culms ca. 12 cm long; culm sheaths lacking auricles, glabrous, usually green to buff at maturity, striped and marginally bordered with red; culms pale green at first, becoming gray to yellowish in age *P. rubromarginata*

* *Phyllostachys aurea* Carrière ex A. & C. Rivière, Golden Bamboo, Fishpole Bamboo. Suburban woodlands; native of China and Japan. Not known to flower in our area. This is the usual large bamboo cultivated and naturalizing in our area, forming dense stands, up to 15 m tall. [= FNA, HC, K1, K2, RAB, WH3, Y, Z]

* *Phyllostachys aureosulcata* McClure, Yellowgroove Bamboo. Cultivated as an ornamental, persistent or spreading from plantings; native of China. [= K1, K2, WV, Y, Z]

* *Phyllostachys bambusoides* Siebold & Zuccarini, Giant Timber Bamboo. Cultivated as an ornamental, persistent or spreading from plantings; native of China. [= FNA, HC, K1, K2, Y, Z]

* *Phyllostachys heterocycla* (Carrière) S. Matsum, Moso Bamboo. Cultivated as an ornamental, persistent or spreading from plantings; native of China. [= Y; ? *P. edulis* (Carrière) Houzeau de Lehaie – K1, K2; ? *P. pubescens* Mazel ex Houzeau de Lehaie – Z]

* *Phyllostachys meyeri* McClure. Cultivated as an ornamental, persistent or spreading from plantings; native of e. Asia. Reported as introduced in FL, NC, and SC (Kartesz 1999). {investigate} [= K1, K2] {not yet keyed}

* *Phyllostachys nigra* (Loddiges ex Lindley) Munro, Black Bamboo. Cultivated as an ornamental, persistent or spreading from plantings; native of China and Japan. [= K1, K2, WV, Y, Z; > *P. nigra* var. *henonis* (Mitford) Makino – WV]

* *Phyllostachys rubromarginata* McClure. Cultivated as an ornamental, persistent or spreading from plantings; native of China. [= K1, K2, Y, Z]

* *Phyllostachys sulphurea* (Carrière) A. Rivière & C. Rivière var. *viridis* R.A. Young. Suburban woodlands and areas near experimental plantations. See Diamond (2013b) for additional information. [*P. sulphurea* – K2; = *P. viridis* (R.A. Young) McClure] {not yet keyed}

Piptatheropsis Romaschenko, P.M. Peterson, & Soreng 2011

A genus of 5 species, perennial herbs, of temperate and boreal ne. and nw. North America. References: Romaschenko et al. (2011)=Z; Barkworth in FNA (2007a).

- 1 Awns 5-15 mm long, persistent, 1-2× geniculate *P. canadensis*
 1 Awns absent (caduceus) or < 2 mm long, straight..... *P. pungens*

Piptatheropsis canadensis (Poir.) Romaschenko, P.M. Peterson, & Soreng, Mountain Ricegrass, Canada *Piptatherum*. Sandy barrens on quartzite. NL (Newfoundland) west to BC, south to n. NY, MI, and WI; disjunct at Panther Knob, Pendleton County, WV. [= Z; = *Piptatherum canadense* (Poir.) Dorn – FNA, K; = *Oryzopsis canadensis* (Poir.) Torrey – C, F, G, HC, WV]

Piptatheropsis pungens (Torrey) Romaschenko, P.M. Peterson, & Soreng, Sharp *Piptatherum*. {habitat}; {abundance}. NL (Labrador), NU, and YT south to NJ, WV, IN, IL, IA, SD, and CO. [= Z; = *Piptatherum pungens* (Torrey ex Sprengel) Dorn – FNA, K, Pa; = *Oryzopsis pungens* (Torrey ex Sprengel) A.S. Hitchcock – C, F, G, HC; = Z]

*Piptatherum* Palisot de Beauvois 1812

A genus of ca. 22 species, perennial herbs, of temperate Eurasia. References: Romaschenko et al. (2011)=Z; Barkworth in FNA (2007a).

* ***Piptatherum miliaceum*** (Linnaeus) Cosson, Smilo Grass. Disturbed areas; native of Eurasia. Reported as an introduced waif in MD (FNA; Kartesz 1999, 2010), NJ, and PA (Kartesz 1999, 2010). [= K, Z; = *Piptatherum miliaceum* ssp. *miliaceum* – FNA; = *Oryzopsis miliacea* (Linnaeus) Benth & Hooker – HC] {not yet keyed}

Piptochaetium J. Presl 1830 (Needlegrass)

A genus of about 27 species, of temperate North and South America, and montane tropical South America (Cialdella & Giussani 2002). References: Barkworth in FNA (2007a); Cialdella & Giussani (2002).

- 1 Lemma 8.0-10.1 mm long (including the callus but not the awn); spikelets 9.7-13 mm long (excluding the awn); awns 4.0-7.5 cm long; [widespread in our area] *P. avenaceum*
 1 Lemma 12.4-18.2 mm long (including the callus but not the awn); spikelets 17.8-20.3 mm long (excluding the awn); awns 62-120 mm long; [endemic to FL] *P. avenacioides*

Piptochaetium avenaceum (Linnaeus) Parodi, Eastern Needlegrass, Black Oatgrass. Upland woodlands and forests, sometimes abundant or even dominant in xeric woodlands over granitic or mafic rocks in the Piedmont. Apr-Jun. MA, KY, s. IL, and c. OK, south to c. FL and s. TX; disjunct inland in n. IN and w. MI. [= C, FNA, K, Pa, WH3; = *Stipa avenacea* Linnaeus – F, G, HC, RAB, S, W, WV]

Piptochaetium avenacioides (Nash) Valencia & Costas. Sandhills. Ne. FL (?) south to c. peninsular FL. [= FNA, K, WH3; = *Stipa avenacioides* Nash – HC; = *Stipa avenaceoides* Nash – S, orthographic variant]

Pleioblastus Nakai 1925

A genus of about 20 species, shrubs, native of China and Japan.

- * ***Pleioblastus argenteostriatus*** (Regal) Nakai f. Floodplain forests; native of Japan. Reported for DC (Steury, Triplett, & Parrish 2013). [= *P. argenteo-striatus*, orthographic variant] {not yet keyed}
 * ***Pleioblastus pygmaeus*** (Miquel) Nakai, Pygmy Bamboo. Floodplain forests and moist slopes; native of Japan. Reported for VA, MD, and DC (Steury, Triplett, & Parrish 2013). {not yet keyed}
 * ***Pleioblastus simonii*** (Carrière) Nakai. Reported for GA (Kartesz 1999). {investigate} [= *Arundinaria simonii* (Carrière) A. & C. Rivière – K] {not yet keyed}

**Poa** Linnaeus 1753 (Bluegrass)

A genus of about 500 species, annuals and perennials, cosmopolitan. References: Soreng in FNA (2007a); Tucker (1996)=Z; Haines (2004)=Y; Soreng (1998).

- 1 Plants with well-developed rhizomes; perennial.
 - 2 Upper stems strongly flattened; [section *Tichopoa*]..... ***P. compressa***
 - 2 Upper stems terete or nearly so.
 - 3 Lower nodes of the panicle with 1-3 branches; [section *Madropoa*]..... ***P. cuspidata***
 - 3 Lower nodes of the panicle with 4 or more branches; [section *Poa*]..... ***P. pratensis***
- 1 Plants lacking rhizomes; perennial or annual.
 - 4 Plants dioecious, the florets unisexual; lemmas and glumes scarious and silvery; [rare introduction in our area]; [section *Dioicopoa*].....
..... **[*P. arachnifera*]**
 - 4 Plants not dioecious, the florets bisexual; lemmas and glumes not notably scarious and silvery; [collectively common and widespread in our area].
 - 5 Lemmas not webbed at the base.
 - 6 Annual; culms decumbent to ascending and 1-3 dm long; inflorescence 2-8 cm long, the ascending branches bearing crowded spikelets above the middle; lemmas 2.4-3.4 mm long; [section *Micrantherae*]..... ***P. annua***
 - 6 Perennial; culms erect, 3-6 dm long; inflorescence 6-15 cm long, the widely spreading branches bearing a few spikelets near the end; lemmas 3.2-4.4 mm long; [section *Sylvestres*]..... ***P. autumnalis***
 - 5 Lemmas webbed at the base.
 - 7 Culm bulbous-thickened at ground level; [section *Arenariae*].
 - 8 Spikelets normally structured, not modified into purplish bulblets **[*P. bulbosa* ssp. *bulbosa*]**
 - 8 Spikelets (most or all) modified into purplish bulblets ***P. bulbosa* ssp. *vivipara***
 - 7 Culm not bulbous-thickened.
 - 9 Annual; [section *Homalopoa*]..... ***P. chapmaniana***
 - 9 Perennial.
 - 10 Marginal veins of the lemma glabrous.
 - 11 Nodes of the panicle mostly with 4-8 branches; lemmas pubescent or scabrous on the keel.
 - 12 Sheaths glabrous; ligule 0.7-2.2 (-3.0) mm long; [section *Sylvestres*] ***P. alsodes***
 - 12 Sheaths scabrous; ligule (2.5-) 3-7 mm long; [section *Pandemos*] ***P. trivialis***
 - 11 Nodes of the panicles mostly with 2 branches; lemmas glabrous on the keel; [section *Sylvestres*].
 - 13 Anthers 0.6-0.9 (-1.0) mm long; lemmas broad-acute, obtuse or truncate at the apex, the keel and lateral margins of the lemma forming an apical angle of 42-82 degrees, firm at the tip, the scarious tip absent or up to 0.25 mm long
..... ***P. languida***
 - 13 Anthers 0.9-1.5 mm long; lemmas acute to acuminate at the apex, the keel and lateral margins of the lemma forming an apical angle of 10-47 degrees, pliable at the tip, the scarious tip prominent and 0.25-0.5 mm long ***P. saltuensis***
 - 10 Marginal veins of the lemma pubescent, at least basally.
 - 14 Lower nodes of the panicles mostly with (1-) 2-3 branches.
 - 15 Ligule truncate, 0-1 mm long; first glume 1.7-2.2 mm long, second glume 2.0-2.8 mm long; anthers 0.5-0.7 mm long; [section *Oreinos*] ***P. paludigena***
 - 15 Ligule rounded-ovate, 1-2 mm long; first glume 2.5-3.5 mm long, second glume 3.0-3.8 mm long; anthers 1.1-1.4 mm long; [section *Sylvestres*]..... ***P. wolfii***
 - 14 Lower nodes of the panicles mostly with (4-) 5 or more branches.
 - 16 Lemmas 5-veined (intermediate veins well-developed); ligule ca. 1 mm long; [section *Sylvestres*]..... ***P. sylvestris***
 - 16 Lemmas 3-veined (intermediate veins obscure); ligule either (2-) 3-5 mm long or 0.2-1 (-1.5) mm long.
 - 17 Ligule 0.2-1 (-1.5) mm long, truncate; culms 4-8 dm tall; anthers 1.2-1.6 mm long; [section *Stenopoa*]... **[*P. nemoralis*]**
 - 17 Ligule (2-) 3-5 mm long, ovate-triangular; culms 5-15 dm tall; anthers 0.8-1.2 mm long; [section *Pandemos*]
..... ***P. palustris***

Poa alsodes A. Gray, Woodland Bluegrass. Rich forests. May-Jun. NS west to SD, south to NC and IL; also in w. United States. [= C, F, FNA, G, HC, K, Pa, RAB, S, W, WV, Z]

* ***Poa annua*** Linnaeus, Speargrass, Six-weeks Grass, Annual Bluegrass. Fields, roadsides, disturbed areas; native of Eurasia. Apr-May. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, W, WH3, WV, Z]

* ***Poa arachnifera*** Torrey, Texas Bluegrass. Disturbed areas; native of sc. United States. Apr. [= FNA, HC, K, RAB, S, WH3]

Poa autumnalis Muhlenberg ex Elliott. Moist or dry nutrient-rich forests. Apr-May. NJ west to MI, south to FL and TX. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, W, WH3, Z]

* ***Poa bulbosa*** Linnaeus ssp. *bulbosa*, Bulbous Bluegrass. Lawns. Not known from our area, but now known from numerous stations in OH, IN, IL, and PA (Cusick 2013). [= K2] {not mapped}

* *Poa bulbosa* Linnaeus ssp. *vivipara*, Bulbous Bluegrass. Lawns; native of Europe. Apr-May. [= FNA; < *P. bulbosa* – RAB, C, F, G, HC, K1, K2, Pa, WV, Z]

Poa chapmaniana Scribner. Low fields, roadsides, disturbed areas. Apr-May. DE west to IA, south to FL and LA. [= C, F, FNA, G, HC, K, RAB, S, W, WH3, WV, Z]

* *Poa compressa* Linnaeus, Canada Bluegrass. Fields, roadsides, disturbed areas; native of Europe. May-Aug. [= C, F, FNA, G, HC, K, Pa, RAB, S, W, WV, Z]

Poa cuspidata Nuttall. Moist forests. Mar-Apr. NJ west to s. IN, south to sw. GA and c. AL. [= C, F, FNA, G, HC, K, Pa, RAB, S, W, WV, Z]

* *Poa infirma* Kunth. Disturbed areas; native of South America. {investigate} [= FNA, K] {not yet keyed; synonymy incomplete}

Poa languida A.S. Hitchcock, Drooping Bluegrass. Ultramafic outcrop woodlands, barrens, and glades. Apr-May. VT and MA west to MN, south to PA, w. VA, KY, and IA. See comments under *P. saltuensis*. [= C, F, G, HC, Pa, W; = *P. saltuensis* Fernald & Wiegand ssp. *languida* (A.S. Hitchcock) A. Haines – FNA, Y; < *P. saltuensis* – K]

* *Poa nemoralis* Linnaeus, Wood Bluegrass. Disturbed areas, sandy creek bottoms; native of Europe. [= C, F, FNA, G, HC, Pa; ? *P. nemoralis* ssp. *nemoralis* – K]

Poa paludigena Fernald & Wiegand, Bog Bluegrass. Bogs, especially in deep shade under shrubs. Apr-Jun. NY west to MN, south to PA, w. NC, and IL. This species withers and disintegrates shortly after flowering; its ephemeral habit may be responsible for its being overlooked in our area for many years. [= C, F, FNA, G, HC, K, Pa]

Poa palustris Linnaeus, Fowl Bluegrass, Fowl Meadow-grass. Meadows, moist areas, bogs. Jun-Jul. Circumboreal, south in North America to VA, w. NC, MO, and NM. Some populations, especially southward, may represent introductions. [= C, F, FNA, G, HC, K, Pa, RAB, W, WV, Z]

* *Poa pratensis* Linnaeus ssp. *pratensis*, Kentucky Bluegrass, Junegrass, Speargrass. Lawns, roadsides, disturbed areas; native of Europe. Apr-Aug. [= FNA, K; < *P. pratensis* – C, F, G, HC, RAB, S, W, WH3, WV, Z]

Poa saltuensis Fernald & Wiegand, Old-pasture Bluegrass. Northern hardwood forests, ultramafic outcrop woodlands, barrens, and glades. Apr-May. NL (Newfoundland) west to MN, south to PA, w. VA, and w. NC. The NC occurrences (on serpentinized olivine barrens) reported as *P. languida* are actually *P. saltuensis*. The taxonomic distinctions between *P. saltuensis* and *P. languida* have been controversial; Haines (2004) provides a detailed and valuable discussion. [= C, F, G, HC, Pa, W, WV; < *P. languida* – RAB, Z, misidentification; = *P. saltuensis* var. *saltuensis* – F; = *P. saltuensis* ssp. *saltuensis* – FNA, Y; < *P. saltuensis* – K (also see *P. languida*)]

Poa sylvestris A. Gray, Forest Bluegrass. Moist forests. Apr-Jun. NY west to MN and SD, south to FL and TX. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, W, WH3, WV, Z]

* *Poa trivialis* Linnaeus ssp. *trivialis*, Rough Bluegrass. Moist forests, disturbed areas, bottomlands; native of Europe. Apr-Jun. [= FNA; < *P. trivialis* – C, F, G, GW, HC, K, Pa, RAB, S, W, WV, Z]

Poa wolfii Scribner. Moist rich forests. OH west to MN, south to c. TN, n. AR, and NE; disjunct eastward w. NC. The NC occurrence is based on material from Great Smoky Mountains National Park (Haywood County) (K. Langdon, pers. comm. 2006). The alleged VA occurrences are in error. [= C, F, G, HC, K, S, W, Z]

Polypogon Desfontaines 1798

A genus of about 18 species, annuals and perennials, of tropical and warm temperate regions. References: Barkworth in FNA (2007a); Tucker (1996)=Z.

- 1 Inflorescence verticillate, the rachis visible between the verticils; glumes 1.6-2.3 mm long, without awns; spikelets disarticulating near base of pedicel; stoloniferous perennial..... **P. viridis**
- 1 Inflorescence dense, cylindrical, and spikelike; glumes 2-3 mm long, with prominent awns 3.5-7 mm long; spikelets disarticulating near apex of pedicel; annual.
 - 2 Glumes deeply lobed, the awn borne between the lobes; glume ciliate-fringed; lemma 0.4-0.7 mm long, awnless..... **P. maritimus var. maritimus**
 - 2 Glumes slightly notched at the tip, the awn borne from near the tip; glume not ciliate-margined; lemma 0.7-1.1 mm long, awned..... **P. monspeliensis**

- * **Polypogon interruptus** Kunth, Ditch Rabbitfoot Grass. Ditches, disturbed wet areas; native of w. North America, Mexico, south through Central America to South America. See Diamond (2013b) for additional information. [= FNA, K2] {not yet keyed}
- * **Polypogon maritimus** Willdenow var. **maritimus**, Mediterranean Beardgrass. Brackish marshes; native of Mediterranean Europe. *P. maritimus* Willdenow is reported as introduced to GA (Small 1933). [= FNA; < *P. maritimus* – HC, K, S, WH3, Z]
- * **Polypogon monspeliensis** (Linnaeus) Desfontaines, Rabbitfoot Grass, Beardgrass, Annual Beardgrass. Brackish marshes, disturbed areas; native of s. Europe to w. Asia. May-Jul. [= C, F, FNA, G, GW, HC, K, Pa, RAB, S, WH3, Z]
- * **Polypogon viridis** (Gouan) Breistroffer, Water Bent-grass. Introduced on ballast around old ports, probably not persistent; native of the Old World. Distinguished from *Agrostis* in having the spikelet falling as a whole, disarticulating below the glumes. [= FNA, K, Z; = *Agrostis viridis* Gouan – C; > *Agrostis verticillata* Villars – F; > *Agrostis semiverticillata* (Forskål) C. Christensen – G, HC]

Pseudosasa Makino ex Nakai 1925 (Arrow Bamboo)

A genus of about 36 species, native of China, Japan, and Korea. References: Stapleton in FNA (2007a); Judziewicz et al. (2000)=Y.

- * **Pseudosasa japonica** (Siebold & Zuccarini ex Steudel) Makino ex Nakai, Arrow Bamboo. Cultivated as an ornamental, persistent or spreading from plantings; native of Japan. This species has the potential to become invasive; it is likely already much more common in the Southeast than the map indicates. [= FNA, HC, K, Pa, WH3, Y, Z; = *Sasa japonica* (Siebold & Zuccarini ex Steudel) Makino]

Puccinellia Parlatore 1848 (Alkali Grass, Goosegrass)

A genus of about 80-120 species, north temperate. References: Davis & Consaul in FNA (2007a).

- 1 Lemmas 3.0-4.5 mm long; spikelets 5-11-flowered..... **P. maritima**
- 1 Lemmas 1.5-2.5 mm long; spikelets 2-6-flowered.
 - 2 Inflorescence diffuse, the lower branches with spikelets restricted to the distal portions; lower inflorescence branches spreading horizontal to deflexed at maturity; lemma 1.5-2.1 mm long, the midnerve not reaching the apex..... **P. distans**
 - 2 Inflorescence compact, the lower branches bearing spikelets nearly to the base; lower inflorescence branches ascending at maturity; lemma 2.0-2.5 mm long, the midnerve reaching the apex, and often excurrent as a mucro..... **P. fasciculata**

- * **Puccinellia distans** (Jacquin) Parlatore, European Alkali Grass, Goosegrass. Disturbed roadsides, coastal sands; native of Eurasia. Late May-early Jul. Confirmed for Watauga County, NC (Poindexter, pers. comm. 2009). [= C, FNA, G, HC, Pa; > *P. distans var. distans* – F; > *P. distans ssp. distans* – K]

* *Puccinellia fasciculata* (Torrey) E.P. Bicknell, Eastern Alkali Grass, Saltmarsh Goosegrass. Salt or brackish marshes. NS south to VA; Europe; and in sw. United States. The native or introduced status of this species in ne. North America is controversial. [= C, F, FNA, G, HC, K]

* *Puccinellia maritima* (Hudson) Parlatore, Seaside Alkali Grass, Seaside Speargrass. Salt marshes and ballast near ports. Introduced south to se. PA (Philadelphia), NJ (Camden), and DE, especially on ballast. [= C, F, FNA, G, HC; > *P. americana* Sorenson – K] {synonymy incomplete}

***Reimarochloa* A.S. Hitchcock 1909**

A genus of about 4 species, of the New World tropics. References: Barkworth in FNA (2003a).

Reimarochloa oligostachya (Munro ex Bentham) A.S. Hitchcock. Moist hammocks, wet grasslands. Ne. FL (Duval County) and s. AL south to s. FL; Cuba. [= FNA, HC, K, WH3]

***Rostraria* Trinius 1820**

A genus of about 10 species, native of the Mediterranean region and w. Asia. References: Standley in FNA (2007a).

* *Rostraria cristata* (Linnaeus) Tzvelev. Waste areas near wool-combing mills, other disturbed areas, ballast; native of Europe. It also occurs at scattered other sites in eastern United States, such as on ballast in se. PA (Rhoads & Klein 1993), and reported for MD, AL, and FL (Kartesz 1999). [= K; > *R. cristata* var. *cristata* – FNA; > *R. cristata* var. *glabriflora* (Trautvetter) Doğan – FNA; = *Lophochloa cristata* (Linnaeus) Hylander; = *Koeleria phleoides* (Villars) Persoon – HC; ? *Koeleria gerardii* (Villars) Shiners – WH3]

***Rottboellia* Linnaeus f. 1782 (Itch-grass)**

A genus of about 5 species, native to tropical Asia and Africa. References: Wipff in FNA (2003a); Wipff & Rector (1993)=Z.

* *Rottboellia cochinchinensis* (Loureiro) W.D. Clayton, Itch-grass. Disturbed ground; native of tropical se. Asia. Aug-Oct. This grass, considered a noxious weed, was found in at least 13 GA counties by 1985 (Duncan 1985; Carter, Baker, & Morris 2009), on a farm in Robeson County, NC in 1984, in cornfields in Westmoreland County, VA in 2007, and in Berkeley County, SC in 2013. [= FNA, K, WH3, Z; = *Rottboellia exaltata* Linnaeus f. – HC; = *Manisuris exaltata* (Linnaeus f.) Kuntze – S]

***Saccharum* Linnaeus 1753 (Sugarcane)**

A genus of ca. 6 species, perennial grasses, of the Paleotropics. References: Webster in FNA (2003a). [also see *Erianthus*]

Saccharum officinarum Linnaeus, Sugarcane. Cultivated along the Gulf Coast, mainly in LA, and sparingly persistent; native of se. Asia. Sugarcane (*Saccharum officinarum* Linnaeus, *S. sinense* Roxburgh, *S. barberi* Jeswiet, *S. spontaneum* Linnaeus, and cultivars and hybrids derived from those four species) is cultivated along the Gulf Coast, notably in FL and LA. [= FNA, HC, K2, WH3]

***Sacciolepis* Nash 1901 (Cupscale)**

A genus of about 30 species, primarily in the tropics and subtropics. References: Wipff in FNA (2003a).

- 1 Annual, cespitose; spikelets 2.5-3.5 mm long; [rare alien]*S. indica*
- 1 Perennial, from creeping stolons; spikelets (3-) 4-5 mm long; [common native]..... *S. striata*

* *Sacciolepis indica* (Linnaeus) Chase, Indian Cupscale. Low fields, ditches; native of India. Oct. [= FNA, GW, HC, K, RAB, WH3]

Sacciolepis striata (Linnaeus) Nash, American Cupscale. Marshes, interdune swales, ditches, swamps. Jul-Oct. S. NJ south to FL, west to e. TX and OK, nearly limited to the Coastal Plain, but occasionally inland as in w. NC and TN; also native in the West Indies and n. South America. [= C, F, FNA, G, GW, HC, K, RAB, W, WH3]

Sasa Makino & Shibata 1901

{A genus of} References:

- * *Sasa palmata* E.G. Camus, Broadleaf Bamboo. Reported for TN (Kartesz 1999; USDA NRCS 2007). [= K]

Schizachne Hackel 1909 (False Melic)

A monotypic genus, circumboreal in Asia and North America. References: Cayouette & Darbyshire in FNA (2007a).

Schizachne purpurascens (Torrey) Swallen, Purple Oatgrass, False Melic. Moist, rocky northern hardwood and spruce forests, rocky river bluffs. NL (Newfoundland) west to AK, south to MD, w. VA, WV, KY, IL, NM, and Mexico; also in ne. Asia. May-Jul. [= F, FNA, G, HC, K, Pa, WV; > *S. purpurascens* var. *purpurascens* – C]

Schizachyrium Nees 1829 (Little Bluestem)

A genus of about 60 species, widespread in tropical, subtropical, and warm temperate regions of the World. References: Wipff (1996a)=Z; Gandhi (1989)=Y; Wipff in FNA (2003a). Key based in part on Wipff in FNA (2003a).

- 1 Leaf blades 0.5-1.5 mm wide, with a lighter-colored zone in the center of the upper surface; sessile spikelet ca. 4 mm long.....*S. tenerum*
- 1 Leaf blades >1.5 mm wide, lacking a distinct lighter zone on the upper surface; sessile spikelet 5-11 mm long.
 - 2 First glume of sessile spikelet pubescent.....*S. sanguineum* var. *hirtiflorum*
 - 2 First glume of sessile spikelet glabrous.
 - 3 Plants rhizomatous, with internodes 6 mm long or longer; sessile spikelet 5-7 mm long.....*S. scoparium* var. *stoloniferum*
 - 3 Plants tufted, rhizome internodes absent or < 3 mm long, the stem sometimes decumbent at the base and rooting at the lower nodes (appearing nearly rhizomatous); sessile spikelet 6-10 mm long.
 - 4 Leaf sheaths broad and strongly keeled, hairs of the raceme internodes 2.5-6 mm long; stems decumbent at base, rooting at the lower nodes
 - 5 Ligules 1.5-2 mm long; pedicellate spikelets 1.5-5 mm long; [of the Atlantic Coast].....*S. littorale*
 - 5 Ligules 0.5-1 mm long; pedicellate spikelets 4.5-8.5 mm long; [of the Gulf Coast].....*S. maritimum*
 - 4 Leaf sheaths rounded or weakly keeled; hairs of the raceme internodes 1-3 (-4) mm long; stems erect, not rooting at the lower nodes.
 - 6 Sessile spikelet 0.4-0.6 mm wide; leaf blades 2.5-10 cm long.....*S. niveum*
 - 6 Sessile spikelet 0.6-1.2 mm wide; leaf blades 7-100 cm long.
 - 7 Pedicellate spikelets of the proximal spikelet units on each rame staminate, 5-10 mm long, with a lemma, the pedicellate spikelets of the distal units usually smaller (1-4 mm long) and sterile; sheaths and blades densely tomentose to glabrate*S. scoparium* var. *divergens*
 - 7 Most pedicellate spikelets sterile, 1-6 mm long, without a lemma; sheaths and blades usually glabrous, occasionally pubescent.....*S. scoparium* var. *scoparium*

Schizachyrium littorale (Nash) E.P. Bicknell, Seaside Little Bluestem. Coastal dunes and maritime dry grasslands, often with *Uniola paniculata*, *Panicum amarum*, and other dune plants. Aug-Oct. E. MA south to NC (or SC?), and inland on the shores of the Great Lakes. Reported for FL for ne. FL (Duval County) and Panhandle FL (Franklin County). [= FNA, GW, K; = *S. scoparium* var. *littorale* (Nash) Gould – C, Pa, WH3, Z; = *Andropogon scoparius* Michaux var. *littoralis* (Nash) A.S. Hitchcock – F, G; = *Andropogon littoralis* Nash – HC, S; < *Andropogon scoparius* Michaux – RAB; < *S. scoparium* (Michaux) Nash ssp. *littorale* (Nash) Gandhi & Smeins – Y]

Schizachyrium maritimum (Chapman) Nash. Coastal dunes and grasslands. AL, FL west to e. LA. [= FNA, GW, K; = *Andropogon maritimus* Chapman – HC, S; < *S. scoparium* var. *scoparium* – WH3] {add to synonymy}

Schizachyrium niveum (Swallen) Gould, Pinescrub Bluestem. Florida scrub, sandhills. FL Panhandle south to s. FL. Reported for Lowndes Co. in sc. GA (Kral 1973), but the report has been discounted by later authors (Wipff in FNA 2003a). [= FNA, K, WH3; = *Andropogon niveus* Swallen – HC, S]

Schizachyrium sanguineum (Retzius) Alston var. ***hirtiflorum*** (Nees) Hatch, Hairy Crimson Bluestem. Pine flatwoods, sandhills, disturbed sandy sites. Sw. GA and FL west to AZ and south through Central America to South America; West Indies. [= FNA, K; = *Andropogon hirtiflorus* (Nees) Kunth – HC, S; ? *S. sanguineum* var. *brevipedicellatum* (Beal) Hatch]

Schizachyrium scoparium (Michaux) Nash var. ***divergens*** (Hackel) Gould, Pinehill Bluestem. Various open habitats. KY, AR, and TX, south to Panhandle FL, AL, MS, and LA. [= FNA, K; = *Andropogon scoparius* Michaux var. *divergens* Hackel; = *Andropogon divergens* – HC; < *Andropogon scoparius* – S]

Schizachyrium scoparium (Michaux) Nash var. ***scoparium***, Common Little Bluestem. In a wide range of moist to dry habitats. (Jun-) Aug-Oct. NB west to AB, south to FL and Mexico. One of the most ubiquitous plants in the modern landscape of our area, occurring throughout in the majority of habitats. This species is extremely variable, some of the variability correlated with habitat and geography; the recognition of infraspecific taxa is warranted. [= C, FNA, Pa, Z; = *S. scoparium* – GW; > *Andropogon scoparius* var. *scoparius* – F, G, HC; > *Andropogon praematurus* Fernald – F, G; > *Andropogon scoparius* var. *polycladus* Scribner & Ball – F; > *Andropogon scoparius* var. *frequens* F.T. Hubbard – F; = *S. scoparium* ssp. *scoparium* – K, Y; < *Andropogon scoparius* Michaux – RAB, S, W, WV; < *S. scoparium* var. *scoparium* – WH3]

Schizachyrium scoparium (Michaux) Nash var. ***stoloniferum*** (Nash) J. Wipff, Creeping Little Bluestem. Fall-line sandhills in the inner Coastal Plain, perhaps in other dry habitats, the habitat and range in our area requiring further study. Aug-Oct. SC and GA south to FL and west to MS. See Wipff (1996a) for additional discussion. [= FNA, K, Z; = *S. stoloniferum* Nash – GW; = *Andropogon stolonifer* (Nash) A.S. Hitchcock – HC, S; < *Andropogon scoparius* Michaux – RAB; < *S. scoparium* ssp. *littorale* (Nash) Gandhi & Smeins – Y]

Schizachyrium tenerum Nees, Slender Bluestem. Longleaf pine savannas, sandhills, and flatwoods. Ne. FL, s. GA, and FL Panhandle west to e. TX. [= FNA, K, WH3; = *Andropogon tener* (Nees) Kunth – HC, S]

Sclerochloa Palisot de Beauvois 1812 (Hard Grass)

A genus of 2 species, annuals, native of s. Europe and w. Asia. References: Brandenburg in FNA (2007a); Tucker (1996)=Z; Brandenburg, Estes, & Thieret (1991).

* ***Sclerochloa dura*** (Linnaeus) Palisot de Beauvois, Hard Grass, Fairground Grass. Athletic fields, lawns; native of Mediterranean Europe. In VA, known from a single site and doubtfully persisting (VBA 2007). Also reported from GA, MD, MS, and TN (Kartesz 1999). [= C, HC, K, Pa, Z]

Secale Linnaeus 1753 (Rye)

A genus of 3 species, native to western w. Asia and the Mediterranean. References: Barkworth in FNA (2007a); Tucker (1996)=Z.

* ***Secale cereale*** Linnaeus, Rye. Fields; commonly cultivated, uncommonly persistent or volunteering after cultivation; native of Eurasia. May-Jul. An important crop, cultivated for at least 8000 years. The lemmas have awns 2-6 cm long. [= C, F, FNA, G, HC, K, Pa, RAB, WH3, Z]

Setaria Palisot de Beauvois 1807 (Foxtail Grass)

A genus of about 110-140 species, of tropical and warm temperate regions. Webster (1995) merged *Paspalidium* into *Setaria*, but it now appears that *Paspalidium* should be held as separate. References: Webster (1993)=Z; Webster (1995)=Y; Crins (1991)=X; Webster (1988); Rominger in FNA (2003a); Allen in FNA (2003a). Key adapted from FNA. [also see *Cenchrus*]

- 1 None of the spikelets subtended by a stiff bristle[see *Paspalidium*]
- 1 Terminal spikelet on each branch subtended by a single bristle (other spikelets also sometimes so subtended)
 - 2 Most spikelets other than the terminal lacking a subtending bristle; leaves flat or plicate; [rare aliens].
 - 3 Blades flat, 2-5 mm wide; only terminal spikelet of each branch with a subtending bristle[*S. chapmanii*]
 - 3 Blades plicate, 10-80 mm wide; a single bristle sometimes present below non-terminal as well as terminal spikelets.
 - 4 Annual; leaves 10-25 mm wide [*S. barbata*]
 - 4 Perennial; leaves 20-80 mm wide *S. palmifolia*
 - 2 All spikelets subtended by 1 or more bristles; leaves flat; [aliens and natives, collectively widespread and common].
 - 5 Bristles 4-12 below each spikelet.
 - 6 Annual, with fibrous roots *S. pumila* ssp. *pumila*
 - 6 Perennial, noticeably rhizomatous.
 - 7 Panicle 3-8 (10) cm long; plant from knotty rhizomes; [native, common (sometimes weedy)] *S. parviflora*
 - 7 Panicle 5-25 cm long; plant from thick rhizomes; [alien, rare] *S. sphacelata*
 - 5 Bristles 1-3 (rarely 6) below each spikelet.
 - 8 Bristles retrorsely scabrous.
 - 9 Leaves strigose on the lower surface; sheath margins glabrous; panicles 2-6 cm long[*S. adhaerans*]
 - 9 Leaves scabrous on the lower surface; sheath margins ciliate; panicles 5-15 cm long *S. verticillata*
 - 8 Bristles antrorsely scabrous
 - 10 Perennial *S. macrosperma*
 - 10 Annual.
 - 11 Upper lemmas smooth and shiny (occasionally with obscure rugosity)
 - 12 Culms to 1 m tall; spikelets ca. 3 mm long; [alien, of ruderal sites] *S. italica*
 - 12 Culms to 6 m tall; spikelets ca. 2 mm long; [native, of marshes] *S. magna*
 - 11 Upper lemmas distinctly transversely rugose, dull.
 - 13 Upper lemmas coarsely rugose; leaves 4-7 mm wide; [native] *S. corrugata*
 - 13 Upper lemmas finely rugose; leaves 4-25 mm wide; [aliens, generally of ruderal sites].
 - 14 Panicles verticillate; rachises visible, scabrous *S. verticilliformis*
 - 14 Panicles densely spiciform; rachises not visible, villous.
 - 15 Leaves softly pilose on the upper surface; panicles arching and drooping from the base; spikelets 2.5-3.0 mm long *S. faberi*
 - 15 Leaves scabrous on the upper surface; panicles nodding only at the tip; spikelets 1.8-2.2 mm long.
 - 16 Panicles 10-20 cm long; culms 10-25 dm tall; leaves 10-25 mm wide *S. viridis* var. *major*
 - 16 Panicles 3-8 cm long; culms 2-10 dm tall; leaves 4-12 mm wide *S. viridis* var. *viridis*

Setaria adhaerans (Forsskål) Chiovenda. Disturbed areas; native of the tropics. Distributed widely throughout the tropics and subtropics, in North America from s. AL west to CA (perhaps only adventive in portions of that distribution). [= FNA, K, Z] {synonymy incomplete}

* *Setaria barbata* (Lamarck) Kunth, Mary-grass. On ballast at Apalachicola (Franklin County, FL), other disturbed areas; native of Africa. [= FNA, HC, K, WH3]

* *Setaria chapmanii* (Vasey) Pilger, Chapman's Bristlegrass. Waste ground near wool-combing mill (Berkeley County, SC); native to s. FL, West Indies, and Mexico. Only the terminal spikelet on each branch is subtended by a bristle, which resembles an aborted pedicel. [= FNA, K; = *Panicum chapmanii* Vasey – HC, S] {not yet keyed; X, Y, and Z may need to be added to synonymy}

Setaria corrugata (Elliott) J.A. Schultes. Pinelands, disturbed areas. Ne. NC south to s. FL, west to e. TX; Cuba; Dominican Republic. [= FNA, HC, K, RAB, WH3, Z; = *Chaetochloa corrugata* (Elliott) Scribner – S]

* *Setaria faberi* R.A.W. Herrmann, Nodding Foxtail Grass, Giant Foxtail-grass. Disturbed areas; native of China. [= C, FNA, G, K, Pa, RAB, W, WH3; = *S. faberii* – F, HC, WV, Z, orthographic variant]

* *Setaria italica* (Linnaeus) Palisot de Beauvois, Foxtail-millet, Italian-millet. Disturbed areas; native of Eurasia. Probably derived via cultivation from *S. viridis*, and cultivated as a food crop in China since at least 6000 BP and later in Europe (Hancock 2004). [= C, F, FNA, G, HC, K, Pa, RAB, W, WH3, WV, Z; = *Chaetochloa italica* (Linnaeus) Scribner – S]

Setaria macrosperma (Scribner & Merrill) K. Schumann, Coral Bristlegrass. Hammocks and maritime forests, also disturbed areas. SC south to FL; Bahamas, Mexico. [= FNA, HC, K, RAB, WH3, Z; = *Chaetochloa macrosperma* Scribner & Merrill – S]

Setaria magna Grisebach, Saltmarsh Foxtail-grass, Giant Foxtail-grass. Interdune swales, near-coastal marshes. NJ south to s. FL, west to e. TX; disjunct inland in GA, AR, LA, TX, and NM; West Indies, Bermuda, Costa Rica. [= C, F, FNA, G, HC, K, RAB, WH3, Z; = *Chaetochloa magna* (Grisebach) Scribner – S]

* *Setaria megaphylla* (Steudel) T. Durand & Schinz, Bigleaf Bristlegrass. Disturbed areas; native of South America. [= FNA, K2, WH3]

* *Setaria palmifolia* (J. König) Stapf, Palmgrass. Disturbed areas; native of Asia. [= FNA, HC, K, WH3]

Setaria parviflora (Poiret) Kerguelen, Knotroot Bristlegrass, Perennial Foxtail-grass. Marshes, ditches, moist disturbed areas. MA to IA south to s. FL and s. TX, south through Mexico to Central America; CA and NV; West Indies. Gandhi & Barkworth (2003) provide a detailed discussion of the reasons for the nomenclatural change. [= FNA, K, Pa, WH3, Z; = *S. geniculata* Palisot de Beauvois – C, F, G, HC, RAB, W, WV; = *Chaetochloa geniculata* (Palisot de Beauvois) Millspaugh & Chase – S]

* *Setaria pumila* (Poiret) Roemer & J.A. Schultes ssp. *pumila*, Yellow Foxtail. Disturbed areas, lawns, fields; native of Europe. Late Jul-Oct. [= FNA; = *Setaria glauca* (Linnaeus) Palisot de Beauvois – RAB, C, F, G, W, WV, misapplied; >> *Setaria lutescens* (Weigel) Hubb. – HC, misapplied; >> *S. pumila* ssp. *pallidifusca* – K, treatment apparently garbled; < *S. pumila* – Pa, WH3; = *Chaetochloa lutescens* (Weigel) Stuntz – S]

* *Setaria setosa* (Swartz) Palisot de Beauvois, West Indian Bristlegrass. On ballast in old seaports, apparently a waif and not established; native of the West Indies. [= FNA, WH3; > *S. setosa* var. *setosa* – K2] {rejected; not keyed}

* *Setaria sphaecelata* (Schumacher) Stapf & C.E. Hubbard, African Bristlegrass. Disturbed areas; native of Africa. [= FNA, K, WH3]

* *Setaria verticillata* (Linnaeus) Palisot de Beauvois, Hooked Bristlegrass. Disturbed areas; native of Europe. [= FNA, G, K, Pa, WH3, WV; = *S. verticillata* var. *verticillata* – C, F, HC; = *Chaetochloa verticillata* (Linnaeus) Scribner – S; < *S. verticillata* – Z]

* *Setaria verticilliformis* Dumortier. Reported for NJ, PA, MD, and AL (FNA 2003a, Kartesz 1999). [= FNA, K; = *S. verticillata* (Linnaeus) Palisot de Beauvois var. *ambigua* (Gussone) Parlatores – C, F, HC; = *S. viridis* (Linnaeus) Palisot de Beauvois var. *ambigua* (Gussone) Cosson & Durieu – G; = *Chaetochloa ambigua* Gussone – S; < *S. verticillata* – Z]

* *Setaria viridis* (Linnaeus) Palisot de Beauvois var. *major* (Gaudin) Pospichal, Giant Green Foxtail. Reported as introduced in TN, MD, and PA (Kartesz 1999). [= C, FNA, G, K, Pa, Z; < *S. viridis* – HC, RAB]

* *Setaria viridis* (Linnaeus) Palisot de Beauvois var. *viridis*, Green Bristlegrass. Fields, disturbed areas; native of Eurasia. Sorghastrum Nash 1901 (Indiangrass)

A genus of about 18-20 species, of tropical and subtropical America and Africa, rarely extending into temperate areas.

References: Hall (1982)=Z; Dávila Aranda & Hatch in FNA (2003a). Key adapted from Z.

- 1 Awns 10-22 (-30) mm long, once-geniculate; plants rhizomatous; surfaces of the glumes tan to slightly brown basally; ligule 2-10 mm long, prominently auricled.....*S. nutans*
- 1 Awns 16-46 mm long, twice-geniculate; plants cespitose; surfaces of the glumes brown; ligule 1-5 mm long, truncate.
- 2 Axis of the panicle straight, erect, the branchlets appressed to ascending, the spikelets drooping-second; spikelets 0.8-1.2 mm wide*S. secundum*
- 2 Axis of the panicle arching, usually strongly so, the branchlets ascending to spreading, the spikelets not drooping-second; spikelets 1.1-1.8 mm wide.
- 3 Axis of the panicle straight, with the branches distributed no more than 180 degrees around the axis (as viewed from above).....*S. apalachicolense*
- 3 Axis of the panicle arching, with the branchlets distributed through 360 degrees around the axis (as viewed from above) *S. elliotii*

Sorghastrum apalachicolense D.W. Hall, Apalachicola Indiangrass, Open Indiangrass. Flatwoods and sandhills. Jul-Aug. Panhandle FL west to s. MS (Sorrie & Leonard 1999). It may well occur as well in GA. [= K, WH3, Z; < *S. elliotii* – FNA]

Sorghastrum elliotii (C. Mohr) Nash, Slender Indiangrass. Woodlands and forests, river-scour areas, including oak-hickory forests and woodlands over mafic rocks. Sep-Oct. MD south to FL and west to TX, inland to TN, AR, and OK, mainly

on the Coastal Plain, but extending inland to other physiographic provinces. [= C, F, G, HC, K, RAB, S, W, WH3, Z; < *S. elliottii* – FNA (also see *S. apalachicolense*)]

Sorghastrum nutans (Linnaeus) Nash, Yellow Indiangrass. Xeric and mesic woodlands and forests of a wide variety, powerline rights-of-way, roadbanks. Late Aug-Oct. ME and QC west to s. MB, south to c. peninsular FL, TX, UT, AZ, and Mexico. Along with *Andropogon gerardi*, *Schizachyrium scoparium*, and *Panicum virgatum*, *Sorghastrum nutans* is one of the dominant grasses of the tall-grass prairie. It is also common in a variety of open habitats (natural and altered) in the forested landscape of eastern North America. [= C, F, FNA, G, HC, K, Pa, RAB, S, W, WH3, WV, Z; = *S. avenaceum* (Michaux) Nash]

Sorghastrum secundum (Elliott) Nash, Lopsided Indiangrass. Sandhills. Sep-Oct. S. SC south to s. FL and west to s. AL (Sorrie & Leonard 1999). [= FNA, HC, K, RAB, S, WH3, Z]

Sorghum Moench 1794 (Sorghum, Milo, Johnson Grass)

A genus of about 25 species, of tropical and subtropical Old World (1 species in Mexico). References: Barkworth in FNA (2003a); de Wet (1978)=Z.

- 1 Rhizomatous perennial; leaves 1-2 cm wide..... *S. halepense*
- 1 Fibrous-rooted annual; leaves (2-) 3-5 cm wide.
- 2 Inflorescence dense, compact; plants 0.5-1.3 m tall..... *S. bicolor* var. *bicolor*
- 2 Inflorescence open, with spreading branches; plants 1.0-3.0 m tall *S. bicolor* var. *drummondii*

* ***Sorghum bicolor*** (Linnaeus) Moench var. *bicolor*, Sorghum, Milo, Broomcorn, Sorgo. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (VA): cultivated, rarely persistent; common in cultivation, rare as an escape. Oct. [= C; < *Sorghum vulgare* Persoon – RAB; < *Sorghum vulgare* – F, orthographic variant; = *S. vulgare* var. *vulgare* – HC; = *S. bicolor* ssp. *bicolor* – FNA, K, Pa, WH3; < *Holcus sorghum* Linnaeus – S]

* ***Sorghum bicolor*** (Linnaeus) Moench var. *drummondii* (Nees ex Steudel) Mohlenbrock, Shattercane. Cp, Pd (GA, NC, SC, VA): cultivated, rarely persistent; common in cultivation, rare as an escape. Oct. This is the taller variety with open inflorescences, usually sporadically present in sorghum fields. [= C; < *Sorghum vulgare* Persoon – RAB; < *Sorghum vulgare* – F, orthographic variant; = *Sorghum bicolor* ssp. *drummondii* (Nees ex Steudel) de Wet – FNA, Pa; = *Sorghum vulgare* Persoon var. *drummondii* (Nees ex Steudel) Hackel ex Chiovenda – HC; = *Sorghum bicolor* ssp. *drummondii* (Nees ex Steudel) de Wet & Harlan – K, WH3; < *Holcus sorghum* Linnaeus – S]

* ***Sorghum halepense*** (Linnaeus) Persoon, Johnson Grass. Roadsides, fields, waste places; native of Eurasia. A serious weed, difficult to eradicate. [= C, FNA, GW, HC, K, Pa, RAB, W, WH3, WV; = *Sorghum halepense* – F, G, orthographic variant; = *Holcus halepensis* Linnaeus – S]

Sphenopholis Scribner 1906 (Wedgegrass)

A genus of 6 species, North American. References: Daniel in FNA (2007a); Tucker (1996)=Z. Key based in part on C.

- 1 Spikelets 5-9.5 mm long; second lemma with an awn 3.5-7 mm long..... *S. pensylvanica*
- 1 Spikelets 1.5-5 mm long; second lemma awnless, or with an awn up to 3.5 mm long.
- 2 Lower leaf blades mostly (10-) 15-45 cm long, usually involute, < 2 mm wide..... *S. filiformis*
- 2 Lower leaf blades mostly < 10 cm long, flat, 2-8 mm wide.
- 3 First glume 1/3-2/3 as wide as the second glume; second lemma strongly scabrous..... *S. nitida*
- 3 First glume less than 1/3 as wide as the second glume; second lemma smooth to slightly scabrous.
- 4 First lemma with an awn up to 3.5 mm long..... *S. x pallens*
- 4 First lemma unawned.
- 5 Panicle open; second glume 3-6× as long as wide, acute at the tip; lowermost rachilla internode 0.8-1.0 mm long *S. intermedia*

- 5 Panicle densely cylindrical; second glume 2-3× as long as wide, rounded or truncate at the tip; lowermost rachilla internode 0.5-0.7 mm long.....*S. obtusata*

Sphenopholis filiformis (Chapman) Scribner. Pine savannas, sandy woodlands. Apr-May. Se. VA south to n. peninsular FL, west to e. TX. [= C, F, FNA, K, RAB, S, WH3, Z]

Sphenopholis intermedia (Rydberg) Rydberg, Slender Wedgegrass. Moist nutrient-rich forests. May-Jun. NL (Newfoundland) west to c. AK, south to Panhandle FL, c. TX, and AZ. Perhaps better treated at the varietal level. [= F, FNA, K, RAB, S, WV; = *S. obtusata* (Michaux) Scribner var. *major* (Torrey) K.S. Erdman – C, Z; < *S. intermedia* – G (also see *S. ×pallens*); < *S. obtusata* – GW, W, WH3; = *S. obtusata* var. *intermedia* (Rydberg) Rydberg – Pa]

Sphenopholis nitida (Biehler) Scribner. Moist forests, bottomlands. Apr-Jun. MA west to IL, south to n. peninsular FL and TX. [= C, F, FNA, K, Pa, RAB, S, W, WH3, WV, Z; > *S. nitida* var. *glabra* (Nash) Scribner – G; > *S. nitida* var. *nitida* – G]

Sphenopholis obtusata (Michaux) Scribner, Prairie Wedgegrass. Forests, roadsides, disturbed areas. Apr-May. ME west to MN and BC, south to s. FL, TX, c. Mexico, and s. CA. [= FNA, G, K, RAB, S, WV; = *S. obtusata* var. *obtusata* – C, Pa, Z; > *S. obtusata* var. *obtusata* – F; > *S. obtusata* var. *pubescens* (Scribner & Merrill) Scribner – F; < *S. obtusata* – GW, W, WH3 (also see *S. intermedia*)]

Sphenopholis ×pallens (Biehler) Scribner (pro sp.) [*S. obtusata* × *pensylvanica*]. Ditches, wet forests. Seemingly not always with its parents. May. [= C, K; = *S. pallens* – RAB, F, S; < *S. intermedia* (Rydberg) Rydberg – G; = *S. obtusata* × *pensylvanica* – Pa]

Sphenopholis pensylvanica (Linnaeus) A.S. Hitchcock, Swamp-oats. Bogs, ditches, wet forests. Apr-Jun. MA west to OH and se. MO, south to n. peninsular FL and LA. [= C, FNA, K, Pa, WH3, Z; = *Trisetum pensylvanicum* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes – F, G, RAB, S, WV; = *S. pensylvanica* – GW, orthographic variant]

Sporobolus R. Brown 1810 (Dropseed)

A genus of about 193 species, perennials and annuals, of tropical, subtropical, and warm-temperate parts of the New World and Old World. Many studies over many decades have pointed towards the likely and necessary combination of related genera with *Sporobolus*. For *Calamovilfa*, Reeder & Ellington (1960) and Ortiz-Diaz & Culham (2000) showed very close affinities of *Calamovilfa* to portions of *Sporobolus*. Molecular studies have made clear that the genera *Spartina*, *Calamovilfa*, and *Crypsis* (in our flora) are deeply embedded with *Sporobolus*, with affinities to different sections of species of *Sporobolus*, and that an appropriate taxonomic treatment either requires a broad *Sporobolus*, as followed here, based on Peterson et al. (2014a, 2014b) or the segregation of 6-7 additional genera from *Sporobolus*. Additionally, there is a nomenclatural issue, requiring nomenclatural conservation of the name *Sporobolus* against several names (including *Spartina*) with priority (Peterson et al. 2014b). References: Peterson et al. (2014a, 2014b)=V; Riggins (1977)=Z; Weakley & Peterson (1998)=Y; Peterson, Hatch, & Weakley in FNA (2003a); Hammel & Reeder in FNA (2003b); Barkworth in FNA (2003a); Thieret in FNA (2003a); Simon & Jacobs (1999)=X; Peterson, Romaschenko, & Johnson (2010); Thieret (1966)=U

Identification notes: *S. brevipilis* and *S. vaseyi* are somewhat similar to *S. pinetorum*, *S. floridanus*, and *S. curtissii* (herbarium specimens of the two genera have been regularly confused); *S. brevipilis* and *S. vaseyi* are distinguished by leaves tapered to either end and long-acuminate (vs. parallel-margined and abruptly acute in *S. pinetorum*, *S. floridanus*, and *S. curtissii*) and tendency to form larger, clonal patches (*S. pinetorum*, *S. floridanus*, and *S. curtissii* form wiregrass-like bunches or clumps). In flower or fruit, *S. brevipilis* and *S. vaseyi* can be distinguished by characters of the spikelet, by vegetative characters, or by its coarser, generally taller culms, with the panicle branches usually spreading (rather than always ascending in *S. pinetorum*, *S. floridanus*, and *S. curtissii*). These five species have very similar bases, unlike any other grasses in our area – the lower leaf sheaths are indurated and shiny, forming a hard, polished, knotty, and fire-proof covering over the short-creeping rhizome. *Aristida stricta* has a somewhat similar base, but less indurated, less creeping, and with an unpolished appearance. Positive identification in sterile condition is not difficult.

- 1 Inflorescences dense and spikelike, symmetrical, cylindrical or ovoid, unbranched; [section *Crypsis*; subsection *Crypsis*] [*S. schoenoides*]
- 1 Inflorescences loose and open, or if relatively dense, then with discernible branches, and thus lobed or asymmetrical.
- 2 Inflorescence an array of spikes, the spikelets closely imbricate in 2 rows along the rachis of the spikes, the spikes alternate along the primary inflorescence axis; [section *Spartina*].
- 3 Leaves with smooth or slightly scabrous margins; spikelets glabrous or nearly so; [of salt to brackish coastal marshes]; [section *Spartina*; subsection *Alterniflori*]..... *S. alterniflorus*
- 3 Leaves with strongly scabrous margins; spikelets scabrous, at least on the keel; [of brackish to fresh marshes, or inland or upland].
- 4 Plants strongly caespitose, forming large clumps with numerous basal leaves and culms; leaves involute; culms 0.5-2 m tall; [of s. SC southward].
- 5 Spikes 3-16 per inflorescence, appressed to ascending; leaves 3-7 mm wide, involute or somewhat flat toward the bases; [section *Spartina*; subsection *Spartina*]..... *S. bakeri*

- 5 Spikes (6-) 15-75 per inflorescence, tightly appressed; leaves 1.5-4.5 mm wide, strongly involute; [section *Spartina*; subsection *Poncoletia*]..... *S. spartinus*
- 4 Plants with elongate rhizomes, forming large clonal patches, the culms arising singly; leaves involute or flat; culms either 0.5-3.5 m tall; [collectively widespread in our area]; [section *Spartina*; subsection *Spartina*].
- 6 Spikes 1-9 per inflorescence; culms 0.5-1 m tall; leaves 0.5-4 (-7) mm wide, usually involute when fresh..... *S. pumilus*
- 6 Spikes 5-70 per inflorescence; culms 1-3.5 m tall; leaves 5-20 mm wide, usually flat when fresh.
- 7 Second glume acute, not awned; first glume averaging ca. 1/2 as long as the lemma; spikes (6-) 20-50 (-more) per inflorescence; [of fresh to brackish coastal marshes] *S. cynosuroides*
- 7 Second glume with an awn 3-10 mm long; first glume averaging ca. 7/8 as long as the lemma; spikes (5-) 7-27 per inflorescence; [of fresh marshes, either inland or coastal]..... *S. michauxianus*
- 2 Inflorescence a slender or broad panicle.
- 8 Florets with a conspicuous tuft of hairs on the callus; [section *Calamovilfa*; subsection *Calamovilfa*].
- 9 Panicles narrow, the branches appressed-ascending; [of the Coastal Plain of FL] *S. vaseyi*
- 9 Panicles broad, the branches ascending-spreading; [either of the Coastal Plain of SC northward, or of the interior].
- 10 Spikelets 6.0-7.4 mm long; glumes acute to acuminate, usually arcuate; lemmas 5.5-7.0 mm long, usually arcuate; [river scour areas in the rocky inland parts of the South] *S. arcuatus*
- 10 Spikelets 4.0-5.8 mm long; glumes acute, straight; lemmas 4.0-5.4 mm long, straight; [pineland habitats of the Coastal Plain of SC, NC, se. VA, and NJ]..... *S. brevipilis*
- 8 Florets not conspicuously hairy on the callus.
- 11 Inflorescence an open panicle, > 2 cm broad, the branches ascending to spreading.
- 12 Branches of the panicle verticillate, whorled; spikelets 2.5-4 mm long; [section *Triachyrum*] *S. junceus*
- 12 Branches of the panicle alternate (some occasionally rather randomly subopposite or opposite, but never regularly whorled); spikelets either 4-6.5 mm long, or 1.5-2.5 (2.7) mm long.
- 13 Spikelets 1.5-2.5 (-2.7) mm long.
- 14 Flag blades (the last leaf below the panicle) nearly perpendicular to the culm; [section *Cryptandri*] *S. cryptandrus*
- 14 Flag blades ascending to appressed.
- 15 Mature panicle 15-25 cm wide; [section *Airoides*] *[S. airoides]*
- 15 Mature panicle (1-) 2-5 cm wide; [section *Pyramidati*] *S. domingensis*
- 13 Spikelets 4-6.5 mm long; [section *Calamovilfa*; subsection *Floridani*].
- 16 First glume scaberulous, acuminate or awn-like; spikelets dark gray; base of plant relatively fibrous; grain spherical; [of rocky barrens of the Mountains of NC and VA] *S. heterolepis*
- 16 First glume glabrous, acute to acuminate; spikelets purplish (fading tan); base of plant smooth and hard, made up of the indurated leaf bases; grain oblong (when present, usually abortive); [of pine savannas and seeps of the Coastal Plain of NC, SC, and southward].
- 17 Leaves terete or subterete (wiry), oval in cross-section, sometimes irregularly channelled for portions of their lengths (never with any portion above the sheath flat), < 1 mm wide, tending to senesce and turning tan in autumn, the margins generally smooth; culms (including the inflorescence) (2-) 4-7 (-10) dm tall; culms (from base to first inflorescence branch) 1.5-5 dm tall; first glume averaging about 0.7× as long as the second glume (though variable, ranging from 0.5-0.75×)..... *S. teretifolius*
- 17 Leaves flat (folded when dry), plane or V-shaped in cross-section, with free margins their entire length, 1.2-2 (-2.7) mm wide, tending to remain green into the winter (at least until December), the margins scabrous (except in *S. curtisii*); culms (including the inflorescence) 3-22 dm tall; culms (from base to first inflorescence branch) (4-) 6-10 dm tall; first glume averaging 0.75-1× as long as the second glume (though variable, collectively ranging from about 0.6-1.2×).
- 18 First glume averaging 0.95-1.1× as long as the second glume (though variable, ranging from 0.8-1.3×); pedicels mostly 1-3 mm long (a few sometimes as long as 10 mm long), appressed; culms (including the inflorescence) 3-7 dm tall; inflorescence branches stiffly ascending; leaves 0.5-1.5 mm wide (or to 2.0 mm wide when unburned), mostly 1.5-4 dm long (rarely to 5 dm long), smooth on the margins; [of e. SC southward] *S. curtisii*
- 18 First glume averaging 0.6-0.9× as long as the second glume (though variable, ranging from 0.6-0.95×); pedicels mostly 4-15 mm long, spreading; culms (including the inflorescence) (3-) 7-16 (-22) dm tall; inflorescence branches initially ascending, later loosely ascending to spreading; leaves 1.2-10.0 mm wide, mostly (3-) 4-8 dm long, upwardly scabrous on the margins; [of e. NC southward].
- 19 Leaves (2.0-) 3-10 mm wide, pale bluish-green (often with some yellowish leaves as well); first glume averaging 0.75-0.9× as long as the second glume (though variable, ranging from 0.6-0.95×); culms (including the inflorescence) usually 12-22 dm tall; inflorescence usually 3.5-5 dm long; [of se. SC southward]..... *S. floridanus*
- 19 Leaves 1.2-2.0 (-3.0) mm wide, dark green; first glume averaging 0.6-0.8× as long as the second glume (though variable, ranging from 0.6-0.8×); culms (including the inflorescence) usually 6-12 (-18) dm tall; inflorescence usually 2-3.5 dm long; [of e. NC south to e. GA]..... *S. pinetorum*
- 11 Inflorescence a contracted, (superficially) spike-like panicle, < 2 cm broad, the branches appressed.
- 20 Plant a geniculate annual; most inflorescences enclosed by sheaths (or most or all exerted); inflorescence 2-5 cm long; [section *Clandestini*].
- 21 Spikelets (1.3-) 1.6-2.8 mm long; grain falling free of the lemma and palea; lemma glabrous..... *S. neglectus*
- 21 Spikelets 2.3-5 mm long; grain falling enclosed in the lemma and palea; lemma strigose (use 10× or more) or glabrous.
- 22 Lemma and palea shorter than the glumes; palea usually shorter than the lemma; lemma glabrous or strigose with hairs < 0.2 mm long; spikelets 2.3 -3.3 (-3.8) mm long; floret (lemma, palea and enclosed grain) 1.6-3.3 (-3.8)× as long as wide *S. ozarkanus*
- 22 Lemma and palea longer than the glumes; palea usually longer than the lemma; lemma strigose with hairs > 0.2 mm long; spikelets 2.8-5 mm long; floret (lemma, palea and enclosed grain) 2.2-5.7 (-7.5)× as long as wide *S. vaginiflorus*
- 20 Plant a rhizomatous or tufted perennial; most inflorescences exerted to partly enclosed; inflorescence 5-15 cm long.
- 23 Plant creeping extensively by slender rhizomes; leaf blades cauline, distichous, to 12 cm long; [section *Virginicae*]..... *S. virginicus*
- 23 Plant loosely tufted, from short rhizomes; leaf blades basal or cauline, not distichous, 10-100 cm long.

- 24 Spikelets 1.5-2.2 mm long; first glume 0.5-0.8 mm long; leaves primarily basal; [section *Sporobolus*].
- 25 Panicle branches appressed, 0.5-2 cm long in the middle of the inflorescence; second glume acute, > 1/2 as long as the spikelet.....*S. indicus*
- 25 Panicle branches ascending, 2-8 cm long in the middle of the inflorescence; second glume truncate or broadly obtuse, < 1/2 as long as the spikelet.
- 26 Plants to 7.5 dm tall; leaf blades to 4 dm long and 2.5-3.5 mm wide *S. Jacquemontii*
- 26 Plants to 17 dm tall; leaf blades to 7 dm long and 6-8 mm wide [*S. pyramidalis*]
- 24 Spikelets 4-8 mm long; first glume 2-5 mm long; leaves cauline and basal; [section *Clandestini*].
- 27 Lemma pubescent, usually conspicuously shorter than the palea; pericarp loose when moist..... *S. clandestinus*
- 27 Lemma glabrous, about as long as the palea; pericarp gelatinous when moist.
- 28 Culms (1.4-) 2.0-5.0 mm thick; uppermost leaf sheath (1.3-) 1.5-6.0 mm wide near its base; panicles with 12-35 primary branches, crowded, densely flowered..... *S. compositus* var. *compositus*
- 28 Culms 1.0-2.0 (-2.5) mm thick; terminal sheath 0.8-2.0 (-2.5) mm wide near its base; panicles with 8-18 primary branches, lax, loosely flowered.
- 29 Plants forming clonal patches, with scaly rhizomes *S. compositus* var. *macer*
- 29 Plants caespitose, lacking scaly rhizomes..... *S. compositus* var. *drummondii*

* *Sporobolus airoides* (Torrey) Torrey, Alkali Sacaton. Waste areas near wool-combing mills, not known to be established or persistent; native of w. North America. [= FNA, HC, K]

Sporobolus alterniflorus (Loiseleur) P.M. Peterson & Saarela, Saltmarsh Cordgrass, Smooth Cordgrass. Salt marshes. Aug-Oct. NL (Newfoundland) south to FL, west to TX; e. South America; introduced in n. Europe. *S. alterniflorus* is the dominant plant (often essentially a monoculture) of intratidal salt marshes in our area. [= V; = *Spartina alterniflora* Loiseleur - C, FNA, GW, K, RAB, WH3; > *Spartina alterniflora* var. *alterniflora* - F, G, HC, S; > *Spartina alterniflora* var. *glabra* (Muhlenberg ex Bigelow) Fernald - F, G, HC, S; > *Spartina alterniflora* var. *pilosa* (Merrill) Fernald - F, G, HC]

Sporobolus arcuatus (K.E. Rogers) P.M. Peterson, Cumberland Sandreed. Riverside scours, usually in areas of sandstone cobble. Ouachita Mountains of w. AR and e. OK; Cumberland Plateau of TN (Morgan and Cumberland counties), KY (McCreary County), and AL (Blount County). [= V; = *Calamovilfa arcuata* K.E. Rogers - FNA, K1, K2, U]

Sporobolus bakeri (Merrill) P.M. Peterson & Saarela, Sand Cordgrass. Brackish marshes, marsh edges, wet coastal hammocks, under *Sabal palmetto*, *Quercus virginiana*, and *Juniperus virginiana* var. *silicicola*. Jun. Se. SC south to s. FL, west to Panhandle FL. Along with *S. spartinus*, distinctive among our species in its densely clumped growth form. [= V; = *Spartina bakeri* Merrill - FNA, GW, HC, K, S, WH3]

Sporobolus brevipilis (Torrey) P.M. Peterson, Pinebarren Sandreed. Savanna-pocosin ecotones, sandhill seepage bogs, pocosins, boggy powerline rights-of-way. Jun-Oct. A "bimodal endemic", with two areas of distribution: Pine Barrens of NJ and the Coastal Plain (very rarely lower Piedmont) of e. NC, n. SC, and s. VA. The recognition of three geographic varieties (under *Calamovilfa*) by Fernald was judged by Thieret (1966) to be "untenable:" var. *brevipilis* of NJ, var. *calvipes* Fernald of VA, and var. *heterolepis* Fernald of NC-SC. Like *Aristida stricta*, this grass is essentially dependent on fire for flowering (it will also sometimes flower in response to mowing or other disturbance). Suppression of the natural fire regime has led to its substantial decline and the severe contraction of its range in the Southeast, since fire exclusion in its seepage or ecotone habitat leads to rapid invasion by shrubs and competitive elimination of *Sporobolus brevipilis* and many other herbs. [= V; = *Calamovilfa brevipilis* (Torrey) Scribner - C, FNA, G, GW, K1, K2, RAB, S, U, Va; > *C. brevipilis* var. *brevipilis* - F, HC; > *C. brevipilis* var. *calvipes* Fernald - F, HC; > *C. brevipilis* var. *heterolepis* Fernald - HC]

Sporobolus clandestinus (Biehler) A.S. Hitchcock, Rough Dropseed. Glades, barrens, and thin soil of woodlands, also in dry sands. Late Aug-Oct. This species is widespread in e. United States. Wipff & Jones (1995) recommend reducing this taxon to a variety under *S. compositus*, because of its morphologic similarity. While *S. clandestinus* and *S. compositus* are undoubtedly closely related, I prefer to retain the two as species. [= C, FNA, F, G, HC, K, Pa, S, W, WH3, Z; = *S. compositus* (Poiret) Merrill var. *clandestinus* (Biehler) J. Wipff & S.D. Jones - WH3]

Sporobolus compositus (Poiret) Merrill var. *compositus*, Tall Dropseed. Diabase glades and barrens, limestone glades and barrens, disturbed areas over diabase or calcareous rocks. Sep-Nov. This species and variety are reported for NC in a recent revision of the *S. asper* group (Riggins 1977); little is known about the occurrence of this species in NC. The general range is centered in the Plains, but extending east into ne. United States. The name *S. compositus* has nomenclatural priority over the more traditionally familiar *S. asper* (Kartesz & Gandhi 1995). [= FNA, K1, K2; = *S. asper* (Michaux) Kunth var. *asper* - C, G, HC, Z; = *S. asper* - F, S, WV; < *S. compositus* - Pa]

Sporobolus compositus (Poiret) Merrill var. *drummondii* (Trinius) Kartesz & Gandhi. Glades, barrens, roadsides, disturbed areas. East to the Ridge and Valley province of e. TN (Chester et al. 1993), occurring over limestone, and allegedly to GA (Kartesz 1999). It could very likely occur in sw. VA, as it is in Hawkins County, TN, immediately adjacent to VA (Chester et al. 1993). [= FNA, K1, K2; = *S. asper* (Michaux) Kunth var. *drummondii* (Trinius) Vasey - C, Z; = *S. drummondii* (Trinius) Vasey - F, S; = *S. asper* var. *hookeri* (Trinius) Vasey - G, HC, misapplied]

Sporobolus compositus (Poir.) Merritt var. *macer* (Trinius) Kartesz & Gandhi. Wet and dry pinelands, prairies, dry woodland margins. MO and KS south to MS, LA and e. TX. [= FNA, K1, K2; = *S. macer* (Trinius) A.S. Hitchcock – HC; = *S. macrus* (Trinius) A.S. Hitchcock – S]

Sporobolus cryptandrus (Torrey) A. Gray, Sand Dropseed. Floodplains, shores, disturbed areas; native west of the Appalachians, introduced eastward. Aug-Sep. C. and w. North America. This species is reported for NC by HC, F, and S. [= C, FNA, G, K, HC, Pa, S, WV, Z; > *S. cryptandrus* var. *cryptandrus* – F]

Sporobolus curtissii (Vasey ex Beal) Small ex Scribner, Curtiss's Dropseed. Moist, gummy-clay flatwoods. Sep-Nov. E. SC south to c. FL. First positively documented for our area in 1993. Earlier attributions of *S. curtissii* to NC and SC were apparently based on misapplication or confusion with *S. teretifolius* and/or *Sporobolus pinetorum*. *S. curtissii* differs from other "bunchgrass" *Sporobolus* of our area in having the spikelets short-pedicelled and appressed against the panicle branches (as opposed to long-pedicelled and spreading in *S. teretifolius* and *Sporobolus pinetorum*). [= FNA, HC, K, S, WH3, Y]

Sporobolus cynosuroides (Linnaeus) P.M. Peterson & Saarela, Giant Cordgrass. Brackish and freshwater tidal marshes, especially along margins of tidal creeks. Jun-Sep. MA south to FL, west to e. TX. [= V; = *Spartina cynosuroides* (Linnaeus) Roth – C, FNA, G, GW, HC, K, RAB, S, WH3; > *Spartina cynosuroides* var. *cynosuroides* – F]

* *Sporobolus diandrus* (Retzius) Palisot de Beauvois. Native of e. and se. Asia. [= FNA, X] {not yet keyed}

*? *Sporobolus domingensis* (Trinius) Kunth, Coral Dropseed. Coastal sands; uncertain whether native or introduced. Se. GA south to s. FL; West Indies, Mexico. The e. GA record (Glynn County) is at Univ. of Georgia (Sorrie, pers. comm.). [= FNA, HC, K, S, WH3]

* *Sporobolus fimbriatus* (Trinius) Nees. Waste areas near wool-combing mills, probably only a waif; native of Africa. [= FNA, HC, K] {not keyed}

* *Sporobolus flexuosus* (Thurb. ex Vasey) Rydberg. Waste areas near wool-combing mills, probably only a waif; native of sw. United States and n. Mexico. [= FNA, HC, K] {not keyed}

Sporobolus floridanus Chapman, Florida Dropseed. Wet savannas. Jun-Sep. Se. SC south to ne. FL, west to Panhandle FL. First positively documented for SC in 1995. Earlier attributions of *S. floridanus* to NC and SC were based on misapplication of the name to material actually representing *Sporobolus pinetorum*. [= FNA, K, WH3, Y; < *S. floridanus* – GW, HC, S (also see *S. pinetorum*); the inclusion of *S. floridanus* in RAB was based on a misidentification of *S. pinetorum*]

Sporobolus heterolepis (A. Gray) A. Gray, Prairie Dropseed. Barrens, glades, and prairies over mafic, ultramafic, and calcareous rocks (olivine, serpentine, limestone). Aug-Sep. The primary distribution of *S. heterolepis* is in the Plains, with outliers east to nw. GA (Jones & Coile 1988), c. TN (Estes & Beck 2005), w. NC, w. VA, se. PA, ne. United States, and adjacent Canada. [= C, F, FNA, G, HC, K, Pa, RAB, W, Y]

Sporobolus indicus (Linnaeus) R. Brown, Smut Grass, Blackseed. Roadsides, lawns, disturbed situations. Pantropical and subtropical, its original distribution apparently in the New World tropics, but obscured by its weedy capabilities and sometimes considered introduced in whole or in part in our area. Jul-Oct. [= C, FNA, GW, W, X; > *S. poiiretii* (Roemer & J.A. Schultes) A.S. Hitchcock – F, G, HC, RAB; > *S. indicus* – HC, S; > *S. berterioanus* (Trinius) A.S. Hitchcock & Chase – S; = *S. indicus* var. *indicus* – K, WH3]

Sporobolus jacquemontii Kunth, West Indian Dropseed. Pine flatwoods, beaches, roadsides on barrier islands. FL Panhandle (Wakulla County), FL peninsula; West Indies. The original distribution is the New World tropics and subtropics, but its exact extent is unclear, and the species may be entirely or partly alien in our area. [= FNA, X; < *S. indicus* var. *pyramidalis* (Palisot de Beauvois) Veldkamp – K; ? *S. berterioanus* (Trinius) A.S. Hitchcock & Chase – S; < *S. pyramidalis* Palisot de Beauvois]

Sporobolus junceus (Palisot de Beauvois) Kunth, Sandhills Dropseed. Sandhills, other dry, open areas. Sep-Oct. Se. VA south to FL and west to se. OK (Mink, Singhurst, & Holmes 2012) and se. TX. [= C, F, FNA, G, HC, K, RAB, WH3, Y; = *S. gracilis* (Trinius) Merrill – S]

Sporobolus michauxianus (A.S. Hitchcock) P.M. Peterson & Saarela, Prairie Cordgrass, Slough Grass. Banks of rivers and lakes, spray cliffs below waterfalls, rocky or sandy flood-scoured riverside grasslands, tidal freshwater (oligohaline) marshes, calcareous oak flatwoods and prairies. Jul-Oct. NL (Newfoundland) west to WA, south to ne. NC, sw. NC, AR, TX, and NM.

[= V; = *Spartina pectinata* Link – C, F, FNA, G, GW, HC, K, Pa, RAB, W, WV; > *Spartina pectinata* var. *pectinata* – F; > *Spartina pectinata* var. *suttiei* (Farwell) Fernald – F; = *Spartina michauxiana* A.S. Hitchcock – S]

Sporobolus neglectus Nash, Barrens Dropseed. Dry rocky barrens and outcrops, over calcareous rocks (such as limestone or dolomite). Aug-Sep. ME west to ND, south to NJ, w. VA, TN, LA, and TX; apparently disjunct in WA and AZ. *S. ozarkanus*, *S. neglectus*, and *S. vaginiflorus* form a still very poorly understood complex. [= C, F, FNA, G, HC, K, Pa, S, W]

Sporobolus ozarkanus Fernald, Ozark Dropseed. Limestone glades, diabase glades. Sep-Oct. KY west to KS, south to e. TN, AR, and TX; disjunct in c. NC. In Granville County, NC, it is associated (on glades of diabase, a mafic rock) with other taxa with affinities to midwestern glades and prairies: *Solidago rigida*, *Solidago ptarmicoides*, *Baptisia australis* var. *aberrans*, *Symphotrichum depauperatum*, *Silphium terebinthinaceum*, *Parthenium auriculatum*, *Ruellia humilis*, and others. *S. ozarkanus*, *S. neglectus*, and *S. vaginiflorus* form a still very poorly understood complex. [= C, F, G, HC, K; = *S. vaginiflorus* (Torrey ex A. Gray) Wood var. *ozarkanus* (Fernald) Shinnery – FNA, K]

Sporobolus pinetorum Weakley & P.M. Peterson, Carolina Dropseed, Savanna Dropseed. Wet savannas, savanna-pocosin ecotones, sandhill-pocosin ecotones, and extending upslope into mesic flatwoods or loamy or clayey shelves in the fall-line sandhills. Jun-Sep (and into Dec in response to growing-season fire). The identity of this taxon has been obscure; it is now clear that it is a previously unrecognized species, endemic to NC, SC, and adjacent e. GA. RAB included it in their concept of *S. teretifolius*, though it does not key well (keying imperfectly to either *S. floridanus* or *S. heterolepis*); in S and HC, it will key to *S. floridanus*, but the leaves are much narrower. Additionally, *S. floridanus* is a taller and coarser plant, the culms often averaging about 1.5 meters in height and 2-3 mm in diameter basally (vs. 1 meter high and 1 mm in diameter for *S. pinetorum*). In wet savannas of Columbus County, NC, *S. pinetorum* occurs with true *S. teretifolius* (the two codominant over many hectares!), and the two taxa are manifestly distinct. The leaves of *S. pinetorum* are not terete; after lengthy drought in the field (or dry on an herbarium sheet), the leaves become tightly folded to involute and can appear wiry. Like many Southeastern pineland grasses, *S. pinetorum* flowers only following fire. In vegetative condition it may be distinguished from *Aristida stricta* and *A. beyrichiana*, with which it often grows, by the leaf pubescence (*S. pinetorum* with scaberulous margins, best felt by running a finger along the margin near the base, from apex toward base, *A. stricta* and *A. beyrichiana* not scaberulous, and with a sparse line of pilose hairs running more or less the length of the leaf in *A. stricta* and sometimes in *A. beyrichiana*) and base (much more indurated and polished in *Sporobolus* than in *Aristida*). [= FNA, K, Y; >> *S. teretifolius* – RAB, misapplied; > *S. floridanus* – RAB, misapplied; < *S. floridanus* Chapman – HC, S]

Sporobolus pumilus (Roth) P.M. Peterson & Saarela, Small Saltmeadow Cordgrass, Salt Hay, Marsh-hay Cordgrass. Dunes, sand flats, upper edges of marshes, maritime wet grasslands, overwash flats. Jun-Sep. NL (Newfoundland) south to FL, west to TX; West Indies; Mexico and Central America. *Spartina patens* var. *monogyna* has spikelets 7-10 mm long (vs. 9-13 mm); second glume acute to obtuse (rarely acuminate) (vs. acuminate); spikes (2-) 4-9 per inflorescence (vs. 1-4); second highest leaf blade on the stem (1-) avg. 2 (-5) dm long (vs. 0.5-2 dm); plants to 15 dm tall (vs. to 8 dm); culms to 6 mm in diameter at base (vs. to 3 mm). Whether var. *monogyna* (name available only in *Spartina*) is worthy of recognition is a matter of debate; there appear to be morphological differences correlated with geography and, according to some authors, habitat, but positive identification to variety is often difficult. [= V; = *Spartina patens* (Aiton) Muhlenberg – C, FNA, GW, K, RAB, S, WH3; > *Spartina patens* var. *patens* – F, G, HC; > *Spartina patens* var. *monogyna* (M.A. Curtis) Fernald – F, G, HC]

* ***Sporobolus pyramidalis*** Palisot de Beauvois, Giant Ratstail Grass. Roadsides; native of the Old World Tropics.

Taxonomically confused with *S. jacquemontii*. [= X; < *S. indicus* var. *pyramidalis* (Palisot de Beauvois) Veldkamp – K, WH3]

* ***Sporobolus schoenoides*** (Linnaeus) P.M. Peterson, Swamp Pricklegrass. Disturbed areas, ballast; native of Mediterranean Europe. [= V; = *Crypsis schoenoides* (Linnaeus) Lamarck – C, FNA, K2, Pa; = *Heleochloa schoenoides* (Linnaeus) Host – F, G, HC]

Sporobolus spartinus (Trinius) P.M. Peterson & Saarela, Gulf Cordgrass. Brackish marshes and inland saline situations. AL and FL west to TX. [= V; = *Spartina spartinae* (Trinius) Merrill ex A.S. Hitchcock – FNA, GW, HC, K, S, WH3]

* ***Sporobolus tenuissimus*** (Martius ex Schrank) Kuntze. Waste areas near wool-combing mills, probably only a waif; native of the tropical Old World and New World. [= FNA, K, WH3] {not keyed}

Sporobolus teretifolius R.M. Harper, Wireleaf Dropseed. Wet savannas, pitcherplant bogs. Jul-Sep (and later in response to growing-season fire). Very similar vegetatively to *Aristida stricta*, *S. teretifolius* can be distinguished by its tuft of hairs at the base of the otherwise glabrous blade (as opposed to line of pilose hairs the length of the blade in *A. stricta*). This very rare species is known only from se. NC, ne. SC, s. GA, and se. AL (Houston County). Many of the counties reported for this species in RAB actually are based on misidentified specimens of *S. pinetorum*. In a few very wet savannas of Columbus and Brunswick counties, NC, *S. teretifolius* is dominant or codominant over many hectares. Like many savanna grasses, *S. teretifolius* generally flowers only following fire. [= FNA, HC, K, S, Y; < *S. teretifolius* – RAB (also see *S. pinetorum*)]

Sporobolus vaginiflorus (Torrey ex A. Gray) Wood, Poverty Dropseed. Glades, barrens, open disturbed sites. Sep-Oct. The species occurs nearly throughout e. United States. *S. ozarkanus*, *S. neglectus*, and *S. vaginiflorus* form a still very poorly understood complex. [= C, G, HC, Pa, RAB, W, WH3, WV; = *S. vaginiflorus* var. *vaginiflorus* – F, FNA, K; = *S. vaginaeflorus* – S, orthographic variant]

Sporobolus vaseyi P.M. Peterson, Curtiss's Sandreed. Moist pinelands and edges of natural ponds. FL Panhandle and e. peninsular FL. *S. vaseyi* is a closely related sibling species of *S. brevipilis*. [= V; = *Calamovilfa curtissii* (Vasey) Scribner – FNA, GW, HC, K, S, U, WH3]

Sporobolus virginicus (Linnaeus) Kunth, Seashore Dropseed, Coastal Dropseed. Salt marshes, tidal mud flats, and low dunes in the outer Coastal Plain. Sep-Oct. Se. NC along the coast to TX, in the West Indies and into n. South America (its alleged occurrence in se. VA is apparently incorrect); also native in e. Asia, Africa, Australia and the Pacific region (Simon & Jacobs 1999). *Sporobolus virginicus* is currently treated as a polymorphous and very widespread species, with a wide range of morphology and several ploidy levels (Simon & Jacobs 1999). *Sporobolus virginicus* is similar in aspect and growth form to *Distichlis spicata*, with which it occurs in tidal flats. *Sporobolus virginicus* is more delicate, and typically has long hairs on either side of the collar of the sheath; *Distichlis spicata* is generally a coarser plant, and lacks long hairs around the collar of the sheath. [= C, F, FNA, G, GW, HC, K, RAB, S, WH3]

* ***Sporobolus wrightii*** Munro ex Scribner, Giant Sacaton. Waste areas near wool-combing mills, probably only a waif; native of sw. United States. [= FNA, HC, K] {not keyed}

Steinchisma Rafinesque 1830 (Gaping Panic Grass)

A genus of about 6 species, perennial herbs, of s. North America, Central America, and South America. See discussion following *Panicum* regarding generic concepts. The large, thickened, pale sterile palea of this species is unique among panicoids of our region; it is one of several morphological characters that led to the segregation of *Steinchisma* as a genus, a finding now confirmed by DNA phylogeny. The enlargement of the sterile palea causes the spikelet to spread open, or "gape." *Steinchisma* has an "intermediate C₃-C₄" pathway. References: Acosta et al. (2014); Zuloaga et al. (1998)=Z; Freckmann & Lelong in FNA (2003a).

Steinchisma hians (Elliott) Nash, Gaping Panic Grass. Stream, pond, and lake shores, low woods, cypress-gum ponds, floodplains, marshes, ditches, seepage slopes. May-Oct. Se. VA south to FL, west to TX and OK, and south through Mexico and Central America to Colombia; also in s. South America. [= FNA, K, Z; = *Panicum hians* Elliott – C, F, G, GW, HC, RAB, S, W, WH3]

Stenotaphrum Trinius 1820 (St. Augustine Grass)

A genus of about 7 species, tropical and subtropical. References: Allred in FNA (2003a); Sauer (1972)=Z.

Stenotaphrum secundatum (Walter) Kuntze, St. Augustine Grass, Carpet Grass. Brackish marshes, roadsides, lawns. Jul-Oct. A pioneer species of beaches and shores, *S. secundatum* was known from the Carolinas prior to 1800. It has been interpreted as native or introduced in our area; its original range is probably now impossible to determine. Sauer (1972) maps it as widespread along the coasts of s. North America, Central America, South America, the West Indies, Africa, Australia, and sw. Pacific Islands. In our area it is certainly now more frequently encountered as a lawn or roadside grass than in anything that could be construed as a natural habitat. The other 6 species in the genus are Asian, or on islands of the sw. Pacific or Indian Oceans. [= FNA, HC, K, RAB, S, WH3, Z]

Thinopyrum (Prat) Á. Löve 1980

A genus of about 10 species, perennials, native of w. Asia and the Mediterranean region. References: Barkworth in FNA (2007a); Tucker (1996)=Z; Barkworth (1997)=Y.

- 1 Plants rhizomatous; lemmas 7.5-10 mm long; lateral veins slightly shorter than and less prominent than the midvein[*T. intermedium*]
- 1 Plants caespitose; lemmas 9-12 mm long; lateral veins of the glumes about as long as and as prominent as the midvein [*T. ponticum*]

* *Thinopyrum intermedium* (Host) Barkworth & D.R. Dewey. Waif in railroad yards; native of Europe and w. Asia. Tucker (1996) states that the record is as a waif in railroad yards. [= K, Z; > *T. intermedium* spp. *intermedium* – FNA; = *Elytrigia intermedia* (Host) Nevski; = *Agropyron intermedium* (Host) Palisot de Beauvois – HC] {add to synonymy}

* *Thinopyrum ponticum* (Podpěra) Barkworth & D.R. Dewey, Tall Wheatgrass. Waste areas near wool-combing mills, not known to be established or persistent; native of Europe and w. Asia. [= FNA, K; ? *Agropyron elongatum* (Host) Palisot de Beauvois] {add to synonymy}

***Torreyochloa* G.L. Church 1949 (Pale Mannagrass)**

A genus of 4 species, with a classic Tertiary moist temperate disjunct pattern; *Torreyochloa* is distributed in e. North America and e. Asia. References: Davis in FNA (2007a); Davis (1991)=Y; Tucker (1996)=Z.

- 1 Leaf blades 1-3 mm wide; anthers 0.2-0.5 mm long *T. pallida* var. *fernaldii*
- 1 Leaf blades 4-8 mm wide; anthers ca. 1 mm long *T. pallida* var. *pallida*

Torreyochloa pallida (Torrey) Church var. *fernaldii* (A.S. Hitchcock) Dore ex Koyama & Koyama. Beaver ponds, swamps. NL (Newfoundland) west to MN, south to ne. WV and TN. [= FNA, K, Pa, Y, Z; < *Glyceria pallida* (Torrey) Trinius – RAB, GW, HC, W; < *Puccinellia pallida* (Torrey) Clausen – C; = *G. fernaldii* (A.S. Hitchcock) St. John – F, WV; = *G. pallida* var. *fernaldii* A.S. Hitchcock – G]

Torreyochloa pallida (Torrey) Church var. *pallida*, Pale Mannagrass. Bogs, mucky wetlands such as old beaver-ponds, pools in cypress swamps, drawdown shores of natural ponds. Jun-Jul. The species as a whole is widespread in e. North America. Var. *pallida* ranges from NS west to MN, south to e. VA, se. NC (Columbus County), nw. NC (Avery County), and nw. GA (Jones & Coile 1988). Var. *pauciflora* (J. Presl) J.J. Davis is distributed in w. North America. Intermediates occur between the varieties. [= FNA, K, Pa, Y, Z; < *Glyceria pallida* (Torrey) Trinius – RAB, GW, HC, W; < *Puccinellia pallida* (Torrey) Clausen – C; = *G. pallida* – F, WV; = *G. pallida* var. *pallida* – G; = *Panicularia pallida* (Torrey) Kuntze – S]

***Tragus* Haller 1768 (Burggrass)**

A genus of 7 species, annuals and perennials, of tropical and subtropical Eurasia and Africa. References: Wipff in FNA (2007a).

* *Tragus australianus* S.T. Blake, Australian Burggrass. Waste areas around wool-combing mills, perhaps only a waif; native of Australia. [= FNA, K] {not keyed}

* *Tragus berteronianus* J.A. Schultes, Spiked Burggrass. Waste areas around wool-combing mills, perhaps only a waif; native of Africa and Asia. Also reported from chrome ore piles at Newport News, VA. [= FNA, K] {not keyed}

* *Tragus heptaneuron* W.D. Clayton. Waste areas around wool-combing mills, perhaps only a waif; native of tropical Africa. [= FNA, K] {not keyed}

* *Tragus racemosus* (Linnaeus) Allioni, Stalked Burggrass, Texas Burggrass. Roadsides, disturbed areas, on ballast near old seaports; native of Mediterranean Europe and w. Asia. Jul-early Oct. [= HC, C, F, FNA, G, K, Pa; = *Nazia racemosa* (Linnaeus) Kuntze – S]

***Tridens* Roemer & J.A. Schultes 1817 (Triodia, Redtop, Tridens, Fluffgrass)**

A genus of about 14 species, native to the Western Hemisphere. References: Valdés-Reyna in FNA (2003a). [also see *Tridentopsis*]

- 1 Panicle dense and spike-like, > 4× as long as wide, the branches ascending to appressed.
- 2 Plants from elongate rhizomes; lemma 4-5 mm long; spikelet 7-9 mm long *T. carolinianus*

- 2 Plants caespitose; lemma 2.5-3 mm long; spikelet 4-6 mm long *T. strictus*
- 1 Panicle open and spreading, < 4× as long as wide, the branches well-developed and spreading-ascending to reflexed. *T. ambigua*
- 3 Spikelets 4-5 mm long, 2.5-3.5 mm wide *T. ambigua*
- 3 Spikelets 6-8 mm long, 1.5-2.2 mm wide.
- 4 Primary pulvini densely pubescent, the hairs encircling the base of the panicle branch; secondary pulvini pubescent; spikelets mostly on pedicels 3-20 mm long, these divergent from the inflorescence branchlets; main branches of the inflorescence stiffly spreading..... *T. chapmanii*
- 4 Primary pulvini glabrous to sparsely pubescent, tufted only in the axil (the upper surface of the panicle branch); secondary pulvini glabrous; spikelets on pedicels mostly < 3 mm long, these mainly appressed to the inflorescence branchlets; main branches of the inflorescence spreading, ascending or drooping..... *T. flavus*

Tridens ambigua (Elliott) J.A. Schultes, Pineland Triodia, Flatwoods Fluffgrass. Wet savannas, clay-based Carolina bays, marshes. Aug-Oct. S. NC south to FL, west to e. TX. [= FNA, GW, HC, K, RAB, WH3; = *Triodia elliottii* Bush – S]

Tridens carolinianus (Steudel) Henrard, Carolina Triodia, Carolina Fluffgrass. Mesic swales in sandhills. Aug-Oct. S. NC south to FL, west to LA. [= FNA, HC, K, RAB, WH3; = *Triodia drummondii* Scribner & Kearney – S]

Tridens chapmanii (Small) Chase, Chapman's Triodia. Loamy sands of disturbed longleaf pine woodlands, glades, roadsides. Aug-Oct. NJ south to FL, west to TX and OK. [= HC; = *Tridens flavus* (Linnaeus) A.S. Hitchcock var. *chapmanii* (Small) Shinnery – C, FNA, K, RAB, WH3; = *Triodia chapmanii* (Small) Bush – F, G; < *Triodia flava* (Linnaeus) Smyth – S]

Tridens flavus (Linnaeus) A.S. Hitchcock, Redtop, Tall Redtop, Purpletop Tridens, Greasy Grass. Roadsides, disturbed areas, glades. Jul-Oct. NH west to NE, south to FL and TX. [= HC, Pa; = *Tridens flavus* var. *flavus* – C, FNA, K, RAB, WH3; = *Triodia flava* (Linnaeus) Smyth – F, G, WV; < *Triodia flava* (Linnaeus) Smyth – S (also see *Tridens chapmanii*); < *Tridens flavus* – W]

Tridens strictus (Nuttall) Nash, Spike Triodia, Longspike Fluffgrass, Longspike Tridens. Sandhills, moist pine savannas, roadsides. Aug-Oct. S. VA south to AL, west to TX, north in the interior to IL and KS. It is possible that this grass is introduced only north and east of GA. Rhoads & Klein (1993) report an old specimen from w. PA, presumably a waif. [= FNA, GW, HC, K, RAB, WH3; = *Triodia stricta* (Nuttall) Bentham ex Vasey – F, G, S]

Tridentopsis P.M. Peterson 2014

A genus of about 2 species, native to the Western Hemisphere. References: Peterson et al. (2014)=Z; Valdés-Reyna in FNA (2003a).

* *Tridentopsis nutica* (Torrey) P.M. Peterson. Disturbed areas, probably adventive from the sc. and sw. United States and Mexico. [= Z; > *Tridens muticus* (Torrey) Nash var. *elongatus* (Buckley) Shinnery – FNA, K2; > *Tridens elongatus* (Buckley) Nash – HC] {not yet keyed}

Tripidium H. Scholz 2006 (Ravenna-grass)

A genus of several species, perennials, of Eurasia. Often recently treated as the genus *Ripidium* Trinius 1820, but this is a later and therefore illegitimate homonym of the fern genus *Ripidium* Bernardi 1801. References: Hodkinson et al. (2002).

* *Tripidium ravennae* (Linnaeus) H. Scholz, Ravenna-grass, Plume-grass. Cultivated as an ornamental and rarely escaping or persisting; native of s. Europe. In sw. GA, TN, and MD (Kartesz 1999), DC (Steury 2004a), FL (Wunderlin & Hansen 2006). [= *Saccharum ravennae* (Linnaeus) Linnaeus – FNA, K, WH3; = *Erianthus ravennae* (Linnaeus) Palisot de Beauvois – F; > *Erianthus ravennae* var. *ravennae* – HC; > *Erianthus ravennae* var. *purpurascens* (Anderss.) Hackel – HC; = *Ripidium ravennae* (Linnaeus) Trinius]

Triplasis Palisot de Beauvois 1812 (Sandgrass)

A genus of 2 species, of eastern and central North America south through Mexico to Costa Rica. References: Hatch in FNA (2003a).

Identification notes: The foliage of both of our species has a sour taste.

- 1 Lemma awn 4.5-8 mm long; culm internodes appressed pilose or puberulent; perennial..... *T. americana*
- 1 Lemma awn 0.5-1.5 mm long; culm internodes glabrous to minutely scaberulous; annual (or rarely perennial) *T. purpurea* var. *purpurea*

Triplasis americana Palisot de Beauvois, Southern Sandgrass. Open sandy areas. Aug-Oct. A Southeastern Coastal Plain endemic: NC south to s. FL, west to e. LA. [= FNA, HC, K, RAB, S, WH3]

Triplasis purpurea (Walter) Chapman var. *purpurea*, Purple Sandgrass. Dunes, maritime dry grasslands, open sandy areas. Sep-Oct. NH south to s. FL, and west to TX, along the coast; also around the Great Lakes, and in central United States. Var.

caribensis R.W. Pohl is in the New World tropics. [= FNA; < *T. purpurea* – C, F, G, HC, K, Pa, RAB, WH3; > *T. intermedia* Nash – S; > *T. purpurea* – S]

Tripsacum Linnaeus 1759 (Gama Grass)

A genus of about 12 species, tropical and subtropical American. References: Barkworth in FNA (2003a); DeWet, Harlan, & Brink (1982)=Z.

Tripsacum dactyloides (Linnaeus) Linnaeus var. *dactyloides*, Gama Grass. Roadsides, moist areas, disturbed areas, moist riverbanks. Late May–Nov. *T. dactyloides* is widespread in e. North America north to MA, MI, IA, and NE, ranging south into tropical Central and South America; var. *dactyloides* is North American. This important species of moist and wetland areas in the Great Plains is generally seen in disturbed habitats in our area; its original habitats in various parts of our area are poorly understood, and it may not be truly native throughout the Southeast. [= FNA, Va, Z; < *T. dactyloides* – C, G, K, Pa, RAB, S, W, WH3, WV; > *T. dactyloides* var. *dactyloides* – F, HC; > *T. dactyloides* var. *occidentale* Cutler & Anderson – F, HC]

Trisetum Persoon 1805 (Oat-grass)

A genus of about 75–85 species, north and south temperate. References: Rumely in FNA (2007a); Randall & Hilu (1986)=Z; Tucker (1996)=Y. [also see *Sphenopholis*]

- 1 Plant an annual, without sterile shoots; anthers ca. 0.2 mm long; [rare waif].....[*T. interruptum*]
 1 Plant a perennial, with both fertile and sterile shoots; anthers 0.7–1.4 mm long; [rare alpine disjunct at high elevations in the Mountains].....
*T. spicatum*

* *Trisetum interruptum* Buckley, Prairie False Oats. Disturbed areas, along railroad tracks; native of sw. United States and Mexico. See Barger et al. (2012). [= FNA, K2] {add synonymy}

Trisetum spicatum (Linnaeus) K. Richter, Alpine Oat-grass, Spike Trisetum. Mountain cliffs at high elevations on metabasalt. Jun–Aug. A circumboreal species, widespread and common in arctic and alpine areas, south in e. North America to New England, NY, and, rarely, PA, and disjunct to Hawksbill Mountain, Page County, VA (where extant) and Roan Mountain, Mitchell County, NC (where not seen since the 19th century). The species is also known from the West Indies, Mexico, and s. South America. *T. spicatum*, as very broadly treated here, following Randall & Hilu (1986), is polymorphic and consists of several ploids and multiple taxa recognized at species and infraspecific ranks by various works around the northern hemisphere. [= C, FNA, HC, K1, K2, Pa, S, Y, Z; > *T. spicatum* var. *molle* (Michaux) Beal – F, G, RAB; > *T. triflorum* (Bigelow) Löve & Löve ssp. *molle* (Michaux) Löve & Löve – W]

Triticum Linnaeus 1753 (Wheat)

A genus of about 25 species (the taxonomy complicated by extensive and ancient cultivation), native of w. and c. Asia. References: Morrison in FNA (2007a); Tucker (1996)=Z; Zohary & Hopf (1994).

* *Triticum aestivum* Linnaeus, Bread Wheat. Fields; frequently cultivated, rarely persistent or volunteering following cultivation; native of Eurasia. May–Jun. One of the most important crops in the world. The lemmas can either be awnless or with long awns (to 8 cm long). [= C, F, FNA, G, HC, K, Pa, RAB, WH3, Z]

Uniola Linnaeus 1753 (Sea Oats)

A genus of 2 species. The only other species of the genus ranges from Baja California south along the Pacific Ocean to Ecuador; other species previously treated in *Uniola* have been shown to be only distantly related and are now treated as *Chasmanthium*. References: Yates in FNA (2003a); Yates (1966a, 1966b)=Z. [also see *Chasmanthium*]

Uniola paniculata Linnaeus, Sea Oats. Abundant on unforested primary and secondary dunes on barrier islands, and on dry to mesic sand flats and interdune swales. Jun–Nov. Se. VA south to FL and west to TX and Mexico; West Indies. This is the

most important sand-binding grass on ocean dunes from NC south, playing a critical role in primary succession on dunes. [= C, F, FNA, G, HC, K, RAB, S, WH3, Z]

***Urochloa* Palisot de Beauvois 1812 (Para-grass, Signal-grass)**

A genus of about 100 species, pantropical and subtropical. References: Crins (1991)=Z; Webster (1988)=Y; Wipff & Thompson in FNA (2003a). Key adapted in part from GW. [also see *Megathyrsus*]

- 1 Spikelets suffused with purple, borne in pairs (or threes) in each row *U. mutica*
- 1 Spikelets green, borne singly in each row.
 - 2 Upper half of second glume and first lemma with evident transverse veins connecting the longitudinal veins; spikelets 3.5-4.7 mm long *U. platyphylla*
 - 2 Upper half of second glume and first lemma without evident transverse veins, or with very obscure cross-veins; spikelets either 2-4 mm or 5-6 mm long.
 - 3 Spikelets 2-4 mm long..... *U. ramosa*
 - 3 Spikelets 5-6 mm long..... *U. texana*

- * *Urochloa adspersa* (Trinius) R. Webster. Moist, sunny, disturbed areas; apparently native of s. FL, the West Indies, and Argentina. Reported from AL, FL peninsula and Panhandle (FNA), and chrome ore piles in Newport News, VA (Reed 1964). [= FNA, K, WH3] {not yet keyed; add to synonymy}
- * *Urochloa arizonica* (Scribner & Merrill) Morrone & Zuloaga, Arizona Signalgrass. Disturbed areas; native of sw. United States. [= K2, WH3] {not yet keyed; add to synonymy}
- * *Urochloa fusca* (Swartz) B.F. Hansen & Wunderlin var. *reticulata* (Torrey) B.F. Hansen & Wunderlin. Disturbed areas; native of sw. and sc. United States and Mexico. East to GA (Kartesz 1999). [= WH3; < *Urochloa fusca* – FNA; ? *Urochloa fasciculata* (Sw.) R. Webster – K; ? *Panicum fasciculatum* Swartz – HC] {not yet keyed; synonymy incomplete}
- * *Urochloa mutica* (Forskål) Nguyen, Para-grass. Wet disturbed areas, margin of ponds; native of Africa. Aug. [= FNA, K, WH3, Z; ? *Panicum purpurascens* Raddi – HC, RAB; ? *B. purpurascens* (Raddi) Henrard – GW; = *Brachiaria mutica* (Forskål) Stapf]
- * *Urochloa piligera* (Muell. ex Bentham) R.D. Webster. Roadsides; native of Australia. Reported for Escambia County in the FL Panhandle (Kunzer et al. 2009). [= WH3] {not yet keyed; synonymy incomplete}
- * *Urochloa plantaginea* (Link) R. Webster. Disturbed areas; native of the Neotropics. Reported for s. GA (Jones & Coile 1988), as *Brachiaria plantaginea*, and for Escambia County in the FL Panhandle (Kunzer et al. 2009). [= FNA, K, WH3, Y, Z; = *Brachiaria plantaginea* (Link) A.S. Hitchcock] {not yet keyed; synonymy incomplete}

- * *Urochloa platyphylla* (Munro ex Wright) R. Webster, Broadleaf Signal-grass. Disturbed wet or seasonally moist areas; apparently native of South America. E. NC south to FL, west to TX, north in the interior to AR, OK, and se. MO; also in MD (Terrell & Reveal 1996). [= FNA, K, WH3, Y, Z; = *Brachiaria platyphylla* (Munro ex Wright) Nash – GW, HC, RAB; ? *B. extensa* Chase – S]
- * *Urochloa ramosa* (Linnaeus) Nguyen, Browntop Millet, Dixie Signalgrass. Disturbed areas; native of tropical Africa and Asia. This species has apparently been widely planted for wildlife food and erosion control in southeastern states. [= FNA, K, WH3, Z; = *Panicum ramosum* Linnaeus – HC; = *Brachiaria ramosa* (Linnaeus) Stapf]
- * *Urochloa reptans* (Linnaeus) Stapf. Disturbed areas; native of the Neotropics and Paletropics. [= FNA, K] {not yet keyed; synonymy incomplete}
- * *Urochloa texana* (Buckley) R. Webster, Texas Millet, Texas Signalgrass. Disturbed areas, fields, gardens; native of TX. First reported for South Carolina by Hill & Horn (1997). [= K, WH3, Y, Z; = *Panicum texanum* Buckley – C, HC, RAB, S; = *Brachiaria texana* (Buckley) S.T. Blake]
- * *Urochloa villosa* (Lamarck) Nguyen, Hairy Signalgrass. Reported from chrome ore piles in Newport News, VA (Reed 1964); native of tropical Asia and Africa. [= FNA, K] {not keyed; add to synonymy}

Zea Linnaeus 1753 (Corn, Maize)

A genus of about 5 species, native of Mexico and Central America. References: Iltis in FNA (2003a).

- 1 Pistillate spikelets (kernels) borne on a spongy rachis (cob) in rows.....**Z. mays ssp. mays**
- 1 Pistillate spikelets embedded in a hardened rachis.
- 2 Annual.....[**Z. mays ssp. mexicana**]
- 2 Perennial from creeping rhizomes.....**Z. perennis**

* **Zea mays** Linnaeus *ssp. mays*, Corn, Maize. Very commonly cultivated, rarely volunteering in old fields or around trashpiles, common in cultivation, rare as a short-lived escape; native of Mexico. Jun-Oct. *Zea* is one of the most important cultivated plants in the world, originating in Mexico, probably from *Zea mays ssp. parviglumis* Iltis & Doebley. It was initially cultivated in sw. Mexico (before 8000 BP), spreading to the sw. United States before 5000 BP, and to the e. United States by 2000 years BP. At the time of European contact, *Zea mays ssp. mays* was an important staple crop from s. Canada south to s. South America (Hancock 2004). [= FNA, K, WH3; < *Z. mays* – RAB, F, HC, S]

* **Zea mays** (Schrader) Kuntze *ssp. mexicana* (Schrader) H.H. Iltis, Chalco Teosinte, Nobogame Teosinte. Disturbed areas. Reported for AL (Kartesz 1999) and FL (Hansen & Wunderlin 2006). HC state that this taxon is "occasionally cultivated in the Southern States for green forage" and is similar to *Z. perennis*, except in being, like *Z. mays ssp. mays*, a coarse annual. It is considered to be an ancestor of *Zea mays*. [= FNA, WH3; = *Z. mexicana* (Schrader) Kuntze – K; = *Euchlaena mexicana* Schrader – HC, S]

* **Zea perennis** (A.S. Hitchcock) Reeves & Manglesdorf, Mexican Teosinte. Disturbed areas; apparently established at least formerly. *Z. perennis* was considered by HC to be "established on James Island, S.C." [= K; = *Euchlaena perennis* A.S. Hitchcock – HC]

Zizania Linnaeus 1753 (Wild-rice)

A genus of 4 species (and 6 taxa) of northern and eastern North America. References: Terrell in FNA (2007a); Terrell et al. (1997)=Y; Tucker (1988)=Z; Judziewicz et al. (2000)=X. Key based on Terrell in FNA (2007a).

- 1 Lemmas of the pistillate spikelets flexible and chartaceous, dull, bearing short scattered hairs, these not or only slightly more dense toward the tip.....**Z. aquatica var. aquatica**
- 1 Lemmas of the pistillate spikelets stiff and coriaceous, lustrous, glabrous or with lines of short hairs, the tips usually more hairy.
- 2 Lower pistillate branches with 9-30 spikelets; pistillate portion of the inflorescence 10-40 (or more) cm wide, the branches ascending to widely divergent; leaves 10-40+ mm wide.....**Z. palustris var. interior**
- 2 Lower pistillate branches with 2-8 spikelets; pistillate portion of the inflorescence 1-8 (-15) cm wide, the branches appressed or ascending; leaves 3-21 mm wide.....**Z. palustris var. palustris**

Zizania aquatica Linnaeus *var. aquatica*, Southern Wild-rice. Freshwater marshes, usually tidal. May-Oct. *Var. aquatica* ranges from ME west to WI, south to FL and LA; *var. brevis* Fassett is restricted to the St. Lawrence River in QC. *Zizania* was formerly an important food for Amerindians; it is now gathered as a specialty grain, commanding high prices. [= C, F, FNA, G, HC, K, X, Y, Z; < *Z. aquatica* – GW, Pa, RAB, S, WH3]

Zizania palustris Linnaeus *var. interior* (Fassett) Dore, Interior Wild-rice. Wetlands. ON west to MN, south to KY, MO, and NE. [= C, FNA, K2; = *Z. aquatica var. interior* Fassett – F, G, HC] {add synonymy: X, Y, Z}

* **Zizania palustris** Linnaeus *var. palustris*, Northern Wild-rice. Lake shores; rare, native of n. North America. Reported for a single county in WV, where apparently introduced. [= C, FNA; = *Z. aquatica* Linnaeus *var. angustifolia* A.S. Hitchcock – F, G, HC; < *Z. palustris* – Pa; < *Z. aquatica* – WV] {add synonymy: X, Y, Z}

Zizaniopsis Döll & Ascherson 1871 (Giant Cutgrass)

A genus of about 5 species, of tropical and subtropical America. References: Terrell in FNA (2007a); Tucker (1988)=Z; Judziewicz et al. (2000)=Y.

Identification notes: Superficially similar to *Zizania* in its habitat and large size, *Zizaniopsis* may be distinguished by its very different inflorescence and by its stout horizontal rhizomes (our taxa of *Zizania* are annual and not rhizomatous).

Zizaniopsis miliacea (Michaux) Döll & Ascherson, Southern Wild-rice, Giant Cutgrass, Water-millet. Brackish and freshwater marshes; common. May-Jul. MD south to FL, west to TX, north in the interior to MO, and disjunct in w. Mexico. The other species of the genus are South American. [= C, F, FNA, G, GW, HC, K, RAB, S, WH3, Y, Z; = *Zizania miliacea* Michaux]

Zoysia Willdenow 1801 (Zoysia, Temple-grass)

A genus of about 11 species, perennials, of tropical, subtropical, and temperate Asia. References: Anderson in FNA (2003a). Key closely following FNA.

- 1 Leaves < 0.5 mm wide; racemes with 3-12 spikelets; peduncles included to extending < 1 cm beyond the sheaths of the flag leaves ***Z. pacifica***
- 1 Leaves 0.5-5 mm wide; racemes with 10-50 spikelets; peduncles extending (0.3-) 1-6.5 cm beyond the sheaths of the flag leaves.
 - 2 Pedicels 1.6-3.5 mm long; spikelets ovate, 1.1-4 mm wide; culm internodes 2-10 mm long; blades ascending..... ***Z. japonica***
 - 2 Pedicels 0.6-1.6 mm long; spikelets lanceolate, 0.6-1.0 mm wide; culm internodes 5-40 mm long, all plants with at least some internodes > 14 mm long; blades spreading at nearly 90 degree angles ***Z. matrella***

- * ***Zoysia japonica*** Steudel, Japanese Lawngrass, Korean Lawngrass, Zoysia. Used as a lawngrass, persisting or spreading; native of Japan. Reported for VA (Kartesz 1999). [= C, FNA, HC, K, WH3]
- * ***Zoysia matrella*** (Linnaeus) Merrill, Zoysia, Manila Temple-grass. Used as a lawngrass, persisting or spreading; native of the Philippines. [= FNA, HC, K, WH3; = *Z. matrella* var. *matrella* - K]
- * ***Zoysia pacifica*** (Goudswaard) M. Hotta & Kuroki, Mascarene-grass, Korean Velvetgrass. Used as a lawngrass, persisting or spreading; native of e. Asia. [= FNA, WH3; ? *Z. tenuifolia* Willdenow - HC; > *Z. tenuifolia* Willdenow - K; > *Z. matrella* var. *pacifica* Goudswaard - K]

Zuloagaea Bess 2006 (Bulb Panicgrass)

A monotypic genus, a perennial herb, of sw. United States south through Central America. References: Freckmann & Lelong in FNA (2003a); Bess et al. (2006)=Z.

* ***Zuloagaea bulbosa*** (Kunth) Bess, Bulb Panicgrass. Disturbed areas; native of sw. United States south to Central America. Reported for MS. [= Z; = *Panicum bulbosum* Kunth - FNA, HC, K2] {add to key}

SECTION 6: EUDICOTYLEDONAE (EUDICOTS)

107. CERATOPHYLLACEAE S.F. Gray 1821 (Hornwort Family) [in CERATOPHYLLALES]

A peculiar and apparently very primitive family, of a single genus and about 6 species, aquatic herbs, of cosmopolitan distribution. References: Les in FNA (1997); Les (1985, 1986, 1988a, 1988b, 1988c, 1989)=Z; Les in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Les.

Ceratophyllum Linnaeus 1753 (Hornwort, Coontail)

A genus of about 6 species, aquatic herbs, of cosmopolitan distribution. References: Les in FNA (1997); Les (1985, 1986, 1988a, 1988b, 1988c, 1989)=Z; Les in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Les.

Identification notes: *Ceratophyllum* is sometimes mistaken for other, superficially somewhat similar aquatics, such as *Cabomba* (Cabombaceae), *Utricularia* (Lentibulariaceae), and *Myriophyllum* (Haloragaceae). *Cabomba* has the leaves opposite (rather than whorled), dichotomously divided (like *Ceratophyllum*), but the divisions lacking the marginal denticles of *Ceratophyllum*, and on a 1-3 cm long petiole (vs. sessile or on a petiole 0-2 mm long). *Utricularia* has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. *Myriophyllum* has the leaves pectinately rather than dichotomously divided.

- 1 Largest leaves forking 1-2× (count branching-nodes from the base of the leaf to the tip of the most-forked division); leaves coarse-textured, stiff, the marginal denticles usually strongly raised on a broad base of green tissue; achene margin wingless, with 2 basal spines or tubercles (these rarely absent), otherwise entire (lacking marginal spines)..... *C. demersum*
- 1 Largest leaves forking 3-4× (count branching nodes from the base of the leaf to the tip of the most-forked division); leaves fine-textured, flaccid, the marginal denticles not raised on a broad base of green tissue, sometimes obscure or obsolete; achene margin winged, with 2-20 lateral spines 0.1-6.5 mm long (occasionally spineless), with 2 basal spines (these rarely absent).
 - 2 Achene body (excluding the spines) 3.0-4.5 mm long; first leaves of the plumule simple; [Coastal Plain, NC southward]..... *C. australe*
 - 2 Achene body (excluding the spines) 4.5-6.0 mm long; first leaves of the plumule forked; [widespread]..... *C. echinatum*

Ceratophyllum australe Grisebach. Ponds, pools, slow-moving streams. May-Sep. Se. NC south to s. FL and Panhandle FL, and in the West Indies; also in s. Mexico, Central America, n. South America, with apparent disjunctions in c. South America and the Galapagos Islands. Les treats this taxon as a subspecies of the Old World *C. muricatum*. Because of their allopatric distribution on separate continents and relative morphological distinctiveness (as shown by Les), I prefer to recognize them at the species level. [= *Ceratophyllum muricatum* Chamisso ssp. *australe* (Grisebach) Les – FNA, K, WH3, Z; < *C. muricatum* Chamisso – GW]

Ceratophyllum demersum Linnaeus, Coontail. Ponds, pools, slow-moving streams. May-Sep. NL (Newfoundland) west to AK, south to s. FL, TX, CA, and south through the West Indies and Central America to South America. [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, WH3, Z]

Ceratophyllum echinatum A. Gray. Ponds, pools, slow-moving streams. May-Sep. NL (Newfoundland) west to ON and n. MN, south to c. peninsular FL and e. TX; also in BC, WA, and OR. [= C, F, FNA, G, K, Pa, RAB, S, Va, WH3, Z; < *C. muricatum* Chamisso – GW; = *C. submersum* Linnaeus var. *echinatum* (A. Gray) Wilmot-Dear]

109a. FUMARIACEAE A.P. de Candolle 1821 (Fumitory Family) [in RANUNCULALES]

This family includes 15-20 genera and 500-600 species, herbs, mostly north temperate. The Fumariaceae are often now subsumed into the Papaveraceae and separated as subfamilies (Lidén 1981, 1986; Lidén et al. 1997; Judd, Sanders, & Donoghue 1994), but the option remains to recognize the two monophyletic clades as families: Papaveraceae s.s. and Fumariaceae. The placement of *Pteridophyllum* (especially) and *Hypecoum* in their own families or basal in either Papaveraceae or Fumariaceae remains unsettled. References: Pérez-Gutiérrez et al. (2012, 2015); Wang et al. (2009); Stern in FNA (1997); Hill (1992); Lidén (1986, 1981); Lidén et al. (1997); Lidén in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Corolla with the 2 outer petals spurred or saccate at their bases; [tribe *Corydaleae*].
 - 2 Ultimate leaf segments 1-4 mm wide; plants with basal leaves only *Dicentra*
 - 2 Ultimate leaf segments 5-70 mm wide; plants of reproductive age with cauline leaves.
 - 3 Ultimate leaf segments 5-10 mm wide; herbaceous vine with cauline leaves (acaulescent in its first year, and appearing to be an herb); [native]..... *Adlumia*
 - 3 Ultimate leaf segments 20-70 mm wide; herb with basal and cauline leaves; [alien, cultivated and rarely persistent or naturalized] *[Lamprocapnos]*
- 1 Corolla with only 1 outer petal spurred or saccate at its base.
 - 4 Ovary and fruit subglobose, with 1 seed; [tribe *Fumarieae*] *Fumaria*
 - 4 Ovary and fruit elongate, with several to many seeds; [tribe *Corydaleae*].
 - 5 Flowers pink, the petals tipped with yellow; biennial; stem erect, 3-8 (-10) dm tall; capsules erect, 25-35 mm long *Capnoides*
 - 5 Flowers yellow or entirely pink-purple or white; annual (biennial in *C. incisa*); stem erect, decumbent, or prostrate, 1-3 (-4) dm tall; capsules erect, ascending, divergent, or pendent, 10-20 (-25) mm long *Corydalis*

Adlumia Rafinesque ex A.P. de Candolle 1821 (Climbing Fumitory)

A genus of 2 species, herbs, of e. North America, Korea, and Manchuria. References: Boufford in FNA (1997); Lidén in Kubitzki, Rohwer, & Bittrich (1993).

Adlumia fungosa (Aiton) Greene ex Britton, Sterns, & Poggenburg, Alleghany-vine, Cliff-Harlequin, Climbing Fumitory. Cliffs, talus, rocky slopes, rich stream-bottom forests, cool rocky forests, burned areas, especially over calcareous or mafic rocks. Jun-Sep. QC west to WI and MN, south to n. DE, w. NC, TN, and IN. [= C, F, FNA, G, K, Pa, RAB, S, Va, W]

Capnoides P. Miller 1754 (Rock Harlequin)

The genus is monotypic, an herb, of n. North America. Recent studies have emphasized the distinction of *Capnoides* from *Corydalis*. Lidén considered it more closely related to *Adlumia* and *Dicentra* than to *Corydalis* (Lidén 1981, 1986; Lidén et al. 1997). Pérez-Gutiérrez et al. (2012, 2015) as basal to the “core Fumariaceae”. The treatment of this species as part of *Corydalis* is no longer tenable. References: Stern in FNA (1997); Ownbey (1947)=Z; Lidén (1981, 1986); Lidén et al. (1997); Ownbey (1947)=Z; Lidén in Kubitzki, Rohwer, & Bittrich (1993).

Capnoides sempervirens (Linnaeus) Borkhausen, Rock Harlequin, Tall Corydalis, Pink Corydalis, Pale Corydalis. Rock outcrops, especially granitic exfoliation domes, but also quartzite, greenstone, and sandstone, up to at least 1700 m in elevation. Apr-Aug; May-Jul. NL (Newfoundland) west to AK, south to NJ, PA, in and near the mountains to ne. GA, n. OH, n. IN, MN, MT, and BC. [= S, Va; = *Corydalis sempervirens* (Linnaeus) Persoon – C, F, FNA, G, K, RAB, W, WV, Z]

*Corydalis* A.P. de Candolle 1805 (Corydalis)

A genus of about 400 species, herbs, of temperate regions of the Northern Hemisphere (especially China and the Himalayas). References: Stern in FNA (1997); Ownbey (1947)=Z; Lidén in Kubitzki, Rohwer, & Bittrich (1993). [also see *Capnoides*]

- 1 Fruits pendent or divergent; spurred petal 7-10 mm long; pedicels 6-15 mm long; seeds 1.8-2.5 mm wide, with a narrow, acute ring-margin
- 2 Flowers pink-purple, with a white crest (or rarely entirely white); seeds 1.8-2.1 mm wide; [alien, sparingly introduced, but seemingly becoming invasive] [*C. incisa*]
- 2 Flowers yellow; seeds 2.0-2.5 mm wide; [native, widespread in our area] *C. flavula*
- 1 Fruits erect or ascending; spurred petal 10-15 mm long; pedicels 1-6 mm long (5-10 mm long in *C. aurea*); seeds 1.0-2.0 mm wide, without a narrow, acute ring-margin.
- 3 Capsule slightly to strongly pubescent with white, pustular-based hairs; outer petals with conspicuous crests [*C. crystallina*]
- 3 Capsules glabrous (or if with a few hairs, these not white and pustular-based); outer petals with inconspicuous crests.
- 4 Capsules mostly 15-20 mm long, ca. 1.0 mm in diameter, strongly constricted between the seeds at maturity; inflorescence long, usually far exceeding the poorly-developed upper leaves; ultimate leaf segments 0.5-1.5 (-3.0) mm wide; seeds < 1.5 mm wide; plant slightly to strongly glaucous; [of sandy soils of the outer Coastal Plain] *C. halei*
- 4 Capsules mostly 10-15 mm long, 1.5-2.0 mm in diameter, slightly or not at all constricted between the seeds at maturity; inflorescence relatively short, barely (if at all) overtopping the upper leaves; ultimate leaf segments 1.0-2.0 (-4.0) mm wide; seeds > 1.5 mm wide; plant green to slightly glaucous; [of circumneutral rock outcrops of the upper Piedmont and Mountains] *C. micrantha*

Corydalis aurea Willdenow var. *aurea*. Reported as occurring as far south and east as MD, WV (?), and PA (Kartesz 1999, Kartesz 2010). Mar-Jun. No definite documentation is known for this species in our area. [= G, K, Pa; = *Corydalis aurea* var. *aurea* – C, F; = *Corydalis aurea* ssp. *aurea* – FNA, Mo; = *Capnoides aureum* (Willdenow) Kuntze – S] {not keyed; not mapped; rejected as a component of our flora}

Corydalis crystallina (Torrey & A. Gray) Engelman ex A. Gray. Disturbed areas, probably only a waif; native of the sc. United States. Apr-Jun. *C. crystallina* was collected in 1930 from an oat field at the Georgia Experiment Station in Laurens County, GA. [= FNA, F, G, K, Mo]

Corydalis flavula (Rafinesque) A.P. de Candolle, Short-spurred Corydalis, Yellow Fumewort, Yellow Harlequin. Rich moist forests, especially alluvial forests, glades and outcrops over mafic rocks (such as greenstone). Mar-May; May-Jun. S. CT, NY, and s. ON west to SD, south to NC, AL, LA, and OK. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WH3, WV, Z; = *Capnoides flavulum* (Rafinesque) Kuntze – S]

Corydalis halei (Small) Fernald & Schubert, Southern Corydalis. Sandy roadsides and disturbed areas. Mar-May; May-Jun. E. NC south to FL, west to TX, and inland north to MO and OK. F and S recognized it as a species distinct from *C. micrantha*; Ownbey reduced it to a subspecies, citing inadequate morphological differences and some alleged intermediates in OK and MO. The two taxa appear readily separable on morphological, ecological, and geographical grounds; species status seems warranted. [= F; = *Corydalis micrantha* (Engelmann ex A. Gray) A. Gray ssp. *australis* (Chapman) G.B. Ownbey – FNA, K, Mo, RAB,

WH3, Z; = *Corydalis micrantha* (Engelmann ex A. Gray) A. Gray var. *australis* (Chapman) Shinnery – C; < *Corydalis micrantha* – G; = *Capnoides halei* Small – S]

Corydalis incisa (Thunberg) Persoon, Purple Keman. Disturbed areas; native of e. Asia. Reported for Albemarle County, VA (R. Douglas, pers comm., 2015; T.F. Wieboldt, pers. comm., 2015); Westchester County, NY. See Atha, Schuler, & Lumban Tobing (2014) for additional information.

Corydalis micrantha (Engelmann ex A. Gray) A. Gray, Slender Corydalis. Circumneutral rock outcrops and adjacent glades and woodlands. Apr-May; Jun. *C. micrantha* (in the narrow sense) is primarily midwestern, ranging from IL, WI, MN, and SD south to AR, TX, and OK, with disjunct outliers in e. TN and w. NC. Ownbey (1947) had no records of Southern Appalachian populations of *C. micrantha*, and considered “ssp. *micrantha*” to range no farther east than IL and MO; RAB included montane populations in ssp. *australis*, stating “this is the only [subspecies] in our range.” Morphologically, however, these populations closely resemble *C. micrantha*; their association in the Brushy Mountains with other species disjunct from western or prairie ranges (*Anemone berlandieri*, *Arabis pycnocarpa*, *Pellaea wrightiana*) provides phylogeographic corroboration. [= F; = *Corydalis micrantha* ssp. *micrantha* – FNA, K, Mo, Z; = *Corydalis micrantha* var. *micrantha* – C; < *Corydalis micrantha* – G; = *Capnoides micranthum* (Engelmann ex A. Gray) Britton – S]

***Dicentra* Bernhardt 1833**

A genus of about 12 species, perennial herbs, with a relictual north temperate distribution: e. North America, w. North America, and e. Asia. References: Stern in FNA (1997); Stern (1961)=Z; Lidén in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Flowers pink, in panicles; rootstock lacking bulblets; ultimate leaf segments generally 3-parted, each part 2-5 mm wide at base, gradually tapering to the tip.
 - 2 Reflexed portions of the outer petals 4-8 mm long; [native and cultivated]..... ***D. eximia***
 - 2 Reflexed portions of the outer petals 2-5 mm long; [cultivated] [***D. formosa* ssp. *formosa***]
- 1 Flowers white or yellowish (very rarely pinkish), in racemes; rootstock with bulblets; ultimate leaf segments not generally 3-parted, about 1 (-3) mm wide, with parallel sides for most of their length, then tapering suddenly to the tip.
 - 3 Spurs of the corolla rounded, incurved, 2-5 mm long; leaves moderately to strongly glaucous beneath, the ultimate segments more or less rounded, but often with a minute acute point at the tip; bulblets yellow, spherical or nearly so ***D. canadensis***
 - 3 Spurs of the corolla elongate, divergent (angled away from the flower stalk), 7-9 mm long; leaves not or only slightly glaucous beneath, the ultimate segments acute; bulblets pink (or less commonly white), tear-shaped (narrowed upward)..... ***D. cucullaria***

Dicentra canadensis (Goldie) Walpers, Squirrel Corn. Rich, moist forests, especially rich cove forests in the mountains. Apr-May; Jun. S. ME west to s. MN, south to w. NC, n. GA, TN, and MO. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WV; = *Bicuculla canadensis* (Goldie) Millspaugh – S]

Dicentra cucullaria (Linnaeus) Bernhardt, Dutchman's Britches. Rich, moist forests, especially rich cove forests in the mountains. Mar-May; May-Jun. NS west to n. MN, south to GA, AR, and KS; disjunct in WA, OR, and ID. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WV; = *Bicuculla cucullaria* (Linnaeus) Millspaugh – S]

Dicentra eximia (Ker-Gawler) Torrey, Wild Bleeding Heart. Cliffs, talus slopes, rocky slopes, rock outcrops, shale slopes. Apr-Jul; Jul-Aug. An Appalachian endemic: NY and NJ south to NC, SC (Gaddy et al. 1984), and TN. [= C, F, FNA, G, K, Pa, RAB, Va, W, WV; = *Bicuculla eximia* (Ker-Gawler) Millspaugh – S]

* ***Dicentra formosa*** (Haworth) Walpers ssp. *formosa*. Native from s. BC south to c. CA, is frequently cultivated and resembles our native *D. eximia*. A variety of cultivars, some apparently derived from hybrids between the two subspecies, make identification uncertain in some cases. [= FNA, Z] {not mapped; rejected as a component of our flora}

Fumaria Linnaeus 1753 (Fumitory)

A genus of about 50 species, annual herbs, primarily Eurasian. References: Boufford in FNA (1997); Stace (2010)=Z; Lidén in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Corolla (9-) 10-14 mm long, creamy white (to reddish); fruiting pedicels deflexed downward; fruit smooth when dry *F. capreolata*
- 1 Corolla 4-8 (-9) mm long, white to pink or purple; fruiting pedicels ascending; fruit rugose or verrucose when dry.
 - 2 Corolla (6-) 7-8 (-9) mm long, dark pink to purple; sepals 1.5-3.5 mm long *F. officinalis*
 - 2 Corolla 4-6 mm long, white to pale pink; sepals 0.5-0.75 (-1.5) mm long
 - 3 Corolla white to pale pink; bracts as long as or longer than the subtended fruiting pedicel [*F. parviflora*]
 - 3 Corolla pink; bracts shorter than the subtended fruiting pedicel [*F. vaillantii*]
- * *Fumaria capreolata* Linnaeus, White Ramping-fumitory. Ditches, fields, disturbed areas; rare, native of sw. Europe. Feb-Apr. [= FNA, K2, WH3, Z]
- * *Fumaria officinalis* Linnaeus, Fumitory, Earthsmoke. Sandy fields, disturbed places, escaped from gardens; native of Europe. Mar-Sep. [= C, F, FNA, G, Mo, Pa, RAB, S, Va, WH3, WV; > *F. officinalis* ssp. *officinalis* – K1, K2, Z; > *F. officinalis* ssp. *wirtgenii* (W.D.J. Koch) Arcangeli – K1, K2, Z]
- * *Fumaria parviflora* Lamarck, Smallflower Fumitory, Fineleaf Fumitory. Abandoned woodlots, other disturbed areas; native of Eurasia. Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). [= FNA (excluded), K1, K2, WH3, Z]
- * *Fumaria vaillantii* Loiseleur. Ballast waif; native of Europe. [= FNA, K2, Z]

Lamprocapnos Endlicher 1850 (Asian Bleeding Heart)

A monotypic genus, a perennial herb of e. Asia. References: Pérez-Gutiérrez et al. (2012, 2015); Lidén et al. (1997); Stern (1961)=Z.

Identification notes: *Lamprocapnos* differs from other "bleeding hearts" (the native *Dicentra eximia* and the western American *Dicentra formosa* ssp. *formosa*) in its leafy stem, the inflorescence borne terminally or opposite a leaf, the leaves much less finely divided, and the flowers about as broad as long (vs. much longer than broad in *Dicentra eximia* and *Dicentra formosa*).

- * *Lamprocapnos spectabilis* (Linnaeus) Fukuhara, Bleeding Heart. Widely cultivated, possibly persistent or weakly naturalizing; native to e. Siberia, Korea, and n. China. It is reported for KY (Kartesz 1999, Kartesz 2010) and various places in ne. United States. [= K; = *Dicentra spectabilis* (Linnaeus) Lemaire – Z] {not mapped; rejected as a component of our flora}

109b. PAPAVERACEAE A.L. de Jussieu 1789 (Poppy Family) [in RANUNCULALES]

A family of 23 genera and about 230 species, mainly herbs (some shrubs and small trees), largely north temperate in distribution. References: Kiger in FNA (1997); Wang et al. (2009); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Flowering stem scapose, leaves basal only; petals 8-16, white; [subfamily *Chelidonioideae*] *5. Sanguinaria*
- 1 Flowering stem with leaves at least low on the stem; petals 0-6, purple, red, orange-red, orange, yellow, cream.
 - 2 Inflorescence a panicle; petals absent; [subfamily *Chelidonioideae*] *4. Macleaya*
 - 2 Inflorescence not a panicle; petals present, 4-6.
 - 3 Leaves and fruits prickly; [subfamily *Papaveroideae*] *1. Argemone*
 - 3 Leaves and fruits not prickly.
 - 4 Sepals connate; leaves ternately dissected into linear segments; sap watery; [subfamily *Eschscholzioideae*] [*8. Eschscholzia*]
 - 4 Sepals separate; leaves pinnately lobed; sap yellow, orange, or milky.
 - 5 Flowers several in a terminal umbel; [subfamily *Chelidonioideae*].
 - 6 Stigma lobes, placentae, and capsule valves 2; style very short; fruit linear, glabrous *6. Chelidonium*
 - 6 Stigma lobes, placentae, and capsule valves (2-) 3-4; style ca. 1 cm long; fruit ellipsoid, pubescent with long white hairs *7. Stylophorum*
- 5 Flowers solitary, terminal.
 - 7 Fruit 15-30 cm long, 2-locular (the partitions complete), dehiscent by elongate valves; stigmatic lobes 2; [subfamily *Chelidonioideae*] [*3. Glaucium*]
 - 7 Fruit 1-8 cm long, 4-20-locular (the partitions incomplete), dehiscent by small valves beneath the stigmatic disc; stigmatic lobes 4-20; [subfamily *Papaveroideae*] *2. Papaver*

1. Argemone Linnaeus 1753 (Prickly-poppy)

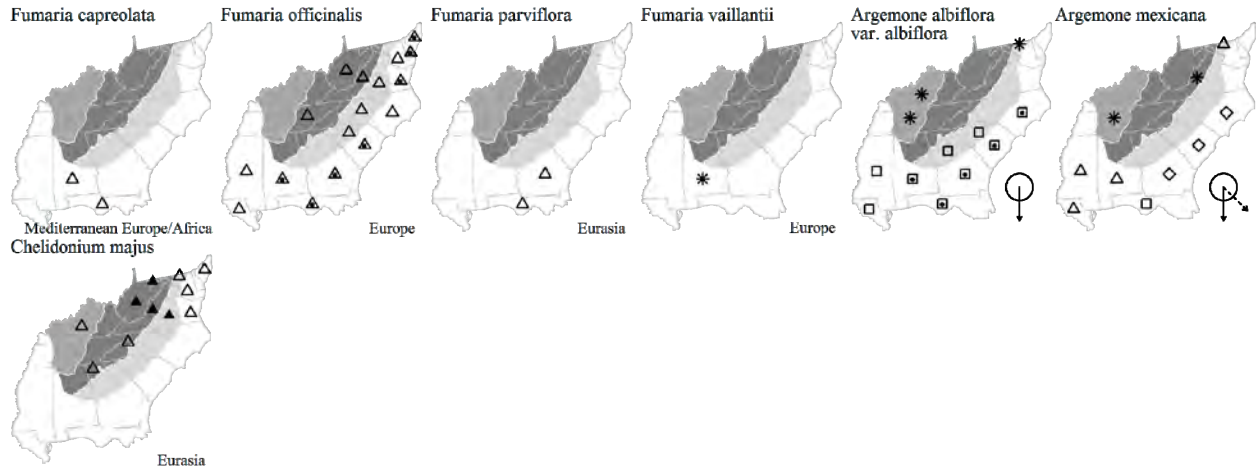

A genus of about 32 species, annual and perennial herbs, of North America, West Indies, Central America, South America, and Hawaii. References: Ownbey in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Flowers white to pink; latex white or nearly clear *A. albiflora* var. *albiflora*
- 1 Flowers yellow to cream; latex yellow *A. mexicana*

Argemone albiflora Hornemann var. *albiflora*, Carolina-poppy, White Prickly-poppy. Sandy roadsides and disturbed areas. Apr-May (-Sep). This species is apparently native to the southeastern United States, presumably including portions of our area,

south to s. FL, but the native range is unclear. The species' weediness suggests that it may be merely adventive in portions of our area. Var. *texana* (G.B. Ownbey) Shinnars occurs in TX, AR, and LA. [= *A. albiflora* ssp. *albiflora* – FNA, K, Mo; < *A. albiflora* – C, RAB, WH3; < *A. alba* Lestib. f. – G, S, misapplied]

* ***Argemone mexicana*** Linnaeus, Mexican-poppy, Mexican Prickly-poppy. Sandy roadsides and disturbed areas; native of peninsular FL, West Indies, and maybe Mexico and Central America. Apr-May (-Aug). [= C, FNA, G, K, Mo, Pa, RAB, WH3]

2. ***Papaver*** Linnaeus 1753 (Poppy)

A genus of about 80 species, annual and perennial herbs, of temperate Northern Hemisphere. References: Kiger & Murray in FNA (1997); Kiger (1975)=Z; Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: Additional species are cultivated and may be found in our area persistent, escaped, as waifs, or as naturalized populations.

- 1 Upper cauline leaves clasping the stem; [section *Papaver*][*P. somniferum*]
- 1 Upper cauline leaves not clasping the stem.
- 2 Ovaries and capsules sparsely to densely setose-pubescent; [section *Argemonidium*].
 - 3 Capsules oblong to clavate, sparsely setose with weak hairs [*P. argemone*]
 - 3 Capsules obovoid-ellipsoid to subglobose, densely setose with strong hairs [*P. hybridum*]
- 2 Ovaries and capsules glabrous.
 - 4 Flowers > 10 cm across; perennial; [section *Macrantha*] [*P. orientale*]
 - 4 Flowers < 10 cm across; annual; [section *Rhoeadium*].
 - 5 Capsule 2-3× as long as broad; stigmatic lobes 5-9 *P. dubium*
 - 5 Capsule 1-1.5× as long as broad; stigmatic lobes 8-15 [*P. rhoeas*]

- * ***Papaver argemone*** Linnaeus, Prickly Poppy. Disturbed areas; native of Europe and sw. Asia. Apr-May. Reported from PA (Rhoads & Black 2007, Kiger & Murray in FNA 1997), VA (probably only from cultivation), and MD (Kiger & Murray in FNA 1997). [= FNA, Pa]
- * ***Papaver dubium*** Linnaeus, Long-headed Poppy, Blind Eyes. Roadsides, fields, disturbed areas; native of Europe. Apr-Jul. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV, Z]
- * ***Papaver hybridum*** Linnaeus, Rough Poppy. Disturbed areas; native of Eurasia. May-Jun. [= FNA, K, RAB, Z]
- * ***Papaver orientale*** Linnaeus, Oriental Poppy. Disturbed areas; native of sw. Asia. May-Jun. [= FNA, G, K, Pa, Z]
- * ***Papaver rhoeas*** Linnaeus, Corn Poppy, Field Poppy, Red Poppy, Shirley Poppy, Common Poppy. Disturbed areas; native of Eurasia and n. Africa. May-Oct. [= C, F, FNA, G, K, Mo, Pa, RAB, WH3, WV, Z]
- * ***Papaver somniferum*** Linnaeus, Opium Poppy, Common Poppy. Disturbed areas; native of Mediterranean Europe and Asia Minor. May-Sep. [= C, F, FNA, G, K, Mo, Pa, RAB, S, WH3, Z]

3. *Glaucium* P. Miller 1754 (Horned-poppy)

A genus of about 23 species, annual and perennial herbs, of temperate Europe and w. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993). Key based on FNA.

- 1 Basal leaves few, glabrate to moderately pubescent; blades of distal leaves not distinctly clasping stem; petals orange to reddish orange, usually with blackish basal spot; capsules straight to slightly curved, pubescent or glabrate [*G. corniculatum*]
- 1 Basal leaves numerous, densely pubescent; distal blades of distal leaves distinctly clasping stem; petals yellow or orange-yellow, sometimes with reddish to violet basal spot; capsules mostly distinctly curved, glabrous, tuberculate, or scabrous [*G. flavum*]

- * *Glaucium corniculatum* (Linnaeus) J.H. Rudolph, Red Horned-poppy, Blackspotted Horned-poppy. Pasture; native of Europe and sw. Asia. Apr-May. [= FNA, K]
- * *Glaucium flavum* Crantz, Yellow Horned-poppy, Sea-poppy. Disturbed areas; native of Mediterranean Europe. Jun. [= C, F, FNA, G, K]

4. *Macleaya* R. Brown 1826 (Plume-poppy)

A genus of 2 species, perennial herbs, of e. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

- * *Macleaya cordata* (Willdenow) R. Brown, Plume-poppy, Tree-celandine. Moist streambanks, persistent or escaped from cultivation; native of e. Asia. Jun-Jul. Reported as naturalized in TN by Kral (1981). [= C, F, FNA, G, K, Pa]

5. *Sanguinaria* Linnaeus 1753 (Bloodroot)

A monotypic genus, a perennial herb, of e. North America. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

Sanguinaria canadensis Linnaeus, Bloodroot, Red Puccoon. Moist nutrient-rich forests. (Late Jan-) Mar-Apr; Apr-May. NS west to MN and MB, south to Panhandle FL and OK. Fernald recognized two varieties – var. *rotundifolia*, more southern and the primary form in our area, considered to have leaves less lobed than the more northern var. *canadensis*; leaf shape variability within populations makes it impractical to recognize infraspecific taxa. [= C, FNA, G, K, Mo, Pa, RAB, S, Va, W, WH3; > *S. canadensis* var. *canadensis* – F; > *S. canadensis* var. *rotundifolia* (Greene) Fedde – F]

6. *Chelidonium* Linnaeus 1753 (Greater-celandine)

A monotypic genus, a perennial herb, of temperate Eurasia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

- * *Chelidonium majus* Linnaeus, Greater-celandine, Rock-poppy, Swallow-wort. Moist slopes, shaded roadsides, rocky forests; native of Eurasia. Mar-Jul. First reported for GA (Rabun County) by Stiles & Howel (1998). [= C, F, FNA, G, Mo, Pa, RAB, S, Va, W; > *C. majus* var. *majus* – K]

7. *Stylophorum* Nuttall 1818 (Celandine-poppy)

A genus of 2-5 species, perennial herbs, of e. North America and e. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

Stylophorum diphyllum (Michaux) Nuttall, Celandine-poppy, Woods-poppy. Moist forests over calcareous rocks (such as limestone). Mar-Jun. S. QU, w. PA, s. MI, and WI, south to sw. VA, e. TN, nw. GA, sc. TN, and AR; introduced elsewhere from horticultural use. [= C, F, FNA, G, K, Mo, Pa, S, Va, W, WV]

8. *Eschscholzia* Chamisso 1820 (California-poppy)

A genus of about 12 species, annual and perennial herbs, of sw. North America and n. Mexico. References: Clark in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

* *Eschscholzia californica* Chamisso ssp. *californica*, California-poppy. Roadsides, disturbed areas; native of w. North America. Apr-Aug. [= FNA, K, Mo; < *Eschscholtzia californica* – F, RAB, orthographic variant; < *Eschscholzia californica* – Pa]

111. LARDIZABALACEAE Decaisne 1839 (Lardizabala Family) [in RANUNCULALES]

A family of about 8 genera and 35 species, shrubs and vines, primarily Asian, but also in s. South America. References: Thieret & Kartesz in FNA (1997); Wang et al. (2009); Cheng-Yih & Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Akebia Decaisne 1837 (Akebia)

A genus of 5 species, vines, of temperate e. Asia. References: Cheng-Yih & Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

* *Akebia quinata* (Houttuyn) Decaisne, Five-leaf, Five-leaf Akebia, Chocolate-vine. Escaped from cultivation to roadbanks, suburban woodlands, and floodplains; native of Japan, China, and Korea Mar-May. This species is likely to become a serious invasive alien in the Southeast over the next decade; it forms dense mats in natural forests and is difficult to eradicate. Apr-Jun; Jun-Jul. [= C, F, FNA, K, Mo, Pa, RAB, Va]

112. MENISPERMACEAE A.L. de Jussieu 1789 (Moonseed Family) [in RANUNCULALES]

A family of about 72 genera and 450 species, vines, shrubs, trees, and herbs, of tropical, subtropical, and warm temperate areas. References: Rhodes in FNA (1997); Wang et al. (2009); Hoot et al. (2009); Kessler in Kubitzki, Rohwer, & Bittrich (1993).

- | | | |
|---|--|--------------------|
| 1 | Leaves asymmetrically peltate (the stem attached 1-5 mm in from the leaf margin); stamens 12-24; petals 6-9; fruit bluish-black; [tribe <i>Menispermeae</i>] | <i>Menispermum</i> |
| 1 | Leaves not peltate, usually cordate (the stem attached at the leaf margin); stamens 6 or 12; petals 6 or 0; fruit red or bluish-black. | |
| 2 | Leaves 3-7-lobed, the sinuses usually deep, the lobes acute; stamens 12; petals 0; fruit bluish-black, 13-25 mm long; [tribe <i>Tinosporeae</i>] | <i>Calyccarpum</i> |
| 2 | Leaves entire to 3-lobed, the sinuses always shallow, the lobes (if present) broadly rounded; stamens 6; petals 6; fruit red, 5-8 mm long; [tribe <i>Tiliacoreae</i>] | <i>Cocculus</i> |

Calyccarpum Nuttall ex Torrey & A. Gray 1838 (Cupseed)

A monotypic genus, a woody vine, of e. North America. References: Kessler in Kubitzki, Rohwer, & Bittrich (1993).

Calyccarpum lyonii (Pursh) A. Gray, Cupseed, Lyonia-vine. Floodplain forests, wet hammocks. May-Jul (-Oct). Se. SC, e. TN, sc. KY, s. IN, s. IL, MO, and e. KS, south to se. GA, Panhandle FL, s. AL, s. MS, s. LA, and e. TX. [= C, F, FNA, G, K, Mo, S, WH3]

Cocculus A.P. de Candolle 1817 (Coralbeads, Snailseed)

A genus of 8 species, woody vines, shrubs, and trees, of tropical, subtropical, and warm temperate regions of North America, Central America, Africa, Madagascar, India, Malaysia, and the Philippines. References: Kessler in Kubitzki, Rohwer, & Bittrich (1993).

Cocculus carolinus (Linnaeus) A.P. de Candolle, Coralbeads, Carolina Moonseed, Snailseed, Red Moonseed. Moist to dry forests and thickets, especially where calcareous, also weedy in landscaping. Jun-Aug. VA south to FL, west to TX, north in the interior to s. IN and MO. Its occurrences in VA may be primarily adventive. [= C, F, FNA, G, K, Mo, RAB, Va, W, WH3; = *Epibaterium carolinum* (Linnaeus) Britton – S]

Menispermum Linnaeus 1753 (Moonseed)

A genus of 2-4 species, woody vines, of temperate e. North America and temperate e. Asia. References: Kessler in Kubitzki, Rohwer, & Bittrich (1993).

Menispermum canadense Linnaeus, Moonseed, Yellow Parilla. Moist nutrient-rich forests, especially on floodplains or lower slopes, less commonly in dry calcium-rich forests and woodlands. May-Aug. QC west to MB, south to GA and OK. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WH3, WV]

113. BERBERIDACEAE A.L. de Jussieu 1789 (Barberry Family) [in RANUNCULALES]

As broadly defined here, a family of about 15 genera and 650 species, herbs and shrubs, of the temperate Northern Hemisphere and Andean South America. There has been much debate and study of whether the Berberidaceae should be recognized as a broadly defined unit, or split into a variety of segregate families (such as Podophyllaceae, Epimediaceae, Nandinaceae, Leonticaceae). Based on molecular studies, Kim & Jansen (1996, 1998) and Kim et al. (2004) conclude that division of the Berberidaceae into segregate families is not warranted. References: Whetstone, Atkinson, & Spaulding in FNA (1997); Wang et al. (2009); Stearn (2002); Kim & Jansen (1996, 1998); Ahrendt (1961); Loconte & Estes (1989b); Kim et al. (2004); Meacham (1980); Loconte in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves ternately compound; [subfamily *Nandinoideae*].
 - 2 Plant a shrub, with multiple leaves; flowers white..... **1. *Nandina***
 - 2 Plant an herb, with 2 leaves; flowers green, greenish yellow, or maroon **2. *Caulophyllum***
- 1 Leaves simple (though sometimes variously lobed or divided into segments).
 - 3 Plant a shrub; leaves not peltate, simple or 1-pinnately compound; flowers yellow; [subfamily *Berberidoideae*] **3. *Berberis***
 - 3 Plant an herb; leaves peltate, 2-parted or radially lobed; flowers white; [subfamily *Podophylloideae*].
 - 4 Plant acaulescent; flower solitary and scapose; leaf segments 2; fruit a capsule..... **4. *Jeffersonia***
 - 4 Plant caulescent; flower solitary, or cymose to umbellate, borne on a stem with leaves; leaf segments several; fruit a berry.
 - 5 Flowers cymose or umbellate; stamens 6; berry globose, 8-12 mm long, 2-4 seeded; larger leaves with only 2 clefts that extend > halfway to the peltate center of the leaf (thus the leaf divided into 2 halves, the other sinuses shallow)..... **5. *Diphylleia***
 - 5 Flower solitary; stamens 12-18; berry ovoid, 25-70 mm long, many-seeded; larger leaves with 5 or more clefts that extend > halfway to the peltate center of the leaf (thus the leaf fairly evenly divided into multiple lobes)..... **6. *Podophyllum***

1. *Nandina* Thunberg 1781 (Nandina, Sacred-bamboo)

A monotypic genus, a shrub, native of Japan, China, and India. Here treated as a monotypic genus in the Berberidaceae, *Nandina* seems to have only a general kinship to the Berberidaceae (see Ehdaie & Russell 1984, Loconte & Estes 1989b, Meacham 1980) and should perhaps be placed in its own monotypic family. References: Whetstone, Atkinson, & Spaulding in FNA (1997); Ehdaie & Russell (1984); Loconte in Kubitzki, Rohwer, & Bittrich (1993).

* ***Nandina domestica*** Thunberg, Nandina, Sacred-bamboo. Forests and woodlands in suburban areas, commonly planted, increasingly escaping and naturalizing; native of China. May-Jun; Oct-Nov. *Nandina* has numerous cultivated forms, and is widely planted in the Piedmont and Coastal Plain of our area, especially southward. Leaflet shape varies in cultivated forms from broadly ovate to linear. [= FNA, K, RAB, Va, WH3]

2. *Caulophyllum* Michaux 1803 (Blue Cohosh)

A genus of 3 species, herbs, with a relictual north temperate distribution (e. North America, e. Asia). The only other species of the genus is *C. robustum* Maximowicz, of e. Asia. References: Loconte in FNA (1997); Stearn (2002)=Y; Loconte & Blackwell (1981, 1984, 1985)=Z; Uttal (1985); Brett (1981); Loconte in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Carpels (in flower) 3.5-5 mm long, averaging 4 mm; style 0.8-1.5 mm long; sepals 6-9 mm long, usually purple; terminal leaflets (5-) 7-9 (-10) cm long, (4-) 5-7.5 (-8) cm wide; main inflorescence with 4-18 flowers; first leaf 2-ternate or 3-ternate ***C. giganteum***
- 1 Carpels (in flower) 1.3-2.8 mm long, averaging 2 mm; style 0.3-1.0 mm long; sepals 3-6.5 mm long, yellow, yellow-purple, or green; terminal leaflets (3-) 5-7 (-8) cm long, (2-) 3.5-6.5 (-10) cm wide; main inflorescence with 5-70 flowers; first leaf 3-ternate or 4-ternate..... ***C. thalictroides***

Caulophyllum giganteum (Farwell) Loconte & Blackwell, Northern Blue Cohosh. Rich forests. Apr-May; Jul-Aug. *C. giganteum* is more northern in distribution than *C. thalictroides*, ranging from QC and ON south to w. NC, e. TN, c. KY, n. OH, and MI. This species blooms about 2 weeks earlier than *C. thalictroides* where they grow together. The combination of sympatry, morphologic distinctness, and phenologic separation of the two taxa argues for recognition at the species level. [= FNA, K, Va, W, Y, Z; < *C. thalictroides* – F, G, Pa, RAB, S; = *C. thalictroides* var. *giganteum* Farwell – C]

Caulophyllum thalictroides (Linnaeus) Michaux, Common Blue Cohosh, Green Vivian. Rich forests. Apr-May; Jul-Aug. NS, QC, ON, and MB, south to GA, AL, AR, and OK. [= FNA, II, K, Va, W, Y, Z; < *C. thalictroides* – F, G, Pa, RAB, S; = *C. thalictroides* var. *thalictroides* – C]

3. *Berberis* Linnaeus 1753 (Barberry)

A genus of 400-600 species, shrubs, of North America, South America, Asia, Europe, and n. Africa. Many authors favor the inclusion of *Mahonia* in *Berberis*. It appears that *Mahonia* is a paraphyletic grade basal to *Berberis* (in the narrow sense) (Kim, Kim, & Landrum 2004). References: Whitmore in FNA (1997); Loconte in Kubitzki, Rohwer, & Bittrich (1993); Kim, Kim, & Landrum (2004).

Identification notes: Other species of *Berberis* are used horticulturally in our area. Though none appear to be established at this time, the possibility of encountering species other than those treated above should be kept in mind.

- 1 Leaves 1-pinnately compound, > 10 cm long, not fascicled on short spur shoots; stems not spiny; leaves evergreen.
 - 2 Bud scales deciduous, 3-8 mm long; leaflet blades 1-3-veined from base *B. repens*
 - 2 Bud scales evergreen, 11-44 mm long; leaflet blades 4-6-veined from base.
 - 3 Leaflet blades with 2-7 teeth per side, each tooth 3-8 mm long; leaflets very thick and stiff *B. bealei*
 - 3 Leaflet blades with 6-13 teeth per side, each tooth 1-2 (-3) mm long; leaflets thickish, but flexible when fresh *B. nervosa*
- 1 Leaves simple, < 6 cm long, fascicled on short spur shoots; stems spiny; leaves deciduous or evergreen.
 - 4 Leaves entire; flowers solitary or 2-4 in umbels; spines mostly simple; [section *Tschososkyanae*] *B. thunbergii*
 - 4 Leaves bristly-serrate; flowers 5-many in racemes (sometimes the racemes umbelliform); spines mostly trifurcate (some simple or bifurcate).
 - 5 Leaves evergreen, coriaceous; leaf teeth tipped with firm prickles; fruits blue-black, pruinose; [section *Wallichianae*] *B. julianae*
 - 5 Leaves deciduous, herbaceous; leaf teeth tipped with weak bristles; fruits red, not pruinose.
 - 6 Leaves with 1-9 (20) bristles on each margin, the bristles 3-6 mm apart; berries ovoid (6-9 mm long, 6-7 mm broad), 5-10 (rarely more) in an often umbellate raceme; petals notched at apex; [section *Canadenses*] *B. canadensis*
 - 6 Leaves with 18-36 bristles on each margin, ca. 2 mm apart; berries ellipsoid (8-10 mm long, 4-5 mm broad), 10-20 in a raceme; petals obtuse at apex; [section *Vulgares*] *B. vulgaris*

* *Berberis bealei* Fortune, Leatherleaf Mahonia, Chinese Mahonia, Holly-grape. In deciduous forests in suburban areas, spread from plantings; native of China. Dec-Mar; May-Jul. Naturalizing widely in the southeastern United States, including (at least) AL, DE, GA, FL, NC, and SC. [= FNA, Va, WH3; = *Mahonia bealei* (Fortune) Carrière – K, RAB]

Berberis canadensis P. Miller, American Barberry, Allegheny Barberry. Rocky woods, forest openings, glades, usually over mafic rocks (such as diabase) or calcareous rocks (such as limestone), sometimes along fence-rows in sw. VA (presumably spread by birds). Apr-May; Sep-Oct. A broad Southern Appalachian-Ozarkian endemic, not occurring in Canada (the epithet a misnomer): scattered and local in VA, WV, KY, TN, NC, SC, AL, GA, MO, IL, IN, and sc. PA (where apparently now extirpated). Along with *B. vulgaris*, *B. canadensis* has been subjected to organized eradication programs because of its serving as an alternate host for wheat rust (*Puccinia graminis*). [= C, F, FNA, G, II, K, Pa, RAB, S, Va, W]

* *Berberis julianae* Schneider, Evergreen Barberry. Seeding down and escaping locally near horticultural plantings; native of China. First reported for NC by Pittillo & Brown (1988). [= K2; = *B. julianae*, orthographic variant]

* *Berberis nervosa* Pursh. Disturbed areas; native of w. North America. Introduced in SC (Hill & Horn 1997). [= FNA; = *Mahonia nervosa* (Pursh) Nuttall – K]

* *Berberis repens* Lindley, Creeping Oregon Grape. Suburban woodlands; native of nw. North America. [= FNA; = *Mahonia repens* (Lindley) G. Don – K] {add to synonymy}

* *Berberis thunbergii* A.P. de Candolle, Japanese Barberry. Rich forests, old fields; native of Japan. Mar-Apr; May-Sep. This species is immune to wheat rust; it is now the most commonly encountered barberry in much of our area. [= C, F, FNA, G, II, K, Pa, RAB, S, Va, W]

* *Berberis vulgaris* Linnaeus, European Barberry, Common Barberry. Disturbed areas; native of Europe. Apr; Sep. This species, once widely cultivated and established in North America, serves as an alternate host to wheat rust and has been subjected to eradication programs for over half a century. It may no longer occur in our area. [= C, F, FNA, G, II, K, Pa]

4. *Jeffersonia* B.S. Barton 1793 (Twinleaf)

A genus of 2 species, the only other species of the genus is native to e. Asia (eastern Russia, Korea, Manchuria). The closest North American relatives of *Jeffersonia* are *Achlys* and *Vancouveria* of the Pacific Northwest. References: George in FNA (1997); Stearn (2002)=Y; Loconte & Estes (1989b); Loconte in Kubitzki, Rohwer, & Bittrich (1993).

Jeffersonia diphylla (Linnaeus) Persoon, Twinleaf. Moist and extremely nutrient-rich forests, generally over calcareous or mafic rocks (including limestone, dolostone, amphibolite, greenstone, etc.) or very rich alluvium. Mar-Apr; May. The species is widespread in ne. United States, south to MD, NC, and AL. It is somewhat suggestive of *Sanguinaria* in both foliage and flower. [= C, F, FNA, G, II, K, Pa, RAB, S, Va, W, WV, Y]

5. *Diphylleia* Michaux 1803 (Umbrella-leaf)

A genus of 3 species, herbs, with a relictual north temperate distribution. The other two species in the genus are east Asian – *D. grayi* F. Schmidt of Japan and Sakhalin, and *D. sinensis* H.L. Li of the Hubei, Shaanxi, Gansu, Sichuan, and Yunnan provinces of China. References: George in FNA (1997); Ying, Terabayashi, & Boufford (1984)=Z; Stearn (2002)=Y; Loconte in Kubitzki, Rohwer, & Bittrich (1993).

Diphylleia cymosa Michaux, Umbrella-leaf, Pixie-parasol. Seepages and brook-banks, sometimes away from brooks or seeps in northern hardwood or cove hardwood forests (but then usually in subterranean seepage), primarily at moderate to high elevations. May-Jun; Jul-Aug. A narrow Southern Appalachian endemic: high mountains of w. NC and e. TN, extending a short distance into ne. GA, nw. SC, and sw. VA. [= C, F, FNA, G, K, RAB, S, Va, W, Y, Z]

6. *Podophyllum* Linnaeus 1753 (May-apple)

A genus of 2 species (or ca. 14 if *Dysosma* is included), herbs, one in e. North America, the other in e. Asia. The obvious morphological kinship of *Podophyllum*, *Diphylleia*, and *Hydrastis* is corroborated by alkaloid chemistry. References: George in FNA (1997); Shaw (2000, 2002)=Z; Loconte in Kubitzki, Rohwer, & Bittrich (1993).

Podophyllum peltatum Linnaeus, May-apple, American Mandrake. Rich forests, bottomlands, slopes, pastures. Mar-Apr; May-Jun. NS west to MN, south to Panhandle FL and TX. The ripe fruits are edible; the rest of the plant contains a variety of alkaloids, and is poisonous-medicinal. Compounds from *Podophyllum* are used in wart removal, and show anti-viral and anti-cancer promise. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WH3, WV; > *P. peltatum* var. *peltatum* – Z; > *P. peltatum* var. *annulare* J.M.H. Shaw – Z]

114a. HYDRASTIDACEAE Martinov 1820 (Golden-seal Family) [in RANUNCULALES]

A family of 2 genera and 2 species, perennial herbs, of temperate e. North America and Japan. In chemistry, morphology, and anatomy, *Hydrastis* shows some relationship to *Podophyllum* and *Diphylleia* of the Podophyllaceae (often included in the Berberidaceae). Though usually placed in the Ranunculaceae, Tobe & Keating (1985) present evidence from morphology, anatomy, embryology, palynology, chemistry, and cytology that suggests that *Hydrastis* is best recognized as a monotypic family. They contend that "*Hydrastis* represents a relictual primitive group which very early diverged from a common ancestral stock of the Ranunculaceae, Berberidaceae and probably of Circaeasteraceae, and that *Hydrastis* has evolved in its own evolutionary line parallel with other lines leading to the modern representatives of these families." Thorne (1992) and Reveal (1993a) have also accepted Hydrastidaceae as a distinct family. Tobe in Kubitzki & Bayer places *Hydrastis* with *Glaucidium* Siebold & Zuccarini in a bigeneric Hydrastidaceae. References: Tamura in Kubitzki, Rohwer, & Bittrich (1993); Wang et al. (2009); Tobe in Kubitzki & Bayer (2002).

1. *Hydrastis* Linnaeus 1759 (Golden-seal)

A monotypic genus, an herb, endemic to e. North America. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Hydrastis canadensis Linnaeus, Golden-seal. Mesic (rarely drier), very nutrient-rich forests, with circumneutral soils, over calcareous or mafic rocks such as limestone, amphibolite, and dolostone, sometimes forming large colonies after canopy disturbance such as logging. Apr-May; May-Jun. VT and MN south to w. and c. NC, n. GA, TN, and AR. Exploited for the herbal trade (and still often used as a home remedy in more remote parts of the mountains), though too rare in the eastern part of our area to support economically significant wild collection. The rhizome and roots are bitter in taste and contain several alkaloids. Reported for SC (P. McMillan, pers.comm., 2002). [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV]

114b. RANUNCULACEAE A.L. de Jussieu 1789 (Buttercup Family) [in RANUNCULALES]

A family of about 62 genera and 2450 species, herbs, shrubs, and vines, primarily of temperate and boreal regions.

Classification of subfamilies and tribes follows Wang et al. (2009). Subfamilies and tribes follow Wang et al. (2009).

References: Whittemore & Parfitt in FNA (1997); Wang et al. (2009); Keener (1977); Tamura in Kubitzki, Rohwer, & Bittrich (1993). [also see *HYDRASTIDACEAE*]

- 1 Shrub or vine; leaves compound (or sometimes some to most of them simple in *Clematis*).
 - 2 Leaves opposite, distributed along the stem; sepals 4, white to blue or purplish, 10-50 mm long; wood not yellow; [subfamily *Ranunculoideae*, tribe *Anemoneae*]..... **15. Clematis**
 - 2 Leaves alternate, clustered together at the top of the usually unbranched, erect stem; sepals 5, maroon, 2-5 mm long; wood yellow; [subfamily *Coptidoideae*]..... **1. Xanthorhiza**
- 1 Herb; leaves compound or simple.
 - 3 Leaves simple, sometimes deeply cleft or lobed into rounded or elongate segments; [subfamily *Ranunculoideae*].
 - 4 Plants in flower..... **Key A**
 - 4 Plants in fruit..... **Key B**
 - 3 Leaves compound, the leaflets either linear or more-or-less petiolulate.
 - 5 Plants in flower..... **Key C**
 - 5 Plants in fruit..... **Key D**

Key A

- 1 Flowers bilaterally symmetrical, the upper sepal hooded or spurred; [tribe *Delphinieae*].
 - 2 Upper sepal hooded or helmet-shaped; petals hidden by the sepals; perianth blue or creamy white; stems weak, clambering, reclining, vining, or ascending in a curve **7. Aconitum**
 - 2 Upper sepal spurred; petals at least partly exerted from the sepals; perianth blue, pink, white, or greenish; stems strong, erect, normally straight..... **8. Delphinium**
- 1 Flowers radially symmetrical, no perianth parts spurred or hooded (except the 5 sepals spurred in *Myosurus*).
 - 3 Petals present, white or yellow, larger and more conspicuous than the sepals; sepals present, green; [in other words, **with** a second, green, less conspicuous perianth whorl below the largest and colored perianth whorl; note that some *Anemone* have a calyx-like involucre of 3 bracts subtending each flower]; [tribe *Ranunculeae*].
 - 4 Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a *Plantago* inflorescence)..... **19. Myosurus**
 - 4 Basal leaves various, but not as above; receptacle globose to sub-cylindric, mostly < 1 cm long
 - 5 Sepals 3 (-4); petals 7-12; achenes pubescent, beakless; leaves simple, cordate, unlobed; [introduced garden plants]..... **18. Ficaria**
 - 5 Sepals (3-) 5 (-6); petals typically 5-9 (10 in some "doubled" forms); achenes smooth or variously ornamented with spines, papillae, or tubercles, sometimes also pubescent; leaves various, usually not at once simple, cordate, and unlobed (except in *Halerpestes*); [native or introduced].
 - 6 Cauline leaves absent; basal leaves cordate, unlobed..... **17. Halerpestes**
 - 6 Cauline leaves present, well-developed; basal leaves not simultaneously cordate and unlobed..... **20. Ranunculus**
 - 3 Petals absent (or modified into relatively inconspicuous nectaries or staminodia); sepals present and petaloid (white, yellow, yellow-green, cream, or blue).
 - 7 Sepals 3-5 mm long, caducous; stamens white and showy; [tribe *Ranunculeae*]..... **16. Trautvetteria**
 - 7 Sepals 6-40 mm long, not caducous; stamens not notably white and showy.
 - 8 Leaves opposite, distributed along the stem; style plumose; [tribe *Anemoneae*]..... **15. Clematis**
 - 8 Leaves all basal, or with a few alternate or whorled involucre leaves on the stem; style not plumose.
 - 9 Sepals white, bluish, or blue; basal leaves 3-5 (-7)-lobed; [tribe *Anemoneae*]..... **14. Anemone**
 - 9 Sepals yellow, green, or whitish (sometimes marked with purple); basal leaves unlobed, or palmately cleft into 5-11 (-many) segments.
 - 10 Leaves cordate-reniform, unlobed; sepals bright yellow; petals absent; [native, of bogs and marshes]; [tribe *Calthaeae*]..... **13. Caltha**
 - 10 Leaves palmately or pedately lobed or divided; sepals green, greenish, dull yellow, or whitish; petals modified into tubular nectaries; [introduced, rarely persistent or escaped from cultivation].
 - 11 Sepals 5-8, much longer than wide, yellow; cauline leaves absent, except for the involucre which immediately subtends the flower; [tribe *Cimicifugeae*]..... **11. Eranthis**
 - 11 Sepals 5, nearly as wide as long, green or maroon; cauline leaves present; [tribe *Helleboreae*]..... **10. Helleborus**

Key B

- 1 Fruit a follicle, each carpel with 2 or more ovules.
- 2 Leaves cordate-reniform, toothed, not lobed or divided; [tribe *Caltheae*] **13. *Caltha***
- 2 Leaves variously palmately or pedately lobed or divided.
- 3 Carpels 1-3; plants 3-30 dm tall; [native, except *Consolida*]; [tribe *Delphinieae*].
- 4 Stems weak, clambering, reclining, or vining **7. *Aconitum***
- 4 Stems strong, erect **8. *Delphinium***
- 3 Carpels 3-6; plants 1-5 dm tall; [introduced, rarely persistent or escaping].
- 5 Cauline leaves absent, except for the involucre which immediately subtends the fruit; [tribe *Cimicifugeae*] **11. *Eranthis***
- 5 Cauline leaves present; [tribe *Helleboreae*] **10. *Helleborus***
- 1 Fruit an achene (or dehiscent utricle in *Trautvetteria*), each carpel with 1 ovule.
- 6 Leaves opposite, distributed along the stem; style plumose; [tribe *Anemoneae*] **15. *Clematis***
- 6 Leaves all basal, or with a few alternate or whorled involucre leaves on the stem; style not plumose.
- 7 Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a *Plantago* inflorescence); [tribe *Ranunculeae*] **19. *Myosurus***
- 7 Basal leaves various, but not as above, generally long-petiolate, with an expanded, crenate-toothed, 3-lobed, or palmately-lobed blade; receptacle globose to sub-cylindric, mostly < 1 cm long.
- 8 Fruit a dehiscent utricle; cauline leaves alternate; [tribe *Ranunculeae*] **16. *Trautvetteria***
- 8 Fruit an achene; cauline leaves opposite or whorled (or alternate in *Ranunculus*, or reduced to alternate scale-like bracts in *Halerpestes*).
- 9 Cauline leaves opposite or whorled, or reduced to 3 sepal-like involucral bracts immediately subtending the flower; sepals absent (but in "*Hepatica*" mimicked by the bracts); [tribe *Anemoneae*] **14. *Anemone***
- 9 Cauline leaves alternate; sepals present; [tribe *Ranunculeae*]
- 10 Achenes smooth or variously ornamented with spines, papillae, or tubercles, sometimes also pubescent, usually noticeably beaked, the beak > 0.3 mm long; leaves various, usually not at once simple, cordate, and unlobed; [native or introduced] **20. *Ranunculus***
- 10 Achenes not ornamented with spines, papillae, or tubercles, pubescent or glabrous, beakless; leaves simple, unlobed.
- 11 Sepals 3; [introduced garden plants] **18. *Ficaria***
- 11 Sepals 5; [native, of s. NJ northwards] **17. *Halerpestes***

Key C

- 1 Leaflets linear, < 1.5 mm wide.
- 2 Flowers bilaterally symmetrical; [subfamily *Ranunculoideae*, tribe *Delphineae*] **8. *Delphinium***
- 2 Flowers radially symmetrical.
- 3 Aquatic; [native]; [subfamily *Ranunculoideae*, tribe *Ranunculeae*] **20. *Ranunculus***
- 3 Terrestrial; [alien].
- 4 Flower lacking involucre; pistils simple; [subfamily *Ranunculoideae*, tribe *Adonideae*] **6. *Adonis***
- 4 Flower closely subtended by a finely dissected involucre; pistils compound; [subfamily *Ranunculoideae*, tribe *Nigelleae*] **9. *Nigella***
- 1 Leaflets broader, rounded, lobed, or toothed.
- 5 Leaves all cauline, opposite; stems somewhat woody at base; [subfamily *Ranunculoideae*, tribe *Anemoneae*] **15. *Clematis***
- 5 Leaves basal and cauline, the cauline alternate (or with opposite or whorled involucral bracts).
- 6 Petals present, conspicuous
- 7 Flowers dangling; petals red, orange with yellow, or blue, spurred; [subfamily *Thalictroideae*] **3. *Aquilegia***
- 7 Flowers not dangling; petals yellow, not spurred; [subfamily *Ranunculoideae*, tribe *Ranunculeae*] **20. *Ranunculus***
- 6 Petals absent or inconspicuous (soon deciduous or altered into a nectary-bearing clavate structure); sepals sometimes petaloid and conspicuous.
- 8 Sepals petaloid, conspicuous, white (or cream, rose, pink, or tinged with green).
- 9 Involucre absent, all leaves on the stem alternate; petaloid sepals 5, white; [subfamily *Thalictroideae*] **4. *Enemion***
- 9 Involucre of opposite or whorled, leaflike bracts present; petaloid sepals (4-) 5-20 (-30), white, cream, rose, or green.
- 10 Basal leaves with 3-5 leaflets, these toothed or incised; petaloid sepals white, cream, rose, or green; [subfamily *Ranunculoideae*, tribe *Anemoneae*] **14. *Anemone***
- 10 Basal leaves with > 5 leaflets; these with 0-3 rounded lobes at the tip; petaloid sepals white to pale pink; [subfamily *Thalictroideae*] **5. *Thalictrum* (*thalictroides*)**
- 8 Sepals absent, or inconspicuous in comparison to the stamens or pistils.
- 11 Leaflets 3; flower solitary; [subfamily *Coptidoideae*] **2. *Coptis***
- 11 Leaflets many; flowers many, in a panicle or raceme.
- 12 Inflorescence a raceme; [subfamily *Ranunculoideae*, tribe *Cimicifugeae*] **12. *Actaea***
- 12 Inflorescence a panicle; [subfamily *Thalictroideae*] **5. *Thalictrum***

Key D

- 1 Fruit a follicle or capsular (or fleshy and berrylike in some *Actaea*).
- 2 Mature leaves > 4 dm wide; [subfamily *Ranunculoideae*, tribe *Cimicifugeae*] **12. *Actaea***
- 2 Mature leaves < 3 dm wide.
- 3 Leaflets linear; [aliens].
- 4 Flowers in a raceme, not subtended by an involucre; fruit follicular, each with a 1-2 mm long beak; [subfamily *Ranunculoideae*, tribe *Delphineae*] **8. *Delphinium***

- 4 Flower solitary, subtended by a finely divided involucre; fruit a spherical capsule-like structure composed of 5 or 10 partially connate follicles, each follicle terminated by a linear beak 13-20 mm long; [subfamily *Ranunculoideae*, tribe *Nigelleae*] **9. *Nigella***
- 3 Leaflets broad, rounded; [mostly natives].
- 5 Follicles borne on stipes, forming an umbel-like cluster; rhizomes yellow or orange; [subfamily *Coptidoideae*] **2. *Coptis***
- 5 Follicles sessile; rhizomes brown or tan; [subfamily *Thalictroideae*].
- 6 Follicles 15-31 mm long, with beaks 7-18 mm long **3. *Aquilegia***
- 6 Follicles 3.5-6.5 mm long, with beaks 1.5-3 mm long **4. *Enemion***
- 1 Fruit an achene.
- 7 Leaves divided into numerous linear segments, all of which are < 1 mm wide.
- 8 Plant terrestrial; [subfamily *Ranunculoideae*, tribe *Adonideae*] **6. *Adonis***
- 8 Plant aquatic (if leaves divided into numerous linear segments); [subfamily *Ranunculoideae*, tribe *Ranunculeae*] **20. *Ranunculus***
- 7 Leaf segments rounded or cleft, > 1 mm wide.
- 9 Leaves cauline, opposite; [subfamily *Ranunculoideae*, tribe *Anemoneae*] **15. *Clematis***
- 9 Leaves basal and/or cauline, cauline alternate (leaflike involucre bracts sometimes present and opposite or whorled).
- 10 Leaflike involucre bracts present, opposite or whorled.
- 11 Achenes not ribbed or veined on lateral surfaces; leaf texture moderate to distinctly thick and leathery; [subfamily *Ranunculoideae*, tribe *Anemoneae*] **14. *Anemone***
- 11 Achenes conspicuously ribbed or veined on lateral surfaces; leaf texture thin, delicate; [subfamily *Thalictroideae*] **5. *Thalictrum* (*thalictroides*)**
- 10 Leaflike involucre bracts not present.
- 12 Leaflets 3-many, if many the leaflets typically with teeth, or sharp lobes; [subfamily *Ranunculoideae*, tribe *Ranunculeae*] **20. *Ranunculus***
- 12 Leaflets many, unlobed or typically with 3-9 rounded lobes; [subfamily *Thalictroideae*] **5. *Thalictrum***

1. *Xanthorrhiza* Marshall 1785 (Yellowroot)

A monotypic genus, a shrub, of temperate e. North America. References: Parfitt in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: An unmistakable plant, the woody stems usually about knee-high and unbranched, bearing a cluster of pinnate leaves near the tip, and the rhizomes with a bright yellow, staining, bitter-tasting alkaloid.

Xanthorrhiza simplicissima Marshall, Yellowroot, Brook-feather. Streambanks and riverbanks. (Late Jan-) Mar-May; May-Jun. Se. VA, w. VA, WV, and s. OH south to FL Panhandle and s. MS; disjunct west of the Mississippi in w. LA and e. TX; also scattered northward as naturalized populations from cultivation in PA, MD, NY, MA, CT, and ME. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WH3, WV; = *Xanthorrhiza simplicissima* - S, orthographic variant]

2. *Coptis* Salisbury 1807 (Goldthread)

A genus of about 15 species, perennial herbs, of boreal to temperate e. Asia and North America. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Coptis trifolia (Linnaeus) Salisbury var. *groenlandica* (Oeder) Fassett, Goldthread, Goldenroot. Bogs. Apr-Jun. The species ranges from Greenland west to AK, south to NJ, nw. NC, n. IN, IA, and BC; and in e. Asia. Var. *groenlandica* is the variety in e. North America, northeast to Greenland, and in southern parts of nw. North America; var. *trifolia* is Alaskan and e. Asian. Whether the varieties are worth recognition is somewhat questionable. *Coptis* had been reported for NC by many florists (for instance, C, F, G, and S), but the documentation was unknown; its presence in NC has now been confirmed by P. McMillan. The species is distinctive, with neatly trifoliolate leaves, small white flowers on scapes, and yellow roots. [= C; = *C. groenlandica* (Oeder) Fernald - F, WV; = *C. trifolia* ssp. *groenlandica* (Oeder) Hultén - G; < *C. trifolia* - FNA, K, Pa, S]

3. *Aquilegia* Linnaeus 1753 (Columbine)

A genus of about 80 species, perennial herbs, of the Northern Hemisphere. References: Whittemore in FNA (1997); Munz (1946)=Z; Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: When in leaf, somewhat easily mistaken for *Thalictrum* or *Enemion*; look for old fruits.

- 1 Flowers red and yellow; {add other characters}; spurs straight; [native, common] ***A. canadensis***
- 1 Flowers blue, purple, mauve, pink, white, or red and yellow; spurs hooked; [alien, rare] ***A. vulgaris***

Aquilegia canadensis Linnaeus, Canada Columbine, Eastern Columbine. Forests, woodlands, rock outcrops, especially (though by no means entirely) on calcareous or mafic substrates. Mar-Jun. NS, QC, ON, MB, and SK south to Panhandle FL, s. AL, w. TN, c. AR, and se. OK; disjunct in Edwards Plateau, TX. One of our most familiar wildflowers. Disjunct populations in the deep South, on limestone in sw. GA and FL Panhandle, have been described as *A. australis* or *A. canadensis* var. *australis*; they need additional study. [= C, FNA, G, K, Mo, Pa, RAB, S, Va, W, WH3; > *A. canadensis* var. *canadensis* - F, Z; > *A. canadensis* var.

coccinea (Small) Munz – F, Z; > *A. canadensis* – S; > *A. australis* Small – S; > *A. coccinea* Small – S; > *A. canadensis* var. *australis* (Small) Munz – Z]

* *Aquilegia vulgaris* Linnaeus, European Columbine. Disturbed areas; native of Europe. Apr-Jun. Many varieties have been named; there seems little utility in trying to apply these names to the cultivated plants rarely persistent in our area. [= C, FNA, G, K, Pa, RAB; > *A. vulgaris* varieties – Z]

4. *Enemion* Rafinesque 1820 (Isopyrum)

A genus of about 6 species, perennial herbs, of temperate North America and e. Asia. The issue of the separation of the genus *Enemion* from *Isopyrum* remains somewhat controversial; I here follow Keener (1977), Tamura (1993), and Ford (1997).
References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993); Keener (1977).

Identification notes: *Enemion* is somewhat superficially similar to the more common and widespread (in the Flora area) *Thalictrum thalictroides*, with which it also sometimes grows, but can be distinguished by the following characters: stem leaves 1-4 and alternate (vs. stem leaves 2 and opposite), fruit an aggregate of follicles (vs. fruit an aggregate of achenes), petaloid sepals 5 (vs. 5-10, usually some at least of the flowers on a plant with 6 or more), leaflets deeply lobed, at least some of the leaflets on a plant with sinuses at least 1/3 as long as the leaflet (vs. leaflets shallowly lobed, the notches < 2 mm long).

***Enemion biternatum* Rafinesque, Isopyrum, False Rue-anemone.** Rich forests, either on natural levees with very nutrient rich sediments or on slopes with underlying mafic rocks. (Late Jan-) Mar-Apr; May. Mainly west of the Appalachians, W. NY, s. ON and MN south to TN and AR; disjunct in the Piedmont and Coastal Plain of VA, NC, and SC, and the FL Panhandle. [= FNA, K, Va, WH3; = *Isopyrum biternatum* (Rafinesque) Torrey & Gray – C, F, G, Mo, RAB, S]

5. *Thalictrum* Linnaeus 1753 (Meadow-rue)

A genus of about 330 species, perennial herbs, of Eurasia, North America, South America, and Africa. Ro & McPherson (1997) corroborate via molecular phylogeny that *Anemone* should be included in *Thalictrum*; in fact, *T. thalictroides* appears to form a basal subclade in *Thalictrum* with *T. clavatum* (and presumably *T. mirabile*). References: Park & Festerling in FNA (1997); Park (1992)=Z; Ro & McPherson (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: *Thalictrum thalictroides* is superficially similar to *Enemion biternatum*, but can be distinguished by the following characters: fruit an achene (vs. fruit a follicle), petaloid sepals 5-10 (vs. 5).

- 1 Sepals petaloid, conspicuous, white (or tinged with pink or green); leaflike involucral bracts present, opposite or whorled; inflorescence an umbel; [section *Anemone*]..... *T. thalictroides*
- 1 Sepals absent, or inconspicuous in comparison to the stamens or pistils; leaflike involucral bracts not present; inflorescence a panicle, corymb or raceme.
- 2 Fruit (achene) scimitar-shaped, borne on a stipe 1.5-4 mm long; flowers perfect; [section *Physocarpum*].
- 3 Achene concave or straight on the upper surface, 4-5.5 mm long, borne on a stipe 1.5-3 mm long; inflorescence branches stiff and diverge at acute angles; [fairly widespread in our area, on a wide variety of moist substrates, especially in the Mountains] *T. clavatum*
- 3 Achene straight on the upper surface, 2.5-4 mm long, borne on a stipe 2.5-4 mm long; inflorescence branches flexuous and divergent; [of sandstone rockhouses of Cumberland Plateau of AL, TN, and KY] *T. mirabile*
- 2 Fruit (achene) not scimitar-shaped, not borne on a stipe; flowers unisexual (or sometimes a few or more bisexual).
- 4 Leaflets of the stem leaves linear to narrowly lanceolate, oblanceolate or elliptic, (3-) 5-10 (-25)× as long as wide; [section *Leucocoma*] *T. cooleyi*
- 4 Leaflets of the stem leaves ovate, obovate, or suborbicular, 0.7-3 (-5)× as long as wide.
- 5 Most of the leaflets with (3-) 4-6 (-9) lobes or teeth; [section *Heterogamia*].
- 6 Cauline leaf subtending the lowest flowering branch sessile; plant flowering May-Jul; achenes borne on a 0.7-2.5 mm long stipe... *T. coriaceum*
- 6 Cauline leaf subtending the lowest flowering branch with a petiole 3-7 cm long; plant flowering Mar-Apr; achenes nearly sessile, the stipe nonexistent or <0.3 mm long.
- 7 Largest leaflets < 15 mm wide; stems 10-40 cm tall, reclining *T. debile*
- 7 Largest leaflets > 15 mm long; stems 30-80 cm tall, erect *T. dioicum*
- 5 Most of the leaflets with 1-3 (-5) lobes or teeth; [section *Leucocoma*].
- 8 Leaflet undersurfaces, peduncles, and achenes with stipitate glands or papillae.
- 9 Anthers 1-3.6 (-4) mm long; stigmas 1.5-4.7 (-6) mm long *T. dasycarpum*
- 9 Anthers 0.5-2.8 mm long; stigmas 0.6-3.5 mm long.

- 10 Anthers 0.5-1.2 mm long; stigmas 0.6-2.2 mm long *T. hepaticum*
- 10 Anthers 1.5-2.8 mm long; stigmas (1.5-) 2.0-3.5 mm long *T. revolutum*
- 8 Leaflet undersurfaces, peduncles, and achenes glabrous or pubescent, lacking both stipitate glands and papillae.
- 11 Leaflet undersurfaces, peduncles, and achenes finely pubescent *T. pubescens*
- 11 Leaflet undersurfaces, peduncles, and achenes glabrous.
- 12 Leaflets entire to 3-lobed, averaging about 10 mm wide, the broadest usually < 20 mm wide; filaments (2-) 3-4.5 (-6.5) mm long (averaging 3.6 mm) *T. macrostylum*
- 12 Leaflets 3-lobed (rarely entire), averaging 15-23 mm wide, the broadest usually 15-60 mm wide; filaments (2-) 4-5 (-8) mm long (averaging 4.5 mm).
- 13 Anthers 1-3.6 (-4) mm long; stigmas 1.5-4.7 (-6) mm long *T. dasycarpum*
- 13 Anthers 0.5-2.8 mm long; stigmas 0.6-3.5 mm long.
- 14 Anthers 0.5-1.2 mm long; stigmas 0.6-2.2 mm long *T. hepaticum*
- 14 Anthers 1.5-2.8 mm long; stigmas (1.5-) 2.0-3.5 mm long *T. revolutum*

Thalictrum clavatum A.P. de Candolle, Lady-rue, Mountain Meadowrue. Seepages, moist forests, spray cliffs at waterfalls, brookbanks. May-Jul. A Southern Appalachian endemic: VA, WV, e. KY south through w. NC and e. TN to nw. SC and n. GA; all records of this species for AL are apparently *T. mirabile* (D. Spaulding, pers.comm, 2013). [= C, F, FNA, G, GW, K, RAB, S, Va, W, WV]

Thalictrum cooleyi H.E. Ahles, Cooley's Meadowrue, Savanna Meadowrue. Ecotones between calcareous savannas and adjacent swamp forests, shallowly underlain by coquina limestone ("marl"), generally within a few meters of both *Taxodium ascendens* and *Liriodendron tulipifera*. Late Jun-early Jul; Aug-Oct. The species is endemic to two small areas, centered around Maple Hill (Pender and Onslow counties, NC) and Old Dock (Columbus and Brunswick counties, NC), with a small disjunct population in Panhandle FL (Walton County), and a small number of ambiguous populations in sw. GA (Dougherty and Worth counties); the GA populations are assigned here for now but may well represent a new taxon. It is associated with a number of other narrow endemic species. The leaflets of basal leaves (winter rosettes) are much broader, resembling the leaflets of other *Thalictrum* species in length/width ratio. Leaves produced from May on have the very narrow leaves typical of the species. Park (1992) found that *T. cooleyi* has the highest chromosome number known in the genus, 2n = 210, a ploidy level of 30x compared to the base chromosome level of 7 in *Thalictrum*. [= FNA, GW, K, RAB, WH3, Z]

Thalictrum coriaceum (Britton) Small, Appalachian Meadowrue, Maid of the Mist. Rich forests. May-Jul. A Southern and Central Appalachian endemic: MD, VA, and WV south through w. KY and e. TN to w. NC and ne. GA. The roots are bright yellow. A preliminary study concluded that *T. steeleanum* B. Boivin is not distinct from *T. coriaceum* (Park 1988); further study is needed. *T. steeleanum* is alleged to differ in the following ways (and others): plant with long, cordlike rhizomes (vs. stout caudex), terminal leaflets mostly wider than long (vs. mostly longer than wide), achenes curved, 4-6 mm long (vs. less curved, 2.5-4 mm long). Park found these characters (and others) to be variable and to occur together within populations. It ranges from s. PA south through MD, e. WV, w. VA to nw. NC. [= FNA, K, Pa, RAB, Va; > *T. coriaceum* - C, F, G, W, WV; > *T. steeleanum* B. Boivin - C, F, G, W, WV; > *T. coriaceum* - S; > *T. caulophylloides* Small - S]

Thalictrum dasycarpum Fischer & Avé-Lallemant, Purple Meadowrue. Forest, woodlands, and prairies. Late May-Jul. QC and YT south to PA, KY, TN, AL, MS, LA, TX, NM, AZ, and WA. It has been reported for scattered localities in VA (Harvill et al. 1992). Park (1992) and FNA do not document the occurrence of *T. dasycarpum* in VA; substantiation is needed. [= FNA, K, Mo, Pa; > *T. dasycarpum* var. *dasycarpum* - C, F, G; > *T. dasycarpum* var. *hypoglaucum* (Rydberg) B. Boivin - C, F, G]

Thalictrum debile Buckley, Trailing Meadowrue. Moist to wet forests over limestone. Nw. GA west to e. MS. [= FNA, GW, K, S]

Thalictrum dioicum Linnaeus, Early Meadowrue. Seepages, moist forests. Apr-May. ME, QC, and MN south to SC, c. GA, AL, and MO. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WV]

Thalictrum hepaticum Greene, Appalachian Tall Meadowrue. Seepage areas. May-Jul. PA south to n. GA and se. TN, strictly or primarily in the Appalachians. Plants tentatively placed here have been problematic. Keener (1981) reduced *T. hepaticum* Greene to a variety of *T. pubescens*, and discussed their distinction. Park (1992) contends that these plants are, indeed, glandular puberulent, and should therefore be reduced to synonymy under *T. revolutum*, stating "these are not given varietal status [under *T. revolutum*] since this morphological variation in anthers is not correlated with a continuous geographic range. As indicated above, I have located specimens from Georgia, North Carolina, Tennessee, and Pennsylvania which fit the description." As mapped by Keener (1981) *T. pubescens* var. *hepaticum* (Greene) Keener appears as an endemic to the Southern Appalachians; if extended to Pennsylvania, the distribution is still very restricted (and in a phytogeographically plausible manner) compared to either *T. revolutum* or *T. pubescens*. This entity appears to be closer to *T. pubescens* in leaflet shape, sepal length, anther length, and stigma length, and to *T. revolutum* in leaflet and petiolule vestiture. More study is needed; the taxon is here provisionally accepted in order to draw attention to the problem. [= *T. pubescens* var. *hepaticum* (Greene) Keener - W; < *T. polygamum* Muhlenberg ex Sprengel - F, G, RAB, S, nomen nudum; < *T. pubescens* - C, GW, K, Va, WV; < *T. revolutum* - FNA, Pa]

Thalictrum macrostylum Small & Heller, Small-leaved Meadowrue. Moist places, perhaps associated with circumneutral soils, moist to dry ultramafic outcrop barrens (over serpentinized olivine), tidal freshwater marshes, rarely pineland seepages with calcareous substrate. May-Aug. Se. VA south and west through NC, SC, sc. GA, FL, and AL to MS. [= C, F, FNA, G, GW, K, S, Va, WH3, Z; > *T. macrostylum* – RAB; > *T. subrotundum* B. Boivin – RAB]

Thalictrum mirabile Small, Rockhouse Meadowrue. Wet sandstone cliffs, primarily in the Cumberland Plateau (and especially associated with sandstone rockhouses). KY south through TN to n. AL and nw. GA (and additionally cited in FNA as occurring in w. NC). A delicate relative of *T. clavatum*, the inflorescence appears sparser because of the shorter and narrower achenes borne on longer stipes. [= FNA, GW, K, S]

Thalictrum pubescens Pursh, Common Tall Meadowrue, Late Meadowrue, King-of-the-meadow. Bogs, marshes, wet forests. May-Jul. NL (Labrador), NL (Newfoundland), and ON south to GA, SC and MS. [= *T. pubescens* var. *pubescens* – W; < *T. polygamum* Muhlenberg ex Sprengel – F, G, RAB, S, nomen nudum; < *T. pubescens* – C, GW, K, Va, WV, Z; < *T. pubescens* – FNA]

Thalictrum revolutum A.P. de Candolle, Skunk Meadowrue, Waxy Meadowrue. Mesic to dry forests, woodlands, and barrens, over hornblende, greenstone, dolostone, and serpentinized olivine. May-Aug. QC and ON south to n. FL, LA, and TX, and scattered southwest to CO, NV, and AZ. The species is normally stipitate-glandular or papillose, but can be glabrous, as accounted for in the key. [= C, F, G, GW, K, Mo, RAB, S, Va, W, WH3, WV; < *T. revolutum* – FNA, Pa]

Thalictrum thalictroides (Linnaeus) A.J. Eames & B. Boivin, Rue-anemone, Windflower. Moist forests. Mar-Jun. ME, MN, and KS, south to Panhandle FL, MS, AR, and OK. [= FNA, K, Pa, RAB, Va, W, WH3, WV; = *Anemonella thalictroides* (Linnaeus) Spach – C, F, G; = *Syndesmon thalictroides* (Linnaeus) Hoffmannsegg ex Britton – S]

6. *Adonis* Linnaeus 1753 (*Adonis*)

A genus of about 26 species, annual and perennial herbs, of Eurasia. References: Tamura in Kubitzki, Rohwer, & Bittrich (1993).

* **Adonis annua** Linnaeus, Autumn Adonis, Bird's-eye, Pheasant's-eye. Disturbed areas, formerly especially as a weed in grain fields; native of Eurasia. Apr-Jun. Naturalized in n. AL and sc. TN (Parfitt in FNA 1997). [= C, FNA, G, K, Mo]

7. *Aconitum* Linnaeus 1753 (*Monkshood, Aconite*)

A genus of about 300 species, herbs, of Eurasia, n. Africa, and North America. References: Brink & Woods in FNA (1997); Hardin (1964b)=Z; Tamura in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Flowers white, creamy white, or yellowish; basal leaves numerous, large, usually 10-20 cm across, on long, stout petioles; roots fascicled; [section *Lycocotum*] **A. reclinatum**
- 1 Flowers pale to medium blue (rarely white); basal leaves fewer, smaller, rarely over 10 cm across, on shorter and wirier petioles; root thickened, tuberous..... **A. uncinatum**

Aconitum reclinatum A. Gray, White Monkshood, Trailing Wolfsbane, White Aconite. Rich cove forests, particularly along brookbanks, in seepages, and in periglacial boulderfields with seepage, primarily over mafic rocks (such as amphibolite, metagabbro, or greenstone), rarely over sandstone or granitic rocks. Jun-Sep. A Southern and Central Appalachian endemic: sw. PA, w. VA and e. WV south to w. NC and ne. TN. It is more restricted in distribution and habitat than *A. uncinatum*, but the two species sometimes occur together, even intertwined! [= C, F, FNA, G, K, Pa, RAB, S, Va, W, Z; *A. vaccarum* Rydberg]

Aconitum uncinatum Linnaeus, Eastern Blue Monkshood, Appalachian Blue Monkshood. Seepages, cove forests, other moist forests. Aug-Oct. C. MD and sw. PA south to e. VA, e. NC, wc. GA, and c. TN; disjunct in sc. MO (Yatskievych 2013). Two varieties or subspecies have sometimes been recognized, but the character differences seem ambiguous, poorly correlated with one another, and geographically incoherent. A third eastern blue-flowered entity, approaching our area in s. OH, has been variously treated as an additional subspecies or variety of *A. uncinatum*, as a separate species, *A. noveboracense* A. Gray, or as disjunct populations of the otherwise more western *A. columbianum* Nuttall. [= FNA, Pa, RAB, S, Va, W; > *A. uncinatum* var. *muticum* A.P. de Candolle – C; > *A. uncinatum* var. *uncinatum* – C, F; > *A. uncinatum* var. *acutidens* Fernald – F; > *A. uncinatum* Linnaeus ssp. *muticum* (A.P. de Candolle) Hardin = K, Z; > *A. uncinatum* ssp. *uncinatum* – K, Z]

8. *Delphinium* Linnaeus 1753 (Larkspur)

A genus of about 360 species, annual and perennial herbs, of Eurasia, Africa, and North America. Jabbour & Renner (2011a, 2011b, 2012) show convincingly that *Consolida* should be included in *Delphinium*. References: Warnock in FNA (1997); Kral (1976)=Z; Jabbour & Renner (2011a, 2011b); Warnock 1995; Tamura in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Annual; pistil 1; petals 2, connate; leaf lobes < 1.5 mm wide; [section *Consolida*]; [aliens]
 - 2 Lower bracts of the inflorescence unlobed or the single lowermost bract with 3 lobes; pistil glabrous; follicle 8-17 mm long.
 - 3 Terminal lobe of petal < 2 mm wide; follicles pubescent[*D. pubescens*]
 - 3 Terminal lobe of petal > 2 mm wide; follicles glabrous or pubescent[*D. consolida*]
 - 2 Lower bracts of the inflorescence (at least 2 of them) with 3 or more lobes; pistil densely pubescent; follicle 12-25 mm long.
 - 4 Spur < 12 mm long; upper bracteoles overlapping the flower, attached 1-4 mm below the flower.....[*D. orientale*]
 - 4 Spur > 12 mm long; upper bracteoles not overlapping the flower, attached 4-20 mm from the flower.
 - 5 Inflorescence with 3 or fewer branches; stems glabrous to sparsely puberulent; follicles 12-25 mm long.....*D. ajacis*
 - 5 Inflorescence with 3 or more branches; stems pubescent; follicles 10-15 mm long.....[*D. pubescens*]
- 1 Perennial; pistil 3 (-5); petals 4, separate; leaf lobes > 2 mm wide; [natives]
 - 6 Follicles divergent; raceme 0.5-2 (-3) dm long; flowering plants 2-9 (-13) dm tall; flowering Mar-May; [section *Diedropetala*; subsection *Grumosa*].
 - 7 Stems (4.5-) 6-9 (-13) dm tall; flowers (sepals) deep blue; lower stem pubescent; [in sunny or semi-sunny situations, apparently endemic to n. AL]*D. alabamicum*
 - 7 Stems 2-6 dm tall; flowers (sepals) deep bluish purple, pink, or white; lower stem glabrous or nearly so; [usually in deep shade, widespread in our area]*D. tricornes*
 - 6 Follicles erect; raceme > 3 dm long; flowering plants 5-20 dm tall; flowering May-Sep.
 - 8 Seeds wing-margined, the surfaces smooth; stem below the inflorescence glabrous; flowering plants 8-20 dm tall; flowering Jul-Sep; [section *Diedropetala*; subsection *Exaltata*].....*D. exaltatum*
 - 8 Seeds with prominent transverse ridges; stem below the inflorescence pubescent; flowering plants 2-10 (-15) dm tall; flowering May-Jul; [section *Diedropetala*; subsection *Virescens*].
 - 9 Basal leaves usually present at anthesis; flowers (sepals) white; stems 2-4 (-7) dm tall; ultimate segments of midcauline leaves 5-12 in number, 2-4 mm wide.....*D. carolinianum* ssp. *calciphilum*
 - 9 Basal leaves absent at anthesis; flowers (sepals) blue to purple (rarely white); stems (3-) 6-10 (-15) dm tall; ultimate segments of midcauline leaves 12-25 in number, 0.5-1.5 mm wide.....*D. carolinianum* ssp. *carolinianum*

* *Delphinium ajacis* (Linnaeus, Rocket Larkspur. Roadsides, fields, waste places, disturbed ground; native of Europe. May-Sep. [= F, G, Mo, RAB, S, WV; = *Consolida ajacis* (Linnaeus) Schur – FNA, K2, Pa, Va, WH3; = *Delphinium ambiguum* Linnaeus – C; = *Consolida ambigua* (Linnaeus) P.W. Ball & Heywood in Heywood & P.W. Ball – W]

Delphinium alabamicum Kral, Alabama Larkspur. Limestone prairies and glades. Endemic to c. and n. AL and nw. GA. May. [= FNA, K]

Delphinium carolinianum Walter ssp. *calciphilum* M.J. Warnock, Glade Larkspur. Limestone glades. KY south through e. and c. TN to ne. AL and nw. GA. [= FNA, K; < *D. virescens* Nuttall – C, G; < *D. carolinianum* var. *carolinianum* – F; < *D. carolinianum* – S; < *D. virescens* var. *virescens* – Z; < *D. carolinianum* Walter ssp. *virescens* (Nuttall) R.E. Brooks]

Delphinium carolinianum Walter ssp. *carolinianum*, Prairie Larkspur, Carolina Larkspur, Blue Larkspur. Rocky woodlands, granite outcrops, Altamaha Grit outcrops, blackland prairies, moist sandy woodlands associated with longleaf pine. May-Jul. IL west to MO, south to LA and TX, with disjunct occurrences eastward in SC, GA, Panhandle FL (Gadsden County), TN, and MS. The flowers are a pale to medium blue. This species has been reported for NC (by C) and "north to Va." (by F and S). I know of no documentation for its past or present occurrence in NC or VA, but its presence in those states is plausible. [= FNA, K, Mo; = *D. carolinianum* Walter – C, G, WH3, Z; < *D. carolinianum* var. *carolinianum* – F; < *D. carolinianum* – S]

* *Delphinium consolida* Linnaeus, Royal Larkspur, Forking Larkspur. Disturbed areas; native of Europe. Jun. Also known from DC and to be expected in VA. [= C, G, Mo, S; = *Consolida regalis* S.F. Gray – FNA, K2, Pa]

Delphinium exaltatum Aiton, Tall Larkspur. Dry to moist soils over calcareous (such as dolostone, especially Elbrook Formation) or mafic rocks (such as amphibolite, metagabbro, greenstone, and diabase), usually in the open (as grassy balds) or on forest edges in partial sun. Jul (low elevations)-Sep (high elevations). Sw. PA and OH southwest to MO and e. TN, and south to the Mountains of VA and the Mountains and Piedmont of NC. The flowers are a pale to medium blue. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV, Z]

* *Delphinium orientale* Gay, Oriental Larkspur. Disturbed areas, perhaps only a waif after cultivation; native of s. Europe, n. Africa, and w. Asia. [= *Consolida orientalis* (Gay) Schrödinger – FNA, K2; ? *Consolida hispanica* (Willk. ex Costa) Greuter & Burdet]

* *Delphinium pubescens* A.P. de Candolle, Hairy Larkspur. Disturbed areas, perhaps only a waif after cultivation; native of sw. Europe and nw. Africa. Naturalized in s. TN (Warnock in FNA 1997). [= *Consolida pubescens* (A.P. de Candolle) Soó – FNA, K2]

Delphinium tricornes Michaux, Dwarf Larkspur. Rich, moist forests, especially over mafic or calcareous rocks, less commonly (as along the Roanoke River in ne. NC) on very fertile alluvial deposits. Mar-May. Sw. PA and MN south to NC, nw. GA, AL, and OK. The flowers are variable in color, usually a deep bluish violet, but ranging through pink to pure white. [= C, F, FNA, G, K, Mo, RAB, S, Va, W, WV, Z]

9. Nigella Linnaeus 1753 (Fennel-flower)

A genus of about 20 species, annual herbs, of Europe, n. Africa, and Asia. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

* **Nigella damascena** Linnaeus, Love-in-a-mist, Fennel-flower. Cultivated in gardens, rarely persistent or escaping; native of s. Europe. Jun-Jul. [= C, F, FNA, G, K, Pa]

10. Helleborus Linnaeus 1753 (Hellebore, Christmas-rose)

A genus of about 21 species, perennial herbs, of Europe and Asia. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: Other species of *Helleborus* are increasingly being cultivated; all have the potential to naturalize.

- 1 Primary leaves of mature (fertile) plants all cauline; leaf segments <1.5 cm wide; flowers <3 cm across, >9 per inflorescence**H. foetidus**
- 1 Primary leaves of mature (fertile) plants basal (the stem with reduced, bracteal leaves subtending the inflorescence); leaf segments >3 cm wide; flowers >4 cm across, (1-) 3 (-5) per inflorescence**H. viridis**

* **Helleborus foetidus** Linnaeus, Stinking Hellebore. Cultivated in gardens, seeding down and spreading locally near plantings; native of Europe. Dec-Mar. [= K2]

* **Helleborus viridis** Linnaeus, Green Hellebore, Christmas-rose, Lenten-rose. Cultivated in gardens, seeding down, rarely escaped or persistent; rare, native of Europe. Dec-May. [= C, F, FNA, G, K1, K2, S, WV]

11. Eranthis Salisbury 1808 (Winter-aconite)

A genus of about 8 species, perennial herbs, of Europe and Asia. References: Parfitt in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

* **Eranthis hyemalis** (Linnaeus) Salisbury, Winter-aconite. Cultivated in gardens, sometimes persisting or escaped near gardens; native of Eurasia. Jan-Mar. [= F, FNA, G, K, Mo, Pa]

12. Actaea Linnaeus 1753 (Baneberry)

A genus of about 28 species, perennial herbs, of temperate regions of the Northern Hemisphere. Compton, Culham, & Jury (1998) support the inclusion of *Cimicifuga* in *Actaea*, based on morphologic and molecular analyses. References: Ford in FNA (1997); Ramsey in FNA (1997); Compton, Culham, & Jury (1998)=Z; Park & Lee 1996; Ramsey (1987, 1988); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: In rich coves and other mesic Appalachian forests, *Actaea* often grows with a number of other herbs with similarly compound leaves, including *Astilbe* (Saxifragaceae), *Aruncus* (Rosaceae), *Caulophyllum* (Berberidaceae), *Angelica*, *Thaspium*, *Osmorrhiza*, and

Ligusticum (Apiaceae), *Aralia* (Araliaceae), *Thalictrum* (Ranunculaceae), and others. The curious evolutionary convergence of leaf morphology (to a 2-3-ternately compound form) of a large number of unrelated genera of Appalachian cove forests is interesting.

- 1 Terminal leaflet deeply cordate, mostly > 12 cm wide, with 7-9 major veins arising palmately from the base; principal leaves with 3-9 (-17) leaflets; [section *Oligocarpae*].....*A. rubifolia*
- 1 Terminal leaflet broadly cuneate, rounded, truncate, or subcordate, mostly < 12 cm wide, with 3 major veins arising from the base; principal leaves with (15-) 20-70 leaflets.
 - 2 Carpels 3-8, on a stipe elongating to 5-8 mm long in fruit; flowering Jul-Sep; petiole of basal leaves with a deep, broad groove (ca. 1 mm wide and 1 mm deep), persistent on fully expanded leaves; roots with vascular tissue in lunate bundles arranged in a circle; [section *Podocarpae*].....*A. podocarpa*
 - 2 Carpels 1 (-3), sessile; flowering Apr-Aug; petiole of basal leaves terete, not grooved (or with a shallow, narrow groove early, obscure or absent on fully expanded leaves); roots with vascular tissue in a central (3-) 4 (-5)-armed cross or star; [section *Actaea*].
 - 3 Fruit dry, follicular, dehiscent; flowering May-Aug*A. racemosa*
 - 3 Fruit fleshy, indehiscent; flowering Apr-May.
 - 4 Fruiting pedicels thick, 1-2 mm in diameter; fruit white (rarely red); [widespread in our area]*A. pachypoda*
 - 4 Fruiting pedicels slender, 0.4-0.7 mm in diameter; fruit red (rarely white); [northern, just reaching our area in ec. NJ].....*A. rubra*

Actaea pachypoda Elliott, White Baneberry, Dolls'-eyes, White Cohosh. Rich cove forests and slopes. Mar-May; Aug-Oct. QC and MN south to c. GA, FL Panhandle, s. AL, s. MS, e. LA, and OK. [= F, FNA, K, Mo, Pa, RAB, Va, W, WH3, Z; = *A. alba* (Linnaeus) P. Miller – C, G, S, probably misapplied; > *A. pachypoda* f. *pachypoda* – Z; > *A. pachypoda* f. *rubrocarpa* (Killip ex House) Fernald – Z]

Actaea podocarpa A.P. de Candolle, Mountain Black-cohosh, Late Black-cohosh. Rich cove forests and slopes, at moderate to high elevations. Jul-Sep. Endemic to the Southern and Central Appalachians: s. PA to w. NC, ne. GA, and e. TN. Most closely related to *Actaea laciniata* (S. Watson) J. Compton of OR and WA. [= K, Pa, Va, Z; = *Cimicifuga americana* Michaux – C, F, FNA, G, RAB, S, W]

Actaea racemosa Linnaeus, Common Black-cohosh, Early Black-cohosh. Rich cove forests, other mesic and moderately to very fertile forests. May-Aug. Primarily Appalachian: w. MA south to SC and c. GA, but extending e. into the Coastal Plain and west to OH, IN, and MO. Var. *dissecta* appears to be a sporadically occurring form, apparently always occurring in small numbers associated with typical material; McCoy (2004) reports its collection in NC. [= K2, Mo, Pa, Va; = *Cimicifuga racemosa* (Linnaeus) Nuttall – C, F, FNA, RAB, S, W; >> *C. racemosa* var. *cordifolia* (Pursh) Gray – F, misapplied in part; > *C. racemosa* var. *racemosa* – F; < *C. racemosa* – G (also see *C. rubifolia*); > *Actaea racemosa* Linnaeus var. *racemosa* – K1, Z; > *Actaea racemosa* Linnaeus var. *dissecta* (A. Gray) J. Compton – K1, Z]

Actaea rubifolia (Kearney) Kartesz, Appalachian Black-cohosh. Rich cove forests over calcareous rocks (limestone or dolostone). Aug-Oct. Sw. VA south to e. TN; disjunct in s. IL, w. KY, and nw. TN. This species is alleged by C (1991) to occur in NC, but this is probably an error, based on confusion with *Cimicifuga cordifolia* Pursh, now considered a form of *Actaea racemosa*. For this reason, the name *Actaea cordifolia* used by Compton, Culham, & Jury (1998) does not apply to this taxon. *Actaea rubifolia* is related to *Actaea elata* (Nuttall) Prantl of nw. North America. [= K, Va; = *Cimicifuga rubifolia* Kearney – C, FNA, S, W; >> *C. racemosa* var. *cordifolia* (Pursh) A. Gray – F, misapplied in part; < *C. racemosa* – G; = *Actaea cordifolia* A.P. de Candolle – Z, misapplied]

Actaea rubra (Aiton) Willdenow, Red Baneberry. Moist forests. May-Jun. Circumboreal, in e. North America to ec. NJ (Monmouth Co.), sc. PA (Rhoads & Klein 1993; Rhoads & Block 2007), OH, IN, IL, IA, and ne. KS. [= C, F, FNA, G, Pa, Z; > *A. rubra* ssp. *rubra* – K]

13. *Caltha* Linnaeus 1753 (Marsh Marigold, Cowslip)

A genus of about 12 species, perennial herbs, of the Northern and Southern Hemispheres (sometimes further divided). References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Caltha palustris Linnaeus var. *palustris*, Marsh Marigold, Cowslip. Bogs, wet meadows, seepage swamps, brookbanks. Apr-Jun. *Caltha palustris* is circumboreal, widespread in n. Eurasia and n. North America, south in e. North America to e. VA, w. NC, ne. TN, WV, IN, IL, IA, and NE. *Caltha palustris* is polymorphic; one or more additional varieties (some of them sometimes recognized as separate species) are more northern. Eastern North American material is apparently uniformly 2n=32 (Keener 1977). [= G, GW, K; < *C. palustris* – C, F, FNA, Pa, RAB, S, Va, W; > *C. palustris* var. *flabellifolia* (Pursh) Torrey & A. Gray]

14. *Anemone* Linnaeus 1753 (*Anemone*)

A genus of about 140-200 species (depending on circumscription), perennial herbs (rarely shrubs), of Eurasia, North America, Central America, South America, and Africa. Hoot, Meyer, & Manning (2012), Hoot, Reznicek, & Palmer (1994), and others discuss the phylogeny of *Anemone*, and also show why *Hepatica* (and other segregates not in our area, such as *Pulsatilla*) should be included within it. The infrageneric classification shown in the key is that of Hoot, Meyer, & Manning (2012). References: Dutton, Keener, & Ford in FNA (1997); Hoot, Meyer, & Manning (2012)=X; Hoot, Reznicek, & Palmer (1994); Ehrendorfer et al. (2009); Mlinarec et al. (2011); Keener, Dix, & Dutton (1996); Tamura in Kubitzki, Rohwer, & Bittrich (1993); Steyermark & Steyermark (1960)=Z; Ziman et al. (2004)=Y.

- 1 Basal leaves lobed but not fully divided into 3 or more leaflets; [subgenus *Anemonidium*].
 - 2 Leaves lobed, and also toothed and variously cleft; leaves not variegated; [section *Anemonidium*].....*A. canadensis*
 - 2 Leaves lobed, the margins of the lobes entire; leaves often prominently variegated; [section *Hepatica*].
 - 3 Leaves 3 (-7) lobed, the lobes acute, the primary sinuses deep, over halfway to the petiole (the middle lobe 70-90% of the total length of the leaf blade); involucre bracts acute*A. acutiloba*
 - 3 Leaves 3-lobed, the lobes broadly rounded, the primary sinuses less deep, about halfway to the petiole (the middle lobe 50-70% of the total length of the leaf blade); involucre bracts obtuse.....*A. americana*
- 1 Basal leaves compound, fully divided into 3 or more leaflets; [subgenus *Anemone*; section *Anemone*].
 - 4 Stem branched, 4-11 dm tall, bearing 2 or more flowers; involucre bracts petiolate; [subsection *Virginianae*].
 - 5 Heads of fruits cylindrical, >2× as long as diameter; fruit beaks 0.5-1.0 mm long; bracts 3-7 per involucre [*A. cylindrica*]
 - 5 Heads of fruits ovoid to short-cylindrical, <2× as long as diameter; fruit beaks 1.0-1.5 mm long; bracts 3 (-5) per involucre.
 - 6 Base of involucre bracts usually truncate to subtruncate, sometimes reniform or cordate, terminal leaflets deep green, margins proximally concave- to straight-sided, distally incised, thinly pubescent; anthers typically < 0.8-1.2 (-1.5) mm long; heads of achenes more or less ovoid-cylindrical, 8-10 (-11) mm in diameter [*A. virginiana* var. *alba*]
 - 6 Base of involucre bracts cordate or reniform, rarely subtruncate, terminal leaflets light green, margins proximally mostly straight- to convex-sided, variously lobed or serrate, variously pubescent; anthers typically > (0.9-) 1.1-1.5 (-1.7) mm long; heads of achenes ovoid to ovoid-cylindrical, (9-) 10-12 (-14) mm in diameter*A. virginiana* var. *virginiana*
 - 4 Stem unbranched, 0.5-4 dm tall, bearing 1 flower; involucre bracts sessile or petiolate.
 - 7 Sepals (5-) 8-20, cream-white, violet, blue, pink, or green; involucre leaves sessile; [subsection *Anemone*; series *Carolinianae*].
 - 8 Stem densely pubescent above and below the involucre; involucre above the midpoint of the stem at anthesis; plant from a globose, vertically oriented bulb; involucre leaflets linear, (1.5-) 3-6 cm long, 1-4 (-6) mm wide; achene bodies > 2.7-3.5 mm long*A. berlandieri*
 - 8 Stem densely pubescent above the involucre, glabrous to very sparsely pubescent beneath the involucre; involucre at or below the midpoint of the stem at anthesis; plant with horizontal rhizomes; involucre leaflets oblanceolate, 1-2.5 cm long, {width}; achene bodies < 1.5-2.5 (-3.0) mm long.....*A. caroliniana*
 - 7 Sepals 5 (-8), white; involucre leaves petiolate, the leaflets ovate, obovate, elliptic, lanceolate, or oblanceolate 2-8 cm long, 8-30 mm wide; [subsection *Anemonanthea*].
 - 9 Ovaries and achenes with hairs 0.1-0.2 mm long; terminal leaflet broadest at or below the middle (lanceolate or ovate), serrate to below the middle; sepals 15 mm or more long*A. lancifolia*
 - 9 Ovaries and achenes with hairs 0.5-1.0 mm long; terminal leaflet broadest at or above the middle (elliptic, oblanceolate, or obovate), serrate only above the middle; sepals < 15 mm long.
 - 10 Achene bodies 2.5-3.0 mm long; lateral leaflets of radical leaves toothed only (rarely lobed); terminal leaflet usually broadest at the middle; styles 0.5-1 mm long; sepals about 8 mm long*A. minima*
 - 10 Achene bodies 3.0-4.5 mm long; lateral leaflets of radical leaves lobed or cleft (sometimes only toothed); terminal leaflet usually broadest above the middle; styles 1-2 mm long; sepals 6-15 mm long.....*A. quinquefolia*

Anemone acutiloba (A.P. de Candolle) G. Lawson, Sharp-lobed Hepatica, Sharp-lobed Liverleaf. Moist forests, especially over calcareous or mafic rocks. (Late Jan-) Mar-Apr. ME, s. QC, s. ON, and MN south to SC, AL, MS, and AR. See comments under *A. americana* about the taxonomy of our two taxa of "Hepatica." [= FNA, Mo, Pa, Va, X; = *Hepatica acutiloba* A.P. de Candolle - C, F, G, RAB, W, WV; = *Hepatica nobilis* P. Miller var. *acuta* (Pursh) Steyermark - K1, K2, Z; = *Hepatica acuta* (Pursh) Britton - S]

Anemone americana (A.P. de Candolle) H. Hara, Round-lobed Hepatica, Round-lobed Liverleaf. Moist forests. (Jan-) Feb-May. NS, s. QC, s. ON, and MB south to Panhandle FL, AL, MS, and AR. The two North American taxa of "Hepatica" seem entirely distinct in our area; they have sometimes been described as hybridizing freely or merging indistinguishably, but this seems inaccurate. They are also both related to the European *H. nobilis* P. Miller. Steyermark & Steyermark (1960) chose to treat the three entities as varieties of *H. nobilis*; I prefer to retain them at the specific level, a position also supported and carefully supported by Yatskiyevych (2013). [= FNA, Mo, Pa, Va, WH3, X; = *Hepatica americana* (A.P. de Candolle) Ker-Gawler - C, F, G, RAB, W, WV; = *Hepatica nobilis* P. Miller var. *obtusata* (Pursh) Steyermark - K1, K2, Z; < *Hepatica hepatica* (Linnaeus) Karsten - S]

Anemone berlandieri Pritzl, Eastern Prairie Anemone, Ten-petal Anemone. Thin, circumneutral soils around rock outcrops, calcareous glades, calcareous hammocks (in FL). Mar-Apr. *A. berlandieri* and *A. caroliniana* have been much confused in floras; see Joseph & Heimburger (1966) for clarification. *A. berlandieri* is primarily a species of midwestern prairies, occurring from n. AR and s. KS south through OK to c. LA and s. TX; disjunct eastward in AL, c. GA, n. FL, c. NC, c. SC, and sc. VA. It reaches its northeastern limit (and only VA occurrence) at calcareous mudstone cliffs on the Banister River (Pittsylvania County); it is scattered in the Piedmont of NC on a variety of rock types, including mafic meta-argillite and plagioclase-rich granite. [= FNA, K1, K2, Va, WH3, X; < *A. caroliniana* Walter - C, F, G, RAB, S, W; ? *A. heterophylla* Nuttall ex Torrey & Gray; < *A. decapetala* Arduino, misapplied (a South American species)]

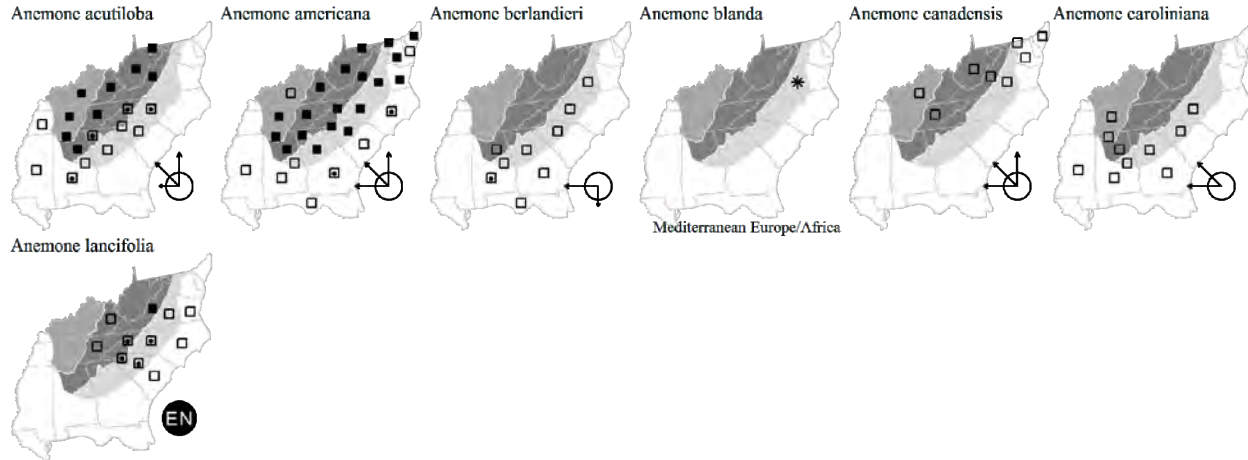

* *Anemone blanda* Schott & Kotschy, Greek Anemone. Reported by Harvill et al. (1992) from Madison County, VA and for Fauquier County, VA by Shetler & Orli {}. It is not known whether this species is established in our area. {make sure this is not a misidentified specimen of *A. berlandieri* - see FNA p. 140} [= FNA, K1, K2, X] {not keyed; rejected}

Anemone canadensis Linnaeus, Canada Anemone. Moist forests. May-Aug. QC west to AB, south to MD, w. VA, s. WV, e. TN (Chester, Wofford, & Kral 1997), KY, MO, and NM. [= C, F, FNA, G, K1, K2, Mo, Pa, Va, W, X]

Anemone caroliniana Walter, Prairie Anemone, Carolina Anemone. Clayey soils of post oak and blackjack oak woodlands (Iredell soils), wet meadows. Mar-Apr. Wc. IN, n. IL, WI, MN, and SD south to s. LA and e. and c. TX; disjunct east of the Mississippi River in c. NC south to s. GA, and c. TN south to s. AL. [= FNA, K1, K2, Mo, X; < *A. caroliniana* Walter – C, F, G, RAB, S, W (also see *A. berlandieri*)]

Anemone cylindrica A. Gray, Thimbleweed, Candle Anemone. Prairies and woodlands. Jun. ME, QC, and BC, south to n. NJ, c. PA, c. OH, c. IN, s. IL, w. MO, ne. KS, CO, NM, and AZ. [= C, FNA, K1, K2, Mo] {not in our area, but approaching it and should be looked for; keyed; not mapped}

Anemone lancifolia Pursh, Lanceleaf Anemone. Rich, moist soils on slopes or in bottomlands. Mar-May. Appalachian: VA south to GA (?), in and near the Appalachians. It is a somewhat larger plant than the closely related *A. quinquefolia*. [= C, F, FNA, G, K1, K2, RAB, S, Va, W; = *A. quinquefolia* var. *lancifolia* (Pursh) Fosberg; < *A. quinquefolia* – X]

Anemone minima A.P. de Candolle, Tiny Anemone. Acidic forests, especially under *Alnus serrulata* along small streams. Mar-May. A Southern Appalachian endemic: VA and WV south to NC and TN. See Dutton & Keener (1994). [= C, F, G, W; = *Anemone quinquefolia* Linnaeus var. *minima* (A.P. de Candolle) Frodin ex Dutton & Keener – FNA, K1, K2, Va; = *A. minima* A.P. de Candolle – C, F, G, W; < *A. quinquefolia* – X]

Anemone quinquefolia Linnaeus, Wood Anemone. Rich, moist forests, grassy balds, often abundant at high elevations. Mar-May. NL, QC, ON, MB, SK, and AB south to SC, GA, AL, MS, AR, and SD. [= Pa, RAB, S, W; = *A. quinquefolia* var. *quinquefolia* – FNA, Mo, Va; > *A. quinquefolia* var. *quinquefolia* – C, F, K1, K2; > *A. quinquefolia* var. *bifolia* Farwell – C, G, K1, K2; > *A. quinquefolia* var. *interior* Fernald – F, G; < *A. quinquefolia* – X]

Anemone virginiana Linnaeus var. *alba* (Oakes) Alph. Wood. This variety ranges south to se. NY and NJ (Kartesz 1999) and has been reported for our area. Keener, Dix, & Dutton (1996) discuss the intergrading varieties of *A. virginiana*. This variety might be expected in n. VA, especially in river scour situations. [= C, FNA, K2; = *A. riparia* Fernald – F, G, X; = *A. virginiana* var. *riparia* (Fernald) Boivin – K1] {not mapped; rejected}

Anemone virginiana Linnaeus var. *virginiana*, Tall Anemone, Thimbleweed. Rich forests and woodlands, especially prevalent on circumneutral soils. May-Aug. NL (Newfoundland), ME, s. ON, and SK, south to GA, AL, MS, LA, OK, and WY. Two other varieties are more northern; see discussion of var. *alba* above. [= C, FNA, K1, K2, Mo, Va; < *A. virginiana* – Pa, RAB, W; = *A. virginiana* – F, G, S, X; > *A. virginiana* – S; > *A. riparia* Fernald – S, misapplied]

15. *Clematis* Linnaeus 1753 (Clematis, Virgin's-bower)

A genus of about 295 species, shrubs, vines, and suffruticose herbs, of Eurasia, North America, South America, Africa, Madagascar, and Oceania. W.A. Weber (1995) proposes generic status (as *Coriflora* W.A. Weber) for the leatherflowers, here treated as *Clematis*, subgenus *Viorna*. References: Pringle in FNA (1997); Moreno & Essig in FNA (1997); Essig (1990); Keener (1975); Keener (1967); Pringle (1971)=Z; Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: Additional species of *Clematis*, of Asian or European origin, are cultivated as ornamentals and might be encountered.

- 1 Flowers numerous, in compound cymose-paniculate inflorescences; sepals white; filaments glabrous; [subgenus *Clematis*].
 - 2 Flowers perfect, with 5-10 carpels; anthers 1.5-3 mm long; leaf margins entire (rarely cleft); leaflets (3-) 5 (-7); [alien, in disturbed areas].. *C. terniflora*
 - 2 Flowers mostly polygamo-dioecious, the pistillate with 18-60 carpels; anthers 0.5-1 mm long; leaf margins coarsely toothed; leaflets 3 (C. *virginiana*) or 5-7 (C. *catesbyana*); [native, though sometimes weedy].
 - 3 Leaves (3-) 5-7-foliolate; pistillate flowers with 18-35 carpels *C. catesbyana*
 - 3 Leaves 3-foliolate; pistillate flowers with 40-60 carpels..... *C. virginiana*
- 1 Flowers solitary or in groups of 3's; sepals usually at least partly bluish, purplish or red; filaments pubescent.
 - 4 Leaves (most or all of them) simple, sessile or subsessile; plant an erect herb to 7 dm tall; [subgenus *Viorna*].
 - 5 Leaves glaucous and glabrous beneath, the uppermost commonly pinnate and tendril-bearing *C. addisonii*

- 5 Leaves green and usually pubescent beneath (glabrous in *C. baldwinii*), the uppermost usually simple and entire, neither pinnate nor tendril-bearing (though occasionally lobed).
- 6 Leaves of flowering material soft-pubescent beneath, the largest 3-9 cm wide, with stomates on the lower surface only; leaves of fruiting material usually light green with the secondary and tertiary veins forming prominent reticulations on the upper surface.
- 7 Stems and leaves usually densely sericeous-woolly; sepal backs densely sericeous; mature styles white to pale yellow, sharply recurved and flexuous; [of shale barrens and calcareous woodlands of w. VA] *C. coactilis*
- 7 Stems and leaves villous; sepal backs moderately sericeous-pilose; mature styles yellowish-white to deep tawny, loosely spreading-recurved; [of various woodlands, fairly widespread in our area] *C. ochroleuca*
- 6 Leaves of flowering material glabrous to sparsely pilose beneath, the largest 2-5 cm wide (or 3.5-11 cm wide in *C. fremontii*), with stomates on both surfaces; leaves of fruiting material often dark green, either with the secondary and tertiary veins forming prominent reticulations on the upper surface (*C. fremontii*) or the upper with the secondary and tertiary veins not forming prominent reticulations on the upper surface (*C. albicoma*, *C. viticaulis*, and *C. baldwinii*).
- 8 Sepal tips acuminate; achene bodies cobwebby-tomentose toward the tip (*C. fremontii*) or long pilose (*C. baldwinii*)
- 9 Leaf blades 0.2-2.5 (-3.5) cm wide, not notably reticulate on the upper surface; beak of the achene plumose with long hairs; [of wet pinelands of n. FL southward] *C. baldwinii*
- 9 Leaf blades 3.5-11 cm wide, prominently reticulate on the upper surface; beak of the achene silky tomentose near the base, nearly glabrous toward the tip; [of prairies of nw. GA and se. TN, disjunct from further west] *C. fremontii*
- 8 Sepals tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of w. VA and WV].
- 10 Sepal backs villous; pubescence on the summit of the achene and the base of the style spreading or reflexed; mature styles white to pale yellow, sharply recurved and flexuous *C. albicoma*
- 10 Sepal backs finely puberulent; pubescence on the summit of the achene and the base of the style closely appressed-ascending; mature styles tawny to deep reddish-brown, loosely spreading-recurved *C. viticaulis*
- 4 Leaves (most of them) compound, petiolate; plant a trailing or climbing vine or shrubby, to many meters long (or erect or ascending in *C. addisonii* and *C. socialis*).
- 11 Sepals thin in texture, 3-5 cm long, soft-villous, neither apically recurved nor with broad, strongly crisped margins; leaves 3-foliolate; [subgenus *Atragene*] *C. occidentalis* var. *occidentalis*
- 11 Sepals thick in texture, 1-5 cm long, short-sericeous, apically recurved; leaves 1-11-foliolate; [subgenus *Viorna*].
- 12 Lower surface of leaves glaucous and glabrous (rarely with a few scattered hairs).
- 13 Plant an erect or ascending herb; lower leaves simple, upper leaves simple to 2-6-foliolate; [of dry limestone glades, endemic to VA] *C. addisonii*
- 13 Plant a climbing vine; all leaves generally compound, often 6-10-foliolate; [of various habitats, ranging from NC south].
- 14 Leaf blade thin in texture; secondary and tertiary veins not prominently reticulate *C. glaucophylla*
- 14 Leaf blade leathery in texture; secondary and tertiary veins prominently reticulate; [in the Ridge and Valley of eastern TN and westward] *C. versicolor*
- 12 Lower surface of leaves not glaucous, pubescent (rarely nearly glabrous).
- 15 Plants erect, to 2-3 (-5) dm tall, forming clonal patches by underground rhizomes; leaflets linear-lanceolate, averaging ca. 10× as long as wide *C. socialis*
- 15 Plants viny, sprawling or climbing, the stems usually over 1 m long, not rhizomatous-clonal; leaflets generally broader.
- 16 Leaves coriaceous, the secondary and tertiary veins forming prominent reticulations on the upper surface.
- 17 Leaf blade coarsely reticulate-veined, the ultimate closed areoles often > 2 mm long in the longer dimension, the tertiary and quaternary veins not prominently raised; achene beak sparsely pubescent to silky, with ascending or appressed hairs *C. pitcheri* var. *pitcheri*
- 17 Leaf blade finely reticulate-veined, the ultimate closed areoles mostly < 2 mm long in the longest dimension, the tertiary and quaternary veins often prominently raised; achene beak plumose, with spreading hairs *C. reticulata*
- 16 Leaves membranous, the secondary and tertiary veins forming faint, indistinct reticulations on the upper surface.
- 18 Sepals 2.5-5 cm long, the tips widely spreading, the upper margins thin, crisped, to 6 mm wide; peduncles usually without bracts *C. crispa*
- 18 Sepals 1.5-3 cm long, the tips either abruptly and shortly recurved (*C. viorna*) or spreading to short-reflexed (*C. morefieldii*), the upper margins not thin or crisped, to 2.5 mm wide; peduncles usually with bracts.
- 19 Stems with cobwebby pubescence; bracts near the base of the peduncle; sepals densely silky-pubescent on the outer surface, pinkish-green; [limestone habitats of n. AL and se. TN] *C. morefieldii*
- 19 Stems glabrous to sparsely pilose; bracts well above the base of the peduncle; sepals sparsely pubescent on the outer surface, pale lavender to purple; [widespread in our area] *C. viorna*

Clematis addisonii Britton, Addison's Leatherflower. Dry to mesic calcareous barrens, woodlands, and forests, over dolostone (Elbrook Formation). Apr-Jun; May-Jul. Endemic to w. VA (Botetourt, Montgomery, Roanoke, and Rockbridge counties). [= C, F, FNA, G, K, Va, W; = *Viorna addisonii* (Britton) Small - S; = *Coriflora addisonii* (Britton) W.A. Weber]

Clematis albicoma Wherry, White-haired Leatherflower. Shale barrens. May-Jun; May-Aug. Endemic to w. VA (Alleghany, Augusta, Bath, Botetourt, Highland, and Rockbridge counties), and e. WV. [= C, FNA, G, K, Va, W; = *Clematis albicoma* var. *albicoma* - F; = *Coriflora albicoma* (Wherry) W.A. Weber]

Clematis baldwinii Torrey & A. Gray, Pine-hyacinth, Flatwood Clematis. Wet pine flatwoods. (Jan-) Apr-Aug (-Dec). Ne. FL south to s. FL. [= FNA, GW, WH3; > *Clematis baldwinii* var. *baldwinii* - K2; > *Clematis baldwinii* var. *latiuscula* R.W. Long - K2; = *Viorna baldwinii* (Torrey & A. Gray) Small - S; = *Coriflora baldwinii* (Torrey & A. Gray) W.A. Weber]

Clematis catesbyana Pursh, Coastal Virgin's-bower, Satin-curls. Dunes and interdune swales with abundant shell hash, calcareous woodlands and thickets, calcareous hammocks. Jun-Sep. Se. VA south to c. peninsular FL and west to LA, and inland especially in calcareous parts of c. KY, c. TN and n. AR and s. MO, as well as in the Ridge and Valley of VA and disjunct at Linville Caverns, McDowell County, NC, where on dolomite in a geologic window in the Blue Ridge. [= C, FNA, GW, K, Mo, Tn, Va, WH3; < *Clematis ligusticifolia* Nuttall – RAB, misapplied; > *Clematis catesbyana* – S; > *Clematis micrantha* Small – S]

Clematis coactilis (Fernald) Keener, Virginia White-haired Leatherflower. Shale barrens, shaly woodlands, dry calcareous barrens and woodlands. May-Jun; May-Aug. Endemic to w. VA (Botetourt, Craig, Giles, Montgomery, Pulaski, Roanoke, and Wythe counties). [= C, FNA, K, Va, W; = *Clematis albicoma* Wherry var. *coactilis* Fernald – F; = *Coriflora species 1*]

Clematis crispa Linnaeus, Marsh Clematis, Southern Leatherflower, Blue Jasmine. Marshes, tidal and non-tidal swamps, floodplain forests, disturbed wet or moist areas. Apr-Aug. FL to TX, north to se. VA and s. IL. [= C, F, FNA, G, GW, K, Mo, RAB, Tn, Va, W, WH3; = *Viorna crispa* (Linnaeus) Small – S; = *Coriflora crispa* (Linnaeus) W.A. Weber]

Clematis fremontii S. Watson, Fremont's Leatherflower. Calcareous flatwoods and limestone glades. E. MO, s. MO, nc. KS and sc. NE; disjunct in the Ridge and Valley of nw. GA (Floyd County) and se. TN (Hamilton County). The disjunct eastern populations warrant additional study. Apr-May. See Anonymous (2003) and Horn & Shaw (2007) for additional information. [= FNA, K, Mo, Tn; = *Coriflora fremontii* (S. Watson) W.A. Weber]

Clematis glaucophylla Small, White-leaved Leatherflower. Wet hammocks, habitat in our area poorly known, also probably in dry woodlands or openings over calcareous rocks, according to RAB in "rich woods". May-Sep. Widespread in Southeastern United States, from se. TN and OK, south to FL Panhandle and LA, but apparently rare and poorly known. Previous attributions of this species for NC, SC, KY, and (perhaps) VA appear to be based on misidentifications. [= C, F, FNA, G, GW, K, RAB, Tn, WH3; = *Viorna glaucophylla* (Small) Small – S; = *Coriflora glaucophylla* (Small) W.A. Weber]

Clematis morefieldii Kral, Morefield's Leatherflower. Ion vertical limestone exposures, along seasonal washes in open calcareous woodlands. Endemic to nc. AL and se. TN. See Estes & Fleming (2006) for additional information. [= FNA, K, Tn; = *Coriflora morefieldii* (Kral) W.A. Weber]

Clematis occidentalis (Hornemann) A.P. de Candolle var. *occidentalis*, Purple Clematis, Mountain Clematis. Rocky slopes over mafic rocks (greenstone, amphibolite), known positively in NC only from amphibolite peaks in Ashe County. May-Jun. Var. *occidentalis* is widespread in ne. North America, from NB west to w. ON, south to NJ, DE, OH, nw. IL, and ne. IA, and in the mountains to w. VA and w. NC. Two other varieties occur in the Rocky Mountains. Fernald's var. *cacuminis*, published under *C. verticillaris*, described plants from the mountains of VA and NC; it is apparently merely a form based on material in early flower (Pringle 1971). [= FNA, K, Pa, Va; < *Clematis occidentalis* – C, W; > *Clematis verticillaris* var. *verticillaris* – F; > *Clematis verticillaris* A.P. de Candolle var. *cacuminis* Fernald – F; < *Clematis verticillaris* A.P. de Candolle – G, RAB; < *Atragene americana* Sims – S]

Clematis ochroleuca Aiton, Curlyheads. Dry woodlands and woodland borders, generally over mafic or calcareous rocks, such as diabase, gabbro, or calcareous siltstone. Apr-Jun. Primarily Piedmont: C. MD south to ec. GA; disjunct on Long Island, NY. [= C, F, FNA, G, K, RAB, Va, W; = *Viorna ochroleuca* (Aiton) Small – S; = *Coriflora ochroleuca* (Aiton) W.A. Weber]

Clematis pitcheri Torrey & A. Gray var. *pitcheri*, Bellflower Leatherflower. Limestone glades and barrens. Apr-Oct. IN, IL, IA, and e. NE south to w. KY, c. TN, ne. MS, AR, TX, and NM. Var. *dictyota* (Greene) W.M. Dennis occurs in w. TX and s. NM south to n. Mexico. [= FNA, K, Mo; < *Viorna pitcheri* (Torrey & A. Gray) Britton – S; < *C. pitcheri* – Tn]

Clematis reticulata Walter. Dry, sandy woodlands, such as longleaf pine sandhills and dry hammocks. May-Aug. Se. SC south to c. peninsular FL, west to TX, and north in the interior to TN and AR. [= FNA, K, RAB, Tn, WH3; = *Viorna reticulata* (Walter) Small – S; = *Coriflora reticulata* (Walter) W.A. Weber]

Clematis socialis Kral, Alabama Leatherflower. Wet calcareous flatwoods. Nw. GA (Floyd Co.) and ne. AL (St. Clair and Cherokee counties). Timmerman-Erskine & Boyd (1999) report on reproductive ecology of this endangered species; Goertzen & Boyd (2007) on its genetic diversity. [= FNA, K]

* **Clematis terniflora** A.P. de Candolle, Sweet Autumn Clematis, Yam-leaved Clematis. Disturbed areas; native of e. Asia (Japan, China, Korea). Jul-Sep. [= C, FNA, GW, K, Mo, Pa, Tn, Va, W, WH3; > *Clematis dioscoreifolia* Léveillé & Vaniot var. *robusta* Carrière & Rehder – F; ? *Clematis dioscoreifolia* Léveillé & Vaniot – RAB; ? *Clematis paniculata* Thunberg – S; ? *Clematis maximowicziana* Franchet & Savatier]

Clematis versicolor Small ex Rydberg, Pale Leatherflower. Rocky, calcareous woodlands, bluffs, and cliffd. May-Aug. Sc. KY, c. TN, nc. AL; Ozarks and Ouachitas of s. MO, n. and c. AR, and e. OK south into e. TX. [= FNA, K, Mo, Tn; = *Viorna versicolor* (Small ex Rydberg) Small – S; = *Coriflora versicolor* (Small ex Rydberg) W.A. Weber]

Clematis vinacea Floden, Ocoee Leatherflower, Wine-colored Leatherflower. See Floden (2013) for additional and detailed information. [= Tn] {not yet keyed}

Clematis viorna Linnaeus, Northern Leatherflower, Vase-vine. Mesic forests, woodlands, thickets, especially over mafic rocks. May-Sep. PA, IL, and MO south to GA, AL, MS, and AR. [= C, F, FNA, G, K, Mo, Pa, RAB, Tn, Va, W; > *Viorna viorna* (Linnaeus) Small – S; > *Viorna beadleii* Small – S; > *Viorna flaccida* (Small) Small – S; > *Viorna gattingeri* (Small) Small – S; > *Coriflora viorna* (Linnaeus) W.A. Weber; > *Coriflora beadleii* (Small) W.A. Weber]

Clematis virginiana Linnaeus, Virgin's-bower. Moist forests, thickets, and openings. Jul-Sep. Noca Scotia, ON and MB, south to c. peninsular FL and TX. Vegetatively, this species can be distinguished from *C. viorna* and *C. crispa* (the other common and widespread species in our area) by its leaves with three relatively symmetrical leaflets (vs. leaves with 3-many irregular leaflets). [= C, F, FNA, GW, K, Mo, Pa, RAB, S, Tn, Va, W, WH3; ? *C. virginiana* var. *virginiana* – G]

* **Clematis vitalba** Linnaeus, Traveler's Joy. Disturbed areas, persistent after culticavation; native of e. Asia. Reported for Baltimore County, MD (Kartesz 2010). [= FNA, K2] {not yet keyed}

Clematis viticaulis Steele, Millboro Leatherflower. Shale barrens and shaly woodlands. May-Jun; May-Aug. Endemic to w. VA (Bath and Rockbridge counties). [= C, F, FNA, G, K, Va, W; = *Coriflora viticaulis* (Steele) W.A. Weber]

* **Clematis viticella** Linnaeus, Italian Clematis. Disturbed areas, persistent after cultivation; native of Europe. Reported for TN (Pringle in FNA 1997). [= FNA, K; *Viticella viticella* (Linnaeus) Small] {not yet keyed}

16. Trautvetteria Fischer & C.A. Meyer 1835 (Tassel-rue)
[contributed by Aaron J. Floden and Alan S. Weakley]

A genus of 4-6 closely related species, perennial herbs, disjunctly distributed in temperate to boreal e. North America, w. North America, and Japan. References: Parfitt in FNA (1997); Floden (2011)=Z; Tamura in Kubitzki, Rohwer, & Bittrich (1993); Johansson (1998).

- 1 Basal leaves deeply (over halfway to nearly all the way to the petiole) 5-9-lobed, the lobes oblanceolate, membranous (to fairly stiff when growing in an exposed setting), each lobe further divided into 2-4 lobules, the margin irregularly serrate, the venation not highly reticulate; cauline leaves 3-7-lobed; [rather widespread in our area]..... *T. caroliniensis*
- 1 Basal leaves shallowly (less than halfway to the petiole) 3 (-5)-lobed, thickly chartaceous and stiff, lobes round/deltoid, outer lobes usually shallowly 1-lobed, margin regularly crenate/dentate, venation highly reticulate; cauline leaves unlobed to shallowly 3-5-lobed, lobes deltoid; [endemic to Ridge and Valley of TN]..... *T. species 1*

Trautvetteria caroliniensis (Walter) Vail, Tassel-rue, False Bugbane. Streambanks, seepages, grassy balds, moist forests, swamp forests, very rarely in calcareous longleaf pine savanna ecotones. Late May-Aug. Sw. PA and KY to GA, AL, and Panhandle FL, primarily in the Southern and Central Appalachians, disjunct on calcareous sites in AR (Sundell et al. 1999), e. TX (Floden 2011), IN, IL, and MO; w. North American and e. Asian *Trautvetteria* has sometimes been considered conspecific with *T. caroliniensis*, but should not be so regarded. The discovery of this species in the edge of a calcareous savanna (Camp Branch Savanna, Brunswick County, NC) in the outer Coastal Plain was surprising; the small population has since apparently been destroyed by intensive silvicultural practices. *T. nervata* Greene, named from the Coastal Plain of s. GA, needs additional evaluation (Floden 2011); the type specimen is striking in its deeply and multiply divided leaf segments. [= G, S, Va, Z; = *T. caroliniensis* var. *caroliniensis* – C, K; < *T. caroliniensis* – F, FNA, GW, Mo, Pa, RAB, W, WV; > *T. nervata* Greene]

Trautvetteria species 1. Dolomitic fens. Endemic (so far as known) to Claiborne County, ne. TN. Under study by A. Floden.

17. *Halerpestes* Greene 1900

A genus of ca. 10 species, herbs, of North America, South America, and Eurasia. Following the circumscriptions of Emadzade et al. (2010), Paun et al. (2005), and Tamura in Kubitzki, Rohwer, & Bittrich (1993), *Halerpestes* should be segregated from *Ranunculus*, being in a clade with *Trautvetteria* and additional segregates from *Ranunculus*. References: Whittemore in FNA (1997); Emadzade et al. (2010); Paun et al. (2005); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Halerpestes cymbalaria (Pursh) Greene, Seaside Crowfoot. Brackish to salt marshes (in freshwater habitats outside of our area). May-Sep. Circumboreal, in Eurasia and n. North America, south in e. North America to s. NJ, in w. North America widespread in montane areas, extending into Mexico and disjunct in South America. [= *Ranunculus cymbalaria* Pursh – C, F, FNA, G, K2, Mo]

18. *Ficaria* Schaeffer 1760 (Lesser Celandine)

A genus of about 5 species, herbs, or Europe west to c. Asia. Best treated as a genus separate from *Ranunculus*, based on morphology and molecular phylogenetics; *Myosurus* is (for instance) more closely related to *Ranunculus* than is *Ficaria* (Paun et al. 2005; Emadzade et al. 2010). Post et al. (2009) analyze the presence in North America of the various infrataxa recognized in Europe and find evidence that all are naturalizing. The species is reported to be developing into a seriously invasive species in ne. United States and adjacent Canada (Axtell, DiTommaso, & Post 2010) and increasingly as well in at least the more northern or montane parts of our area. References: Whittemore in FNA (1997); Sell (1994)=Z; Stace (2010)=Y; Emadzade et al. (2010); Paun et al. (2005); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: When in flower, *Ficaria* is sometimes confused with the superficially similar *Caltha*. *Ficaria* has both yellow petals and (usually 3) green sepals, whereas *Caltha* has only yellow sepals and no green (sepaloid) structures. The yellow petals of *Ficaria* are oblong, > 2× as long as wide, whereas the yellow petaloid sepals of *Caltha* are broadly ovate, obovate, or orbicular, < 1.5× as long as wide. The utility of attempting to recognize the multiple European subspecies in the United States is questionable.

- 1 Leaves up to 8 cm long and 9 cm wide; petioles up to 28 cm long; petals 17-26 mm long, 4-15 (-18) mm wide; achenes 3-5 mm long, 2-3.5 mm wide.
 - 2 Stem robust and erect; bulbils absent in leaf axils after flowering; petals 9-15 (-18) mm wide *F. verna* ssp. *chrysocephala*
 - 2 Stem rather robust, but straggling; bulbils present in leaf axils after flowering; petals 4-12 mm wide *F. verna* ssp. *ficariiformis*
- 1 Leaves up to 4 cm long and 4 cm wide (rarely slightly larger); petioles up to 15 cm long; petals 6-20 mm long, 2-9 mm wide; achenes 2.5-3.5 mm long, 1.7-2.2 mm wide.
 - 3 Leaves crowded at base with few on short stems; petiole to 10 cm long; petals 2.5-6 mm wide *F. verna* ssp. *calthifolia*
 - 3 Leaves less crowded at base and more numerous on the elongating stem; petiole to 15 cm long (at least some on a plant > 10 cm long); petals 2-9 mm wide.
 - 4 Bulbils not present in leaf axils after flowering; achenes well-developed; petals 4-9 mm wide *F. verna* ssp. *fertilis*
 - 4 Bulbils present in leaf axils after flowering; achenes poorly developed (rarely fertile, and then only several per flower); petals 2-5 mm wide *F. verna* ssp. *verna*

* ***Ficaria verna* Hudson ssp. *calthifolia*** (Reichenbach) Nyman. Disturbed rich forests and bottomlands, mesic suburban forests, lawns, naturalized locally from horticultural plantings; native of ec. and se. Europe. Naturalized in the US in CT, DE, DC, IL, KY, MD, MA, MI, MO, NJ, NY, OH, OR, PA, TN, VA, WA, WV, WI (Post et al. 2009). [*< Ranunculus ficaria* Linnaeus – C, F, FNA, G, Pa, WV; < *R. ficaria* var. *bulbifera* Marsden-Jones – K; < *Ranunculus ficaria* ssp. *bulbifer* Lambinon – Mo; < *F. verna* – Va; = *Ranunculus ficaria* Linnaeus ssp. *calthifolius* (Reichenbach) Arcangeli – Z]

* ***Ficaria verna* Hudson ssp. *chrysocephala*** (P.D. Sell) Stace. Disturbed areas; native of e. Mediterranean Europe. Naturalized in the US in MD, NY, OR, WA (Post et al. 2009). [= Y; < *Ranunculus ficaria* Linnaeus – C, F, FNA, G; < *R. ficaria* var. *bulbifera* Marsden-Jones – K; = *Ranunculus ficaria* Linnaeus ssp. *chrysocephalus* P.D. Sell – Z]

* ***Ficaria verna* Hudson ssp. *fertilis*** (Lawralrée ex Laegaard) Stace. Disturbed areas; native of w. Europe. Naturalized in the US in DC, IL, MD, MA, NY, PA, WA, WV (Post et al. 2009). [= Y; < *Ranunculus ficaria* Linnaeus – C, F, FNA, G, Pa; < *R. ficaria* var. *bulbifera* Marsden-Jones – K; = *Ranunculus ficaria* Linnaeus ssp. *ficaria* – Z]

* ***Ficaria verna* Hudson ssp. *ficariiformis*** (F.W. Schultz) B. Walln. Disturbed rich forests and bottomlands, mesic suburban forests, lawns, naturalized locally from horticultural plantings; native of c. and w. Mediterranean Europe. First reported for NC by Krings et al. (2005). Naturalized in the US in MO, NY, NC, OH, PA, TX (Post et al. 2009). [= Y; < *Ranunculus ficaria* Linnaeus – C, F, FNA, G, Pa; < *R. ficaria* var. *bulbifera* Marsden-Jones – K; < *F. verna* – Va; = *Ranunculus ficaria* Linnaeus ssp. *ficariiformis* (F.W. Schultz) Rouy & Fouc. – Z]

* *Ficaria verna* Hudson ssp. *verna*. Disturbed rich forests and bottomlands, mesic suburban forests, lawns, naturalized locally from horticultural plantings; native of Europe. Naturalized in the US in CT, DC, DE, MA, MD, MI, MO, NH, NJ, NY, OH, OR, PA, VA, WA, WV (Post et al. 2009). [= Y; < *Ranunculus ficaria* Linnaeus – C, F, FNA, G, Pa, WV; < *R. ficaria* var. *bulbifera* Marsden-Jones – K; < *F. verna* – Va; = *Ranunculus ficaria* Linnaeus ssp. *bulbilifer* Lambinon – Z]

19. *Myosurus* Linnaeus 1753 (Mousetail)

A genus of about 15 species, annual scapose herbs, nearly cosmopolitan (lacking in e. Asia and tropical regions), with a center of diversity in w. North America. References: Whittemore in FNA (1997); Campbell (1952)=Z; Emadzade et al. (2010); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Myosurus minimus Linnaeus, Mousetail. Usually in disturbed areas, such as fields in floodplains. Mar-May. The species is circumboreal and also found in various places in the Southern Hemisphere. Widely distributed in North America, Eurasia, and the Southern Hemisphere. A number of subspecies have been described; if these are recognized, our material is the typic ssp. *minimus*. The pre-Columbian occurrence of *Myosurus* in our area is uncertain; it may well be an alien, early introduced from sc. North America. The plant is a winter annual, sprouting from seed in the fall, overwintering as a rosette, and flowering in early spring. [= C, F, FNA, G, GW, K, Mo, RAB, S, Va; > *M. minimus* ssp. *minimus* – Z]

20. *Ranunculus* Linnaeus 1753 (Buttercup, Crowfoot, Spearwort)

A genus of about 550 species, perennial and annual herbs, nearly cosmopolitan (most diverse in temperate and boreal regions of the Northern Hemisphere), here following the circumscription of Emadzade et al. (2010), with removal of numerous small genera more closely related to *Myosurus* and *Trautvetteria*. Subgeneric and sectional taxonomy follows Hörandl & Emadzade (2012). I am here following Duncan's (1980) taxonomic entities, though recognizing some of his varieties as species; distributions given in many works for the *R. hispidus* complex are apparently garbled by differences in taxonomic concepts. References: Whittemore in FNA (1997); Hörandl & Emadzade (2012); Duncan (1980)=Z; Keener (1976)=Y; Keener & Hoot (1987)=X; Emadzade et al. (2010); Paun et al. (2005); Tamura in Kubitzki, Rohwer, & Bittrich (1993). Keys adapted, in part, from C, GW, X, Y, and Z. [also see *Ficaria* and *Halerpestes*]

Identification notes: Mature or relatively mature achenes are necessary for the identification of some species. Shape and pubescence of the receptacle is also a frequently used taxonomic character, best judged by stripping off the achenes.

- 1 Petals dull, white; achenes roughly transverse-ridged; plants aquatic, the leaves finely dissected to merely shallowly lobed; [native, occurring in circumneutral waters]; [subgenus *Auricomus*; section *Batrachium*]..... **Key A**
- 1 Petals shiny, yellow (sometimes fading or bleaching to whitish); achenes usually not transverse-ridged (though often variously ornamented); plants aquatic or terrestrial, the leaves various; [native or introduced, occurring in various habitats].
- 2 Cauline leaves all simple, mostly lanceolate, either entire, denticulate, or serrate, but not lobed or deeply divided; [native, occurring in marshes or other wetlands]; [subgenus *Auricomus*; section *Flammula*]..... **Key B**
- 2 Cauline leaves (at least most them) lobed, divided, or compound; [native or introduced, occurring in various habitats].
- 3 Basal leaves not divided, mostly cordate, reniform, or ovate (and merely toothed), distinctly unlike the deeply divided cauline leaves; achenes turgid, ovoid, 1-2.5 mm long, without pronounced marginal rims; petals 1.5-6.5 mm long; [native, occurring in mesic to dry forests and woodlands, and also (especially *R. abortivus*) weedy]; [subgenus *Auricomus*; section *Auricomus*]..... **Key C**
- 3 Basal leaves mostly deeply parted or compound, the cauline leaves generally similar but smaller and often less divided; achenes various, 1-5 mm long, with or without pronounced marginal rims; petals 2-15 mm long; [native or introduced, occurring in various habitats].
- 4 Achenes markedly spiny, papillose, or tuberculate (the protuberances few and small in *R. sardous*, keyed both here and below); [introduced, usually weedy and in disturbed habitats]..... **Key D**
- 4 Achenes smooth (rarely pubescent or papillose); [native or introduced, occurring in various habitats].
- 5 Achenes turgid, 1-1.5 (-2) mm long, the marginal rims scarcely or not at all evident, the achenes corky-thickened at their bases for dispersal by floating; [of mucky marshes or ditches, or aquatic in pools]; [subgenus *Auricomus*; section *Hecatonia*]..... **Key E**
- 5 Achenes moderately turgid or flattened, 1.5-3.8 mm long, with a pronounced (at 10× or more) marginal rim appearing as a differentiated border or flange, more-or-less flattened, and separated from the central bulge of the achene by a concavity or even a groove, the achenes not corky-thickened at their bases; [of mostly terrestrial habitats or in bottomland forests]..... **Key F**

Key A – subgenus *Auricomus*; section *Batrachium* (White Water Crowfoots)

- 1 Leaves floating, shallowly lobed; receptacles glabrous..... *R. hederaceus*
- 1 Leaves submersed (or stranded by falling water levels), dissected into filiform segments; receptacles hispid.
- 2 Leaves firm (not collapsing when removed from water); free petioles much shorter than the dilated stipular base; leaves usually much shorter than the internode above; achene beaks 0.7-1.5 mm long *R. longirostris*
- 2 Leaves flaccid (collapsing when removed from water); free petioles about as long as the dilated stipular base; leaves usually about as long as the internode above; achene beaks 0.1-0.3 (-0.5) mm long..... *R. trichophyllus* var. *trichophyllus*

Key B – subgenus *Auricomus*; section *Flammula* (simple-leaved buttercups) (Spearworts)

- 1 Petals 1-3 (-5), 1-2 mm long, about as long as the sepals; annual..... *R. pusillus*
- 1 Petals (4-) 5-9, distinctly longer than the sepals; annual or perennial.
- 2 Cauline leaves 6-14 cm long; sepals 4-7 mm long; achene beak 1.0-1.3 mm long..... *R. ambigena*
- 2 Cauline leaves 1-6.5 cm long; sepals 1.5-4 mm long; achene beak 0.1-0.6 mm long.
- 3 Cauline leaves linear, < 1 mm wide; achenes 1.2-1.6 mm long *R. flammula* var. *reptans*
- 3 Cauline leaves ovate to lanceolate, 4-24 mm wide; achenes 0.8-1.0 mm long..... *R. laxicaulis*

Key C – subgenus *Auricomus*; section *Auricomus*

- 1 Achene beaks (0.6-) 0.7-1.0 mm long; petals < ½ as long as the sepals; sepals hirsute..... *R. allegheniensis*
- 1 Achene beaks 0.1-0.3 mm long; petals > ½ as long as the sepals; sepals glabrous to sparsely long-villous.
- 2 Petals 4-8 mm long, longer than the sepals..... *R. harveyi*
- 2 Petals 1.5-3.5 mm long, slightly shorter than the sepals.
- 3 Leaves and stems glabrous or nearly so (or the upper stem puberulent); basal leaves 1-6 (-10) cm wide, reniform to cordate at the base; roots usually all filiform..... *R. abortivus*
- 3 Leaves and stems villous, at least toward the base; basal leaves 1-2.5 cm wide, truncate to cuneate (rarely cordate) at the base; roots sometimes in part fusiform-thickened..... *R. micranthus*

Key D – subgenus *Ranunculus*; sections *Polyanthemos*, *Ranunculus*, and *Echinella*

- 1 Flowers sessile, opposite the petioles; sepals 3; petals 3; [section *Polyanthemos*]..... *R. platensis*
- 1 Flowers pedunculate, axillary; sepals usually 5; petals usually 5.
- 2 Petals 1-2 (-3) mm long; receptacles glabrous; [section *Ranunculus*]..... *R. parviflorus*
- 2 Petals (3-) 4-12 mm long; receptacles pubescent.
- 3 Achenes bodies 1.5-3 mm long, 30-60 per head; achene beak ca. 0.5 mm long; achene with conical protuberances or short spines, to 0.16 mm long; achene beak 0.1-0.5 mm long; basal leaves compound; [section *Polyanthemos*].
- 4 Achene with a few conical protuberances; petals 5-12 mm long; plant sparsely to densely hirsute; achenes 30-40 per head..... *R. sardous*
- 4 Achene with numerous short spines; petals (3-) 4-5 mm long; plant with a few, widely scattered, long hairs; achenes 40-60 per head.. *R. trilobus*
- 3 Achenes 2.5-5 mm long, 4-20 per head; achene beak 1.5-3.0 mm long (or 0.8-1 mm long in *R. marginatus*); achene conspicuously spiny, the longer spines mostly 0.30-0.85 mm long (or only ca. 0.2 mm long in *R. marginatus*); basal leaves simple (but deeply lobed) or compound.
- 5 Achenes 4-9 per head, in a single whorl; achene margins spiny, as also the faces; beak of the achene 2.5-3 mm long; [section *Echinella*]..... *R. arvensis*
- 5 Achenes 10-20 per head, in several whorls; achene margins smooth, the spines restricted to the faces; beak of the achene 1.5-2.5 mm long; [section *Polyanthemos*].
- 6 Achene faces with short protuberances ca. 0.2 mm long; achene beak 0.8-1.0 mm long; peduncle usually longer than the subtending leaf..... *R. marginatus* var. *trachycarpus*
- 6 Achene faces with stout spines ca. 0.5 mm long; achene beak 2.0-2.5 mm long; peduncle usually shorter than the subtending leaf.. *R. muricatus*

Key E – subgenus *Auricomus*; section *Hecatonia*

- 1 Petals 6-14 mm long; achene body 1.3-2.5 mm long, the beak 0.7-1.5 mm long; plants with submersed leaves dissected into numerous linear segments; [aquatic]..... *R. flabellaris*
- 1 Petals 2-4 (-5) mm long; achene body 0.8-1.2 mm long, the beak 0-0.1 mm long; plants without distinctive, dissected submersed leaves; [terrestrial or semi-aquatic]..... *R. sceleratus* var. *sceleratus*

Key F – subgenus *Ranunculus*; section *Polyanthemos* (and *Ranunculus*)

- 1 Petals 2-6 mm long, about as long as the sepals; [section *Polyanthemos*].
- 2 Basal leaves simple; achene beak strongly hooked..... *R. recurvatus* var. *recurvatus*
- 2 Basal leaves 3-foliolate; achene beak straight or nearly so.
- 3 Petals 4-6 mm long, 3.5-5 mm wide; achene beak 1.0-1.2 mm long; [WV northward]..... *R. macounii*
- 3 Petals 2-4 mm long, 1.2-5 mm wide; achene beak 0.6-0.8 mm long; [widespread]..... *R. pennsylvanicus*
- 1 Petals 5-15 mm long, (1.3-) 1.5× or more as long as the sepals; achene beak straight, flexuous, slightly curved, or hooked, 0.2-3.0 mm long.

- 4 Achene beaks recurved or hooked, the stigmatic surface elongate, along the upper (curved) side of the style (beak) (visible at 10×); [introduced, usually weedy in disturbed habitats].
- 5 Stems repent, rooting at the nodes; [section *Polyanthemos*] ***R. repens***
- 5 Stems erect, not rooting at the nodes.
 - 6 Petals 5-8 mm long; plant a soft-based annual; achene face usually with at least a few conical protuberances (if examined carefully at 10× or more); [section *Polyanthemos*] ***R. sardous***
 - 6 Petals 8-16 mm long; plant a cormose or hard-based perennial; achene face truly smooth.
 - 7 Sepals spreading; stems not cormose-thickened at the base; larger leaves appearing (3-) 5-parted, all of the segments sessile; plant to 12 dm tall; [section *Ranunculus*] ***R. acris***
 - 7 Sepals tightly reflexed; stems cormose-thickened at the base; larger leaves pinnately 3-5-parted, the terminal segment long-stalked; plant to 6 dm tall; [section *Polyanthemos*] ***R. bulbosus***
- 4 Achene beaks straight or slightly curved, flexuous, the stigmatic surface limited to the tip of the style (beak); [native, normally in more-or-less natural habitats]; [section *Polyanthemos*].
 - 8 Larger leaves mostly pinnately 3-7-foliolate, the terminal leaflet larger than the lateral leaflets, the leaflets (especially the terminal) often further cleft or lobed, the blade usually longer than wide in outline, the segments often rather narrow; naked receptacle conical, tapering gradually to the apex (the region of staminal attachment as thick as the region of gynoecial attachment, which tapers through all or nearly all of its length, best seen by stripping off the achenes); rhizome regenerating totally each growing season, producing both fibrous and (at the end of the growing season) tuberous roots (1.3-4.9 mm in diameter); [rare in our area, in calcareous, mafic, or ultramafic sites with prairie affinities] ***R. fascicularis***
 - 8 Larger leaves mostly palmately 3-foliolate, the terminal leaflet about the same size as the lateral leaflets, the leaflets sometimes further cleft or lobed, the blade usually as wide as long or wider; naked receptacle clavate or ellipsoid (the region of staminal attachment distinctly narrower than the region of gynoecial attachment, thus forming a waist, from which the gynoecial region expands and then tapers to the apex); rhizome regenerated partially each growing season, producing uniform, fibrous roots (up to 3.0 mm in diameter); leaves usually simple and ovate, or trifoliolate with ovate leaflets; [collectively widespread in our area].
 - 9 Achenes wide-margined (wider portions of the margin 1/4 to 2/3 as wide as the achene body); plants colonial, sending out stolons (by the time of fruiting) which root at the nodes, forming new plants; sepals reflexed at full anthesis ***R. carolinianus***
 - 9 Achenes narrow-margined (wider portions of the margin 1/8 or less as wide as the achene body); plants usually erect or repent by the time of fruiting (if repent sometimes forming adventitious roots at the nodes, but not generally developing new plants); sepals spreading at full anthesis (sometimes reflexed later).
 - 10 Plants repent; aerial shoots 50-80 (-91) cm long at time of fruiting; [generally of swamps and marshes] ***R. caricetorum***
 - 10 Plants erect; aerial shoots 14-45 (-60) cm long at time of fruiting; [generally of upland habitats] ***R. hispidus***

Ranunculus abortivus Linnaeus, Kidneyleaf Buttercup. Low fields, disturbed areas, bottomlands, lawns, roadsides. (Feb-) Mar-Jun. NL (Labrador) to AK, south to FL, TX, and CO. A common weed in shady and sunny places. [= FNA, GW, K, Mo, Pa, RAB, S, Va, W, WH3, WV, Y; > *R. abortivus* var. *abortivus* - C, F, G; > *R. abortivus* var. *indivus* Fernald - F]

* ***Ranunculus acris*** Linnaeus, Tall Buttercup, Bitter Buttercup. Pastures, fields, roadsides, disturbed areas; native of Europe. May-Aug. [= C, F, FNA, G, GW, Mo, Pa, RAB, S, W, WV, Y; > *R. acris* var. *acris* - K]

Ranunculus allegheniensis Britton, Allegheny Buttercup, Mountain Crowfoot. Cove forests, rich forested slopes, sometimes in drier forests on calcareous or mafic substrates. Apr-Jun. MA west to OH, south to w. NC and ne. TN, an Appalachian endemic. [= C, F, FNA, G, GW, K, Pa, RAB, S, W, WV, Y]

Ranunculus ambigens S. Watson, Water-plantain Crowfoot, Water-plantain Spearwort. Marshes. Apr-Jun. ME west to MN, south to VA, NC, ne. TN, w. TN, and LA. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WV, Y; = *R. obtusiusculus* Rafinesque - S]

* ***Ranunculus arvensis*** Linnaeus, Corn Crowfoot, Hungerweed. Fields, disturbed areas; native of Europe. Apr-Jun. [= C, FNA, G, GW, K, Mo, WV, X, Y; > *R. arvensis* var. *arvensis* - RAB; > *R. arvensis* var. *tuberculatus* (A.P. de Candolle) Koch - RAB]

* ***Ranunculus bulbosus*** Linnaeus, Bulbous Buttercup. Fields, roadsides, disturbed areas; native of Europe. Apr-Jun. [= C, FNA, GW, K, Mo, Pa, RAB, S, Va, W, WV, Y; > *R. bulbosus* var. *bulbosus* - F; > *R. bulbosus* var. *dissectus* Barbey - F; > *R. bulbosus* var. *valdepubens* (Jordan) Briquet - F]

Ranunculus caricetorum Greene, Northern Swamp Buttercup, Marsh Buttercup. Swampy forests and marshes. Apr-Aug. NB west to s. MB, south to NJ, n. VA, s. OH, and s. MO; reports of this species farther south are probably in error. This species is octoploid (n = 32); the remainder of the *R. hispidus* complex is tetraploid. [= Va; = *R. hispidus* Michaux var. *caricetorum* (Greene) T. Duncan - C, FNA, K, Mo, Pa, Z; = *R. septentrionalis* Poir - GW, W, Y, misapplied; > *R. septentrionalis* var. *caricetorum* (Greene) Fernald - F, G; > *R. septentrionalis* var. *pterocarpus* Linnaeus Benson - G; > *R. septentrionalis* var. *septentrionalis* - F, G]

Ranunculus carolinianus A.P. de Candolle, Carolina Buttercup. Swamp forests, wet woodlands, open marshy wetlands. Mar-Aug. NY west to s. ON, WI, and MN, south to n. peninsular FL, LA, and e. TX. This species is tetraploid (n = 16). [= F, G, GW, RAB, Va, W, WV, Y; = *R. hispidus* Michaux var. *nitidus* (Chapman) T. Duncan - C, FNA, K, Mo, Pa, WH3, Z; > *R. palmatus* Elliott - S; > *R. septentrionalis* - S]

Ranunculus fascicularis Muhlenberg ex Bigelow, Thick-root Buttercup, Early Buttercup. Feb-May. Wet flats with prairie affinities (with *Camassia scilloides*), rocky barrens and glades over mafic rocks (such as gabbro or diabase), ultramafic outcrop

barrens (over olivine), limestone barrens. Mar-Jun. MA and NY west to s. ON, MN, and se. MB, south to c. NC, nc. SC, sw. GA, and e. TX; occurrences which are both south of New England and east of the Appalachians are scattered and disjunct. This species is tetraploid ($n = 16$). [= C, FNA, GW, K, Mo, Pa, S, Va, W, Y, Z; > *R. fascicularis* var. *fascicularis* – F, G]

Ranunculus flabellaris Rafinesque, Yellow Water Crowfoot. Pools in floodplains of small stream swamps, other stagnant or slowly moving waters. Mar-Jul. ME west to BC, south to ne. NC, KY, IN, IL, LA, OK, UT, and CA. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, Va, Y; = *R. delphiniifolius* Torrey ex Eaton – S]

Ranunculus flammula Linnaeus var. ***reptans*** (Linnaeus) E. Meyer, Creeping Spearwort. Shallow water. Circumboreal, south in North America to NJ, WV, MI, MN, and WY. [= FNA, PA; = *R. flammula* Linnaeus var. *filiformis* (Michaux) Hooker – C, G, K; = *R. reptans* Linnaeus var. *reptans* – F]

Ranunculus harveyi (A. Gray) Britton. Forests, savannas, and prairies, mostly on acidic substrates. Mar-May. IN, IL, MO, and OK south to TN, AL, and LA. [= C, F, G; = *R. harveyi* var. *harveyi* – FNA, K, Mo; < *R. harveyi* – C, F, G]

Ranunculus hederaceus Linnaeus, Ivy-leaved Water Crowfoot. Longstalked Crowfoot. Coastal brackish marshes, other circumneutral marshes. Apr-Jun. Se. PA south to SC on the Coastal Plain; disjunct in NL (Newfoundland); also in Europe. Perhaps questionable whether native in North America. [= C, F, FNA, G, GW, K, Pa, RAB, Va, Y]

Ranunculus hispidus Michaux, Hispid Buttercup, Hairy Buttercup. Rich moist forests, creekbanks, mesic to dry woodlands and forests, bottomlands. Mar-Jun. MA and VT west to s. ON, n. IL, and se. KS, south to e. and c. NC, s. GA, s. AL, AR, and ne. OK. This species is tetraploid ($n = 16$). [= GW, RAB, S, Va, W, Y; = *R. hispidus* var. *hispidus* – C, FNA, K, Mo, Pa, Z; > *R. hispidus* var. *hispidus* – F, G, WV; > *R. hispidus* var. *falsus* Fernald – F; > *R. hispidus* var. *marilandicus* (Poiret) L. Benson – G; > *R. hispidus* var. *eurylobus* L. Benson – F, G, WV]

Ranunculus laxicaulis (Torrey & A. Gray) Darby, Coastal Plain Spearwort. Marshes, swamps, tidal cypress swamps. Apr-Sep. DE south to sw. GA, west to TX, inland in the interior to w. TN, s. IN, s. IL, MO, and KS, almost entirely on the southeastern Coastal Plain. *R. subcordatus* E.O. Beal, allegedly endemic to NC, is conspecific with *R. laxicaulis*. [= F, FNA, G, K, Mo, RAB, Va, W, WH3; ? *R. texensis* Engelmann – C; > *R. laxicaulis* – GW, Y; > *R. subcordatus* E.O. Beal – GW, Y; ? *R. oblongifolius* Elliott – S, misapplied]

Ranunculus longirostris Godron, White Water Crowfoot. Submerged in streams. May-Sep. Sw. QC west to SK, ID, and OR, south to DE, VA, KY, nc. TN, AL, AR, TX, NM, and AZ. [= C, F, GW, K, Va, WV, Y; < *R. aquatilis* Linnaeus var. *diffusus* – FNA, Mo; ? *R. circinatus* Sibthorp – G; ? *Batrachium trichophyllum* – S, misapplied]

Ranunculus macounii Britton. Bogs, marshes. Jun. NL (Newfoundland) west to AK, south to MI, IA, TX, NM, AZ, CA; disjunct in WV. [= C, F, FNA, G, K, WV]

* ***Ranunculus marginatus*** d'Urville var. ***trachycarpus*** (Fischer & C.A. Meyer) Aznavour, St. Martin's Buttercup. Moist, disturbed areas, roadsides; native of e. Mediterranean Europe. [= K2, WH3; < *R. marginatus* – FNA; = *R. trachycarpus* Fischer & C.A. Meyer]

Ranunculus micranthus Nuttall, Small-flowered Buttercup, Rock Buttercup. Rich forests. Mar-Jun. MA west to SD, south to e. VA, c. NC, sc. TN, WV, OH, and OK. [= C, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WV, Y; > *R. micranthus* var. *micranthus* – F; > *R. micranthus* var. *delitescens* (Greene) Fernald – F]

* ***Ranunculus muricatus*** Linnaeus. Ditches and marshes; native of Europe. Apr-Jun. [= FNA, GW, K, RAB, S, WH3, X, Y]

* ***Ranunculus parviflorus*** Linnaeus, Small-flowered Buttercup, Stickseed Crowfoot. Disturbed areas; native of Europe. Feb-Jul. [= C, F, FNA, G, GW, K, Mo, RAB, S, Va, W, WH3, X, Y]

Ranunculus pensylvanicus Linnaeus f., Bristly Buttercup. Wet meadows, floodplains. NL (Newfoundland) west to AK, south to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), DE, DC, MD (Whittemore in FNA 1997), WV, OH, n. IN, n. IL, MN, and AZ; also in ne. Asia. [= C, F, FNA, G, K, Pa, WV]

* **Ranunculus platensis** Sprengel. Lawns, ditches; native of South America. [= FNA, GW, K, WH3, X, Y]

Ranunculus pusillus Poirlet, Low Spearwort. Marshes, ditches, other wet habitats. Apr-Jun. S. NY south to c. peninsular FL, west to TX, north in the interior to OH, IN, and MO. [= C, F, FNA, G, GW, Mo, Pa, RAB, S, Va, W, WH3, WV, Y; > *R. pusillus* var. *pusillus* – K]

Ranunculus recurvatus Poirlet var. *recurvatus*, Hooked Buttercup, Hooked Crowfoot. Bottomland forests, cove forests, swamps, mesic slope forests. Apr-Jul. ME and QC west to MN, south to sw. GA, MS, and OK. Var. *tropicus* (Grisebach) Fawcett & Rendle occurs in Puerto Rico and other islands of the West Indies. [= FNA, K, Mo, Va; < *R. recurvatus* – C, G, GW, Pa, RAB, S, W, WH3, Y; > *R. recurvatus* var. *recurvatus* – F, WV; > *R. recurvatus* var. *adpressipilis* Weatherby – F, WV]

* **Ranunculus repens** Linnaeus, Creeping Buttercup, Meg-many-feet. Low meadows, disturbed areas; native of Europe. May-Sep. [= FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, Y; > *R. repens* var. *repens* – C, F, WV; > *R. repens* var. *degeneratus* Schur – C; > *R. repens* var. *glabratus* A.P. de Candolle – C, F; > *R. repens* var. *pleniflorus* Fernald – F, WV]

* **Ranunculus sardous** Crantz, Sardinian Buttercup, Hairy Buttercup. Low fields, disturbed areas; native of Europe. Apr-Jul (-Oct). [= C, F, FNA, G, GW, K, Mo, Pa, RAB, Va, WH3, X, Y]

Ranunculus sceleratus Linnaeus var. *sceleratus*, Cursed Buttercup, Celery-leaf Crowfoot. Marshes, ditches, and stream margins. Apr-Sep. The species is circumboreal, ranging south in North America (partly introduced, at least southward) to n. FL, LA, TX, and CA. Var. *sceleratus* is widespread and the only variety in e. North America; var. *multifidus* occurs in w. North America. The epithet is sometimes misspelled "*scleratus*." [= C, F, FNA, G, K, Mo, Va; < *R. sceleratus* – GW, Pa, RAB, S, W, WH3, Y]

Ranunculus trichophyllus Chaix var. *trichophyllus*, White Water Crowfoot. Submerged in water of acidic streams. *R. trichophyllus* is circumboreal, ranging south in North America to NJ, VA, nc. TN, PA, MN, SD, NM, AZ, and CA. Var. *trichophyllus* ranges south to the southern limit of the species. This taxon was reported as far south as NC by G and S; the documentation is unknown and the species was not treated by RAB. The more northern var. *calvescens* W. Drew, with the receptacle glabrous or with a few scattered hairs (vs. hirsute with tufted hairs), ranges south to PA and MI. [= C, F, K; < *R. aquatilis* Linnaeus var. *diffusus* Withering – FNA, Pa; < *R. trichophyllus* – WV, Y; ? *R. aquatilis* Linnaeus var. *capillaceus* (Thuillier) A.P. de Candolle – G; ? *Batrachium flaccidum* (Persoon) Ruprecht – S]

* **Ranunculus trilobus** Desfontaines. Fields, roadsides, ditches; native of sw. Europe. [= FNA, K, WH3, X, Y]

116. NELUMBONACEAE Dumortier 1829 (Lotus-lily Family) [in PROTEALES]

A family of 1 genus and 2 species, aquatic herbs, of temperate and subtropical e. North America and e. Asia. References: Wiersma in FNA (1997); Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Nelumbo Adanson 1763 (Lotus-lily, Lotus, Sacred-lotus, Sacred-bean)

A genus of 2 species, aquatic herbs, of temperate and subtropical e. North America and e. Asia. References: Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: *Nelumbo* can be immediately distinguished in vegetative condition from the other "pads" (*Nymphaea*, *Nuphar*, and *Nymphoides*) by its peltate leaves, and from the peltate *Brasenia* by the much larger size and round (rather than elliptic) leaves.

- 1 Petals yellow; flower stalks and petioles smooth; mature fruits ("nuts") usually < 1.25× as long as wide *N. lutea*
- 1 Petals pink or white; flower stalks and petioles roughened; mature fruits ("nuts") usually > 1.5× as long as wide..... *N. nucifera*

Nelumbo lutea Willdenow, Yonkapin, American Lotus-lily, Yellow Lotus, Yockernut, Water-chinquapin, Pond-nuts. Ponds, natural lakes, sluggish streams, freshwater tidal marshes. Jun-Sep. NY and s. ON west to MN and IA, south to s. FL and e. TX, and south into the West Indies and Mexico. [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, WH3, WV; = *N. nucifera* ssp. *lutea* (Willdenow) Borsch & Barthlott; = *N. pentapetala* (Walter) Fernald]

* ***Nelumbo nucifera*** Gaertner, Sacred-lotus, Oriental Lotus-lily, Pink Lotus. Ponds and lakes; native of Asia. Jun-Sep. [= C, F, FNA, G, GW, K, RAB, WH3]

117. PLATANACEAE Dumortier 1829 (Plane-tree Family) [in PROTEALES]

A family of a single genus and about 7 species (and several additional infrataxa), trees, of North America south to Central America and w. Asia to se. Asia. Probably with a close relationship to the Proteaceae (Angiosperm Phylogeny Group 2009), and sometimes included there (Angiosperm Phylogeny Group 1998, 2003). References: Kaul in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Platanus Linnaeus 1753 (Plane-tree, Sycamore)

A genus of about 7 species (and several additional infrataxa), trees, of North America south to Central America and w. Asia to se. Asia. References: Kaul in FNA (1997); Grimm & Denk (2010)=Y; Nixon & Poole (2003)=Z; Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: The exposed white inner bark on the middle and upper trunks make *Platanus occidentalis* recognizable at long distances, especially in winter.

- 1 Fruiting heads 1-2 (-3) per peduncle; bark exposed by peeling green; lobes of leaves elongate, often longer than wide; [rarely persistent or escaped cultivar] [*P. ×acerifolia*]
- 1 Fruiting heads 1 per peduncle; bark exposed by peeling mostly white; Lobes of leaves broad, broader than long; [common, widespread native tree] *P. occidentalis*

* ***Platanus ×acerifolia*** Willdenow [*occidentalis*×*orientalis*], London Planetree. Disturbed areas; hybrid of our native species and the Eurasian *P. orientalis*, planted as a street tree and reported as "occasionally escaping" (Rhoads & Black 2007). [= FNA, Mo, Pa]

Platanus occidentalis Linnaeus, Sycamore, Plane-tree. Riverbanks and alluvial forests, streambanks, sometimes weedy on rocky roadcuts. Apr-Jun; Sep-Nov. S. ME west to s. ON, MI, and MN, south to Panhandle FL and TX. One of the largest trees in e. North America, and probably the largest that is widespread in the Piedmont of our area. *P. palmeri* Kuntze, sometimes treated as *P. occidentalis* var. *palmeri* (Kuntze) Nixon & Poole ex Geerinck, but better interpreted as a species (Grimm & Denk 2010), occurs from central TX south into Coahuila. [= Mo, Va, Y; = *P. occidentalis* var. *occidentalis* - Z; < *P. occidentalis* - C, FNA, G, GW, K, Pa, RAB, S, W, WH3, WV; > *P. occidentalis* var. *occidentalis* - F; > *P. occidentalis* var. *glabrata* (Fernald) Sargent - F]

118. PROTEACEAE A.L. de Jussieu 1789 (Protea Family) [in PROTEALES]

A family of about 80 genera and 1600 species, trees and shrubs, mainly of the tropics and subtropics (and Southern Hemisphere temperate areas).

Grevillea R. Brown ex Knight 1809 (Silk-oak)

A genus of about 500 species, trees, mainly of Australia.

* ***Grevillea robusta*** A. Cunningham ex R. Brown, Silk-oak. Disturbed areas; native of Australia. [= K2, WH3]

121. BUXACEAE Dumortier 1822 (Boxwood Family) [in BUXALES]

A family of 5 genera and about 100 species, mainly shrubs, mainly of the Northern Hemisphere. References: von Balthazar, Endress, & Qiu (2000); Channell & Wood (1987); Köhler in Kubitzki, Bayer, & Stevens (2007).

- 1 Plant a woody shrub; leaves opposite, < 1 cm wide[*Buxus*]
- 1 Plant a suffrutescent herb; leaves alternate, 1.5-7 cm wide *Pachysandra*

Buxus Linnaeus 1753 (Boxwood)

A genus of about 50-90 species, shrubs, of tropical to temperate areas of Europe, Africa, West Indies, Central America, and e. Asia; Köhler in Kubitzki, Bayer, & Stevens (2007).

* ***Buxus sempervirens*** Linnaeus, Boxwood. Persistent for decades at abandoned homesites, and spreading weakly from dumped hedge trimmings and other cuttings; native of Europe. Popular for hedges and landscaping; also cultivated in the Mountains for wreathing. Reported for AL Coastal Plain (Diamond 2013). [= K]

Pachysandra Michaux 1803 (*Pachysandra*)

A genus of 4-5 species, 1 of e. North America, the others of e. Asia, suffruticose herbs and shrubs. References: Robbins (1968)=Z; Köhler in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves subcoriaceous, semi-evergreen, pubescent, mottled with several shades of green (more apparently so at some seasons than others); inflorescences lateral from near the base of the plant; [native plant of rich forests]..... *P. procumbens*
- 1 Leaves coriaceous, evergreen, glabrous, dark green; inflorescences terminal; [cultivated alien plant, rarely persistent] [*P. terminalis*]

Pachysandra procumbens Michaux, Mountain Pachysandra, Allegheny-spurge. Moist rich woods. Mar-Apr; Jul-Aug. C. KY south to w. NC, nw. SC, w. GA, Panhandle FL (Jackson County only), AL, MS, and e. LA (on loess in the Tunica Hills). Its distribution (and, for that matter, that of the genus as a whole) appears to be relictual and to reflect a poor ability to disperse itself and colonize new territory. Channell & Wood (1987) refer to *P. procumbens* as a "nonaggressive if not 'senile' species with a very low evolutionary potential." The only locations for this species in NC are in Polk County, NC, which has other notable disjunctions of species which normally occur west of the Blue Ridge (*Veratrum woodii*, *Smilax lasioneura*). [= C, F, G, K, Pa, RAB, S, W, WH3, Z]

* ***Pachysandra terminalis*** Siebold & Zuccarini, Pachysandra, Japanese-spurge. Persistent after cultivation, and spreading vegetatively to adjacent forests; commonly cultivated, rarely persistent to naturalized, native of China and Japan. This species is a popular ground-cover, difficult to eradicate once well-established. [= C, F, G, K, Pa, RAB, Z]

127. ALTINGIACEAE Lindley 1846 (Sweet-gum Family) [in SAXIFRAGALES]

A family of 2 genera and about 12 species, trees, of e. Asia, Indomalaysia, e. North America, Central America, and e. Mediterranean. Various molecular studies show that *Liquidambar* is better separated from the Hamamelidaceae (Hoot, Magallón, and Crane 1999). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Hoot, Magallón, and Crane (1999).

Liquidambar Linnaeus 1753 (Sweet Gum)

A genus of 4-5 species, trees, north temperate, of e. North America, Central America (Mexico to Nicaragua), e. Asia (s. China, Taiwan, Vietnam), and e. Mediterranean (Turkey, Rhodos, Cyprus). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Li & Donoghue (1999).

Liquidambar styraciflua Linnaeus, Sweet Gum, Red Gum. Swamp forests, floodplains, moist forests, depressional wetlands, old fields, disturbed areas. Apr-May; Aug-Sep. CT west to s. OH, s. IL and OK, south to s. FL, TX, and Guatemala. One of the most spectacular of our trees in the fall; a single tree often has a mixture of green, yellow, orange, dark red, bronze, and purple leaves. The sap was previously gathered as a source of chewing gum. The bark is one of the favorite foods of

beavers. Although sometimes thought of as a small and weedy tree, *Liquidambar* reaches its greatest abundance and size in Coastal Plain swamp forests, where it can reach 2 meters in diameter. Along with such species as *Pinus taeda*, *Quercus phellos*, and others, *Liquidambar* is a good example of a primarily bottomland tree which has proven to be an excellent colonizer of disturbed uplands. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WH3, WV]

128. HAMAMELIDACEAE R. Brown 1818 (Witch-hazel Family) [in SAXIFRAGALES]

A family of ca. 27 genera and ca. 87 species, trees and shrubs, tropical to temperate, and especially e. Asian. References: Meyer in FNA (1997); Endress in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves 5-7-palmately lobed and palmately veined, glabrous..... [see *Liquidambar* in *ALTINGIACEAE*]
- 1 Leaves unlobed, pinnately veined, stellate-pubescent beneath (at least when young).
 - 2 Leaves entire or with very obscure teeth (visible at 10×); petals 4-5 (-6), white, cream, or pink..... [*Loropetalum*]
 - 2 Leaves csparsely crenate, at least towards the apex; petals 0 or 4, if present, greenish, yellow, or reddish.
 - 3 Petals 0; stamens 12-32; flowers numerous in dense globose or elongate spikes; leaves with a symmetric or asymmetric (oblique) base, the lateral veins marginal for a distance of at least 2-3 mm; [tribe *Fothergilleae*]..... *Fothergilla*
 - 3 Petals 4; stamens 4; flowers few in small clusters; leaves with a weakly to strongly asymmetric (oblique) base, the lateral veins included in the blade tissue or barely exposed for a distance of <1 mm; [tribe *Hamamelideae*]..... *Hamamelis*

***Fothergilla* Murray in Linnaeus 1774 (Witch-alder)**

A genus of 2 (-3) species, shrubs, of temperate e. North America. References: Meyer in FNA (1997); Weaver (1969)=Z; Darke (2008); Ranney et al. (2007); Endress in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: *Fothergilla major* often occurs with *Hamamelis virginiana*, with which it is easily confused in vegetative condition; a reliable character is the base of the lateral veins (marginal in *Fothergilla*, included in leaf tissue in *Hamamelis*). Most of the cultivated material of *Fothergilla*, including the best known cultivar ‘Mount Airy,’ are *Fothergilla ×intermedia* Ranney & Fantz, a pentaploid hybrid of tetraploid *F. gardenii* and hexaploid *F. major* (Ranney et al. 2007; Darke 2008).

- 1 Leaves stellate-pubescent above, up to 6 cm long and 5 cm wide (the largest < 5.2 cm wide); stamens 12-24; capsules 6.5-10.5 (-13) mm long, the persistent hypanthium 3.4-5 mm long; seeds 4.8-6.3 mm long; [of wet savannas, pocosins, and pocosin margins of the Coastal Plain]..... *F. gardenii*
- 1 Leaves glabrous or sparsely stellate-pubescent above, up to 12 cm long and 10 cm wide (the largest > 5.2 cm wide); stamens (18-) 22-32; capsules 8-15.2 mm long, the persistent hypanthium 4-9.2 mm long; seeds 6.2-7.8 mm long; [of mostly rocky habitats of the Mountains and Piedmont]..... *F. major*

***Fothergilla gardenii* Linnaeus, Coastal Witch-alder.** Wet savannas, pocosins, and margins of pocosins, Baygalls, and pitcherplant bogs. Mar-May; Sep-Oct. Se. NC (and allegedly se. VA) south to Panhandle FL and s. AL (Barger, Spaulding, & Holt 2013). An ornamental prized for its small size and attractive fall color. A tetraploid species ($2n=4x=48$) (Ranney et al. 2012). [= F, FNA, GW, K, RAB, WH3, Z; > *F. gardenii* – S, orthographic variant; > *F. parvifolia* Kearney – S]

***Fothergilla major* (Sims) Loddiges, Large Witch-alder.** Dry ridgetop forests of middle elevation ridges in the mountains, especially along the Blue Ridge Escarpment, summits and upper slopes of Piedmont monadnocks, north-facing bluffs and along small streams in the lower Piedmont. Apr-May; Jul-Oct. C. NC west to ne. TN, south to nc. GA and nc. AL; disjunct in AR. A hexaploid species $2n=6x=72$. [= FNA, K, RAB, S, W, Z; > *F. monticola* W.W. Ashe]

Fothergilla species 1. Seepy, acid wetlands Coastal Plain. Under study by T.G. Ranney. A diploid species ($2n=2x=24$). {not yet keyed}

***Hamamelis* Linnaeus 1753 (Witch-hazel)**

A genus of 5-6 species, shrubs and small trees, of e. North America and e. Asia (China and Japan). The other North American species, *H. vernalis* Sargent, is endemic to the Ozark/Ouachita region of AR, OK, and MO. References: Leonard (2006)=X; Meyer in FNA (1997); Lane (2005)=Z; Jenne (1966)=Y; Wen & Shi (1999); Endress in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Outer surface of calyx scarlet; petals 7-14 mm long, red or reddish (often yellow-tipped), flowering late Dec to early Feb; leaves 12-24 cm long, 5-17 cm wide, densely stellate-pubescent below, usually with 11 lateral veins (6 on one side of the leaf, 5 on the other); [plants of pineland ravines in the Coastal Plain of s. MS, s. AL, and e. GA]..... *H. ovalis*
- 1 Outer surface of calyx yellow; petals 6-8 mm long, yellow, flowering Oct-Jan; leaves 3.7-16.7 cm long, 2.5-13 cm wide, glabrous to densely stellate-pubescent beneath, usually with 9 or 10 lateral veins (5 on one side of the leaf, 4-5 on the other); [plants collectively widespread in our area]
- 2 Stellate trichomes of the leaves moderately dense to dense, averaging 0.09 mm across, with 7-11 rays; leaves (3.6-) avg. 6.4 (-10.3) cm long, (1.8-) avg. 4.1 (-6.2) cm wide; petals 7-15 mm long, 0.5-0.8 mm wide; [e. SC south to Panhandle FL, west to se. LA in the Coastal Plain]..... *H. virginiana* var. *henryae*
- 2 Stellate trichomes of the leaves sparse to moderately dense, averaging 0.16-0.40 mm across, with 3-6 (-8) rays; leaves (4.7-) avg. 9.9 (-14.0) cm long, (3.9-) avg. 6.6 (-9.2) cm wide; petals 15-20 mm long, 1 mm wide; [widespread in our area].... *H. virginiana* var. *virginiana*

Hamamelis ovalis S.W. Leonard, Running Witch-hazel, Southern Red Witch-hazel, Bigleaf Witch-hazel. Dry-mesic pineland ravines. Late Dec-early Feb. Originally believed to be possibly endemic to sc. MS (Perry County) (Leonard 2006), but now found as well in five counties in s. AL (Butler, Clarke, Covington, Crenshaw, and Monroe Counties.) (Keener 2010, Diamond 2013) and in e. GA (T. Patrick, pers. comm., 2015). [= X]

Hamamelis virginiana Linnaeus var. *henryae* Jenne ex C. Lane, Small-leaved Witch-hazel. Sandhill margins, xeric hammocks, streamheads. Nov-Jan. E. SC (Horry and Hampton counties), s. GA, and Panhandle FL west to se. LA. Though cited in Lane (2005) as var. *henryi*, the honoree is collector Mary G. Henry; thus the honorific epithet should be corrected to the feminine. Additional study is needed of these small-leaved Coastal Plain populations. [< *H. virginiana* – FNA, GW, K, S, WH3; = *H. virginiana* var. *henryi* Jenne ex C. Lane – Y, Z, orthographic error]

Hamamelis virginiana Linnaeus var. *virginiana*, Northern Witch-hazel. Moist to dryish forests. Oct-Dec; Oct-Nov (of the following year). QC and NS west to n. MI and MN, south to FL and TX. The bark is still gathered in large quantities in the Southern Appalachians, as the source for witch hazel liniment. The name ‘witch-hazel’ alludes to its superficial resemblance to *Corylus*, the true hazel, and to its ‘perverse’ habit of flowering in the fall, as it drops its leaves. [= Va, Y, Z; < *H. virginiana* – C, FNA, G, GW, K, Mo, Pa, TAB, S, W, WH3, WV; > *H. virginiana* var. *parvifolia* Nuttall – F; > *H. virginiana* var. *virginiana* – F]

Loropetalum R. Brown 1828 (*Loropetalum*)

A genus of 3 species, shrubs and small trees, native of China, n. and e. India, and Japan. References: Zhang, Zhang, & Endress (2003)=Z; Endress in Kubitzki, Rohwer, & Bittrich (1993).

* *Loropetalum chinense* (R. Brown) Oliver, *Loropetalum*. Disturbed urban and suburban areas, spreading at least locally around plantings in suburban and urban areas, both by seed and by root sprouts. Var. *rubrum* seems to be merely a form; root sprouts revert from pink to white petal color and coppery to green leaf color. [> *L. chinense* var. *rubrum* Yieh – Z]

131. ITEACEAE J. Agardh 1858 (Sweetspire Family) [in SAXIFRAGALES]

A family of 1 genus and about 27 species, shrubs, of e. and se. Asia (about 25 species), e. North America (1 species), and sub-Saharan Africa (1 species). References: Kubitzki in Kubitzki, Bayer, & Stevens (2007).

Itea Linnaeus 1753 (Virginia-willow, Sweetspire, Tassel-white)

A genus of about 27 species, shrubs and trees, all but 2 (ours and 1 in sub-Saharan Africa) are in e. and se. Asia. The closest relative of our species is *I. japonica* Oliver, of Japan. Various treatments in a very broadly-conceived Saxifragaceae (RAB, F, G, GW, W), a less comprehensive Grossulariaceae (C, K), a narrow Escalloniaceae, or a very narrow (single genus) Iteaceae (S), the relationships of *Itea* remain problematic. Recent molecular data suggest that the relationship between *Itea* and other woody “saxifragaceous” genera (including *Escallonia*) is only distant (Morgan & Soltis 1993). *Itea* is here conservatively treated in a narrow Iteaceae. References: Morin in FNA (2009); Spongberg (1972); Morgan & Soltis (1993); Bohm et al. (1999); Kubitzki in Kubitzki, Bayer, & Stevens (2007).

Identification notes: Sometimes confused needlessly with *Clethra*, whose much more coarsely serrate, obovate leaves contrast with the serrulate, elliptic leaves of *Itea*. Also often confused with *Eubotrys racemosus* in vegetative condition.

Itea virginica Linnaeus, Virginia-willow, Sweetspire, Tassel-white. Moist forests and thickets, especially along the banks of small streams. May-Jun. S. NJ south to s. FL and west to e. TX and OK, north in the interior (especially in the Mississippi Embayment) to s. IL and se. MO. [= C, F, FNA, K, G, GW, Mo, Pa, RAB, S, Va, W, WH3]

132. **GROSSULARIACEAE** A.P. de Candolle 1805 (Currant Family) [in SAXIFRAGALES]

A family of one genus, of the northern hemisphere and montane South America (Andes). The familial distinction from the Saxifragaceae is supported by recent molecular data, though the affinities of Grossulariaceae and Saxifragaceae (sensu stricto) are closer than those of many other groups traditionally included in the Saxifragaceae, such as *Parnassia*, *Lepuropetalon*, and *Penthorum* (Morgan & Soltis 1993). References: Weigend in Kubitzki, Bayer, & Stevens (2007).

Ribes Linnaeus 1753 (Currant, Gooseberry)

A genus of 150-200 species, temperate, of the Northern Hemisphere and montane South America. The genus is separated into distinctive subgenera, these sometimes maintained as full genera (as by S). Of the species treated here, the currants (subgenus *Ribes*) include *R. americanum*, *R. aureum* var. *villosum*, *R. glandulosum*, *R. lacustre*, *R. nigrum*, *R. rubrum*, and *R. triste*. The gooseberries (subgenus *Grossularia*) include *R. curvatum*, *R. cynosbati*, *R. echinellum*, *R. hirtellum*, *R. missouriense*, *R. rotundifolium*, and *R. uva-crispa*. The dried "currants" commonly available in stores are actually raisins made from a small variety of grape, and have nothing to do with *Ribes*. A molecular study suggests that recognition of *Grossularia* as a genus distinct from *Ribes* is not warranted, though it does form a monophyletic group nested within *Ribes* s.l. (Senters & Soltis 2003; Weigend, Mohr, & Motley 2002). References: Morin in FNA (2009); Sinnott (1985)=Z; Weigend, Mohr, & Motley (2002); Spongberg (1972); Schultheis & Donoghue (2004); Senters & Soltis (2003); Weigend in Kubitzki, Bayer, & Stevens (2007). Key adapted from C, F, and Z.

- 1 Flowers solitary or in corymbs of 2-4; pedicels not jointed just beneath the ovary or fruit, the fruit not disarticulating at maturity and thus the fruit shed with the entire pedicel; stems generally with (0-) 1-3 nodal spines and sometimes also with internodal bristles (especially on young, vigorous growth) (though these sometimes absent or nearly so in some species); [subgenus *Grossularia*].
 - 2 Ovary and fruit glabrous.
 - 3 Stamens (at full anthesis) 3-4.5 mm long, about equaling the calyx lobes *R. hirtellum*
 - 3 Stamens (at full anthesis) 6-12 mm long, exerted well beyond the calyx lobes.
 - 4 Calyx tube white; stamens 9-12 mm long; nodal spines 1-3 per node, 7-18 mm long, stout..... *R. missouriense*
 - 4 Calyx tube purplish or purplish-green; stamens 6-8 mm long; nodal spines 0-1 (-2) per node, 3-11 mm long, slender..... *R. rotundifolium*
 - 2 Ovary and fruit hairy or bristly.
 - 5 Stamens (at full anthesis) 9-15 mm long, exerted well beyond the calyx lobes; calyx lobes 4-7 mm long; petals 2-3 mm long..... *R. echinellum*
 - 5 Stamens (at full anthesis) <7.5 mm long, shorter than the calyx lobes; calyx lobes **either** 2.5-4 mm long **or** 7.5-9 mm long; petals 1-2.5 mm long.
 - 6 Calyx lobes 7.5-9 mm long; stamens 6-7.5 mm long..... *R. curvatum*
 - 6 Calyx lobes 2.5-4 mm long; stamens 1-2 mm long or 4-6 mm long
 - 7 Fruit hispid; stamens 1-2 mm long; peduncles 7-25 mm long; pedicels 5-16 mm long; [of native habitats of the Mountains]..... *R. cynosbati*
 - 7 Fruit glandular-pubescent; stamens 4-6 mm long ; peduncles < 5 mm long; pedicels < 5 mm long; [alien]..... [*R. uva-crispa*]
- 1 Flowers in racemes of 4-many; pedicels jointed just beneath the ovary or fruit, a portion of the pedicel thus remaining attached to the plant when mature sfruit or aborted flowers are shed, the fruit disarticulating at maturity; stems lacking nodal spines and internodal bristles (except *R. lacustre*); [subgenus *Ribes*].
 - 8 Ovaries and fruits bristly or spiny with gland-tipped hairs.
 - 9 Stems lacking internodal bristles and nodal spines; racemes ascending to erect; fruit dark red when mature *R. glandulosum*
 - 9 Stems (especially young, vigorous growth) with internodal bristles and sometimes internodal spines; racemes spreading to drooping; fruit purple or black when mature *R. lacustre*
 - 8 Ovaries and fruits glabrous or with sessile glands.
 - 10 Lower leaf surface with scattered golden glands; fruit black when mature (except sometimes in *R. aureum* var. *villosum*).
 - 11 Bracts of the pedicels 0.5-2 mm long; ovaries and fruits with sessile glands; fruits black when mature [*R. nigrum*]
 - 11 Bracts of the pedicels 3-10 mm long; ovaries and fruits glabrous; fruits black, red, brown, or orange when mature.
 - 12 Pedicels 0.1-2 mm long, shorter than the lanceolate bracts (which are 3-10 mm long); fruits black when mature..... *R. americanum*
 - 12 Pedicels 2-8 mm long, about as long as the obovate bracts (which are 4-9 mm long); fruits black (rarely red, orange, brown, or yellow) when mature..... *R. aureum* var. *villosum*
 - 10 Lower leaf surface lacking golden glands.
 - 13 Hypanthium narrowly tubular, 6-20 mm long; fruits black (rarely red, orange, brown, or yellow) when mature; sepals golden yellow .
 - *R. aureum* var. *villosum*
 - 13 Hypanthium saucer-shaped, < 1 mm long; fruits bright red when mature; sepals brown, greenish brown, or greenish purple.

- 14 Pedicels glabrous; petals cream to pinkish; anther sacs separated by a connective as broad as the anther sacs; erect shrub [cultivated and sometimes persisting or escaping] *R. rubrum*
- 14 Pedicels stipitate-glandular; petals reddish purple; anther sacs almost adjacent, the connective much narrower than the sacs; declining or ascending shrub; [native] *R. triste*

Auxiliary Key to widely distributed native *Ribes* of the Mountains

- 1 Leaves usually 5-10 cm long and wide, serrate or doubly serrate with sharp teeth; plants usually without nodal spines; inflorescence a raceme of 4-15 flowers; pedicel jointed below the fruit *R. glandulosum*
- 1 Leaves 1-5 cm long and wide, serrate with rounded teeth; plants usually with nodal spines; inflorescence a raceme of 1-4 flowers; pedicel not jointed below the fruit.
 - 2 Ovary with glandular hairs which become stiff spines on the mature fruit; leaf bases cordate to deeply cordate (rarely truncate or cuneate), the angle of leaf tissue mostly 190-230°, moderately to sparsely silvery-pilose beneath, usually on the surface as well as on the veins and in the vein axils; stamens at full anthesis equaling the petals *R. cynosbati*
 - 2 Ovary and fruit glabrous; leaf bases rounded or cuneate (rarely truncate or cordate), the angle of leaf tissue mostly 130-170°, glabrescent to sparsely pubescent beneath (mostly on the veins and in the vein axils); stamens at full anthesis exceeding the petals *R. rotundifolium*

Ribes americanum P. Miller, American Black Currant. Moist forests, marl marshes. Apr-Jun. NS west to AB, south to w. VA, WV, e. and nc. KY (Clark et al. 2005), ne. TN, IN, NE, and NM. [= C, F, FNA, G, K, Pa, Va, W, WV]

Ribes aureum Pursh var. *villosum* A.P. de Candolle, Buffalo Currant, Golden Currant. Leges, bluffs, also disturbed areas, meadows. Apr-May. MA, ON, MN, ND, and MT south to MD, TN, AR, TX, and NM; the original eastward extent unclear because of occasional cultivation and naturalization). It is reported as occurring as a native species as far east as Montgomery County in nc. TN (Chester, Wofford, & Kral 1997). [= FNA, K; = *R. odoratum* H.L. Wendland – C, F, G, Mo, Pa, WV]

Ribes curvatum Small, Granite Gooseberry. Rocky upland forests. E. TN, AR, and OK south to GA, AL, LA, and TX. Also reported for NC by Sinnott (1985); the specimens came from cultivated plants in a botanist's garden, so there is no evidence that *R. curvatum* is a native or naturalized component of NC's flora. [= FNA, K; = *Grossularia curvata* (Small) Coville & Britton – S]

Ribes cynosbati Linnaeus, Prickly Gooseberry, Dogberry. Moist slopes, periglacial boulderfields, grassy balds, especially at medium to high elevations. Apr-Jun; Jul-Sep. NB, ON, MN, and ND south to w. NC, e. TN, n. GA, n. AL, AR, and OK. [= C, FNA, G, K, Mo, Pa, RAB, Va, W, WV, Z; > *R. cynosbati* var. *cynosbati* – F; > *R. cynosbati* var. *glabratum* Fernald – F; = *Grossularia cynosbati* (Linnaeus) P. Miller – S]

Ribes echinellum (Coville) Rehder, Miccosukee Gooseberry. Mesic, nutrient-rich forests. Mar-Apr; Jun-Sep. This species has a remarkable range, known only from a small area of McCormick County, SC and the vicinity of Lake Miccosukee, Jefferson County, FL. Godfrey (1988) has a detailed description of *R. echinellum*. Catling, Dumouchel, & Brownell (1998) discuss its pollination biology. [= FNA, K, RAB, WH3, Z; = *Grossularia echinella* Coville – S]

Ribes glandulosum Grauer, Skunk Currant, Mountain Currant. Periglacial boulderfields, high elevation seeps, spruce-fir forests. May-Jun; Jun-Sep. NL (Newfoundland) west to AK, south to VT, MI, MN, and BC, and in the Appalachians south to w. NC and e. TN. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV]

Ribes hirtellum Michaux, Northern Gooseberry. Rocky forests. May-Jun; Jun-Sep. NL (Newfoundland) west to AB, south to WV (Tucker County), n. NJ, s. PA, OH, IN, IL, IA, and NE. [= C, FNA, K, Pa; > *R. hirtellum* var. *hirtellum* – F, G]

Ribes lacustre (Persoon) Poiret, Bristly Black Currant, Spiny Swamp Currant. Forests, acid swamps. May-Jun; Jun-Sep. NL (Labrador) to AK, south to MA, PA, w. VA, TN (allegedly), n. OH, MI, MN, SD, CO, UT, and CA. Reported for AL (FNA). The alleged documentation for the inclusion of *R. lacustre* in the flora of VA is a sterile specimen at WILLI that is not definitely identifiable (Wieboldt, pers. comm.). [= C, F, FNA, G, K, Pa, W, WV]

Ribes missouriense Nuttall, Missouri Gooseberry. Forests, rock outcrops. Apr-Jun; May-Jul. W. WV, sw. OH, IN, WI, MN, and e. ND south to KY, e. TN (Roane and Grainger counties), s. IL, MO, n. AR, and KS, with scattered occurrences

(perhaps escapes from cultivation) eastwards in CT, NJ, PA, MD, VA, and WV. [= C, F, FNA, G, K, Mo, WV, Z; = *Grossularia missouriensis* (Nuttall) Coville & Britton – S]

* ***Ribes nigrum*** Linnaeus, Garden Black Currant, Cassis. Disturbed areas; native to Europe. Cultivated in ne. United States, rarely as far south as our area (in MD and NJ according to FNA); it may escape. [= C, F, FNA, G, K]

Ribes rotundifolium Michaux, Appalachian Gooseberry. Moist slopes, balds, boulderfields, rocky forests, seepage swamps, shrub balds, mostly at high elevations south of VA. Apr-May; Jun-Sep. An Appalachian endemic: MA, CO, and NY south to w. NC and e. TN. [= C, F, FNA, G, K, Pa, RAB, Va, W, WV, Z; = *Grossularia rotundifolia* (Michaux) Coville & Britton – S]

* ***Ribes rubrum*** Linnaeus, Garden Red Currant. Persistent from cultivation and escaped to adjacent fence-rows and disturbed areas; native of Europe. Late Apr-May; Jun-Aug. [= FNA, K, Pa, Va; > *R. sativum* Syme – C, F, G, WV]

Ribes triste Pallas, Swamp Red Currant, Wild Red Currant. Boggy forests, seepage wetlands. May-Jul. NL (Labrador) west to AK, south to MD, WV (Mineral, Pocahontas, and Randolph counties), OH, MN, SD, MT, ID, and OR. [= C, F, FNA, G, K, Pa, WV]

* ***Ribes uva-crispa*** Linnaeus, Garden Gooseberry, European Gooseberry. Fencerows, disturbed areas; native of Europe. Cultivated in ne. United States. [= C, FNA; = *Ribes uva-crispa* Linnaeus var. *sativum* A.P. de Candolle – K, Pa; > *R. uva-crispi* – C; = *R. grossularia* Linnaeus – F, G, WV]

133. SAXIFRAGACEAE A.L. de Jussieu 1789 (Saxifrage Family) [in SAXIFRAGALES]

If narrowly circumscribed (as here), a family of about 35 genera and 500-650 species, herbs (mainly perennial), nearly cosmopolitan, but especially diverse in warm temperate and cold temperate regions of North America and Eurasia. The circumscription of a much narrower Saxifragaceae is clearly warranted, based on a wide variety of data, and strongly corroborated by molecular data (Morgan & Soltis 1993 and many later references). References: Wells & Elvander in FNA (2009); Spongberg (1972); Morgan & Soltis (1993); Soltis in Kubitzki, Bayer, & Stevens (2007). [also see GROSSULARIACEAE, HYDRANGEACEAE, ITEACEAE, PARNASSIACEAE, and PENTHORACEAE]

- 1 Leaves compound.....*Astilbe*
- 1 Leaves simple (sometimes cleft or lobed).
 - 2 Stem creeping, the leaves all cauline, opposite; leaves short-petioled or sessile, < 2 cm long.....*Chrysosplenium*
 - 2 Stem erect, the leaves mostly or entirely basal, alternate (stem leaves opposite in *Mitella*); leaves long-petioled, > 4 cm long (except short-petioled or sessile and sometimes < 4 cm long in *Micranthes*).
 - 3 Basal leaves short-petioled or sessile, the petioles 0-1× as long as the blade; basal leaves cuneate or rounded at the base; leaf venation predominately pinnate.
 - 4 Corolla bilaterally symmetrical, the 3 upper petals distinctly clawed (the petal blade with a cordate or truncate base) and with 2 yellow spots, the 2 lower petals smaller, cuneate, and not spotted; leaf margins coarsely dentate.....*Hydatica*
 - 4 Corolla radially symmetrical; leaf margins entire to serrate.....*Micranthes*
 - 3 Basal leaves long-petioled, the petioles (1-) 2-5× as long as the blade; basal leaves cordate at the base; leaf venation predominantly palmate.
 - 5 Stem leaves opposite; petals fimbriate; inflorescence a raceme; flowers on pedicels 1.5-3 mm long.....*Mitella*
 - 5 Stem leaves absent or alternate; petals not fimbriate; inflorescence a panicle or raceme; flowers mostly on pedicels > 3 mm long.
 - 6 Inflorescence racemose; stamens 10.....*Tiarella*
 - 6 Inflorescence paniculate; stamens 5.
 - 7 Seeds winged, 1.3-1.5 mm long; leaves cleft < ½ way to base; hypanthium fused to the pistils only at their bases; stems normally with several petiolate leaves much like the basal leaves (though typically somewhat smaller).....*Sullivantia*
 - 7 Seeds papillose, echinate, smooth, or slightly ridged, 0.4-0.7 mm long; leaves cleft > ½ way to base (in *Boykinia*) or < ½ way (in *Heuchera*); hypanthium fused to the lower half or more of the pistils; stems with (in *Boykinia*) or without (in *Heuchera*) several petiolate leaves.
 - 8 Stems normally with several petiolate leaves much like the basal leaves (though typically somewhat smaller); ovary with 2 locules; leaves cleft > ½ way to base.....*Boykinia*
 - 8 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base.....*Heuchera*

Astilbe Buchenau-Hamilton ex D. Don 1825 (False Goat's-beard)

A genus of 14-25 species, perennial herbs, of e. Asia and e. North America. References: Mellichamp in FNA (2009); Zhu et al. (2013); Soltis in Kubitzki, Bayer, & Stevens (2007).

Identification notes: Superficially, *Astilbe* is quite similar to *Aruncus* (Rosaceae). *Astilbe* may be distinguished by the following characteristics: pubescence of the stem and lower leaf surface glandular, plants monoecious, carpels 2 per flower, stamens 10 per flower (vs. *Aruncus*: pubescence nonglandular, plants dioecious, carpels 3-4 per flower, stamens 15-20 per flower).

- 1 Leaves serrate, the teeth sharp; fruit conic-lanceolate, tapering gradually, 4-5 mm long..... *A. biternata*
 1 Leaves crenate, the teeth rounded (but with a prominent mucronate tip); fruit ovoid, abruptly contracted to the tip, 3 mm long.....
 *A. crenatiloba*

Astilbe biternata (Ventenat) Britton, Appalachian False Goat's-beard. Cove forests, seepage slopes, boulderfield forests. May-Jun; Jul-Aug. VA, sw. WV, and KY south to n. GA. [= C, F, G, K, S, Va, W; < *A. biternata* – FNA, RAB]

Astilbe crenatiloba (Britton) Small, Roan Mountain False Goat's-beard. Mountain forests. Jul?; Sep. Known only from Roan Mountain, Carter County, TN and very rare or extinct. This species has apparently not been seen since the original collections (11 September 1885) by N.L. Britton and Mrs. Britton ("Tennessee. Base of Roan Mountain. Collected on the slope of Roan Mountain, East Tennessee, along the trail from 'Cloudland' to the Roan Mountain station of the E.T. & W.N.C.R.R."); the habitat, phenology, and other characteristics of this species are therefore poorly known. The morphologic characters are striking. [= K, S, W; < *A. biternata* – FNA, RAB]

Boykinia Nuttall 1834 (Boykinia)

A genus of 7 species, herbs, of e. Asia, e. North America, and w. North America, a classic relictual distribution. The other species are distributed primarily in the Pacific Northwest or Rocky Mountains, with several endemics in Japan and an endemic in the unglaciated portions of AK and e. Siberia. References: Gornall in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007)

Identification notes: Sometimes mistaken in vegetative condition for *Trautvetteria*, which is a coarser plant, often occupying similar habitats.

Boykinia aconitifolia Nuttall, Brook-saxifrage, Aconite-saxifrage, Eastern Boykinia, Allegheny Brookfoam. Streambanks, riverbanks, in crevices in spray cliffs around waterfalls, seepages. Jun-Jul. A Southern Appalachian endemic: sw. VA and s. WV, south through w. NC, e. TN, and nw. SC, to n. GA and ne. AL. Apparently closely related to the Japanese endemic *B. lycocotonifolia* (Maximowicz) Engler. [= C, F, FNA, G, GW, K, RAB, Va, W; = *Therophon aconitifolium* (Nuttall) Millsbaugh – S; > *B. turbinata* (Rydberg) Fedde; > *Therophon turbinatum* Rydberg]

Chrysosplenium Linnaeus 1753 (Golden-saxifrage)

A genus of about 60 species, herbs, of Europe, ne. Asia, n. North America, n. Africa, and temperate South America. References: Freeman & Levens in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007).

Chrysosplenium americanum Schweinitz ex Hooker, Golden-saxifrage, Water-mat, Water-carpet. In shaded, rocky, gravelly, and/or mossy seeps and seepage swamps. Mar-Jun. QC west to SK, south to e. VA, w. NC, n. GA, e. TN, and IN. [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W]

Heuchera Linnaeus 1753 (Alumroot)

[contributed by R.A. Folk and A.S. Weakley]

A genus of about 37 (or more) species, perennial herbs, of North America. Sections and subsections recognized follow Folk & Freudenstein (2014). References: Folk & Freudenstein (2014); Folk & Freudenstein (in press, 2015)=X; Wells & Shippe in FNA (2009); Wells (1984)=Z; Rosendahl, Butters, & Lakela (1936)=Y; Wells (1979); Soltis in Kubitzki, Bayer, & Stevens (2007). The keys partly adapted from Wells (1984).

Identification notes: Vegetatively, *Heuchera* resembles *Tiarella* and *Mitella*. *Heuchera* usually has leaves as wide as long and with prominent variegation, while *Tiarella* and *Mitella* usually have leaves longer than wide and lacking variegation.

- 1 Calyx glandular-villous, white or pink, often with green-tipped lobes, 1.3-3.3 mm long, 1.1-2.9 mm in diameter; free hypanthium 0.1-0.4 mm long; petals linear or oblanceolate, 2-3× as long as the calyx lobes, glabrous; plants flowering (Jun-) Jul-Oct; [section *Holochloa*, subsection *Villosae*].
 2 Leaves with widely to narrowly triangular lobes and triangular teeth; petals linear, often coiled; seeds echinate; internodes of floral branches 0.3-2.9 mm long.
 3 Inflorescences strongly condensed; flowers larger and campanulate with mouth sides parallel; leaf blades viscid, very thin, and soft-pilose; [of the southern Ozarks] *[H. arkansana]*
 3 Inflorescences open; flowers small and urceolate with a tapering mouth (in life, pressing campanulate as above); leaf blades somewhat coriaceous, hispid or smooth, hardly or not at all viscid [of the Cumberland Plateau and Appalachian Mountains].
 4 Leaves shallowly lobed, the terminal lobe wider than long; bracts of the inflorescence oblong to spatulate, at least the lower ones toothed; [of the Alleghenies, Cumberlands, and Interior Low Plateau, usually in calcareous or subcalcareous substrates]
 *H. villosa* var. *macrorrhiza*
 4 Leaves deeply and sharply lobed, the terminal lobe longer than wide; bracts of the inflorescence linear, rarely toothed; [primarily of Ridge and Valley, Blue Ridge, and upper Piedmont, usually in very acidic substrates]..... *H. villosa* var. *villosa*

- 2 Leaves with rounded lobes and rounded teeth; petals oblanceolate, reflexed; seeds smooth; internodes of floral branches 2.5-11.2 mm long.
- 5 Leaves coriaceous; petioles puberulent (the trichomes < 0.5 mm long), inflorescence bracts mostly entire; [of dolomite or limestone landscapes, often in more exposed situations in riparian areas, in the Ozarks] *H. puberula*
- 5 Leaves membranaceous (extremely thin), petioles almost always villous (the trichomes almost always > 0.6 mm long), inflorescence bracts mostly trifid; [growing on acidic to neutral substrates, almost exclusively in rockhouses and only occasionally riparian, of various provinces east of the Mississippi River].
 - 6 Styles exerted < 1.25 mm, inflorescences notably condensed (lower pedicels mostly < 5 mm long), flower orientation in life subhorizontal (Interior Low Plateau and s. Cumberlands to St. Francis River, MO)..... *H. missouriensis*
 - 6 Styles exerted > 1.75 mm, inflorescence open (lower pedicels mostly > 5 mm long), flower orientation in life pendent.
 - 7 Mature leaf blades not viscid (the texture suede-like); [of sandstone substrates in the Cumberland Plateau, and disjunct in the southern Appalachian Escarpment of sw. NC, nw. SC, and ne. GA] *H. parviflora* var. 1
 - 7 Mature leaf laminae strongly sticky-viscid; [of quartzite substrates in the NC Piedmont and Blue Ridge escarpment of nw. and nc. NC] *H. parviflora* var. 2
- 1 Calyx glandular-puberulent, greenish, 2.9-13.2 mm long, 2.4-7.5 mm in diameter; free hypanthium 0.6-7.0 mm long; petals rhombic-spatulate, slightly shorter to slightly longer than the calyx lobes, glandular-puberulent on the lower surface; plants flowering Apr-Jun; [section *Heuchera*, subsection *Heuchera*].
 - 8 Free hypanthium < 2 mm long; calyx weakly zygomorphic; calyx urceolate, subglobose, or campanulate.
 - 9 At the onset of anthesis stamens exerted 0.2-1.5 mm beyond the calyx and styles included or exerted up to 1.1 mm beyond the calyx; calyx subglobose *H. caroliniana*
 - 9 At the onset of anthesis the stamens exerted 3 mm or more beyond the calyx and styles exerted 2.6 mm or more beyond the calyx; calyx urceolate or campanulate.
 - 10 Petioles densely hirsute; free hypanthium (1.1-) avg. 1.5 (-1.9) mm long *H. hirsuticaulis*
 - 10 Petioles glabrous, short-pubescent, or scantily hirsute; free hypanthium either (0.6-) avg. 1.1 (-1.5) mm long or (1.5-) avg. 1.7 (-1.9) mm long.
 - 11 Free hypanthium 0.6-1.5 mm long; petals greenish, white, creamy, or pink, the margins entire or bearing short teeth *H. americana*
 - 11 Free hypanthium 1.5-1.9 mm long; petals purple or pink, the margins fimbriate *H. hispida*
 - 8 Free hypanthium > 2 mm long; calyx weakly to strongly zygomorphic; calyx subglobose, campanulate, or tubular.
 - 12 Stigmas included within the calyx (the calyx lobes extending 1.3-5.3 mm beyond the stigma tips); calyx tubular; calyx lobes and petals inflexed, closing the mouth of the flower *H. longiflora*
 - 12 Stigmas barely included within the calyx (the calyx lobes extending up to 0.6 mm beyond the stigma tips) to moderately exerted beyond it; calyx subglobose or campanulate; calyx lobes and petals erect or spreading, not closing the mouth of the flower.
 - 13 Calyx 2.8-4.5 mm long, subglobose; [of the Piedmont of sc. VA southward to SC]..... *H. caroliniana*
 - 13 Calyx 5.5-13.2 mm long, narrowly campanulate; [primarily of the Mountains and upper Piedmont of VA and nc. NC].
 - 14 Flowers large, with white, exerted petals; [of high elevations (usually over 1000 m) on strongly acidic substrates, such as quartzitic sandstones, in w. VA and adjacent e. WV] *H. alba*
 - 14 Flowers smaller, with greenish or purplish-green petals; [of lower elevations on circumneutral or subacidic substrates] *H. pubescens*

Heuchera alba Rydberg. Quartzitic outcrops at high elevations. Jul-Sep. Further study of *H. alba* Rydberg is needed; its recognition as distinct from *H. pubescens* is probably warranted (R. Bartgis, pers. comm.). It apparently differs from *H. pubescens* in its large flowers with white, exerted petals (vs. greenish or purplish-green petals), and occurs at higher elevations (usually over 1000 m) on acidic substrates, such as quartzitic sandstones (vs. at lower elevations on circumneutral or subacidic substrates). [= FNA, K, Va, WV; < *H. pubescens* - C, F, S, W, Z; < *H. pubescens* var. *brachyandra* Rosendahl, Butters, & Lakela - G, Y]

Heuchera americana Linnaeus, American Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. Apr-Aug. CT and NY west to s. ON, n. IN, s. IL, and sc. MO south to c. GA, c. AL, n. MS, n. LA, and ne. TX. *H. americana* is the most widespread species of *Heuchera* in e. North America. Within the range of *H. caroliniana*, *H. americana* is nearly absent. *H. americana* var. *heteradenia* may warrant recognition, and is likely the basis of some eastern records considered to be *H. hirsuticaulis*; further study is needed. [= C, Pa, Va; > *H. americana* var. *americana* - F, G, WV; = *H. americana* var. *americana* - FNA, K, Mo, Z; > *H. americana* var. *heteradenia* Fernald - F; > *H. americana* var. *subtruncata* Fernald - F; > *H. americana* var. *brevipetala* Rosendahl, Butters, & Lakela - G, Y; < *H. americana* - RAB, W; > *H. calycosa* Small - S; > *H. curtisii* - S; > *H. lancipetala* Rydberg - S; > *H. americana* var. *typica* - Y; > *H. americana* var. *calycosa* (Small) Rosendahl, Butters, & Lakela - Y]

Heuchera caroliniana (Rosendahl, Butters, & Lakela) E.F. Wells, Carolina Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral, replacing *H. americana* in much of the upper Piedmont. Apr-Jun. Endemic to the Piedmont of sc. VA, NC, and nc. SC; first found in VA (Henry County) by T.F. Wieboldt in 2002 (Belden et al. 2004). [= FNA, K, Va, Z; < *H. americana* - RAB, S; = *H. americana* Linnaeus var. *caroliniana* Rosendahl, Butters, & Lakela - Y]

Heuchera hirsuticaulis (Wheelock) Rydberg. Bluffs and outcrops. S. MI west to n. IL and sw. MO, south to c. TN, nw. AR, and ne. OK; disjunct in e. GA (Screven County). OH, MI, WI, and IA south to TN, MS, AR, and OK. Considered by Wells

(1984) to represent fertile hybrids between *H. americana* var. *americana* and *H. richardsonii*; here regarded as a stabilized taxon, with numerous occurrences beyond the distribution of one or the other alleged parent. Allegedly ranging east to w. KY (Medley 1993), w. and c. TN (D. Estes, pers. comm. 2008), and e. GA (Screven County specimens at NCU, but perhaps better considered *H. americana* [var. *heteradenia*]). [= *H. americana* Linnaeus var. *hirsuticaulis* (Wheelock) Rosendahl, Butters, & Lakela – FNA, K, Mo, Z; > *H. americana* Linnaeus var. *hirsuticaulis* (Wheelock) Rosendahl, Butters, & Lakela – F, Y; > *H. americana* var. *interior* Rosendahl, Butters, & Lakela – F, Y] {add to synonymy, C, G, S}

Heuchera hispida Pursh, Purple Alumroot. Calcareous rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. Apr-Jun. S. PA south through MD, WV, and VA to nw. NC. This species is intermediate between *H. americana* and *H. pubescens*; it is almost certainly of hybrid origin. The treatment of this hybrid derivative of *H. americana* and *H. pubescens* as *H. americana* var. *hispida* (a variety of one parent) seems undesirable. Since it partly replaces its parents within its range, occurs in populations away from one or both parent, and is not strictly intermediate, it seems best to accord it species status. [= F, G, S, Va, WV, Y; = *H. ×hispida* Pursh – C; = *H. americana* var. *hispida* (Pursh) E.F. Wells – FNA, K, Z; < *H. americana* – RAB, W]

Heuchera longiflora Rydberg, Long-flowered Alumroot. Rich shaded forests and woodlands over calcareous rocks such as limestone, dolostone, or calcite-cemented shales, siltstones, or sandstones, in circumneutral soils. May-Jun. This species is nearly limited to sedimentary rocks, occurring in e. and c. KY, s. OH, sw. WV, sw. VA, ne. TN, w. NC, and c. AL (?). In NC, it occurs primarily in the sedimentary window around Hot Springs, and is possibly limited to Madison, Buncombe, and Haywood counties. Wells (1984) calls it "most distinctive", "characterized by a unique combination of floral characters: long, tubular calyx, deeply included styles, inflexed calyx lobes and petals that close the mouth of the flower obliquely, and horizontal orientation of the flowers." [= C, F, FNA, G, K, W, WV, Z; = *H. pubescens* – RAB, misapplied; > *H. longiflora* – S; > *H. aceroides* Rydberg – S; > *H. scabra* Rydberg – S; > *H. longiflora* Rydberg var. *aceroides* (Rydberg) Rosendahl, Butters, & Lakela – Y; > *H. longiflora* var. *typica* – Y]

Heuchera parviflora Bartling var. 1, Cumberland Grotto Alumroot. Shaded cliff bases, usually under overhangs, on grotto floors, behind waterfalls where humidity is high but not in the spray zone, in rockhouses of the Cumberland Plateau, nearly always in deeply shaded situations where little or no direct sunlight falls. Jul-Sep. An uncommon species throughout its range (s. OH, WV, w. VA south through e. KY to w. NC, nw. SC, n. GA, and se. TN), *H. parviflora* is probably most common in the gorge and waterfall country of sw. NC and in the Cumberland Plateau of TN and KY. In deeply shaded sites, it is often the only vascular plant present. [= *H. parviflora* var. *parviflora* – X; < RAB, S, W; < *H. parviflora* var. *parviflora* – C, FNA, K, Z; >> *H. parviflora* var. *parviflora* – F, G; > *H. parviflora* var. *rugelii* (Shuttleworth) Rosendahl, Butters, & Lakela – F, G, WV, Y; >> *H. parviflora* var. *typica* – Y]

Heuchera parviflora Bartling var. 2, Sauratown Grotto Alumroot. Shaded cliff bases, nearly always in deeply shaded situations where little or no direct sunlight falls. Jul-Sep. Known only from the Sauratown Mountains and Linville Gorge, in the upper Piedmont and Blue Ridge escarpment of nw. NC. See Folk & Freudenstein (2014) and Folk & Freudenstein (in press, 2015). [= *H. parviflora* var. *saurensis* – R.A. Folk – X; < *H. parviflora* – RAB, S, W; < *H. parviflora* var. *parviflora* – C, F, G, FNA, K, Z; >> *H. parviflora* var. *rugelii* (Shuttleworth) Rosendahl, Butters, & Lakela – F, G, WV, Y; >> *H. parviflora* var. *typica* – Y]

Heuchera missouriensis Rosendahl, Interior Low Plateau Grotto Alumroot. Shaded cliff bases, usually under overhangs, on grotto floors, nearly always in deeply shaded situations where little or no direct sunlight falls. Jul-Sep. S. IN and s. IL south through Cumberland TN to n. AL. See Folk & Freudenstein (2014) and Folk & Freudenstein (in press, 2015). [= X; < *H. parviflora* – S; < *H. parviflora* var. *parviflora* – C, FNA, K, Z; ? *H. parviflora* var. *parviflora* – F, G; ? *H. parviflora* var. *rugelii* (Shuttleworth) Rosendahl, Butters, & Lakela – F, G, WV, Y; < *H. parviflora* var. *typica* – Y]

Heuchera puberula Mackenzie & Bush. Riparian areas, and also shaded cliff bases. Apparently restricted to the Ozark Plateau and not present in our area; references to this taxon occurring east of the Mississippi River appear to be based on misidentifications of *H. parviflora*, based on aberrant glabrous specimens otherwise consistent with the latter taxon. See Folk & Freudenstein (2014) and Folk & Freudenstein (in press, 2015). [= F, G, X, Y; = *H. parviflora* Bartling var. *puberula* (Mackenzie & Bush) E.F. Wells – FNA, K, Z]

Heuchera pubescens Pursh, Marbled Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic or circumneutral. May-Jul. Primarily a species of the Ridge and Valley Province of PA, MD, WV, and VA, *H. pubescens* ranges south to only a few locations in the upper Piedmont of NC. See discussion under *H. alba*. The report in RAB of the occurrence of *H. pubescens* in Madison County, NC, is apparently erroneous; Wells (1984) shows *H. pubescens* reaching its southern limit just south of the VA border, and not occurring at all in KY, TN, or the mountains of NC. She found the bract characters used in the key in RAB to be unreliable. Reported by Hill & Horn (1997) for South Carolina {report needs verification}. [= FNA, K, Pa, WV; < *H. pubescens* – C, S, W, Z (also see *H. alba*); >> *H. pubescens* var. *brachyandra* Rosendahl, Butters, & Lakela – F, G, Y; > *H. pubescens* var. *pubescens* – F; > *H. pubescens* var. *typica* – Y]

* ***Heuchera sanguinea*** Engelmann var. *sanguinea*, Coral Bells. Cultivated as an ornamental "wildflower;" native of w. North America. [= K; < *H. sanguinea* – FNA, G; = *H. sanguinea* var. *typica* – Y] {not keyed; not mapped; rejected as a component of the flora}

Heuchera villosa Michaux var. *macrorhiza* (Small) Rosendahl, Butters, & Lakela, Giant Alumroot. Cliffs, riverbanks, especially in calcareous or subcalcareous substrates. Jul-Oct. S. WV, s. OH, and s. IN south through c. KY and c. TN to n. AL and ne. MS. This taxon has usually been disregarded in recent years, but is recognized by Chester et al. (1997). In its purest

form, this plant seems to be very distinct from typical *H. villosa*, and actually may be more closely related to *H. arkansana*. The existence of intermediates and intergrades with *H. villosa* var. *villosa* muddies the taxonomic waters, however, and the overall best treatment (pending additional study) seems to be at the varietal level. In the Ozarks of AR it is replaced by the related *H. arkansana* Rydberg [*H. villosa* var. *arkansana* (Rydberg) E.B. Smith] with shorter and narrower inflorescence, shorter pedicels, and larger flowers. [= G; < *H. villosa* var. *villosa* – C, FNA, K, Z; > *H. villosa* var. *macrorrhiza* – F, WV, Y; > *H. villosa* var. *intermedia* Rosendahl, Butters, & Lakela – F, WV, Y; = *H. macrorrhiza* Small – S]

Heuchera villosa* Michaux var. *villosa, Crag-jungle, Rock Alumroot. In crevices of rock outcrops, or in thin soil over boulders, a characteristic component of the flora of high elevation cliffs and summits (to at least 1920 m), not particular about the rock type, occurring on a wide range of rock types in our area, including felsic gneisses and schists, mafic gneisses, granites, quartzites, and others, probably the most acidophilic of our taxa of *Heuchera*. Late Jun-Oct. W. VA and s. WV south through w. NC and e. TN to nw. SC, n. GA, ne. AL (primarily a Southern Blue Ridge endemic). [= G, Va; < *H. villosa* var. *villosa* – C, FNA, K, Z; = *H. villosa* var. *villosa* – F; < *H. villosa* – RAB, W; = *H. villosa* – S; = *H. villosa* var. *typica* – Y]

***Hydatica* Necker ex Gray 1821 (Appalachian Saxifrage)**

A genus of about 12 species, herbs, of temperate w. North America, Europe, and e. North America. References: Lanning (2009)=Y.

***Hydatica petiolaris* (Rafinesque) Small**, Cliff Saxifrage. In crevices in exposed rock outcrops at high elevations, other rock outcrops (moist to rather dry), periglacial boulderfields, rocky seeps. Jun-Aug. A Southern Appalachian endemic: nw. VA, WV, and KY south to e. TN, w. NC, sw. SC, and ne. GA. The orange anthers are an attractive contrast to the white petals (the three upper with two yellow spots each). [= S, Va, Y; = *Micranthes petiolaris* (Rafinesque) Bush – FNA, Z; = *Saxifraga michauxii* Britton – C, F, G, GW, K, RAB, W, WV]

Hydatica species 1. In seepage on granite. (Feb-) Mar-Apr. Endemic, so far as is known, to Pickens County, SC. Under study by Patrick McMillan. {not yet keyed}

***Micranthes* Haworth 1812 (Saxifrage)**

A genus of about 60-75 species, perennials, mostly of north temperate, boreal, and arctic regions of North America, South America, and Eurasia. As shown by molecular data, *Saxifraga*, as often broadly defined, is polyphyletic, and all of our species either belong in *Micranthes* (Soltis 1995, Soltis et al. 1996, Mort & Soltis 1999), or with further separation into *Micranthes* and *Hydatica* (as followed here). Soltis et al. (1996) demonstrate that *Micranthes* is closely allied with *Heuchera*, *Mitella*, and *Tiarella*, less closely related to *Astilbe*, *Boykinia*, *Sullivantia*, and *Chrysosplenium*, and least closely related to the bulk of *Saxifraga*. References: Elvander & Brouillet in FNA (2009); Lanning (2009)=Y; Brouillet & Gornall (2007)=Z; Soltis in Kubitzki, Bayer, & Stevens (2007). Key based on various sources, including Lanning (2009).

- 1 Larger leaf blades oblanceolate, 4-10× as long as wide.
 - 2 Leaf margin entire to crenate; petals greenish-white, lacking yellowish spots *M. pensylvanica*
 - 2 Leaf margin coarsely serrate; petals white, either 3 or 5 of them with yellowish spots.
 - 3 Leaves with mostly 12-40 teeth per side; pubescence of the leaves and scapes mostly nonglandular; corolla radially symmetrical; filaments strongly clavate; [mostly of shaded seepages and brook-banks] *M. micranthidifolia*
 - 3 Leaves mostly with 4-8 teeth per side; pubescence of the leaves and scapes mostly gland-tipped; corolla bilaterally symmetrical, the 3 upper petals distinctly clawed (the petal blade with a cordate or truncate base) and with 2 yellow spots, the 2 lower petals smaller, cuneate, and not spotted; filaments filiform; [mostly of rock outcrops and seepages, often exposed, but sometimes shaded] [see *Hydatica*]
- 1 Larger leaf blades ovate or obovate, 1-3 (-4)× as long as wide.
 - 4 Leaf margins entire or with obscure teeth mostly < 1 mm long; leaves to 5 (-9) cm long and 2.5 cm wide; filaments 1-1.5 mm long; ovary partly inferior, the hypanthium partly adnate to the ovary; petals spatulate and cuneate, but not clawed; petals not spotted; [widespread in our area].
 - 5 Inflorescence remaining compact with age; inflorescence axis sparsely short-hairy, the hairs not glandular (or with a very few glandular hairs interspersed; pedicels glabrous or nearly so; petals 2-3.5 mm long; [of granite outcrops in GA, otherwise in sc. US] *M. texana*
 - 5 Inflorescence branching with age, some branches often lower than the midpoint of the plant's height; inflorescence axis glandular-hairy; pedicels glandular-hairy; petals 3.5-6 mm long; [widespread in our area] *M. virginiensis*
 - 4 Leaf margins with coarse teeth mostly 2-10 mm long; leaves to 15 cm long and 8 cm wide; filaments 2.5-3.5 mm long; ovary superior, the hypanthium free from the ovary; petals (either 3 or 5 of them) moderately to strongly clawed; petals (either 3 or 5 of them each with 2 yellow spots; [of the Mountains and upper Piedmont].
 - 6 Leaves not petiolate, cuneate to the base, gradually increasing in width from the base to the widest point; corolla bilaterally symmetrical, the 3 upper petals distinctly clawed and with yellow spots, the 2 lower smaller, cuneate, and not spotted [see *Hydatica*]

- 6 Leaves petiolate, the blade rather abruptly contracted to the petiole; corolla radially symmetrical, all the petals alike.
- 7 Sepals erect, later spreading; filaments filiform (use 10×) *M. careyana*
- 7 Sepals spreading, later reflexed; filaments slightly clavate (use 10×) *M. caroliniana*

Micranthes careyana (A. Gray) Small, Carey Saxifrage. Moist rock outcrops and cliffs, often under overhangs, often in moist soil at the base of a vertical or overhanging rock outcrop. May-Jun. A Southern Appalachian endemic: e. TN and nw. NC south to sw. NC and se. TN. Lanning (2009) has clarified the taxonomy of the *M. careyana* / *caroliniana* complex through molecular and morphological study. [= FNA, S, Va, Z; = *Saxifraga careyana* A. Gray – C, F, G, GW, K, RAB, W]

Micranthes caroliniana (A. Gray) Small, Carolina Saxifrage. Moist rock outcrops and cliffs, often under overhangs, often in moist soil at the base of a vertical or overhanging rock outcrop. May-Jun. A Southern Appalachian endemic: sw. VA south to nw. NC and ne. TN. [= FNA, S, Va, Z; = *Saxifraga caroliniana* A. Gray – C, F, G, K, RAB, W; > *M. caroliniana* – S; > *M. tennesseensis* Small – S]

Micranthes micranthidifolia (Haworth) Small, Branch-lettuce. Wet soils of seepages, in the beds of high elevation brooks, brookbanks; rocky seepages. May-Jun. A Southern and Central Appalachian endemic: e. PA and WV, south to e. TN, w. NC, nw. SC, and ne. GA. This plant is gathered in considerable quantities as a spring green in the mountains of our area, and can sometimes be seen for sale in local grocery stores. The common name refers to the plant's habitat; "branches" are mountain streams. [= FNA, S, Va, Z; = *Saxifraga micranthidifolia* (Haworth) Steudel – C, F, G, GW, K, Pa, RAB, W, WV]

Micranthes pensylvanica (Linnaeus) Haworth, Swamp Saxifrage. Forested seeps and seepage swamps, fens, usually over mafic or calcareous rocks. Apr-Jun. ME west to MN, south to e. VA, c. and w. NC, and MO. [= FNA, Va, Z; = *Saxifraga pensylvanica* Linnaeus – C, F, K, Pa, RAB, W, WV; > *S. pensylvanica* ssp. *pensylvanica* – G; > *Saxifraga forbesii* Vasey – G; > *M. pensylvanica* var. *pensylvanica* – Mo; > *M. pensylvanica* var. *forbesii* (Vasey) Bush – Mo]

Micranthes texana (Buckley) Small, Texas Saxifrage. Granite outcrops. Found in 1980 by Jim Allison on a small granite outcrop in McDuffie County, GA. It is uncertain whether its occurrence in GA represents a natural disjunction or a freak introduction (J. Allison, pers. comm.). [= FNA, Mo, S, Z; = *Saxifraga texana* Buckley – F, G, K]

Micranthes virginiensis (Michaux) Small, Early Saxifrage. Rock outcrops, moist alluvial and slope forests, streambanks, riverbanks. Feb-Jun. NB west to MB, south to c. GA, LA, and AR. [= FNA, Mo, S, Va, Z; = *Saxifraga virginensis* Michaux – C, F, G, GW, Pa, RAB, W, WV; > *S. virginensis* var. *virginensis* – K]

***Mitella* Linnaeus 1753 (Miterwort)**

As traditionally circumscribed, a genus of about 20 species, herbs, of cold temperate e. North America, w. North America, and e. Asia. Soltis (2007), Okuyama, Pellmyr, & Kato (2008), and Folk & Freudenstein (2014) indicate that *Mitella* as currently circumscribed is polyphyletic and is likely to be divided; *Mitella diphylla* will remain in *Mitella*, as it is the type of the genus, probably along with only one additional species, *Mitella nuda* Linnaeus. References: Soltis & Freeman in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007).

Mitella diphylla Linnaeus, Two-leaved Miterwort. Mesic, rocky forests, rocky seeps, and seepage swamps, especially over mafic or calcareous rocks. Apr-Jun. QC west to MN, south to e. VA, w. NC, nw. SC, ne. GA, nw. GA, and MO. The fringed petals will reward a close look. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WV]

***Saxifraga* Linnaeus 1753 (Saxifrage)**

A genus of ca. 390 species, herbs (mainly perennial), of mainly north temperate regions. References: Brouillet & Elvander in FNA (2009). [also see *Hydaticea* and *Micranthes*]

- 1 Plant perennial via stolons; leaves orbicular, cordate at the base, broadly rounded at the tip, serrate; flowers bilaterally symmetrical or asymmetrical *S. stolonifera*
- 1 Plant annual; leaves elongate, cuneate at base, tridentate at the tip; flowers radially symmetrical *S. tridactylites*

* ***Saxifraga stolonifera*** Meerburgh, Creeping Saxifrage, Strawberry-begonia, Strawberry-geranium. Frequently cultivated, sometimes persistent or spreading in suburb; native of China and Japan. Reported for Jackson County, NC, by Kartesz (2010). [= FNA, K2] {not yet keyed}

* ***Saxifraga tridactylites*** Linnaeus, Rue-leaved Saxifrage. Gravel and thin soils along roads and highways; native of Mediterranean Europe, n. Africa, and w. Asia. [= FNA, K2]

Sullivantia Torrey & A. Gray 1842 (*Sullivantia*)

A genus of 3-4 species, perennial herbs, of c. North America. References: Soltis in FNA (2009); Soltis (1980)=Z; Soltis in Kubitzki, Bayer, & Stevens (2007).

Sullivantia sullivantii (Torrey & A. Gray) Britton, *Sullivantia*. Moist limestone, dolomite, and calcareous sandstone cliffs. Jun-Aug. *S. sullivantii* has a very scattered, relictual distribution, known from w. VA (Russell County), e. KY, ne. TN (Claiborne County), s. OH, IL, sw. WI, ne. IA, se. MN, and e. and s. MO. [= C, F, FNA, G, K, Mo, Va, Z]

Tiarella Linnaeus 1787 (Foamflower)

A genus of 3-6 species, perennial herbs, of temperate North America and e. Asia. References: Jog in FNA (2009); Lakela (1937)=Y; Spongberg (1972)=Z; Wherry (1940, 1949)=X; Fernald (1943)=V; Soltis in Kubitzki, Bayer, & Stevens (2007).

Tiarella cordifolia Linnaeus. Moist forests, cove forests, rock outcrops, well-drained bottomland forests. Apr-Jun. NS west to ON and WI, south to w. NC, nw. SC, sw. GA, AL, MS, and MO. Several taxa have been recognized (or not) in eastern North America *Tiarella*. The characters used to recognize additional species or varieties are often missing on herbarium sheets and also seem to be imperfectly correlated. *T. wherryi* (or var. *collina*) is alleged to differ from *T. cordifolia* s.s. in lacking stolons (vs. having stolons), capsules 6-10 mm long and round-tipped (vs. 8-12 mm long and subacuminate), and lower fruiting pedicels 6-10 mm long (vs. 7-13 mm long). Additional taxa have sometimes been recognized; see Lakela (1937), Wherry (1940, 1949), Fernald (1943), and Spongberg (1972) for discussion. Further study is needed; for now, I have opted (without great confidence) for a broad approach. [= FNA, Pa, S, W; > *T. cordifolia* var. *cordifolia* – C, G, K, RAB; > *T. cordifolia* Linnaeus var. *collina* Wherry – C, G, K, RAB; > *T. cordifolia* – F, V, WV, Z; > *T. wherryi* Lakela – F, V, Z; > *T. cordifolia* var. *austrina* – K, X, Y; > *T. macrophylla* Small – S (type a combination of *Heuchera* and *Tiarella*); > *T. wherryi* – X, Y; > *T. cordifolia* var. *typica* – Y; > *T. cordifolia* var. *collina* – X]

134. CRASSULACEAE A.P. de Candolle 1825 (Stonecrop Family) [in SAXIFRAGALES]

A family of about 34-35 genera and 1100-1410 species, succulent shrubs and herbs, nearly cosmopolitan, but with centers of diversity in s. Africa and Mexico. References: Moran in FNA (2009); Thiede & Eggl in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves connate at the base, opposite; flowers solitary in the axils of leaves; flowers 3-4-merous; [subfamily *Crassuloideae*]..... **Crassula**
- 1 Leaves distinct, whorled or alternate; flowers in terminal cymose inflorescences; flowers 4-5 (-8)-merous.
- 2 Petals connate as a tube; leaves serrate, bearing plantlets in the serrations; [subfamily *Kalanchoideae*] **Bryophyllum**
- 2 Petals distinct or at most basally connate; leaves entire, crenate, or serrate, but not bearing plantlets along the margin; [subfamily *Sempervivoideae*].
- 3 Plants with spheroidal basal rosettes consisting of dozens or more spirally arranged leaves; flowers 8-16-merous..... [**Sempervivum**]
- 3 Plants with or without basal rosettes (if rosettes present, these not as above); flowers 4-6-merous
- 4 Perennials without rosettes, the stems 0.5-10 dm tall (dying back in winter to the rootstock); leaves large, relatively thin in texture, usually 5-25 times as wide as thick, often crenate; flowers pink, purple, white, or greenish.
- 5 Flowers 5-merous, bisexual; flowering stems 2-10 dm tall, from an underground, tuberous base; average leaves 3-11 cm long, 1-5 cm wide; ovaries attenuate at the base; [tribe *Telephieae*]..... **Hylotelephium**
- 5 Flowers 4 -(5)-merous, usually unisexual and then the plants dioecious; flowering stems 0.5-4 dm tall, from axils of brown scale-leaves clothing a stout rootstock at least in part exposed aboveground; average leaves 1-5 cm long, 0.4-1.5 cm wide; ovaries not attenuate at the base; [tribe *Umbiliceae*]..... **Rhodiola**
- 4 Perennials or annuals with or without rosettes, the stems < 2 dm tall (the perennials with stems persistent through the winter); leaves smaller, flat or terete, relatively thicker, entire; flowers white or yellow; [tribe *Sedeeae*].
- 6 Carpels united basally (to about 1/3 their length); petals cucullate, initially partly enclosing 4 of the 8 stamens; follicles dehiscent by a tear-shaped valve on the lower surface; stem and leaves normally red; [of granitic flatrocks of the Piedmont of GA, NC, SC, and VA; also on sandstone in TN, nw. GA, and AL]..... **Diamorpha**
- 6 Carpels free; petals flat, never enclosing any of the 8 anthers; follicle dehiscent by a longitudinal slit along the adaxial (upper) suture; stem and leaves normally green, sometimes somewhat pink or reddish; [collectively of various habitats, including granitic flatrocks of GA, NC, SC, and VA] **Sedum**

Bryophyllum Salisbury 1805

A genus of about 30 species, perennial herbs, of islands of the Indian Ocean. Sometimes treated as a subgenus of *Kalanchoe*. Moran in FNA (2009).

- 1 Leaves pinnately compound; calyx 25-50 mm long, inflated..... *B. pinnatum*
- 1 Leaves simple; calyx 6-16 mm long, not inflated.
- 2 Leaves flat; leaf margins serrate, bearing plantlets between the teeth..... [*B. daigremontianum*]
- 2 Leaves terete, about as thick as wide; leaf margins entire, except for a few teeth at the apex, bearing plantlets between the teeth..... [*B. delagoense*]

* *Bryophyllum daigremontianum* (Raymond-Hamet & H. Perrier) A. Berger, Maternity Plant, Devil’s Backbone, Alligator-plant, Mother-of-millions. Disturbed areas; native of Madagascar. Jan-Dec. Barger et al. (2012) describe the first naturalizing population in AL; McNair, Alford, & Turnbull (2014) describe its naturalization in Orleans Parish, LA. [= FNA; = *Kalanchoe daigremontiana* Raymond-Hamet & H. Perrier – K1, K2, WH3]

* *Bryophyllum delagoense* (Ecklon & Zeyher) Schinz, Chandelier Plant, Tingo Tingo. Suburban areas, disturbed areas; native of Madagascar. [= FNA; = *Kalanchoe delagoense* Ecklon & Zeyher – K2, WH3]

* *Bryophyllum pinnatum* (Lamarck) Oken, Cathedral Bells, Life Plant, Good Luck Plant, Mother-of-millions. Suburban areas, disturbed areas; native of Madagascar. [= FNA; = *Kalanchoe pinnata* (Lamarck) Persoon – K2, WH3]

Crassula Linnaeus 1753

A genus of 195-250 species, nearly cosmopolitan (centered in s. Africa). Mort et al. (2009) provide strong evidence supporting the inclusion of *Tillaea* in *Crassula*. References: Moran in FNA (2009); Bywater & Wickens (1984)=Z; Mort et al. (2009); Thiede & Egli in Kubitzki, Bayer, & Stevens (2007).

- 1 Seeds rugulose; leaves 2-6 mm long, the apex acute; sepals 0.5-1.5 mm long..... *C. aquatic*
- 1 Seeds with sharp-pointed papillae; leaves 1.5-3 mm long, the apex acute; sepals 0.4-0.6 mm long [*C. drummondii*]

Crassula aquatic (Linnaeus) Schönland, Pygmyweed. Tidal marshes and shores, shores and mudflats of artificial lakes and reservoirs. Occuring in tidal marshes and shores, south to MD and se. PA, and also inland along shores and mudflats of inland reservoirs in SC, GA, and AL (Kartesz 1999, FNA, England 2013). Reported for AL by England (2013). Inland records have fruiting pedicels 1-19 mm long (such populations sometimes considered as the segregate taxon *C. saginoides*), while coastal populations have fruiting pedicels which remain < 1 mm long. [= FNA, K1, K2, Pa; = *Tillaea aquatic* Linnaeus – GW; = *Tillaeastrum aquaticum* (Linnaeus) Britton – S; > *C. aquatic* – Z; > *C. saginoides* (Maximilian) Bywater & Wickens – Z]

* *Crassula drummondii* (Torrey & A. Gray) Fedde. Waste area around wool-combing mill, perhaps merely a waif; native of sc. United States. [= FNA, K1, K2, Z; = *Tillaea drummondii* Torrey & A. Gray]

Crassula longipes (Rose) Bywater & Wickens. {AL, GA}. [= K1, K2, Z] {not yet keyed; synonymy incomplete}

Diamorpha Nuttall 1818 (Elf-orpine)

A monotypic genus, a succulent annual, endemic to se. North America. It is quite likely that *Diamorpha* will be re-included in *Sedum*, unless, alternatively *Sedum* is itself split finely (Thiede & Egli 2007). References: Wilbur (1988a)=Z; Moran in FNA (2009); Clausen (1975)=Y; Thiede & Egli in Kubitzki, Bayer, & Stevens (2007).

Diamorpha smallii Britton ex Small, Elf-orpine. In very thin soil (generally less than 2 cm deep) of vernal wet depressions on granite flatrocks and other granitic outcrops. Apr-May; May-Jun. Primarily limited to granitic flatrocks of the Piedmont, ranging from sc. VA to ec. AL, and on sandstone from se. TN south into c. AL. This species is both one of the most typical and one of the most interesting of the dozens of species endemic (or largely so) to granite flatrocks of the southeastern Piedmont. See Wilbur (1988a) for a thorough discussion of the muddled nomenclatural history of this remarkable species, as well as for a detailed summary of systematic and ecological information. [= FNA, GW, K, Va, Z; = *Sedum smallii* (Britton ex Small) H.E. Ahles – RAB, W; = *Diamorpha cymosa* (Nuttall) Britton ex Small – Y; > *Diamorpha cymosa* – S; > *Diamorpha smallii* – S]

Hylotelephium H. Ohba 1977 (Live-for-ever)

A genus of about 30 species, of temperate Eurasia and North America. References: Moran in FNA (2009); Clausen (1975)=Z; Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007). Key based on Moran in FNA (2009).

- 1 Petals 2× as long as the sepals; nectaries wider than long; flowers fertile; [native] *H. telephioides*
- 1 Petals 2.5-4× as long as the sepals; nectaries longer than wide; flowers sterile (rarely fertile); [introduced].
 - 2 Flowers white or greenish; cymes lax, subcorymbose; leaves not markedly reduced upward from base of plant upward.... *H. erythrostickum*
 - 2 Flowers deep pink to purple; cymes densely subglobose; leaves typically strongly reduced in size from base of plant upward..... *H. telephium*

* *Hylotelephium erythrostickum* (Miquel) H. Ohba, Garden Orpine, Live-for-ever. Disturbed areas; native of Europe. Aug-Sep; Sep-Oct. [= FNA, K, Va; ? *Sedum spectabile* Boreau – Pa, RAB, misapplied; = *Sedum ×erythrostickum* – C; ? *Sedum alboroseum* Baker – F, G, Z; ? *Sedum ×alboroseum* Baker – Pa]

Hylotelephium telephioides (Michaux) H. Ohba, Allegheny Live-for-ever. Rock outcrops, mostly at high to moderate elevations, ascending to 2000 m. Jul-Sep; Aug-Oct. Essentially a Central and Southern Appalachian endemic, *H. telephioides* ranges from s. PA south to w. NC, with a few outlying populations to the west in s. IL, s. IN, and w. KY. The species is apparently not known from TN. [= FNA, K, Va; = *Sedum telephioides* Michaux – C, F, G, Pa, RAB, W, WV, Z; = *Anacampteros telephioides* (Michaux) Haworth – S]

* *Hylotelephium telephium* (Linnaeus) H. Ohba, Live-for-ever. Disturbed areas; native of Europe. Sep-Oct; Oct-Nov. [= FNA, Va; > *Sedum purpureum* (Linnaeus) Link – C, F, RAB, WV, Z; > *S. telephium* – F, Pa; > *Sedum telephium* Linnaeus ssp. *purpureum* (Link) Schinz & R. Keller – G; > *Sedum telephium* ssp. *fabaria* (Koch) Schinz & Keller – G; = *Hylotelephium telephium* ssp. *telephium* – K]

Rhodiola Linnaeus 1753 (Roseroot)

A genus of about 40-60 species, of cold temperate and boreal areas of the northern hemisphere. Thiede & Eggli (2007) place *Rhodiola* in a separate tribe from *Sedum* s.s. References: Moran in FNA (2009); Clausen (1975)=Z; Zhang et al. (2014); Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007).

Rhodiola rosea Linnaeus, Roseroot. High elevation rocky summits. Jul-Aug; Aug-Sep. Circumboreal, widely distributed in northern Europe, Asia, and North America, south in e. North America to e. PA and thence disjunct to Roan Mountain (Mitchell County, NC) and Grandfather Mountain (Avery County, NC), where nearly (if not completely) extirpated. Dwarfed, high elevation forms of *Hylotelephium telephioides*, with narrow, nearly toothless leaves, have been confused with *Rhodiola rosea*; they are perhaps readily distinguished only in flower or fruit. [= FNA, K; = *Sedum rosea* (Linnaeus) Scopoli – Pa, Z; = *Sedum rosea* (Linnaeus) Scopoli var. *rosea* – C; < *S. rosea* var. *rosea* – F; < *S. rosea* – G, RAB, W; > *Rhodiola roanensis* Britton – S; > *Sedum rosea* (Linnaeus) Scopoli var. *roanense* (Britton) Berger]

Sedum Linnaeus 1753 (Stonecrop, Orpine, Sedum)

A genus of perhaps 200 species, depending on circumscription. There is considerable controversy about the circumscription of the genus *Sedum*. *Diamorpha* is usually separated, but Thiede & Eggli (2007) include it in *Sedum*; the separation of *Rhodiola* and *Hylotelephium* have been more controversial, but Thiede & Eggli (2007) place these in separate tribes from *Sedum* s.s. Other segregates which would affect the species treated below have been proposed, such as *Chetyson*, *Clausenellia*, and *Spathulata* (see synonymy). References: Ohba in FNA (2009); Clausen (1975)=Z; Calie (1981)=Y; Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007). [also see *Diamorpha*, *Hylotelephium*, and *Rhodiola*]

Identification notes: Other species of *Sedum* are grown as ornamentals, especially in rock gardens; some are aggressive and rather weedy and can be expected eventually to become a naturalized part of our flora.

- 1 Leaves primarily whorled in 3's or 4's (to 5's).
 - 2 Largest leaves distinctly spatulate, much wider than thick, 8-20 mm wide; flowers and fruits 4-merous; petals white; [native, of moist forest and rock outcrops]; [section *Ternata*] *S. ternatum*
 - 2 Largest leaves linear-lanceolate, oblanceolate, or elliptic, almost as thick as wide, < 7 mm wide; flowers and fruits 5-merous; petals yellow; [alien].
 - 3 Leaves 4 (-5) per whorl; flowering shoots erect [*S. mexicanum*]
 - 3 Leaves 3 (-4) per whorl; flowering shoots pendulous, creeping, or ascending.
 - 4 Flowering shoots pendulous or ascending; leaves linear-lanceolate [*S. lineare*]

- 4 Flowering shoots creeping or ascending; leaves oblanceolate to elliptic*S. sarmentosum*
- 1 Leaves primarily alternate.
 - 5 Flowers and fruits 5-merous; [plants aliens].
 - 6 Leaves 2-5 mm long; petals yellow*S. acre*
 - 6 Leaves 6-15 mm long; petals yellow or white.
 - 7 Petals white; flowers 5-merous.....[*S. album*]
 - 7 Petals yellow; flowers (5-) 7 (-9) merous.....[*S. rupestre*]
 - 5 Flowers and fruits 4-merous; [plants natives].
 - 8 Leaves of flower-bearing stems linear, sagittate-spurred at the base (the spurs clasping the stem); petals pink to white; annual; [section *Ternata*]*S. pulchellum*
 - 8 Leaves of flower-bearing stems narrowly elliptic, oblanceolate, spatulate, cuneate or short-spurred at the base (not clasping); petals white; perennial or annual.
 - 9 Plants annual; sepals 0.4-1 mm long; petals 1.4-4.2 mm long; [restricted to shallow soils of granitic flatrocks of the Piedmont, from s. NC south to wc. GA]; [section *Tetrorum*].....*S. pusillum*
 - 9 Plants perennial; sepals 2-9 mm long; petals 4-9 mm long; [of outcrops of various rocks, not as above]; [section *Ternata*].
 - 10 Leaves of flowering stems with width/thickness ratio of >2.0; seeds averaging 0.8 mm long; leaves pale green or bluish green, sometimes with a glaucous coating; [of MD south through VA and WV to sc. and sw. NC].....*S. glaucophyllum*
 - 10 Leaves of flowering stems with width/thickness ratio of <1.7; seeds averaging 0.7 mm long; leaves green or gray-green, but not glaucous; [of se. TN south into AL and GA].....*S. nevii*

* *Sedum acre* Linnaeus, Wallpepper, Mossy Stonecrop, Golden Carpet, Gold-moss, Bitter Stonecrop. Rock outcrops, gravel parking lots, disturbed areas, commonly cultivated; native of Europe. May-Jun; Jun-Jul. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WH3, WV, Z]

* *Sedum album* Linnaeus, White Stonecrop. Disturbed areas; native of Eurasia. Introduced and naturalized as far south as se. PA and WV. [= C, F, FNA, G, K, Pa, Z; = *Oreosedum album* (Linnaeus) Grulich]

Sedum glaucophyllum Clausen, Cliff Stonecrop. Rock outcrops, usually basic and/or sedimentary. May-Jun; Jun-Jul. Endemic to the Central and Southern Appalachians (extending into the Piedmont), known from MD, WV, VA, and NC (reports for GA are based on confusion with *S. nevii*). This species is complex, with several ploidies and morphologies represented, some at least showing geographic integrity and perhaps worthy of taxonomic recognition. Material in sw. NC (south of the Asheville Basin) has been identified as polyploid and differs in many ways from more typical *S. glaucophyllum*, in some ways suggesting the similar and closely related *S. nevii* A. Gray (known from nearby TN and AL). Further study is needed of this group. [= C, F, FNA, K, Va, W, WV, Y, Z; < *S. nevii* A. Gray – G, RAB, S]

* *Sedum lineare* Thunberg. Margin of granitic flatrock; native of e. Asia. Duncan (1985) discusses the establishment of this species in Columbia County, GA. [= FNA, K, Z]

* *Sedum mexicanum* Britton, Mexican Stonecrop. Dry, disturbed areas; native of Mexico or perhaps e. Asia. [= FNA, WH3]

Sedum nevii A. Gray, Nevius's Stonecrop. Gneiss rock outcrops on river bluffs. Endemic to se. TN (Polk County, just west of Cherokee County, NC) (Chester, Wofford, & Kral 1997), nc. and ec. AL, and wc. GA (where it occurs on gneiss outcrops along the Chattahoochee River in Muscogee and Harris counties), and reported for s. WV (Greenbrier County) by Harmon, Ford-Wertz, & Grafton (2006). [= FNA, K, W, Y, Z; < *S. nevii* – S (also see *S. glaucophyllum*)]

Sedum pulchellum Michaux, Widow's-cross. Calcareous rock outcrops. E. TN (Monroe, Knox, and Bradley counties) (Chester, Wofford, & Kral 1997) and nw. GA (Jones & Coile 1988) west to KS, OK, and TX. [= C, F, FNA, G, K, W, Y, Z; > *Chetyson pulchella* (Michaux) A. & D. Löve; > *Sedum pulchellum* – S; > *Sedum vigilimontis* Small – S; > *Chetyson vigilimontis* (Small) A. & D. Löve]

Sedum pusillum Michaux, Puck's Orpine. In very thin soil (generally less than of vernal wet depressions on granite flatrocks, often in mats of the moss *Hedwigia ciliata*). Mar-Apr; Apr-May. Endemic to granite flatrocks of the southeastern Piedmont, from sc. NC south to wc. GA. Superficially rather similar to *Diamorpha smallii*, and historically confused with it (see Wilbur 1988 for details). Wyatt (1983) discusses the reproductive biology of this species. [= FNA, GW, K, RAB, S, Z; = *Tetrorum pusillum* (Michaux) Rose]

* *Sedum rupestre* Linnaeus. Disturbed rock outcrops; native of Europe. Reported for nc. GA (Jones & Coile 1988), as *S. reflexum* Linnaeus. [= FNA; = *S. reflexum* Linnaeus – C, K, misapplied; = *Petrosedum reflexum* (Linnaeus) Grulich, misapplied]

* *Sedum sarmentosum* Bunge. Xeric rock outcrops, stone walls, disturbed areas; native of China. May-Jun; Jun-Jul. [= C, F, FNA, G, K, Pa, RAB, Va, W, WH3, WV, Z]

Sedum ternatum Michaux, Mountain Stonecrop. Moist forests, coves, bottomlands, shaded rock outcrops. Apr-Jun; May-Jul. NJ west to IA and AR, south to nw. GA and AL. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV, Y, Z; = *Clausenella ternata* (Linnaeus) A. & D. Löve]

Sempervivum Linnaeus 1753 (Hen-and-chickens, Houseleek)

A genus of 40-100 species, perennials, of Eurasia. References: Lis in FNA (2009).

* *Sempervivum tectorum* Linnaeus, Hen-and-chickens, Houseleek, Hens-and-chicks. Disturbed areas, cultivated as a rock garden and potted plant, rarely persistent; native of Europe. *S. tectorum* is reported for VA by Massey (1961) as “escapes from cultivation;” the documentation of this is unknown, but the record has been perpetuated by Kartesz (1999), Lis in FNA (2009), and others. [= FNA, C, F, K]

137. PENTHORACEAE Rydberg ex Britton 1901 (Ditch-stonecrop Family) [in SAXIFRAGALES]

A family of one genus and 2 species, herbs, of e. North America and e. Asia. *Penthorum* has been variously placed in the Crassulaceae, Saxifragaceae, or in the Penthoraceae. Haskins & Hayden (1987) concluded that *Penthorum* was best treated in a monogeneric Penthoraceae, a conclusion based on extensive anatomical evidence. Among those who do not favor a monotypic family, there is nearly evenly divided opinion between the Crassulaceae and Saxifragaceae; this in itself perhaps supports segregation in the Penthoraceae. Molecular evidence supports the recognition of the Penthoraceae, and suggests closer affinities with the Haloragaceae than with either the Crassulaceae or the Saxifragaceae (Morgan & Soltis 1993). References: Thiede in Kubitzki, Bayer, & Stevens (2007); Freeman in FNA (2009).

Penthorum Linnaeus 1753 (Ditch-stonecrop, Penthorum)

A genus of 2 species, herbs, of e. North America and e. and se. Asia. The only other species in the genus is *P. chinense* Pursh, of e. Russia, China, Korea, and Japan. References: Freeman in FNA (2009); Haskins & Hayden (1987)=Z; Thiede in Kubitzki, Bayer, & Stevens (2007).

Penthorum sedoides Linnaeus, Ditch-stonecrop, American Penthorum. Shores, drawdown areas, moist forests, floodplain forests, moist disturbed areas, ditches. Jun-Oct. NB west to MB, south to Panhandle FL and TX; introduced from BC south to OR. [= C, F, FNA, G, GW, K, MO, Pa, RAB, S, Va, W, WH3, WV, Z]

138. HALORAGACEAE R. Brown 1814 (Water-milfoil Family) [in SAXIFRAGALES]

A family of 8-9 genera and about 150 species, aquatic and wetland herbs, but also shrubs and trees, cosmopolitan but centered in the Southern Hemisphere, especially Australia. The family has sometimes spelled "Haloragidaceae." References: Kubitzki in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves whorled or alternate; stamens 4 or 8; carpels 4; emersed leaves bract-like and much-reduced (except in *M. aquaticum*) *Myriophyllum*
- 1 Leaves alternate; stamens 3; carpels 3; emersed leaves foliaceous, little if at all reduced *Proserpinaca*

Myriophyllum Linnaeus 1753 (Water-milfoil)
(contributed by B.A. Sorrie and A.S. Weakley)

A genus of about 68 species, aquatic and wetland herbs, cosmopolitan, with a primary center of diversity in Australia and secondary centers in North America and Asia. The species taxonomy and infrageneric classification used here follow Moody & Les (2010). References: Moody & Les (2010)=X; Crow & Hellquist (2000)=Z; Aiken (1981)=Y.

Identification notes: Stranded plants of *M. heterophyllum* and *M. humile* (and perhaps others) produce leaves that are reduced in size. Leaves and bracts become pectinate or pinnate, so that plants resemble *M. pinnatum*. Such plants are the source of nearly all inland records of *M. pinnatum* in the VA-NC-SC-GA area. *M. heterophyllum* usually flowers and fruits when stranded and may be distinguished from *M. pinnatum* by its much denser disposition of leaves and bracts, and by its dull red fruits obscurely tuberculate (vs. tan or pale brown fruits strongly tuberculate). From stranded *M. humile*, *M. heterophyllum* may be distinguished by leaves and bracts which are clearly whorled and much more densely disposed. *M. humile* differs from *M. pinnatum* by its wholly alternate leaves and bracts, and by its smooth fruits.

- 1 Leaves reduced to small scales or absent; stems short, erect from substrate; [subgenus *Brachythea*; section *Tessaronia*; subsection *Spondylastrum*]..... *M. tenellum*
- 1 Leaves well-developed, pinnately divided with filiform segments; stems elongate, suspended in the water column and/or floating.

- 2 Flowers/fruits absent and emerged shoots with leaves closely similar in size and shape to submersed ones; widespread alien; [subgenus *Myriophyllum*; section *Pectinatum*].....*M. aquaticum*
- 2 Flowers/fruits present; emerged shoots present or not.
- 3 Flowers/fruits in axils of leaves.
- 4 Leaves whorled; emerged stems present and with feathery leaves; [subgenus *Myriophyllum*; section *Pectinatum*]*M. aquaticum*
- 4 Leaves strictly alternate; flowers/fruits on submersed stems (forma *capillaceum*) or on emerged stems with pinnatifid or pectinate leaves (forma *natans*); [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*]*M. humile*
- 3 Flowers/fruits in erect spikes emerged from water, flowers/fruits subtended by bracts much smaller than the normally submersed leaves.
- 5 Uppermost flowers/fruits alternate; leaves alternate or whorled or both; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*].
- 6 Bracts much shorter than floral internodes, varying from pectinate to entire; fruit surface smooth or papillose*M. laxum*
- 6 Bracts usually longer than floral internode, pinnatifid to pectinate; fruit surface strongly tuberculate *M. pinnatum*
- 5 Uppermost flowers/fruits opposite; leaves whorled (technically pseudo-whorled in many *M. heterophyllum*) (note that early season plants of *M. pinnatum* may have flowers opposite, but at least some leaves will be alternate).
- 7 Bracts usually > 2× as long as pistillate flowers; stems drying brown, pale brown, or reddish.
- 8 Bracts throughout inflorescence pectinate to pinnatifid; winter buds scattered along stem, clavate, falling by early winter; [of DE and northward]; [subgenus *Myriophyllum*; section *Myriophyllum*; subsection *Isophylleae*]*M. verticillatum*
- 8 Distal bracts subtentire to serrate, proximal bracts pectinate to serrate; winter buds developed only at base of stem or on rhizomes, usually persisting; [widespread]; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*].....*M. heterophyllum*
- 7 Bracts usually < 2× as long as pistillate flowers; stems drying pale tan or whitish; [subgenus *Myriophyllum*; section *Myriophyllum*; subsection *Myriophyllum*].
- 9 Midstem leaves with 11 or fewer segments on each side of rachis; leaves rounded at apex; stem diameter more-or-less uniform; stem tips usually green; winter buds produced; [native, of DE and northward]*M. sibiricum*
- 9 Midstem leaves with 12 or more segments on each side of rachis; many leaves appear truncate or clipped at apex; stem diameter below inflorescence is up to 2× diameter of lower stem; stem tips usually reddish; no winter buds; [widespread alien].*M. spicatum*

Alternate key

- 1 Leaves reduced to small scales or absent; stems short, erect from substrate; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*].....*M. tenellum*
- 1 Leaves well-developed, pinnately divided with filiform segments; stems elongate, suspended in the water column and/or floating.
- 2 Flowers/fruits produced in axils of submersed leaves; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*]...*M. humile*
- 2 Flowers/fruits produced in axils of emerged leaves or on emerged shoots with bracts (reduced bracteal leaves).
- 3 Emerged shoots with feathery leaves about same size and shape as submersed leaves; flowers/fruits rarely produced; [widespread alien] [subgenus *Myriophyllum*; section *Pectinatum*].....*M. aquaticum*
- 3 Emerged shoots with bracts subtending flowers/fruits; these bracts much different in shape than submersed leaves. [stranded plants may produce bracts and leaves of similar size and shape, but these not feathery].
- 4 All flowers/fruits alternate; fruits smooth; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*]*M. humile*
- 4 All flowers/fruits opposite or whorled (or the lower opposite and the upper alternate in *M. pinnatum*).
- 5 Bracts usually longer than the internodes; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*].
- 6 Leaves whorled or pseudo-whorled; fruits with low bumps*M. heterophyllum*
- 6 Leaves strictly alternate; fruits strongly tuberculate *M. pinnatum*
- 5 Bracts usually shorter than the internodes.
- 7 All bracts pectinate to pinnatifid; [subgenus *Myriophyllum*; section *Myriophyllum*; subsection *Isophylleae*]*M. verticillatum*
- 7 Bracts vary from entire to pectinate.
- 8 Leaves alternate, pseudo-whorled, or both; plain green; [of se. VA and southward]; [subgenus *Brachythecha*; section *Tessaronia*; subsection *Spondylastrum*]*M. laxum*
- 8 All leaves whorled, grayish green; [collectively widespread]; [subgenus *Myriophyllum*; section *Myriophyllum*; subsection *Myriophyllum*].
- 9 Midstem submersed leaves with (3-) 5-11 segments on each side of rachis; leaves rounded at apex; stem diameter more-or-less uniform; stem tips usually green; turions (specialized winter buds) produced late in the season; [native, of DE and northward].....*M. sibiricum*
- 9 Midstem leaves with 12-25 on each side of rachis; many leaves appear truncate or clipped at apex; stem diameter below inflorescence up to 2× the diameter of the lower stem; stem tips usually reddish; turions (specialized winter buds) not produced; [widespread alien]*M. spicatum*

* *Myriophyllum aquaticum* (da Conceição Vellozo) Verdcourt, Parrot-feather. Ditches, slow-moving rivers, pools, ponds; native of South America. Apr-Jun. An introduced species now widespread in se. United States, north to NY, WV, and MO. [= C, GW, K, Mo, Pa, Va, W, WH3, X, Y, Z; = *M. brasiliense* Cambessedes – F, G, RAB, WV; = *M. proserpinacoides* Gillies ex Hooker & Arnott – S]

Myriophyllum heterophyllum Michaux, Southern Water-milfoil. Ditches, slow-moving waters of rivers and streams, pools, ponds. Apr-Jul. NY west to ON and MN, south to FL and TX. [= C, F, G, GW, K, Mo, Pa, RAB, S, Va, WH3, WV, X, Y, Z]

Myriophyllum humile (Rafinesque) Morong. Millponds, other artificial ponds, slow-moving water of streams. NS west to MN, south to DE, MD, VA, and IL. [= C, F, G, K, Pa, Va, X, Y, Z]

Myriophyllum laxum Shuttleworth ex Chapman, Loose Water-milfoil. Limesink depression ponds (dolines), spring-runs, rarely also in lakes. Se. VA south to n. FL, s. AL, and s. MS (Sorrie & Leonard 1999). *M. laxum* and *M. heterophyllum* both have reddish submersed stems and present difficulties in identification when in sterile condition. *M. laxum*

has a total of 7-15 (-17) segments per leaf, vs. (15-) 17-31 (-37) segments in *M. heterophyllum*. Documented for VA by a 1922 specimen from Princess Anne County at GH (Sorrie, pers. comm.). [= GW, K, RAB, S, Va, WH3, X, Y]

Myriophyllum pinnatum (Walter) Britton, Sterns, & Poggenburg, Alternate-leaved Water-milfoil. Ponds, ditches, ponds. Jun-Oct. MA west to IA and SD, south to GA and TX. [= C, F, G, GW, K, Mo, RAB, S, Va, W, WH3, WV, X, Y, Z]

Myriophyllum sibiricum Komarov, Common Water-milfoil. Quiet circumneutral to alkaline waters. NL (Labrador) west to AK, south to VA, WV, IL, MO, NM, and CA; also in n. Eurasia. [= C, G, K, Pa, X, Z; > *M. exalbescens* Fernald – F, Y]

* ***Myriophyllum spicatum*** Linnaeus, Eurasian Water-milfoil. Ponds and impoundments; native of Eurasia. Easily confused with *M. sibiricum*, *M. spicatum* is an introduced species, now widespread in e. United States. Reported for South Carolina by Hill & Horn (1997). [= C, GW, K, Mo, Pa, Va, W, WH3, X, Y, Z]

Myriophyllum tenellum Bigelow, Leafless Water-milfoil. Natural lakes (Carolina bay lakes), typically growing on the sandy bottoms in water 1-2 meters deep. NL (Newfoundland) west to MN, south to PA and NJ, and disjunct south to a few occurrences in NC; the report from Virginia Beach, VA is false. [= C, F, G, K, Pa, X, Y, Z]

Myriophyllum verticillatum Linnaeus. Quiet waters. A circumboreal species, south in North America to DE, MD, n. WV, IN, NE, TX, and CA. [= C, G, K, Pa, X, Y, Z; > *M. verticillatum* var. *pectinatum* Walloth – F]

***Proserpinaca* Linnaeus 1753 (Mermaid-weed)**

A genus of 2-3 species, aquatic and wetland herbs, of e. North America and the West Indies. References: Catling (1998)=Z.

- 1 Bracteal (emersed) leaves pinnatifid to pectinate; submersed pectinate leaves with 4-12 pairs of divisions 2-7.5 mm long; fruits 2.0-3.6 mm wide.
- 2 Leaves with a flattened rachis 1-4 mm wide, the 7-12 pairs of divisions 2.0-3.5 mm long; fruits 2.3-3.6 mm wide.....***P. intermedia***
- 2 Leaves with a filiform rachis (midrib) 0.2-1.0 mm wide, the 4-9 pairs of divisions 2.0-7.5 mm long; fruits 2.0-2.8 mm wide.....***P. pectinata***
- 1 Bracteal (emersed) leaves serrate; submersed pectinate leaves with 8-14 pairs of divisions 5-30 mm long; fruits 2.3-6.0 mm wide.
- 3 Fruit 2.5-3.5 mm wide, bluntly angled, the faces of the capsule convex.....***P. palustris* var. *amblyogona***
- 3 Fruit 2.3-6.0 mm wide, acutely to sharply angled, the faces planar to concave.
- 4 Fruit 2.3-4.0 mm wide, acutely angled, not winged, the faces of the capsule more-or-less planar.....***P. palustris* var. *crebra***
- 4 Fruit (3.5-) 4.0-6.0 mm wide, sharply angled (to somewhat winged), the faces of the capsule concave.....***P. palustris* var. *palustris***

Proserpinaca intermedia Mackenzie, Intermediate Mermaid-weed. Wet places. Jul-Sep. NS to SC, and west to w. LA, on the Coastal Plain; disjunct in sc. TN. This taxon is intermediate in morphology between *P. palustris* and *P. pectinata*; whether it warrants species status is unclear. If merely a rarely produced first-generation hybrid, it should be treated as a hybrid binomial (*P. ×intermedia*); if it forms independent, self-reproducing populations, it should probably be treated as a species. [= C, F, G, K, RAB, Z; < *P. palustris* – GW, Va]

Proserpinaca palustris* Linnaeus var. *amblyogona Fernald. Swamps. OH, ON, MI, IL, MO and OK south to GA (?), AL, MS, LA, and e. TX. [= C, F, G, K; < *P. palustris* – GW, S]

Proserpinaca palustris* Linnaeus var. *crebra Fernald & Griscom, Common Mermaid-weed. Wet places, swamp forests. Jun-Oct. Throughout e. North America and south to the Caribbean and Central America. [= C, F, G, K, Pa, WV, Z; < *P. palustris* – RAB, S, W, WH3; < *P. palustris* – GW, Va (also including *P. intermedia*)]

Proserpinaca palustris* Linnaeus var. *palustris, Coastal Mermaid-weed. Wet places, swamp forests. Jun-Oct. MA (?) to FL and west to LA, on the Coastal Plain. [= C, F, G, K, Pa, Z; < *P. palustris* – RAB, W, WH3; < *P. palustris* – GW, Va (also including *P. intermedia*); >> *P. palustris* – S; > *P. platycarpa* Small – S]

Proserpinaca pectinata Lamarck, Feathery Mermaid-weed. Bogs, savannas, ditches, other wet places. Jun-Oct. NS south to s. FL and west to w. LA, mostly on the Coastal Plain, but scattered inland as well, as in c. TN. [= C, F, G, GW, K, Pa, RAB, S, Va, WH3, Z]

140. VITACEAE A.L. de Jussieu 1789 (Grape Family) [in VITALES]

A family of about 14 genera and 750-850 species, vines (rarely small trees or herbs), of tropical, subtropical, and temperate regions of the Old and New Worlds. References: Moore & Wen in FNA (in prep.); Chen, Ren, & Wen (2007); Ren et al. (2011); Tröndle et al. (2010); Pérois et al. (2011); Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves simple, sometimes shallowly or deeply 3-5 (-7)-lobed.
 - 2 Tendrils not twining, terminating in adhesive disks..... 3. *Parthenocissus (tricuspidata)*
 - 2 Tendrils twining, lacking adhesive disks.
 - 3 Petals separate at their tips, falling individually; pith white, continuous through the node; bark adherent; tendrils bifid or trifid..... 1. *Ampelopsis*
 - 3 Petals connate at their tips, falling together; pith tan to brown, interrupted by a diaphragm at each node (*Vitis*) or continuous through the node (*Muscadinia*); bark adherent (*Muscadinia*) or exfoliating (*Vitis*); tendrils bifid or trifid (*Vitis*) or simple (*Muscadinia*).
 - 4 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small (< 10 cm long and wide) and coarsely toothed, pentagonal in outline, but never deeply lobed..... 4. *Muscadinia*
 - 4 Tendrils bifid to trifid; bark shedding, the lenticels inconspicuous; pith interrupted by diaphragms at nodes; leaves relatively large (well-developed leaves usually > 10 cm wide and long) and finely toothed, often deeply lobed..... 5. *Vitis*
- 1 Leaves compound with either 3-5 (-7) or numerous leaflets.
 - 5 Leaves bipinnate to tripinnate..... 2. *Nekemias*
 - 5 Leaves 3-5 (-7)-foliolate.
 - 6 Leaves pedately 5-foliolate (the lateral 2 leaflets on either side borne on a common stalk)..... 7. *Causonis*
 - 6 Leaves palmately 3-5 (-7)-foliolate (the petioles of all leaflets joined at the summit of the petiole).
 - 7 Branches and leaves distinctly fleshy, the leaves > 1 mm thick when fresh; leaves 3-foliolate..... 6. *Cissus*
 - 7 Branches and leaves herbaceous; leaves simple, 3-5 (-7)-foliolate.
 - 8 Leaflets pinnately lobed; tendrils twining, lacking adhesive tips; berries yellow to orange when ripe..... [1. *Ampelopsis (aconitifolia)*]
 - 8 Leaflets toothed or entire; tendrils not twining, usually terminating in adhesive tips; berries dark blue when ripe..... 3. *Parthenocissus*

1. *Ampelopsis* Michaux 1803 (Peppervine)

A genus of about 25 species, woody vines, of temperate and subtropical America and Asia. See Wen, Boggan, & Nie (2-14) and Soejima & Wen (2006) for the reasons for separating *Ampelopsis* sect. *Leeaceifoliae* as genus *Nekemias*. References: Chen, Ren, & Wen (2007)=Z; Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves bipinnate to tripinnate, with > 11 leaflets; [native and alien species]; [section *Leeaceifoliae*]..... [see *Nekemias*]
- 1 Leaves simple and palmately veined (grape-like), or palmately 5-foliolate (the leaflets additionally pinnately lobed); [alien species]; [section *Ampelopsis*].
 - 3 Leaves palmately 5-foliolate, the leaflets additionally pinnately lobed..... *A. aconitifolia*
 - 3 Leaves simple, grape-like, to 12 cm long and 9 cm wide.
 - 4 Leaves not lobed (to shallowly 3-lobed); young twigs green, glabrous..... *A. cordata*
 - 4 Leaves 3 (-5) lobed; young twigs purplish, sparsely puberulent (sometimes becoming glabrate)..... *A. glandulosa*

* *Ampelopsis aconitifolia* Bunge. Planted as an ornamental, rarely escaping to suburban woodlands; native of n. China. [= K1, K2; > *A. aconitifolia* var. *aconitifolia* - Z]

Ampelopsis cordata Michaux, Raccoon-grape, False-grape. Moist forests, bottomlands, and thickets, particularly where disturbed. May-Jul. E. VA south to Panhandle FL, west to TX, north in the interior to s. OH, s. IN, s. IL, MO, and NE; also introduced at scattered sites inland. [= C, F, G, GW, K1, K2, Mo, RAB, S, Va, W, WH3]

* *Ampelopsis glandulosa* (Wallroth) Momiyama, Porcelain-berry, Amur Peppervine. Riverbanks, thickets and disturbed areas, native of ne. Asia. May-Aug; Sep-Oct. [= FNA; > *A. brevipedunculata* (Maximowicz) Trautvetter - C, F, K1, K2, Mo, Pa, RAB, Va; < *A. heterophylla* (Thunberg) Siebold & Zuccarini - S; > *A. glandulosa* (Wallroth) Momiyama var. *brevipedunculata* (Maximowicz) Momiyama - Z; > *A. heterophylla* (Thunberg) Siebold & Zuccarini var. *brevipedunculata* (Maximowicz) C.L. Li]

2. *Nekemias* Rafinesque 1833 (Peppervine)

A genus of ca. 9 species, lianas, of e. Asia and e. North America. See Wen, Boggan & Nie (2014) for a discussion of the issues of generic circumscription. References: Wen, Boggan, & Nie (2014)=Y; Chen, Ren, & Wen (2007)=Z; Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaflets 2-6 cm long; [common native species of mesic to wet habitats] *N. arborea*
 1 Leaflets 5-12 cm long (at least the larger > 8 cm long); [introduced species] [*N. megalophylla*]

Nekemias arborea (Linnaeus) J. Wen & Boggan, Peppervine. Swamp forests, marshes, wet thickets, moist to wet maritime forests. Jun-Oct. Se. VA (and MD?) south to s. FL, west to TX and n. Mexico, north in the interior to s. IL and sw. WV. [= Y; = *Ampelopsis arborea* (Linnaeus) Koehne – C, F, G, GW, K1, K2, Mo, RAB, S, Va, W, WH3, WV]

* *Nekemias megalophylla* (Diels & Gilg) J. Wen & Z.L. Nie, Bigleaf Peppervine. Planted in the Southeast, and has the potential to naturalize; native of China. Reports of its occurrence as naturalized in MS are based on *Causonis* (S.W. Leonard, pers. comm., 2006). [> *N. megalophylla* var. *megalophylla* – Y; > *Ampelopsis megalophylla* var. *megalophylla* – Z] {not mapped; rejected as a component of our flora}

3. *Parthenocissus* Planchon 1887 (Virginia-creeper, Woodbine)

A genus of about 15 species, woody vines, of temperate Asia and North America. References: Chen, Ren, and Wen (2007)=Z; Wen in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves 3-lobed to 3-foliolate; [introduced ornamental, rarely escaped] *P. tricuspidata*
 1 Leaves (3-) 5 (-7)-foliolate (only a few leaves on a plant 3-foliolate); [native].
 2 Inflorescence with a well-developed (zigzag) central axis, the dichotomous branches very unequal, the inflorescence therefore paniculiform; tendrils many-branched, usually with numerous adhesive disks (though young shoots may not have the disks yet formed); leaves usually dull above; [widespread in our area] *P. quinquefolia*
 2 Inflorescence without a well-developed central axis, the dichotomous branches relatively equal, the inflorescence therefore corymbiform, as wide or wider than long, with 2-3 main branches; tendrils few-branched, usually lacking adhesive disks (though sometimes swollen at the tip); leaves usually glossy above; [from e. VA and n. WV northward] *P. inserta*

Parthenocissus inserta (Kerner) Fritsch, Thicket Creeper. Maritime thickets, rich alluvial forests, rich forests over mafic rocks, roadsides, and dumps. QC west to MB, WY, and CA, south to e. VA, n. WV, OH, MO, TX, and AZ. Recently found in Polk County, NC (D. Campbell, pers. comm., 2014). Pringle (2010) reviews the complicated nomenclatural history and convincingly concludes that *P. inserta* is the correct name for this taxon. [= F, Pa; = *P. vitacea* (Knerr) A.S. Hitchcock – C, G, K1, K2, Mo; = *Cissus verticillata* (Linnaeus) Jarvis]

Parthenocissus quinquefolia (Linnaeus) Planchon, Virginia-creeper. Swamp forests, bottomlands, maritime forests and thickets, rock outcrops, mesic forests. May-Jul; Jul-Aug. ME west to IA and NE, south to s. FL and TX. [= C, F, G, K1, K2, Pa, RAB, Va, W, WH3, WV, Z; > *P. quinquefolia* – S; > *P. hirsuta* (Pursh) Graebner – S]

* *Parthenocissus tricuspidata* (Siebold & Zuccarini) Planchon, Boston-ivy. Frequently grown for ornament, persisting or escaped, and occasionally naturalizing away from known plantings; native of Japan and China. Reported from a road cut in se. TN (Polk County) by Hart, Shaw, & Estes (2012). [= C, F, G, K1, K2, Mo, Pa, Z]

4. *Muscadinia* (Planchon) Small (Muscadine, Scuppernong)

A genus of 2 species and 4 taxa, woody vines, of se. North America (including Mexico) and the West Indies. In the past decade, a number of molecular phylogenetic studies of the Vitaceae have been undertaken, using different genes and different sampling within the family; overall, they all corroborate the clear distinction of the muscadines from the true grapes. Some studies suggest that muscadines are sister to *Vitis* s.s., while others show equivocal results as to whether *Muscadinia* + *Vitis* is a monophyletic group. Overall, and even if *Muscadinia* is basal to but forms a monophyletic clade with *Vitis* s.s., recognition of *Muscadinia* at generic rank is warranted, based on the long-recognized morphological distinctiveness of *Muscadinia* vs. *Vitis* s.s. (see key), the genetic distance of it from *Vitis* s.s., the different chromosome numbers (40 in *Muscadinia*, 38 in *Vitis* s.s.), the frequent past and current recognition of *Muscadinia*, and the standards of morphological distinctiveness of genera in the Vitaceae (Nie et al. 2012; Ren et al. 2011; Péros et al. 2011; Tröndle et al. 2010; Rossetto et al. 2002; Soejima & Wen 2006; Weakley et al. 2011). References: Moore (1991)=Z; Ward (2006b)=Y; Weakley et al. (2011)=X; Wen in Kubitzki, Bayer, & Stevens (2007).

- 1 Mature fruits 5-10 (-13) mm in diameter; infructescences with 12-30 berries; seeds < 6 mm long; leaf blades 3-8 cm long and wide; [of s. GA southward] *M. rotundifolia* var. *munsoniana*
 1 Mature fruits 12-25 mm in diameter; infructescences with 2-8 (-12) berries; seeds > 9 mm long; leaf blades usually > 6 cm long and wide; [widespread in our area] *M. rotundifolia* var. *rotundifolia*

Muscadinia rotundifolia (Michaux) Small var. *munsoniana* (J.H. Simpson ex Planchon) Weakley & Gandhi, Munson Grape, Bullace Grape. Pinelands, scrub, floodplain forests, banks of blackwater rivers. Late Apr-May; late Jul-Sep. Sc. GA and s. AL south to s. FL; Bahamas. Recent evidence suggests that the “*munsoniana* entity” may warrant specific status. An additional entity, more questionably distinct, *Muscadinia rotundifolia* var. *pygmaea* (McFarlin ex D.B. Ward) Weakley & Gandhi, is narrowly endemic in scrub habitats of the c. FL peninsula (Ward 2006b; Weakley et al. 2011); its affinities appear to

be with *M. munsoniana*, so if it is to be recognized in *Muscadinia*, a new combination at either varietal or specific rank will be needed. [= X; = *M. munsoniana* (J.H. Simpson ex Planchon) Small – S; = *Vitis rotundifolia* Michaux var. *munsoniana* (J.H. Simpson ex Munson) M.O. Moore – FNA, K, Y, Z; < *V. rotundifolia* – WH3; = *V. munsoniana* J.H. Simpson ex Munson]

Muscadinia rotundifolia (Michaux) Small var. ***rotundifolia***, Muscadine, Scuppernong. Dry upland forests (especially sandy or rocky), other forests, swamps, dunes, roadsides, thickets. May-Jun; Aug-Oct. DE west to s. WV, KY, and MO, south to n. FL and TX. Cultivars of this species are popular in the Southeastern United States as table grapes and the source of a distinctive wine. [= X; = *Vitis rotundifolia* Michaux – C, F, GW, RAB, W, WV; = *Vitis rotundifolia* Michaux var. *rotundifolia* – FNA, K, Mo, Y, Z; = *M. rotundifolia* (Michaux) Small – S; < *V. rotundifolia* – WH3]

5. *Vitis* Linnaeus 1753 (Grape)

A genus of about 60-65 species, vines, of temperate regions of Eurasia and North America. References: Moore (1991)=Z; Ward (2006b)=Y; Wen in Kubitzki, Bayer, & Stevens (2007).

- 1 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small (< 10 cm long and wide) and coarsely toothed, pentagonal in outline but never deeply lobed [see *Muscadinia*]
- 1 Tendrils bifid to trifid; bark shedding, the lenticels inconspicuous; pith interrupted by diaphragms at nodes; leaves relatively large (well-developed leaves usually > 10 cm wide and long) and finely toothed, often deeply lobed.
 - 2 Mature leaves glaucous beneath (the glaucescence sometimes rather obscured by pubescence); nodes often glaucous; [series *Aestivalis*].
 - 3 Mature 3-4 seeded berries > 9 mm in diameter; mature leaves slightly to strongly arachnoid-pubescent beneath; nodes usually not glaucous; nodal diaphragms usually > 2 mm in diameter *V. aestivalis* var. *aestivalis*
 - 3 Mature 3-4 seeded berries < 9 mm in diameter; mature leaves glabrous to glabrate beneath; nodes usually glaucous; nodal diaphragms usually < 2 mm in diameter *V. aestivalis* var. *bicolor*
 - 2 Mature leaves not glaucous beneath; nodes not glaucous.
 - 4 Leaves densely pubescent beneath, so as to obscure the surface; [series *Labruscae*].
 - 5 tendrils or inflorescences present at 3 or more consecutive nodes *V. labrusca*
 - 5 tendrils or inflorescences present at only 2 consecutive nodes *V. shuttleworthii*
 - 4 Leaves glabrous or moderately pubescent beneath (not so densely as to completely obscure the leaf surface).
 - 6 Leaves reniform, glabrous beneath at maturity; tendrils absent, present only opposite the uppermost nodes, or sometimes extending down the stem; [series *Ripariae*] *V. rupestris*
 - 6 Leaves cordate to cordate-ovate, glabrous to pubescent beneath at maturity; tendrils present opposite most nodes.
 - 7 Nodal diaphragms < 1 mm wide, usually < 0.5 mm wide; growing shoot tips enveloped by enlarging, unfolded leaves; [section *Ripariae*] *V. riparia*
 - 7 Nodal diaphragms > 1 mm wide; growing shoot tips not enveloped by enlarging, unfolded leaves.
 - 8 Branchlets of the season more or less terete, glabrous or arachnoid-pubescent; mature 3-4 seeded berries usually > 8 mm in diameter; nodes usually not banded with red pigmentation; [series *Cordifoliae*].
 - 9 Nodal diaphragms > 2.5 mm wide; leaves strongly 3-lobed, the tips usually long-acuminate; branchlets of the season with a red or purplish cast *V. palmata*
 - 9 Nodal diaphragms < 2.5 mm wide; leaves unlobed or shallowly lobed, the tips acute to short-acuminate; branchlets of the season gray, green, or brown (sometimes purple only on one side) *V. vulpina*
 - 8 Branchlets of the season angled, arachnoid-pubescent and/or hirtellous-pubescent (or nearly glabrous); mature 3-4 seeded berries < 8 mm in diameter; nodes frequently banded with red pigmentation; [series *Cinerecentes*].
 - 10 Branchlets of the season sparsely to densely hirtellous pubescent, often with arachnoid pubescence as well; leaf undersurfaces usually more-or-less uniformly hirtellous on the veins; [western, east to w. KY, w. TN, sc. AL, and Panhandle FL] *V. cinerea* var. *cinerea*
 - 10 Branchlets of the season lacking evident hirtellous trichomes (if present, obscured by the arachnoid pubescence; leaf undersurfaces lacking hirtellous pubescence, or only very sparsely so; [collectively widespread in our area].
 - 11 Branchlets glabrate to only slightly arachnoid-pubescent; nodes usually banded with red pigmentation; leaves glabrous to very slightly arachnoid-pubescent beneath; [mostly of the Piedmont and Mountains] *V. cinerea* var. *baileyana*
 - 11 Branchlets slightly to densely arachnoid-pubescent; nodes usually not banded with red pigmentation; leaves slightly to densely arachnoid-pubescent beneath; [mostly of the Coastal Plain] *V. cinerea* var. *floridana*

Vitis aestivalis Michaux var. ***aestivalis***, Summer Grape. Forests and woodlands, mostly upland. May-Jun; Sep-Oct. MA west to MO and IA, south to s. FL and e. TX. [= C, F, G, K, Mo, RAB, Va, WH3, WV, Y, Z; = *V. aestivalis* – S; < *V. aestivalis* – FNA, GW, Pa, W; > *V. rufotomentosa* Small; > *V. simpsonii* Munson]

Vitis aestivalis Michaux var. ***bicolor*** Deam, Silverleaf Grape. Forests and woodlands, mostly upland. May-Jun; Sep-Oct. ON and MN south to n. GA and n. AL. [= Va, Z; = *V. aestivalis* var. *argentifolia* (Munson) Fernald – C, F, G, K, RAB, WV; = *V. bicolor* Le Conte – S; < *V. aestivalis* – FNA, GW, Pa, W]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. *baileyana* (Munson) Comeaux, Possum Grape. Forests and woodlands, mostly bottomlands. Late May-Jun; Sep-Oct. S. PA, s. OH, and se. IN south to c. SC, c. GA, and AL. [= FNA, K, Pa, Va, Z; = *V. baileyana* – C, F, G, RAB, S; < *V. vulpina* – GW; < *V. cinerea* – W, WV]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. *cinerea*, Graybark Grape, Pigeon Grape. Hammocks, most forests. VA (?), w. KY, wc. TN, IN, and WI, south to Panhandle FL (Okaloosa County), sc. AL and TX. [= C, F, FNA, G, K, Mo, RAB, Z; = *V. cinerea* – S; < *V. cinerea* – GW, W]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. *floridana* Munson, Florida Grape. Hammocks, floodplain and other moist forests. Late May-Jun; Aug-Oct. Se. VA south to s. FL, west to s. MS. [= C, F, FNA, G, K, RAB, Va, WH3, Z; = *V. simpsonii* Munson – S, Y; < *V. cinerea* – GW, W]

Vitis labrusca Linnaeus, Fox Grape. Forests and woodlands, mainly in wet to moist situations. May-Jun; Sep-Oct. ME west to s. MI, south to n. GA, n. AL, and n. MS. [= C, FNA, GW, K, Pa, RAB, S, Va, W, Z; > *V. labrusca* var. *labrusca* – F, G; > *V. labrusca* var. *subdentata* Fernald – F, G; < *V. labrusca* – Mo]

* *Vitis ×labruscana* L.H. Bailey [*aestivalis* × *labrusca*], Concord Grape. Commonly cultivated as a table grape. It is sometimes persistent after cultivation. [= K, Pa; = *V. labruscana* L.H. Bailey – F; < *V. labrusca* – Mo] {not keyed; not mapped}

Vitis mustangensis Buckley, Mustang Grape. Woodland edges, fencerows, thickets, lowland woods, disturbed areas. May-early Jun; Aug-Sep. AR and s. OK south to s. LA and s. TX; disjunct in sc. AL. [= FNA, K] {add to synonymy; not yet keyed}

Vitis palmata Vahl, Red Grape, Cat Grape, Catbird Grape. Floodplain forests, riverbanks. Mid Jun-late Jun; late Jul-Oct. IN, sw. VA (Townsend, pers. comm. 2009), c. TN (Chester, Wofford, & Kral 1997), sc. GA (Jones & Coile 1988), and FL Panhandle west to MO, OK, and TX. [= C, F, FNA, G, GW, K, Mo, S, Va, WH3, Y, Z]

Vitis riparia Michaux, Riverbank Grape. Forests and woodlands, mostly moist to wet. Apr-Jun; Aug-Sep. NB west to se. SK, south to VA, NC, c. and w. TN, n. MS, LA, and e. TX, and in the Pacific Northwest. [= C, FNA, G, GW, K, Mo, Pa, RAB, Va, Z, W, WV; > *V. riparia* var. *riparia* – F]

Vitis rupestris Scheele, Sand Grape. Along streams and in riverbank scour areas, especially in calcareous areas. Apr-Jun; Aug-Sep. MD, WV, sw. PA west to MO, south to VA, c. TN, and n. AR. [= C, F, FNA, K, Mo, Pa, W, S, Va, WV, Z]

Vitis shuttleworthii House, Calusa Grape. Moist hammocks, disturbed areas. N. peninsular FL south to s. FL. [= FNA, GW, K2, WH3, Y, Z; = *V. coriacea* Shuttleworth – S]

* *Vitis vinifera* Linnaeus, European Wine Grape. Increasingly cultivated in our area, especially in VA and NC, now significant wine-producing areas. [= FNA, K, Pa] {not keyed}

Vitis vulpina Linnaeus, Frost Grape, Winter Grape, Chicken Grape. Forests and woodlands, primarily upland, but also in bottomlands. May-Jun; Jul-Nov. Se. NY west to MO and e. KS, south to c. peninsular FL and nc. TX. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WH3, WV, Y, Z; < *V. vulpina* – GW; > *V. vulpina* – S; > *V. cordifolia* Michaux – S]

6. *Cissus* Linnaeus 1753

A genus of about 350 species, woody vines, herbaceous vines, and rarely shrubs, of tropical and rarely warm temperate areas. References: Wen in Kubitzki, Bayer, & Stevens (2007).

Cissus trifoliata (Linnaeus) Linnaeus, Marine-ivy. Coastal hammocks, dunes, disturbed coastal areas, the more northerly occurrences introduced. Se. SC (Jasper County) south through GA, FL, and west along the Gulf Coast to TX, AR, and Mexico. [= FNA, K, Mo, S, WH3; > *C. incisa* (Nuttall) Des Moulins – GW, S]

7. *Causonis* Rafinesque 1830 (Bushkiller)

A genus of 25 species, lianas and herbaceous vines, of the Old World tropics and subtropics. Our single introduced species has been traditionally placed in *Cayratia* subgenus *Discypharia*, but this has been shown to be more closely allied to *Tetrastigma*

than to *Cayratia* s.s., and so has been separated as *Causonis* (Lu et al. 2013). References: Moore & Wen in FNA (in prep.); Lu et al. (2013); Chen, Ren, & Wen (2007)=Z; Krings & Richardson (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

* *Causonis japonica* (Thunberg) Rafinesque, Bushkiller, Sorrel Vine. Disturbed areas, suburban woodlands; native of temperate and subtropical se. Asia. Jul-Aug. Reported for NC from several suburban areas, as in Forsyth County (Krings & Richardson 2006) and Mecklenburg, Davidson, and Franklin counties (Soule et al. 2008). Also reported as naturalized in AL (Hansen & Goertzen 2006), MS, LA, and TX. [= FNA; = *Cayratia japonica* (Thunberg) Gagnepain – K1, K2; > *Cayratia japonica* var. *japonica* – Z]

141. **KRAMERIACEAE** Dumortier 1829 (Krameria Family) [in ZYGOPHYLLALES]

A family of a single genus and about 15-18 species, herbs, shrubs, and trees, of warm (and usually dry) parts of s. North America, Central America, South America, and the West Indies. References: Robertson (1973); Simpson et al. (2004); Simpson in Kubitzki, Bayer, & Stevens (2007).

Krameria Loeffling 1758 (Ratany)

A genus of 15-18 species, herbs, shrubs, and trees, hemiparasitic by haustoria. References: Robertson (1973)=Z; Simpson in Kubitzki, Bayer, & Stevens (2007).

Krameria lanceolata Torrey, Trailing Ratany, Sandspur. Sandhills. AR, TX, and s. KS west to se. CO, se. AZ, Chihuahua, and Coahuila; disjunct eastward in the Coastal Plain of Panhandle FL, peninsular FL, and GA (east to Bulloch, Bryan, Evans, and Emanuel counties, GA). [= K, WH3, Z; > *K. spathulata* Small – S]

142. **ZYGOPHYLLACEAE** R. Brown 1814 (Creosote-bush Family) [in ZYGOPHYLLALES]

A family of about 22-27 genera and 230-285 species, trees, shrubs, and (rarely) herbs, of tropical and subtropical regions of the Old and New Worlds. References: Sheahan in Kubitzki, Bayer, & Stevens (2007).

- 1 Fruit with tubercles, at maturity separating into 10 mericarps *Kallstroemia*
- 1 Fruit with spines, at maturity separating into 5 mericarps *Tribulus*

Kallstroemia Scopoli 1777

A genus of about 17 species, herbs, of tropical and subtropical America. References: Porter (1969)=Z; Sheahan in Kubitzki, Bayer, & Stevens (2007)

- 1 Ovary and fruit glabrous (rarely strigose) *K. maxima*
- 1 Ovary and fruit pubescent.
 - 2 Beak of fruit longer than fruit body; petals orange [*K. parviflora*]
 - 2 Beak of fruit shorter than fruit body; petals yellow [*K. pubescens*]

* *Kallstroemia maxima* (Linnaeus) Hooker & Arnott, Greater Caltrop. Disturbed areas, dunes; native status uncertain, but probably early introduced from the Neotropics. SC south to FL; West Indies; Mexico (Sinaloa and Tamaulipas) south through Central America to northern South America (Venezuela, Colombia). Early collections from Charleston (Stephen Elliott) and Savannah suggest the likelihood of introduction via ballast. [= K1, K2, RAB, S, WH3, Z]

* *Kallstroemia parviflora* J.B.S. Norton, Texas Caltrop. Roadsides, other disturbed areas; native of sc. United States south into Mexico. Introduced eastward, as in MS and nw. LA (MacRoberts & MacRoberts 2011). [= K2, Mo, S, Z]

* *Kallstroemia pubescens* (G. Don) Dandy, Caribbean Caltrop. Disturbed areas; native of tropical America. [= K2, WH3]

Tribulus Linnaeus 1753

A genus of about 25 species, herbs, of tropical and subtropical parts of the Old World (introduced in the New World). References: Sheahan in Kubitzki, Bayer, & Stevens (2007).

- 1 Petals 8-22 mm long; peduncle > 2 cm long; perennial **T. cistoides**
- 1 Petals 3-5 mm long; peduncle < 1 cm long; annual **T. terrestris**

* **Tribulus cistoides** Linnaeus, Jamaican Fever-plant. Disturbed areas; native of Africa. [= K, S, WH3]
 * **Tribulus terrestris** Linnaeus, Puncture-weed, Caltrop, Devil's-thorn. Dunes, sandy roadsides, ballast; native of Mediterranean Europe. Jun-Dec. [= C, F, G, K, Mo, Pa, RAB, S, WH3]

144. FABACEAE Lindley 1836 or **LEGUMINOSAE** A.L. de Jussieu 1789 (Legume Family) [in FABALES]

A family of about 730 genera and 20,000 species, trees, shrubs, and herbs, cosmopolitan. References: Isely (1990)=SE (throughout the family treatment); Isely (1998)=I; Lewis et al. (2005); Wojciechowski, Lavin, & Sanderson (2004); Wilbur (1963a); Robertson & Lee (1976).

Subfamily Caesalpinioideae

- Tribe Cercideae: 1. *Cercis*
- Tribe Cassieae: 2. *Chamaecrista*, 3. *Senna*
- Tribe Caesalpinieae: 4. *Gymnocladus*, 5a. *Gleditsia*, 5b. *Guilandina*, 6. *Parkinsonia*

Subfamily Mimosoideae

- Tribe Mimoseae: 7. *Neptunia*, 8. *Leucaena*, 9. *Desmanthus*, 10. *Dichrostachys*, 11. *Mimosa*
- Tribe Acacieae: 12. *Acaciella*, 13. *Vachellia*
- Tribe Ingeae: 14. *Calliandra*, 15. *Albizia*

Subfamily Faboideae (Papilionoideae)

- Tribe Sophoreae: 16. *Cladrastis*, 17. *Styphnolobium*, 18. *Maackia*, 19. *Sophora*
- Tribe Thermopsideae: 20. *Thermopsis*, 21. *Baptisia*
- Tribe Crotalariae: 22. *Crotalaria*
- Tribe Genisteae: 23. *Lupinus*, 24. *Cytisus*, 25. *Genista*, 26. *Ulex*
- Tribe Amorphaeae: 27. *Amorpha*, 28. *Dalea*
- Tribe Dalbergieae: 29. *Zornia*, 30. *Chapmannia*, 31. *Stylosanthes*, 32. *Arachis*, 33. *Aeschynomene*
- Tribe Indigoferaeae: 34. *Indigofera*
- Tribe Millettieae: 35. *Wisteria*, 36. *Tephrosia*
- Tribe Abreae: 37. *Abrus*
- Tribe Phaseoleae: 38. *Canavalia*, 39. *Galactia*, 40. *Lackeya*, 41. *Clitoria*, 42. *Centrosema*, 43. *Apios*, 44. *Mucuna*, 45. *Rhynchosia*, 46. *Erythrina*, 47. *Pueraria*, 48. *Amphicarpaea*, 49. *Glycine*, 50. *Lablab*, 51. *Vigna*, 52. *Phaseolus*, 53. *Strophostyles*, 54. *Macroptilium*
- Tribe Desmodieae: 55. *Kummerowia*, 56. *Lespedeza*, 57. *Desmodium*, 58. *Hylodesmum*, 59. *Alysicarpus*
- Tribe Psoraleeae: 60. *Orbexilum*, 61. *Pediomelum*, 62. *Cullen*
- Tribe Sesbanieae: 63. *Sesbania*
- Tribe Loteae: 64. *Scorpiurus*, 65. *Securigera*, 66. *Anthyllis*, 67. *Acmispon*, 68. *Lotus*
- Tribe Robinieae: 69. *Robinia*
- Tribe Galegeae: 70. *Glycyrrhiza*, 71. *Astragalus*
- Tribe Cicereae: 72. *Cicer*
- Tribe Trifolieae: 73. *Trifolium*, 74. *Ononis*, 75. *Melilotus*, 76. *Medicago*
- Tribe Fabeae: 77. *Vicia*, 78. *Lens*, 79. *Lathyrus*, 80. *Pisum*

- 1 Trees, shrubs, or woody vines; [subfamilies *Caesalpinioideae*, *Mimosoideae*, and *Faboideae*] **Key A**
- 1 Herbs (including herbaceous vines).

- 2 Leaves 4-many-foliolate.
- 3 Leaves palmately compound, with 4 or more leaflets; [subfamily *Faboideae*] **Key B**
- 3 Leaves pinnately or bipinnately compound.
 - 4 Leaves bipinnately compound; [subfamily *Mimosoideae*] **Key C**
 - 4 Leaves pinnately compound; [subfamilies *Faboideae* and *Caesalpinioideae*] **Key D**
- 2 Leaves 0-3-foliolate; [subfamily *Faboideae*].
- 5 Leaves 2-foliolate **Key D**
- 5 Leaves 0, 1, or 3-foliolate.
 - 6 Leaves unifoliolate, or with leaf or leaflet blades absent, replaced by a tendril (and with foliaceous stipules) **Key E**
 - 6 Leaves trifoliolate (plants with some upper stem or lower stem leaves unifoliolate but with other trifoliolate leaves should be keyed here).
 - 7 Leaves palmately trifoliolate (the petiolules of the 3 leaflets usually of similar length, if the petiolule of the terminal leaflet is slightly longer) **Key F**
 - 7 Leaves pinnately trifoliolate **Key G**

Key A – woody legumes (trees, shrubs, or woody vines)

- 1 Leaves unifoliolate or trifoliolate, or reduced to phyllodial spines.
 - 2 Tree; leaves unifoliolate and > 5 cm wide; [subfamily *Caesalpinioideae*, tribe *Cercideae*] **1. Cercis**
 - 2 Shrubs or woody vines (rarely tree in *Erythrina*); leaves trifoliolate, unifoliolate, or reduced to phyllodial spines (if unifoliolate, < 2 cm wide); [subfamily *Faboideae*].
 - 3 Woody vine (*Pueraria*, a robust herbaceous vine, also keyed here as a failsafe).
 - 4 Calyx 4.5-6 mm long; leaflets unlobed; [tribe *Phaseoleae*] **40. Lackeya**
 - 4 Calyx 10-12 mm long; leaflets generally lobed; [tribe *Phaseoleae*] **47. Pueraria**
 - 3 Shrub or tree.
 - 5 Shrub with angled or flanged green twigs; leaves palmately trifoliolate, unifoliolate, or reduced to spine-tipped phyllodes; flowers bright yellow; [introduced, usually of roadsides or as remnants of cultivation]; [tribe *Genisteae*].
 - 6 Leaves all reduced to phyllodial spines; flowers axillary; calyx 10-15 mm long **[26. Ulex]**
 - 6 Leaves with normal lamina, either unifoliolate or trifoliolate; flowers in terminal racemes; calyx 3-6 mm long.
 - 7 Leaves trifoliolate lower on the stem, often unifoliolate above; corolla 15-22 mm long **24. Cytisus**
 - 7 Leaves unifoliolate throughout; corolla 10-14 mm long **[25. Genista]**
 - 5 Shrub or tree with twigs various, but not conspicuously green or flanged; leaves pinnately trifoliolate or unifoliolate.
 - 8 Leaflet margins toothed; [rare waif]; [tribe *Trifolieae*] **[74. Ononis]**
 - 8 Leaflet margins entire; [collectively common and widespread].
 - 9 Leaves unifoliolate; [tribe *Genisteae*] **23. Lupinus**
 - 9 Leaves trifoliolate.
 - 10 Corolla 30-50 mm long, scarlet; legume with several seeds; leaflets lobed or not; [tribe *Phaseoleae*] **46. Erythrina**
 - 10 Corolla 8-15 mm long, purplish, pink, or white; legume 1-seeded; leaflets not lobed; [tribe *Desmodieae*] **56. Lespedeza**
 - 1 Leaves pinnate or bipinnate.
 - 11 Woody vines
 - 12 Legumes spiny; flowers caesalpinoid; [subfamily *Caesalpinioideae*; tribe *Caesalpineae*] **5b. Guilandina**
 - 12 Legumes not armed; flowers papilionaceous; [subfamily *Faboideae*].
 - 13 Leaves even-pinnate; legume 3.5-4 cm long; seeds shiny, scarlet and black (bicolored); [tribe *Abreae*] **36. Abrus**
 - 13 Leaves odd-pinnate; legume 4-15 cm long; seeds dull, brown; [tribe *Milletieae*] **35. Wisteria**
 - 11 Trees or shrubs.
 - 14 Leaves 2×-even-pinnate; [subfamily *Mimosoideae*]
 - 15 Inflorescence cylindrical, elongate, bicolored (the basal flowers sterile, with pink staminodes, the upper fertile, yellowish); [tribe *Mimoseae*] **10. Dichrostachys**
 - 15 Inflorescence spherical or hemispheric, as wide as long, all the flowers fertile and of the same color.
 - 16 Stamens connate at the base; inflorescence pink, 2.5-5 cm in diameter; [tribe *Ingeae*]
 - 17 Petioles with glands; leaves with >4 pinnae pairs, each pinna with >10 pinnule pairs; inflorescence 2.5-5 cm in diameter **15. Albizia**
 - 17 Petioles lacking glands; leaves with 2 pinnae pairs, each pinna with <8 pinnule pairs; inflorescence 5-7 cm in diameter **[14. Calliandra]**
 - 16 Stamens free; inflorescence **either orange or yellowish-white or pink to whitish**, 0.9-2.2 cm in diameter.
 - 18 Inflorescence pink to whitish, 0.9-1.2 cm in diameter; [tribe *Mimoseae*] **11. Mimosa**
 - 18 Inflorescence yellowish-white to orange, either 1.0-1.3 cm or 1.8-2.2 cm in diameter.
 - 19 Inflorescence yellowish-white, 1.8-2.2 cm in diameter; stamens 10; [tribe *Mimoseae*] **8. Leucaena**
 - 19 Inflorescence orange, 1.0-1.3 cm in diameter; stamens many; [tribe *Acacieae*] **13. Vachellia**
 - 14 Leaves 1×- or 2×-odd-pinnate.
 - 20 Flowers not papilionaceous; petals yellow or greenish; stamens 5-10, separate; [subfamily *Caesalpinioideae*].
 - 21 Leaves all 2-pinnate, or a mixture of 1-pinnate and 2-pinnate on the same plant; shrub or tree; [tribe *Caesalpineae*].
 - 22 Leaves a mixture of 1-pinnate and 2-pinnate on the same plant **5a. Gleditsia**
 - 22 Leaves all 2-pinnate.
 - 23 Leaves petiolate; leaflets 20-70 mm long **4. Gymnocladus**
 - 23 Leaves subsessile (the pinnae simulating 1-pinnate leaves); leaflets 1-5 mm long **6. Parkinsonia**
 - 21 Leaves all 1-pinnate (or appearing so in *Parkinsonia*); herb, shrub or tree.
 - 24 Shrub with prominent glands on the leafstalk; [tribe *Cassieae*] **3. Senna**
 - 24 Tree or shrub (if a shrub, then lacking prominent glands on the leafstalk); [tribe *Caesalpineae*].
 - 25 Leaflets 13-45 mm long; tree; leaves 1-pinnate **5a. Gleditsia**

- 25 Leaflets 1-5 mm long; shrub; leaves actually 2-pinnate, but sessile, the pinnae simulating 1-pinnate leaves 6. *Parkinsonia*
- 20 Flowers obviously papilionaceous (except *Amorpha*); petals white, creamy-white, yellow, pink, or blue; stamens 10, monadelphous, diadelphous, or connate at the very base; [subfamily *Faboideae*].
- 26 Leaves glandular-punctate; corolla of only 1 petal (the standard); inflorescence a spike; shrubs; stamens monadelphous; [tribe *Amorpheae*] 27. *Amorpha*
- 26 Leaves not glandular-punctate; corolla of 5 petals, papilionaceous; inflorescence a raceme or panicle; trees or shrubs; stamens diadelphous or connate at the very base.
- 27 Corolla 5-6 mm long; [tribe *Indigofereae*] 34. *Indigofera*
- 27 Corolla > 15 mm long.
- 28 Leaflets alternate on the rachis; leaflets 4-15 (-20) cm long; [tribe *Sophoreae*] 16. *Cladrastis*
- 28 Leaflets opposite on the rachis, leaflets (1-) 2-5 (-6) cm long.
- 29 Flowers yellow; [FL southwards] 19. *Sophora*
- 29 Flowers white creamy white with some blue, or pink; [collectively widespread].
- 30 Flowers in an upright, stiff raceme or panicle; flowers creamy white with some blue; stamens connate at the very base; [tribe *Sophoreae*] 18. *Maackia*
- 30 Flowers in dangling racemes; flowers white or pink; stamens diadelphous or connate at the very base.
- 31 Leaflets with persistent linear stipels; stamens diadelphous; [native and planted, collectively widespread and common]; [tribe *Robinieae*] 69. *Robinia*
- 31 Leaflets lacking stipels; stamens connate at the very base; [alien, planted, rare]; [tribe *Sophoreae*] 17. *Styphnolobium*

Key B – herbaceous legumes with palmate leaves with 4 or more leaflets [subfamily *Faboideae*]

- 1 Leaflets 4; corolla yellow; [tribe *Dalbergieae*] 29. *Zornia [bracteata]*
- 1 Leaflets 5 or more (at least on the largest and best developed leaves); corolla blue, pink, or violet (except yellow in *Lupinus luteus*).
- 2 Leaflets and fruits not glandular-punctate; stamens monadelphous; [tribe *Genisteae*] 23. *Lupinus*
- 2 Leaflets and fruits glandular-punctate; stamens diadelphous; [tribe *Psoraleae*].
- 3 Leaflets linear to very narrowly oblanceolate, 0.5-2.0 (-3.5) mm wide, > 10× as long as wide; [Coastal Plain] 60. *Orbexilum [lupinellus]*
- 3 Leaflets broader, >5 mm wide, 2-4.5× as long as wide; [collectively more widespread] 61. *Pediometelum*

Key C – herbaceous legumes with bipinnate leaves [subfamily *Mimosoideae*]

- 1 Stamens > 10; [tribe *Acacieae*] 12. *Acaciella*
- 1 Stamens 10 or fewer; [tribe *Mimoseae*].
- 2 Petiole with 1-several glands; stems ascending to erect; flowers greenish-white 9. *Desmanthus*
- 2 Petiole without glands; stems prostrate to weakly arching; flowers pink-purple, yellow, or greenish-yellow.
- 3 Flowers pink-purple; legume ribbed, the ribs with prickles 11. *Mimosa*
- 3 Flowers yellow to greenish-yellow; legume not ribbed or prickly 7. *Neptunia*

Key D – herbaceous legumes with once-pinnately compound leaves with 4 or more leaflets [subfamilies *Faboideae* and *Caesalpinioideae*]

- 1 Leaves even-pinnate (lacking a terminal leaflet, this sometimes replaced by a tendril).
- 2 Flowers nearly regular; stamens 5-10, separate; [subfamily *Caesalpinioideae*, tribe *Cassieae*].
- 3 Leaflets 5-25 pairs, each leaflet 0.5-1.5 cm long; stipules persistent, striate 2. *Chamaecrista*
- 3 Leaflets (2-) 3-12 pairs, each leaflet 1.5-12 cm long; stipules caduceous, small, not striate 3. *Senna*
- 2 Flowers papilionoid; stamens diadelphous or monadelphous; [subfamily *Faboideae*].
- 4 Tendrils lacking on all leaves; stamens monadelphous or diadelphous.
- 5 Leaflets 20-60 per leaf; strong herbs (or woody) 1-4 m tall, simultaneously erect, > 1 m tall, and with stems usually > 5 mm in diameter; stamens diadelphous; [tribe *Sesbanieae*] 63. *Sesbania*
- 5 Leaflets 4-16 per leaf; weak or sprawling herbs to 1.5 m long, with weak stems usually < 5 mm in diameter (or if thicker, then < 1 m long; stamens monadelphous or diadelphous).
- 6 Leaflets 4 per leaf; stamens monadelphous; [tribe *Dalbergieae*] 32. *Arachis*
- 6 Leaflets 4-16 per leaf; stamens diadelphous; [tribe *Fabeae*] 77. *Vicia*
- 4 Tendrils present in the terminal position on some or all leaves; stamens diadelphous; [tribe *Fabeae*].
- 7 Stipules foliaceous, typically larger than the leaflets 80. *Pisum*
- 7 Stipules smaller, typically much smaller than the leaflets.
- 8 Calyx lobes 2-4× as long as the calyx tube; [rare waif] [78. *Lens*]
- 8 Calyx lobes 1-2× as long as the calyx tube; [collectively widespread and common].
- 9 Style stout, flattened or folded, with a dense longitudinal band of hairs longitudinally arrayed along the inner side; stems ridged, angled, or longitudinally winged; leaflets 2-6 (-8) cm long; calyx 5-12 mm long 79. *Lathyrus*
- 9 Style slender and hair-like, terete (round in x-section), glabrous except for a ring of short hairs just below the stigma; stems ridged or angled, but not longitudinally winged; leaflets 0.5-4.5 cm long (except larger in a few waifs); calyx 2-8 mm long (except larger in a few waifs) 77. *Vicia*
- 1 Leaves odd-pinnate (with a terminal leaflet).
- 10 Lateral veins of each leaflet lateral veins neatly straight and parallel to one another; [tribe *Millettieae*] 36. *Tephrosia*

- 10 Lateral veins of each leaflet complicatedly and irregularly arrayed.
- 11 Leaves (at least the largest and those with the most leaflets) with ≥ 13 leaflets.
- 12 Ovaries (and later fruits) with dense, hooked prickles; leaves and stems glandular-punctate with brown or black glands; stamens diadelphous (9 and 1); [rare waif in our area]; [tribe *Galegeae*] [70. *Glycyrrhiza*]
- 12 Ovaries (and later fruits) glabrous, glandular, or hairy; leaves and stems glabrous, variously hairy, but not glandular-punctate (except *Dalea*); stamens 5-10, monadelphous, diadelphous, or separate; [collectively widespread].
- 13 Leaflets conspicuously dentate; [tribe *Cicereae*]..... [72. *Cicer*]
- 13 Leaflets entire.
- 14 Hairs dolabriform (with 2 branches parallel to the surface and pointing at 180° from each other; petals reddish orange and/or with some pink or salmon; [tribe *Indigofereae*]..... 34. *Indigofera*
- 14 Hairs basifixed; petals of various colors.
- 15 Fruit a loment (constricted or jointed between each seed and splitting into single-seeded segments).
- 16 Loment flattened, prominently constricted between the seeds; inflorescence a raceme of 2-6 flowers; corolla primarily yellow (sometimes also marked with pink or orange); [tribe *Dalbergieae*]..... 33. *Aeschynomene*
- 16 Loment cylindrical, jointed but not noticeably constricted between the seeds; Inflorescence an umbel of (7-) 10-15 flowers; corolla white and pink (or yellow in the rare waif *S. securidaca*); [tribe *Loteae*] 65. *Securigera*
- 15 Fruit a legume (lacking constrictions between the seeds).
- 17 Inflorescences pedunculate, axillary racemes; [tribe *Galegeae*]..... 71. *Astragalus*
- 17 Inflorescences terminal spikes or heads; [tribe *Amorpheae*] 28. *Dalea*
- 11 Leaves (the largest and those with the most leaflets) with < 11 leaflets.
- 18 Fruit a loment (constricted between each seed and splitting into single-seeded segments); petals primarily yellow (sometimes also marked with pink or orange); [of the se. Coastal Plain, from e. GA southwards and westwards]; [tribe *Dalbergieae*].
- 19 Stems prostrate, trailing; loment flattened..... 33. *Aeschynomene*
- 19 Stems ascending or erect; loment subterete 30. *Chapmannia*
- 18 Fruit a legume (lacking constrictions between the seeds); petals variously colored; [collectively widespread].
- 20 Ovaries (and later fruits) with dense, hooked prickles; leaves and stems glandular-punctate with brown or black glands; stamens diadelphous (9 and 1); [rare waif in our area]; [tribe *Galegeae*]..... [70. *Glycyrrhiza*]
- 20 Ovaries (and later fruits) glabrous, glandular, or hairy; leaves and stems glabrous, variously hairy, but not glandular-punctate (except *Dalea*); stamens 5-10, monadelphous, diadelphous, or separate; [collectively widespread].
- 21 Plants with basal rosettes, the basal and cauline leaves a mixture of simple and pinnately compound; [rare waif in our area]; [tribe *Loteae*]..... [66. *Anthyllis*]
- 21 Plants with primarily cauline leaves, all pinnately compound; [collectively widespread]
- 22 Plants erect or ascending herbs.
- 23 Leaves with 5 leaflets, the 2 basal leaflets positioned like stipules at the base of the leaf (the leaf thus sessile); [tribe *Loteae*]..... 68. *Lotus*
- 23 Leaves with 5-9 (or fewer or more and then keyed elsewhere), the lower leaflets positioned above a definite petiole.
- 24 Hairs dolabriform (with 2 branches parallel to the surface and pointing at 180° from each other; petals reddish orange and/or with some pink or salmon; flowers papilionaceous; stamens 10, diadelphous (9+1); leaflets often > 5 mm wide; legume 3+-seeded; flowers 5-12 mm long, in racemes; [tribe *Indigofereae*]..... 34. *Indigofera*
- 24 Hairs basifixed; petals of various colors; flowers not papilionaceous, barely bilaterally symmetrical; stamens 5, monadelphous; leaflets 0.5-5 mm wide; legume 1-seeded; flowers very small, < 5.5 mm long, aggregated into tight spike; [tribe *Amorpheae*]..... 28. *Dalea*
- 22 Plants prostrate or twining herbaceous vines.
- 25 Hairs dolabriform (with 2 branches parallel to the surface and pointing at 180° from each other; petals reddish orange and/or with some pink or salmon; [tribe *Indigofereae*] 34. *Indigofera*
- 25 Hairs basifixed; petals of various colors; [tribe *Phaseoleae*].
- 26 Flower usually solitary, resupinate (twisted at 180° so that the standard is below); standard 3.5-5 cm long..... 41. *Clitoria [ternatae]*
- 26 Flowers few to many in racemes, normally positioned (with the standard above); standard < 2.5 cm long.
- 27 Corolla purplish, maroon, brownish, or yellowish green; leaflets 4-9 cm long, on petioles 3-5 mm long; keel coiled.. 43. *Apios*
- 27 Corolla white with red striations; leaflets 2-5 cm long, on petioles 1-2 mm long; keel carinate, not coiled 39. *Galactia [elliottii]*

Key E – herbaceous legumes with all leaves unifoliate or leaflets absent [subfamily *Faboideae*]

- 1 Tendrils present on plant; leaves modified into tendrils (leaflike structures present clearly interpretable as stipules); [tribe *Fabeae*].
- 2 Legume 4-7 mm wide; corolla 10-13 mm long..... [79. *Lathyrus aphaca*]
- 2 Legume 12-20 mm wide; corolla 18-25 mm long..... 80. *Pisum*
- 1 Tendrils absent; leaves or stipules present on plant and interpretable as leaves with 1 leaflet.
- 3 Leaflet blades roundish, 0.6-1.5× as long as wide.
- 4 Leaves with a well-developed petiole, > 2 cm long.
- 5 Leaflet margins dentate; corollas white to pink; [tribe *Psoraleeae*]..... [62. *Cullen corylifolium*]
- 5 Leaflet margins entire; corollas yellow; [tribe *Phaseoleae*] 45. *Rhynchosia*
- 4 Leaves sessile, subsessile, or perfoliate.
- 6 Corolla bright or creamy yellow; stamens separate; leaves all 1-foliate; leaflet blades perfoliate or sessile; [tribe *Thermopsidae*].... 21. *Baptisia*
- 6 Corolla violet to blue (drying pale); stamens diadelphous; leaves 1-foliate and with some leaves 3-foliate or 2-foliate; leaflet blades cuneate, subsessile; [tribe *Psoraleeae*] 61. *Pedimelum [canescens]*
- 3 Leaflet blades elongate, 1.5-15× as long as wide.

- 7 Leaves basally disposed.
 - 8 Leaflet blades elliptic, widest near the midpoint of the blade; flowers pink, rose, or purplish; legume straight; [native of the Coastal Plain, se. NC south to s. FL, west to e. LA]; [tribe *Genisteae*]..... **23. Lupinus**
 - 8 Leaflet blades oblanceolate, widest well past the midpoint of the blade; flowers yellow; legume coiled; [rare waif]; [tribe *Loteae*]..... **64. Scorpiurus**
- 7 Leaves all or primarily cauline.
 - 9 Leaves long-petioled, the petiole > 2 cm long.
 - 10 Petiole winged its entire length; leaflet blade 2-4× as long as wide, sagittate at the base; foliage not glandular; [tribe *Phaseoleae*].. **42. Centrosema [sagittatum]**
 - 10 Petiole not winged; leaflet blade 8-15× as long as wide, cuneate at the base; foliage glandular-punctate; [tribe *Psoraleae*]..... **60. Orbexilum [virgatum]**
 - 9 Leaves sessile, subsessile, or short-petiolate, the petiole < 1 cm long.
 - 11 Stamens monadelphous; corolla yellow, 8-30 mm long; [tribe *Crotalariae*]..... **22. Crotalaria**
 - 11 Stamens diadelphous; corolla lavender or cream, 5-7 mm long.
 - 12 Flowers solitary in leaf axils; [tribe *Loteae*] **67. Acmispon**
 - 12 Flowers in racemose inflorescences; [tribe *Desmodieae*]..... **59. Alysicarpus**

Key F – herbaceous legumes with palmately trifoliate leaves [subfamily *Faboideae*]

- 1 Leaflets generally < 3 cm long; stems usually <5 dm tall.
 - 2 Lateral veins of each leaflet lateral veins neatly straight and parallel to one another; leaflets entire; [tribe *Desmodieae*]..... **55. Kummerowia**
 - 2 Lateral veins of each leaflet complicatedly and irregularly arrayed; leaflets denticulate; [tribe *Trifolieae*] **73. Trifolium**
- 1 Leaflets (at least the larger) > 3 cm long; stems usually >4 dm tall.
 - 3 Foliage glandular-punctate; stamens diadelphous; [tribe *Psoraleae*] **61. Pedimelum**
 - 3 Foliage lacking punctate glands; stamens monadelphous or separate.
 - 4 Legumes turgid and inflated; stamens monadelphous; [tribe *Crotalariae*]..... **22. Crotalaria**
 - 4 Legumes either turgid and inflated or flattened; stamens separate; [tribe *Thermopsidae*]
 - 5 Legumes turgid, inflated; corolla white, cream, yellow, blue, or purple; [widespread in our area, especially Coastal Plain]..... **21. Baptisia**
 - 5 Legumes laterally compressed; corolla yellow; [primarily montane, elsewhere as an escape from cultivation] **20. Thermopsis**

Key G – herbaceous legumes with pinnately trifoliate leaves [subfamily *Faboideae*]

- 1 Leaflets denticulate (sometimes inconspicuously so); [tribe *Trifolieae*].
 - 2 Inflorescences elongate racemes with an axis 5-15 cm long, the flowers well-spaced along the axis, the overall inflorescence much longer than its diameter..... **75. Melilotus**
 - 2 Inflorescences umbellate or headlike clusters or short racemes with an axis < 2 cm long, the flowers closely clustered, the overall inflorescence little (if at all) longer than its diameter.
 - 3 Legumes spirally coiled or curved, often tuberculate or prickly; stems 4-angled towards the tip **76. Medicago**
 - 3 Legumes straight or nearly so, never tuberculate or prickly; stems terete or flattened (2-angled) towards the tip..... **73. Trifolium**
- 1 Leaflets entire, not denticulate (though sometimes with 1 or 2 broad lobes).
 - 4 Main stems erect or ascending, not trailing, twining, or otherwise vine-like.
 - 5 Flowers not papilionaceous (the wings and keel epistemonous, arising terminally or laterally from the stamen tube), barely bilaterally symmetrical; stamens 5, monadelphous; [tribe *Amorpheae*]..... **28. Dalea**
 - 5 Flowers papilionaceous; stamens 10, diadelphous or monadelphous.
 - 6 Plants with separate leafy and flowering stems (the flowering stems naked or nearly so of leaves.
 - 7 Standard bright red, remaining folded, 30-50 mm long; leaves hastately lobed; fruit a torulose legume, 6-20 cm long, the seeds red; [tribe *Phaseoleae*] **46. Erythrina**
 - 7 Standard white or pink, expanded, 4-8 mm long; leaves not hastate; fruit a flattened loment, < 5 cm long, the seeds drab; [tribe *Desmodieae*]..... **58. Hylodesmum**
 - 6 Plants bearing leaves and flowers on the same stems.
 - 8 Leaves, stems, and/or calyces glandular-punctate.
 - 9
 - 9

- 45. *Rhynchosia*
- 60. *Orbexilum*
- 61. *Pedimelum*
- [62. *Cullen americanum*]

- 8 Leaves, stems, and calyces lacking punctate glands.

- 67. *Acmispon*
- 56. *Lespedeza*
- 57. *Desmodium*
- 34. *Indigofera*
- 49. *Glycine*

- 4 Main stems trailing, twining, or sprawling over other vegetation.

- 31. *Stylosanthes*
- 38. *Canavalia*
- 39. *Galactia*
- 40. *Lackeya*
- 41. *Clitoria*
- 42. *Centrosema*
- 44. *Mucuna*
- 45. *Rhynchosia*
- 47. *Pueraria*
- 48. *Amphicarpaea*
- 56. *Lespedeza*
- 57. *Desmodium*
- 50. *Lablab*
- 52. *Phaseolus*
- 53. *Strophostyles*
- 54. *Macroptilium*
- 51. *Vigna*

34. *Indigofera*

1. *Cercis* Linnaeus 1753 (Redbud)

A genus of about 6-10 species, trees of north temperate areas. Apparently the basalmost (evolutionarily the earliest diverging) extant genus in the Fabaceae (Lewis et al. 2005). References: Isely (1975)=Z; Isely (1990)=SE; Robertson & Lee (1976)=Y; Isely (1998)=I.

- 1 Flowering pedicels 10-20 mm long; flowers (11-) 12-14 mm long [*C. chinensis*]
- 1 Flowering pedicels 6-8 mm long; flowers 8-13 mm long.
 - 2 Leaves this, dull above (sun leaves slightly coriaceous, slightly glossy above); legumes 9-14 (-18) mm wide; flowers 8-11 mm long *C. canadensis* var. *canadensis*
 - 2 Leaves coriaceous, glossy above; legumes (11-) 13-17 (-20) mm wide; flowers (9-) 10-13 mm long [*C. canadensis* var. *texensis*]

Cercis canadensis Linnaeus var. *canadensis*, Eastern Redbud. Moist to dry forests and woodlands, especially over calcareous or mafic rocks, also commonly planted as an ornamental. Mar-May; Jun-Nov (and persistent later). MA, WI, and NE south to c. peninsular FL and e. TX. This spectacular small tree is showy in bud or flower. The smooth, medium gray bark is distinctive in winter. Other varieties occur in OK, TX, and Mexico. [= C, G, I, K, SE, Va, Y, Z; < *C. canadensis* – F, Pa, RAB, S, W, WH3]

* *Cercis canadensis* Linnaeus var. *texensis* (S. Watson) M. Hopkins, Texas Redbud. Native of OK and TX, sometimes cultivated. [= I, K2] {keyed; not mapped; rejected as a currently naturalized component of the flora}

* *Cercis chinensis* Bunge, Chinese Redbud. Native to China, sometimes cultivated. [= I] {keyed; not mapped; rejected as a currently naturalized component of the flora}

2. *Chamaecrista* Moench 1794 (Partridge-pea)

A genus of about 250-350 species, shrubs and herbs, of primarily tropical and subtropical areas, extending into temperate areas in North America, South America, and e. Asia. References: Isely (1975)=Z; Irwin & Barneby (1982)=Y; Robertson & Lee (1976)=X; Isely (1998)=I; Isely (1990)=SE.

- 1 Corolla 0.8-1.0 cm in diameter, the larger petals 4-7 (-8) mm long; functional stamens 5-8.
 - 2 Petiole pilose with hairs 1-2 (-3) mm long; petiolar gland cylindrical or clavate; functional stamens 5-8; leaflets 5-6× as long as wide *C. nictitans* var. *aspera*
 - 2 Petiole incurved-puberulent with hairs 0-0.8 mm long; petiolar gland stalked-cupuliform or stalked-discoid; functional stamens 5; leaflets 3-5× as long as wide *C. nictitans* var. *nictitans*
- 1 Corolla 2.5-3.5 cm in diameter, the larger petals 15-20 mm long; functional stamens 10.
 - 3 Perennial from a horizontal woody root or crown; stems clustered *C. deeringiana*
 - 3 Annual from a taproot; stems solitary.
 - 4 Pods 6.5-10 mm wide; seeds 4.7-6.3 mm across; [of tidal marshes in e. VA] *C. fasciculata* var. *macroperma*
 - 4 Pods 3-5 (-6.5) mm wide; seeds (2.8-) 3.2-4.8 mm across; [widespread geographically and ecologically].
 - 5 Surface of leaflets pubescent; [from w. Panhandle FL and s. AL westward] *C. fasciculata* var. *1*
 - 5 Surface of leaflets glabrous; [collectively widespread in our area].
 - 6 Petiolar gland depressed, 1.5-2.5 mm wide, raised at both ends; pods 6-10 cm long; plant usually glabrous or glabrescent, to 24 dm tall *C. fasciculata* var. *brachiata*
 - 6 Petiolar gland not depressed, <1.5 mm wide; pods 4-6 cm long; plant usually pubescent, to 10 dm tall

C. fasciculata var. *fasciculata*

Chamaecrista deeringiana Small & Pennell, Florida Senna. Sandhills, dry longleaf pine woodlands, disturbed sandy areas. Jun-Jul. Sw. and wc. GA (Jones & Coile 1988) south to s. peninsular FL, Panhandle FL, and west to s. MS (Sorrie & Leonard 1999); disjunct in s. FL. [= I, K, S, SE, Y, Z; < *C. fasciculata* (Michaux) Greene – WH3]

Chamaecrista fasciculata (Michaux) Greene var. *I*. Dunes, sandy disturbed areas. S. AL west to e. and s. TX. [< *Chamaecrista fasciculata* var. *fasciculata* – K; > *Chamaecrista littoralis* Pollard – S; > *Chamaecrista mississippiensis* (Pollard) Pollard ex Heller – S; < *Chamaecrista fasciculata* – WH3, Y; = *Cassia fasciculata* Michaux var. *puberula* (Greene) J.F. Macbride (variants 1, 2, and 3) – I, SE, Z; > *Chamaecrista puberula* Greene] {synonymy incomplete}

Chamaecrista fasciculata (Michaux) Greene var. *brachiata* (Pollard) Isely. Fields, disturbed areas. E. GA south to s. FL, west to w. Panhandle FL. [= I, SE; < *Chamaecrista fasciculata* var. *fasciculata* – K; = *Cassia fasciculata* var. *brachiata* (Pollard) Pullen ex Isely – X, Z; = *Chamaecrista brachiata* Pollard – S; < *Chamaecrista fasciculata* – WH3, Y]

Chamaecrista fasciculata (Michaux) Greene var. *fasciculata*, Common Partridge-pea. Fields, disturbed areas, fencerows, and a wide range of other habitats. Jun-Sep; Jul-Nov. MA west to MN, south to s. FL and Mexico. See discussion of the *Chamaecrista fasciculata* complex under var. *macrosperma*. [= Va; < *Cassia fasciculata* Michaux – RAB, W; < *Chamaecrista fasciculata* – C, Pa, WH3, Y; > *Cassia fasciculata* var. *fasciculata* – F, G, X; > *Cassia fasciculata* var. *robusta* (Pollard) J.F. Macbride – F, G, X; > *Chamaecrista fasciculata* – S; > *Chamaecrista robusta* Pollard – S; = *Chamaecrista fasciculata* var. *fasciculata* (variant 1, variant 2, and typical variant) – Z; < *Chamaecrista fasciculata* var. *fasciculata* – I, SE (also see var. *macrosperma*); < *Chamaecrista fasciculata* var. *fasciculata* – K (also see var. *brachiata*); > *Cassia fasciculata* var. *littoralis* (Pollard) J.F. MacBride – X]

Chamaecrista fasciculata (Michaux) Greene var. *macrosperma* (Fernald) C.F. Reed, Tidal-marsh Partridge-pea. Freshwater tidal marshes. Endemic to e. VA (Rappahannock, Mattaponi, Pamunkey, Chickahominy, James, and Appomattox Rivers and their major estuarine tributaries) and MD. Isely (1975) did not recognize this taxon formally, but treated it informally as "variant 1," commenting (incorrectly) that it is "apparently a local, saline-adapted ecotype." Irwin & Barneby (1982) treated *C. fasciculata* as a very polymorphic species in which it was impractical to recognize infraspecific taxa, concluding "a student of tropical *Chamaecrista* has the choice of accepting as a fact of life that sort of infraspecific variability that inspired the dissection of *C. fasciculata* or of retreating to the position of Britton & Urban who, driven by logic rather than sense, found a species in every particular combination of gland and hairiness that fell in their way. But in passing over the observed variation as taxonomically insignificant, it is well to bear in mind that its cause and its biological significance remain a mystery." Botanists familiar with var. *macrosperma* in the field contend that it shows a cohesion in morphologic characters, ecology, and distribution that is biologically and taxonomically significant; it warrants varietal status. [= K, Va; < *Chamaecrista fasciculata* – C, S, Y; = *Cassia fasciculata* var. *macrosperma* Fernald – F, G; < *Chamaecrista fasciculata* var. *fasciculata* – I, SE; = *Cassia fasciculata* var. *fasciculata* "variant 1" – Z]

Chamaecrista nictitans (Linnaeus) Moench var. *aspera* (Muhlenberg ex Elliott) Irwin & Barneby, Southern Sensitive-plant. Savannas, pinelands, disturbed sandy soils. Jun-Oct; Jul-Nov. Var. *aspera* ranges from se. SC south to s. FL. [= I, WH3; = *Cassia aspera* Muhlenberg ex Elliott – RAB, X, Z; = *Chamaecrista nictitans* ssp. *nictitans* var. *aspera* (Muhlenberg ex Elliott) Irwin & Barneby – K, SE, Y; = *Chamaecrista aspera* (Muhlenberg ex Elliott) Greene – S]

Chamaecrista nictitans (Linnaeus) Moench var. *nictitans*, Common Sensitive-plant. Forests, woodlands, disturbed areas, pine savannas, and a wide variety of other habitats. Jun-Oct; Jul-Nov. *C. nictitans* is widely distributed in e. North America, and (depending on the scope of what is included in it) south into South America. Var. *nictitans* ranges throughout se. United States, north to MA, NY, OH, and KA. [= I, Va, WH3; < *Cassia nictitans* Linnaeus – RAB, W, X, Z; < *Chamaecrista nictitans* – C, Pa; > *Cassia nictitans* var. *nictitans* – F, G; > *Cassia nictitans* var. *hebecarpa* Fernald – F, G; = *Chamaecrista nictitans* ssp. *nictitans* var. *nictitans* – K, SE, Y; > *Chamaecrista procumbens* (Linnaeus) Greene – S; > *Chamaecrista multipinnata* Pollard – S]

3. Senna P. Miller 1754 (Senna, Sicklepod, Wild Coffee)

A genus of about 295-350 species, trees, shrubs, and herbs, of tropical and warm temperate areas. References: Isely (1975)=Z; Irwin & Barneby (1982)=Y; Robertson & Lee (1976)=X; Isely (1998)=I; Isely (1990)=SE; Marazzi et al. (2006).

- 1 Racemes spike-like, 3-6 (-10) dm long; legume winged; [section *Senna*, series *Pictae*][*S. alata*]
- 1 Racemes not spike-like, <3 dm long; legume not winged; [section *Chamaefistula*].
- 2 Plant a shrub, 1-3 m tall; gland between the lowest pair of the acute or acuminate leaflets; [plants aliens, barely established in the vicinity of cultivation]; [section *Chamaefistula*, series *Coluteoideae*].
- 3 Gland between the lowest pair of leaflets only; leaflets 3-5× as long as wide.....*S. corymbosa*
- 3 Glands between each pair of leaflets; leaflets 2-3× as long as wide, acuminate..... [*S. septentrionalis*]

- 2 Plant an herb, 0.1-1.5 m tall; gland near the base of the petiole (except in *S. occidentalis* which has leaflets rounded to emarginate at the apex); [plants natives, or aliens generally well-established and weedy].
- 4 Leaflets obovate, the apex rounded to emarginate, 1.3-2× as long as wide; gland between the lowest pair of leaflets; [section *Chamaefistula*, series *Trigonelloideae*] *S. obtusifolia*
- 4 Leaflets ovate or narrowly elliptic, the apex acute or acuminate, 2-3.5× as long as wide; gland near the base of the petiole.
- 5 Leaflets 1.5-3.0 cm wide, in 3-6 pairs; racemes with 1-5 flowers; [section *Chamaefistula*, series *Basiglandulosae*]..... *S. occidentalis*
- 5 Leaflets 0.7-2.0 cm wide, in 6-10 pairs; racemes with 5-10 (-25) flowers; [series *Temperatae*].
- 6 Legume 5.5-8 mm wide, with broad, nearly square segments, usually pilose initially, the hairs up to 0.8-2 mm long (sometimes glabrate); ovary lanate with hairs to 1 mm long; ovules 10-15 (-18); petiolar gland broadest above the middle..... *S. hebecarpa*
- 6 Legume 8-11 mm wide, with narrow segments (much shorter than broad), glabrous (or with a few hairs, these < 0.6 mm long); ovary strigulose with hairs to 0.5 mm long; ovules 20-25 (-30); petiolar gland usually broadest at or below the middle..... *S. marilandica*

* *Senna alata* (Linnaeus) Roxburgh, Emperor's Candlesticks, Candlestick Plant. Disturbed areas; native of tropical America. Sep-Nov. Planted and slightly naturalized from s. AL and FL west to OK and TX. [= I, K, SE, WH3, Y; = *Cassia alata* Linnaeus - Z]

* *Senna corymbosa* (Lamarck) Irwin & Barneby. Cultivated as an ornamental, rarely persistent or spreading to disturbed areas; native of South America. Aug-Sep. reported for AL (Diamond & Woods 2009). [= I, K, SE, WH3, Y; = *Adipera corymbosa* (Lamarck) Britton & Rose - S; = *Cassia corymbosa* - X, Z]

Senna hebecarpa (Fernald) Irwin & Barneby, Northern Wild Senna. Open wet habitats, moist forests. Jul-Aug; Aug-Nov. MA and s. NH west to s. WI, south to sc. NC, e. TN, s. IN, and c. IL. [= C, I, K, Pa, SE, Va, Y; = *Cassia hebecarpa* Fernald - G, RAB, W, X, Z; > *C. hebecarpa* var. *hebecarpa* - F, WV; > *C. hebecarpa* var. *longipila* E.L. Braun - F, WV; = *Ditremexa marilandica* (Linnaeus) Britton & Rose - S, misapplied]

Senna ligustrina (Linnaeus) Irwin & Barneby, Privet Wild Senna. Hardwood hammocks, wet disturbed habitats. N. peninsular FL south to s. FL; Central America; West Indies. [= I, K2, SE, WH3; ? *Peiranisia bahamensis* (P. Miller) Britton & Rose - S; = *Cassia ligustrina* Linnaeus] {not yet keyed; add X, Y, Z synonymy}

Senna marilandica (Linnaeus) Link, Maryland Wild Senna. Dry to moist forests, especially on greenstone and diabase barrens and rocky woodlands, thickets, woodland borders, sometimes somewhat weedy. Jul-Aug; Aug-Nov. S. MA and s. NY west to e. NE, south to c. peninsular FL and c. TX. [= C, I, K, Pa, SE, Va, WH3, Y; = *Cassia marilandica* Linnaeus - F, G, RAB, W, WV, X, Z; = *Ditremexa medsgeri* (Shafer) Britton & Rose - S]

* *Senna obtusifolia* (Linnaeus) Irwin & Barneby, Sicklepod, Coffeeweed. Fields (especially soybean fields), disturbed areas; probably native of the New World Tropics. Jul-Sep; Aug-Nov. The species is now pantropical. [= C, I, K, Pa, SE, Va, WH3, X, Y; = *Cassia obtusifolia* Linnaeus - RAB, W, Z; < *Cassia tora* Linnaeus - F, G, misapplied; < *Emelista tora* (Linnaeus) Britton & Rose - S, misapplied]

* *Senna occidentalis* (Linnaeus) Link, Coffee Senna. Disturbed places; native of the Old World Tropics. Jul-Aug; Aug-Nov. The species is now pantropical. [= C, I, K, SE, Va, WH3, Y; = *Cassia occidentalis* Linnaeus - F, G, RAB, X, Z; = *Ditremexa occidentalis* (Linnaeus) Britton & Rose ex Britton & Wilson - S]

* *Senna septentrionalis* (Viviani) Irwin & Barneby. Disturbed areas; native of the tropics, probably originally from tropical America, perhaps not truly established, though Isely (1990) states that "the weedy nature of this species suggests that it is almost certainly somewhat established." [= I, K, SE, Y; = *Cassia laevigata* Willdenow - Z]

4. *Gymnocladus* Lamarck 1785 (Kentucky Coffee-tree)

A genus of 6 species, all trees, ours in e. North America and 5 species in e. Asia, related to *Gleditsia*. References: Isely (1975)=Z; Robertson & Lee (1976)=Y; Lee (1976)=X; Isely (1998)=I; Isely (1990)=SE.

Gymnocladus dioica (Linnaeus) K. Koch, Kentucky Coffee-tree, Kentucky Mahogany. Native in rich bottomland and slope forests, also in disturbed areas, persistent and weakly spreading from horticultural plantings. Apr-Jun; Aug-Nov (and persistent). The original native range has been obscured, perhaps PA west to se. SD, south to w. VA, TN, n. AL, and OK. [= C, F, G, I, K, Pa, RAB, S, SE, Va, WV, X, Y, Z]

5a. *Gleditsia* Linnaeus 1753 (Honey Locust, Water Locust)

A genus of 13-16 species, trees (and a shrub), scattered relictually in the Old and New Worlds, related to *Gymnocladus*.
References: Isely (1975)=Z; Robertson & Lee (1976)=Y; Isely (1998)=I; Isely (1990)=SE; Schnabel & Wendel (1998).

Identification notes: The hybrid *Gleditsia* × *texana* Sargent (pro sp.) [*G. aquatica* × *triacanthos*] occurs occasionally in the area of range overlap of its parents. It is intermediate between its parents.

- 1 Legume ovate, 3-5 (-8) cm long and 1-3-seeded; foliage glabrous (or slightly puberulent when young); [trees of frequently flooded swamps, often with *Taxodium*, rarely planted and escaped] *G. aquatica*
- 1 Legume elongate, 20-40 cm long and multi-seeded; foliage puberulent (even in age); [trees of moist to dry forests, frequently planted and escaped in disturbed areas]..... *G. triacanthos*

Gleditsia aquatica Marshall, Water Locust. Swamp forests. Apr-May; Jul-Nov. E. SC south to c. peninsular FL, west to TX, and north in the interior to IN, IL, and MO (as a native species almost completely restricted to the Coastal Plain); occasionally cultivated north of its native range. [= C, F, G, GW, I, K, RAB, S, SE, WH3, Y, Z]

Gleditsia triacanthos Linnaeus, Honey Locust. Woodlands, forests (generally bottomland), fencerows, often planted as a street tree. Apr-early Jun; Jul-Nov. Native distribution is believed to be from w. NY west to se. SD, south to Panhandle FL and TX (west of the Blue Ridge); its occurrence over much of our region appears to be as an adventive. The trunks are normally beset with lengthy, branched thorns, but thornless trees are encountered (and are usually favored for horticultural planting). [= C, G, GW, I, K, Pa, RAB, S, SE, Va, W, WH3, WV, Y, Z]

5b. *Guilandina* Linnaeus 1753 (Nicker)

A genus of 7 or more species, lianas and scandent shrubs, pantropical. References: Lewis et al. (2005)=Z; Gagnon et al. (2013); Isely (1998)=I; Isely (1990)=SE.

Guilandina bonduc Linnaeus, Gray Nicker. Coastal beaches and thickets. [= Z; = *Caesalpinia bonduc* (Linnaeus) Rozburgh – I, K1, K2, SE, WH3; > *Guilandina bonduc* – S; > *Guilandina crista* (Linnaeus) Small – S, misapplied]

6. *Parkinsonia* Linnaeus 1753 (Jerusalem Thorn)

A genus of about 10-30 species (if circumscribed to include *Cercidium*), shrubs and trees of sw. North America, Central America, and Africa. References: Isely (1975)=Z; Robertson & Lee (1976)=Y; Isely (1998)=I.

* ***Parkinsonia aculeata*** Linnaeus, Jerusalem Thorn, Retama, Horse-bean, Mexican Palo Verde. Disturbed areas; native of sw. North America. May. Rarely established or spread from cultivation in our area, more commonly so in much of FL. [= I, K, S, SE, Y, WH3, Z]

7. *Neptunia* Loureiro 1790 (Neptunia)

A genus of about 12 species, herbs, of the tropics and subtropics of America and Eurasia. References: Isely (1998)=I; Windler (1966)=Z.

- 1 Leaflets 9-15 pairs per pinna; stipules 2-4 mm long; all flowers perfect, with functional stamens; stipe of fruit 4-14 mm long *N. lutea*
- 1 Leaflets (12-) 15-25 pairs per pinna; stipules 4-10 mm long; flowers in the lower part of the inflorescence with flattened staminodes; stipe of fruit 2-5 mm long *N. pubescens* var. *pubescens*

Neptunia lutea (Leavenworth) Bentham, Yellow Neptunia. Savannas, prairies, roadsides. AL west to OK and TX. [= I, K, S, SE, Z]

Neptunia pubescens Bentham var. *pubescens*, Tropical Neptunia. Savannas, sandhills, scrub, prairies, roadsides. AL and FL west to TX and south to Argentina. [= I, K1, SE, Z; > *N. floridana* Small – S; < *N. pubescens* – K2, WH3; > *Neptunia pubescens* var. *floridana* (Small) B.L.Turner]

8. *Leucaena* Benthham 1842 (Leadtree, Leucaena)

A genus of about 22 species, of tropical and warm temperate America. References: Hughes (1998)=Z; Isely (1998)=I; Govindarajulu et al. (2011a, 2011b).

* *Leucaena leucocephala* (Lamarck) de Wit *ssp. leucocephala*, Leadtree, Leucaena, Jumbie-bean. Disturbed areas; native of the New World tropics. E. GA (Kartesz 1999, voucher at UGA), south into FL and the New World tropics. An allotetraploid species derived from *L. cruziana* × *pulverulenta* (Govindarajulu et al. 2011b). [= WH3, Z; < *L. leucocephala* – I, K, SE; < *L. glauca* (Linnaeus) Benthham – S, misapplied]

9. *Desmanthus* Willdenow 1806 (Bundflewer)

A genus of about 25 species, herbs and shrubs, of warm temperate and subtropical America. References: Isely (1973)=Z; Isely (1998)=I.

- 1 Leaves with (4-) 6-12 pairs of pinnae; stamens 5; legume 1.5-2.5 cm long *D. illinoensis*
- 1 Leaves with 2-4 pairs of pinnae; stamens 10; legume 4-8 cm long *D. virgatus* var. *depressus*

Desmanthus illinoensis (Michaux) MacMillan ex B.L. Robinson & Fernald, Bundflewer, Prairie Mimosa. Prairies, marsh edges, disturbed areas. Jun-Jul; Aug-Nov. OH, MN, and ND south to Panhandle FL, TX, and NM; with scattered adventive occurrences east and west of the native distribution. [= C, F, G, I, K1, K2, RAB, SE, W, WH3, Z; = *Acuan illinoense* (Michaux) Kuntze – S; = *Mimosa illinoensis* Michaux]

Desmanthus virgatus (Linnaeus) Willdenow var. *depressus* (Humboldt & Bonpland ex Willdenow) B.L. Turner, Wild Tantan. FL peninsula (north to Levy County, FL); West Indies; nw. LA and c. Texas south through Mexico and Central America to South America. [= I, SE; = *Acuan depressum* (Humboldt & Bonpland ex Willdenow) Kuntze – S; < *D. virgatus* – K2, WH3]

10. *Dichrostachys* (A.P. de Candolle) Wight & Arnott 1834 (Sickle Bush)

A genus of about 6-14 species, shrubs and trees, of Africa and tropical Asia. References: Lewis et al. (2005); Isely (1998)=I.

* *Dichrostachys cinerea* (Linnaeus) Wight & Arnott *ssp. africana* Brenan, African Sickle Bush, Kalahari Christmas Tree, Aroma. Coastal dunes; native of Africa. See Barger et al. (2012) for additional information. [= K2, WH3; < *D. cinerea* – I, SE]

11. *Mimosa* Linnaeus 1753 (Mimosa)

A genus of about 500 species, herbs, shrubs, trees, and vines, of tropical, subtropical, and warm temperate areas, especially America. Barneby (1991) and Beard (1963) argue that there are no characters which serve to separate *Schrankia* from *Mimosa*. References: Barneby (1991)=Y; Isely (1973)=Z; Isely (1998)=I.

Identification notes: Unmistakable in our flora for its bipinnate leaves, with tiny (2-4 mm long) leaflets, responding to touch by closing.

- 1 Plant unarmed *M. strigillosa*
- 1 Plant armed.
 - 2 Pinnae (1-) 2 pairs per leaf [*M. pudica*]
 - 2 Pinnae 6-16 (-22) pairs per leaf.
 - 3 Woody shrubs, to 4 m tall *M. pellita*
 - 3 Sprawling vines.
 - 4 Leaflets without apparent secondary veins; pinnae 4-8 (-11) pairs per leaf *M. microphylla*
 - 4 Leaflets with evident (sometimes weakly so) secondary veins; pinnae 3-5 (-6) pairs per leaf *M. quadrivalvis* var. *floridana*

Mimosa microphylla Dryander, Eastern Sensitive-briar. Dry woodlands and forests, especially sandhills, disturbed areas. Jun-Sep; Aug-Nov. DE, WV, and MO south to FL and e. TX. A form with smaller fruits (3-5 cm long vs. 5-12 cm long) has been variously treated as a species [*Leptoglottis chapmanii* – S, *Schrankia chapmanii*] or a "recurrent fruit-form genotype" [phase *brachycarpa* of Isely (1973)]. [= K, Va; = *Mimosa quadrivalvis* Linnaeus var. *angustata* (Torrey & A. Gray) Barneby – C, I, WH3, Y; = *Schrankia microphylla* (Dryander) J.F. Macbride – F, G, RAB, W; > *Leptoglottis microphylla* (Dryander) Britton & Rose – S; > *Leptoglottis*

chapmanii Small ex Britton & Rose – S; = *Schrankia microphylla* (Dryander) J.F. Macbride var. *microphylla* – SE; > *Schrankia microphylla* "phase *brachycarpa*" – Z; > *Schrankia chapmanii* (Small ex Britton & Rose) F.J. Hermann]

Mimosa pellita Humboldt & Bonpland, Black Mimosa. Disturbed areas; native of New World tropics (s. FL, West Indies, Central America, South America). [= I, K2; ? *M. pigra* Linnaeus var. *pigra* – SE, misapplied; < *M. pigra* – WH3]

* ***Mimosa pudica*** Linnaeus, Sensitive Plant, Shameplant. Disturbed areas; perhaps only a waif in our area. [= I, K, S, SE, WH3]

Mimosa quadrivalvis Linnaeus var. ***floridana*** (Chapman) Barneby, Florida Sensitive-briar. Xeric sandhills and other dry, sandy habitats. A Southeastern Coastal Plain endemic: GA south into FL. This taxon is distinct at the specific level from *M. quadrivalvis* and nomenclatural adjustments are forthcoming (Flores-Cruz et al. 2004). [= I, K, WH3, Y; = *Leptoglottis floridana* (Chapman) Small ex Britton & Rose – S; = *Schrankia microphylla* (Dryander) J.F. Macbride var. *floridana* (Chapman) Isely – SE]

Mimosa strigillosa Torrey & A. Gray, Powderpuff Mimosa. Floodplain forests, open wet areas. A Southeastern Coastal Plain endemic: e. GA south to FL, west to TX. It might be expected in se. SC (see SE, Y, Z). [= I, K, S, SE, WH3, Y, Z]

12. *Acaciella* Britton & Rose 1928 (Acacia)

A genus of about 15 species, herbs, of sc. and se. United States south to Argentina. References: Isely (1998)=I.

Acaciella hirta Britton & Rose, Prairie Acacia. Sandhills, disturbed sandy areas. W. LA, AR, and MO west to KS, OK, and TX; disjunct in e. Panhandle FL and n. peninsular FL. [= S; = *Acacia angustissima* (P. Miller) Kuntze var. *hirta* (Nuttall) B.L. Robinson – I, K, SE, WH3; = *Acacia hirta* Nuttall]

13. *Vachellia* Wight & Arnott 1834 (Acacia)

A genus of about 163 species, trees and shrubs, of tropical and subtropical America, Africa, Asia, and Australia. Formerly considered part of *Acacia*. References: Ebinger & Seigler in FNA (in prep.); Isely (1998)=I; Isely (1969)=Z; Ebinger, Seigler, & Clarke (2002)=Y; Seigler & Ebinger (2005)=X; Maslin, Miller, & Seigler (2003).

- 1 Leaves with 2-4 (-6) pairs of pinnae; each pinna with 10-20 pairs of leaflets *V. farnesiana* var. *farnesiana*
- 1 Leaves with 10-15 (-20) pairs of pinnae; each pinna with 20-30 pairs of leaflets *V. macracantha*

Vachellia farnesiana (Linnaeus) Wight & Arnott var. ***farnesiana***, Sweet Acacia, Huisache. Sandy flats on barrier islands, maritime scrub, shell middens. E. GA, along the coast, south to s. FL, west to TX and Tamaulipas, across the sw. United States and south into Mexico. The GA occurrence appears native; see Duncan (1985). [= FNA, X; < *Acacia farnesiana* (Linnaeus) Willdenow – I, K, SE, WH3, Z; > *Acacia smallii* Isely – I, SE, Z; > *Vachellia densiflora* Alexander ex Small – S; > *Vachellia farnesiana* (Linnaeus) Wight & Arnott – S; = *Acacia farnesiana* ssp. *farnesiana* – Y]

* ***Vachellia macracantha*** (Humboldt & Bonpland ex Willdenow) Seigler & Ebinger, Apopanax, Longspine Acacia, Porknut. Planted as an ornamental and rarely naturalized; native of farther south in FL. [= FNA, X; = *Acacia macracantha* Humboldt & Bonpland ex Willdenow – I, K, SE, WH3, Z]

14. *Calliandra* Benthham 1840

A genus of about 135 species, trees and shrubs, of the New World tropics and subtropics. References: Isely (1998)=I.

* ***Calliandra haematocephala*** Hasskarl, Powderpuff Tree. Disturbed areas; native of South America, cultivated in the southern part of our area and allegedly persistent or spreading. [= I, WH3]

15. *Albizia* Durazzini 1772 (Silktree)

A genus of about 100-120 species, trees, shrubs, and vines, of tropical, subtropical, and warm temperate Asia, Africa, and America. References: Isely (1973)=Z; Isely (1998)=I.

- 1 Leaflets 7-15 mm long; bark of mature trees smoothish, with small wart-like bumps.....*A. julibrissin*
- 1 Leaflets 15-30 mm long; bark of mature trees rough, with plates.....*A. kalkora*

* *Albizia julibrissin* Durazzini, Mimosa, Silktree. Disturbed areas, suburban woodlots, escaped and persistent in forests and woodlands; native of tropical Asia. May-Aug; Jul-Nov. Becoming a serious weed; "literally almost everywhere in the 'Dixie' south" (Isely 1973). [= C, I, K, Pa, RAB, SE, Va, W, WH3, Z; = *Albizia julibrissin* – F, G, S, orthographic variant]

* *Albizia kalkora* (Roxburgh) Prain, Kalkora Mimosa. Naturalizing in suburban areas; native of e. Asia (Japan, Korea, Taiwan). Documented by herbarium specimens at DUKE and NCU. Apparently hybridizing with *A. julibrissin* (W. Cook, pers. comm.).

16. *Cladrastis* Rafinesque 1824 (Yellow-wood)

A genus of about 6 species, trees, of the se. United States and montane regions of Japan and China. *Cladrastis* is the only native member of the tribe Sophoreae in our area, with the exception of the cultivated (and weakly, if at all, established) *Styphnolobium* and *Maackia*; additionally the native *Sophora tomentosa* Linnaeus var. *truncata* Torrey & A. Gray closely approaches our area in n. peninsular FL. References: Duley & Vincent (2003)=X; Isely (1981)=Z; Isely (1998)=I; Rudd (1972)=Y.

Cladrastis kentukea (Dumont de Courset) Rudd, Yellow-wood. Mountain forests, Piedmont bluffs, especially on calcareous or mafic rocks (introduced only in the Piedmont of NC). Apr-May; Jul-Aug. This small to large tree has a native range primarily in the Southern Appalachians (mostly on the west side), the Ozarks, and limestone regions in-between (such as c. TN), ranging from s. OH, s. IN, and s. MO south to sw. NC, sc. SC, n. GA, AL, c. AR, and e. OK, but is cultivated more widely. As discussed by Wyatt (1985), the SC occurrence on Fall Line bluffs of the Savannah River is an interesting disjunction, apparently relictual. Yellow-wood is a distinctive tree, distinguished by its smooth silvery-gray bark, peculiar leaves with alternate leaflets, and pendent panicles of white flowers. The genus *Cladrastis* has 4 other species, all of temperate e. Asia. Increasingly planted as an ornamental, and likely to start escaping more widely, as reported for Fairfax County, VA (Steury 2011). [= K, Mo, W, X, Y; = *C. lutea* (Michaux f.) K. Koch – C, F, G, I, RAB, S, SE, Z]

17. *Styphnolobium* Schott 1830 (Pagoda Tree)

A genus of about 9 species, trees, shrubs, of central and South America and e. Asia. References: Isely (1998)=I; Isely (1981)=Z; Sousa S. & Rudd (1993)=Y; Palomino et al. (1993).

- 1 Flowers in terminal panicles; leaflets 13-17 per leaf.....*S. affine*
- 1 Flowers in axillary racemes; leaflets 9-15 per leaf.....*[S. japonicum]*

Styphnolobium affine (Torrey & A. Gray) Walpers, Eve's Necklace. Woodlands, disturbed areas. Apr-Jun. Sw, AR and OK south to sw. LA and c. TX; disjunct eastward in se. LA. [= K2; = *Sophora affinis* Torrey & A. Gray]

* *Styphnolobium japonicum* (Linnaeus) Schott, Pagoda Tree. Cultivated ornamental, rarely persistent; native of China. Reported as "slightly escaped" in the United States by Isely (1981); most specimens in herbaria are from cultivated plants. Steury (2011) and Zell (2012) report it as well-established and invasive in Arlington County, VA. Also reported for MD, PA, and OH (Kartesz 1999). [= Y; = *Sophora japonica* Linnaeus – I, K, Pa, Z]

18. *Maackia* Ruprecht & Maximowicz 1856 (Maackia)

A genus of about 8 species, trees and shrubs, of e. Asia.

* *Maackia amurensis* Ruprecht, Amur Maackia, Chinese Yellow-wood. Sparingly naturalizing in suburban woodlands; native of China and Siberia. Reported as sparingly naturalizing on Duke University campus, Durham County, NC (W. Cook, pers. comm., 2007).

19. *Sophora* Linnaeus 1753 (Necklacepod)

A genus of ca. 50 species, trees, shrubs, and herbs, pantropical but mostly Old World. References: Rudd (1972)=Z.

Sophora tomentosa Linnaeus var. *truncata* Torrey & A. Gray, Yellow Necklacepod. Coastal dunes, also dry, near-coastal sands. N. peninsular FL (Levy County on the west coast and Brevard County on the east coast south to s. FL; West Indies; South America. [= I, K2, SE, WH3; < *S. tomentosa* – S] {add Z to synonymy}

20. *Thermopsis* R. Brown ex Aiton & W.T. Aiton 1811 (Golden-banner)

A genus of ca. 23 species, perennial herbs, of temperate e. North America, w. North America, and e. Asia. References: Chen, Mendenhall, & Turner in FNA (in prep.); Larisey (1940b); Chen, Mendenhall, & Turner (1994)=Y; Isely (1981)=Z; Isely (1998)=I.

- 1 Legumes erect or strongly ascending, densely villous; stipules clasping, those of the principal leaves (20-) 35-65 mm long, 10-30 mm wide; pedicels 2-3 mm long; plants mostly 6-20 dm tall, strict or few-branched *T. villosa*
- 1 Legumes spreading to ascending, glabrate or pubescent; stipules not clasping, those of the principal leaves 12-25 (-32) mm long, 1-5 mm wide; pedicels 4-20 mm long; plants mostly 3-10 dm tall, branched.
- 2 Plants from a single woody rootstock, mostly 5-10 dm tall; calyx glabrous or very sparsely pubescent, often also glaucous, the lobes often only 1-1.5 mm long; pedicels glabrate, (4-) 7-20 mm long (as long as or longer than the bracts); racemes terminal or lateral; plants flowering (late May-) early Jun-Jul; [plants of moderate to high elevations, (300-) 700-2000 m]..... *T. fraxinifolia*
- 2 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late Apr-early May (-Jun); [plants of low to moderate elevations, 200-800 m] *T. mollis*

Thermopsis fraxinifolia (Nuttall) M.A. Curtis, Ash-leaf Golden-banner. Dry slopes and ridges. Late May-Jul; Jul-Oct. A Southern Appalachian endemic: w. NC and e. TN south to nw. SC and n. GA. In addition to the key characters above, *T. fraxinifolia* tends to have thinner stems than *T. mollis*, to average taller, and to have the inflorescence generally arching to reclining (vs. erect to sometimes arching). The phenologic separation (peak flowering times separated by about 6-7 weeks, generally with a 2 week period between the last flowering of *T. mollis* and the first flowering of *T. fraxinifolia*) provides strong support to the recognition of *T. fraxinifolia* and *T. mollis* at the species level. [= FNA, K, RAB, S, W, Y; = *T. mollis* var. *fraxinifolia* (Nuttall) Isely – I, SE, Z]

Thermopsis mollis (Michaux) M.A. Curtis, Appalachian Golden-banner. Dry slopes and ridges. Apr-May; Jun-Aug. Centered in the Southern Appalachians, but mostly in the Piedmont and lower elevation periphery of the mountains, ranging from sc. VA south through w. and c. NC and e. TN to nw. SC, n. GA, and ne. AL. See comments under *T. fraxinifolia*. [= C, F, FNA, G, K, RAB, Va, W, Y; = *T. mollis* var. *mollis* – I, SE, Z; > *T. hugeri* Small – S; > *T. mollis* – S]

Thermopsis villosa (Walter) Fernald & Schubert, Aaron's-rod, Blue Ridge Golden-banner. Floodplains, mesic disturbed areas, woodland edges, roadbanks. May-Jun; Jul-Sep. A Southern Blue Ridge endemic: w. NC and e. TN to n. GA, and escaped from cultivation more widely, as in w. VA, s. MD, c. TN, and WV probably representing escapes from cultivation. *T. villosa* is a more erect and unbranched plant than our other two species. It is generally found in disturbed sites, its natural habitat somewhat of a mystery. [= C, FNA, I, K, RAB, SE, W, Y, Z; = *T. caroliniana* M.A. Curtis – S]

21. *Baptisia* Ventenat 1808 (Wild Indigo)

A genus of about 20 species, perennial herbs, of temperate e. and c. North America. References: Isely (1981)=Y; Larisey (1940a)=Z; Mendenhall (1994a, 1994b)=X; Turner (2006)=Q; Isely (1998)=I; Woods & Diamond (2014).

Identification notes: Many of our species hybridize when they grow in proximity. They are generally recognizable (especially in context with their parents) by their intermediate morphology. Additional hybrids have been created by plant breeders and may be found in cultivation.

- 1 Leaves 1-foliolate, sessile or perfoliate.
 - 2 Leaves perfoliate; plant glabrous or nearly so; [widespread, from s. SC southward] *B. perfoliata*
 - 2 Leaves sessile; plant glabrous or densely cobwebby pubescent; [narrow endemics of GA and FL].
 - 3 Plant cobwebby-pubescent; leaves ca. 1× as long as wide, cordate at base; corolla 9-11 mm long, yellow; [of e. GA (Brantley and Wayne counties)] *B. arachnifera*
 - 3 Plant glabrous; leaves 1.3-1.6× as long as wide, rounded to broadly cuneate at base; corolla 12-15 mm long, pale yellow to greenish; [of the FL Panhandle (Franklin, Gadsden, Leon, Liberty, and Wakulla counties)] *B. simplicifolia*
- 1 Leaves 3-foliolate, petiolate or sessile.
 - 4 Flowering or fruiting pedicels bracteolate; corolla 11-14 mm long
 - 5 Calyx lobes about as long as the calyx tube *B. lecontei*
 - 5 Calyx lobes much > the calyx tube.
 - 6 Plant glabrous; [of ne. FL (Clay and St. Johns counties)] *B. calycosa*
 - 6 Plant tomentose to hirsute; [of FL Panhandle (Escambia, Holmes, Okaloosa, Santa Rosa, and Walton counties) and s. AL (Covington County)] *B. hirsuta*
 - 4 Flowering or fruiting pedicels lacking bracteoles; corolla larger (except *B. tinctoria*).
 - 7 Plants in flower **Key A**
 - 7 Plants in fruit **Key B**

Key A – flowering *Baptisia*

- 1 Flowers lavender or blue.
 - 2 Leaflets 2-4 (-5) cm long, mostly < 10 mm wide (if wider, then < 4 cm long); leaflets mostly oriented in a vertical plane; fertile stems usually 0.4-1.0 m tall, the leafy branches horizontally spreading; racemes 1-2.5 (-4) dm long, rather densely flowered; petioles 0-4 (-12) mm long; [of diabase and limestone glades, barrens, and woodlands] *B. australis* var. *aberrans*
 - 2 Leaflets 4-6 (-9) cm long, mostly > 12 mm wide; leaflets not oriented in a vertical plane; fertile stems usually 1-1.5 m tall, the leafy branches ascending; racemes 2-4 (-5) dm long, rather sparsely flowered; petioles 5-20 (-40) mm long; [of flood-scoured riverside cobblebars and rock outcrops, also frequently cultivated and sometimes persistent or escaped] *B. australis* var. *australis*
- 1 Flowers yellow, cream-white, or white.
 - 3 Flowers white or cream-white.
 - 4 Flowering pedicels 10-18 (-30) mm long, subtended by persistent bracts 10-25 mm long and 7-10 mm wide; flowers cream-white (to pale-yellow).
 - 5 Petioles of median leaves 4-10 mm long *B. bracteata*
 - 5 Petioles of median leaves 2-4 mm long
 - 6 Leaves and stems glabrous; leaflets 1.5-2.5× as long as wide *B. leucophaea* var. *laevicaulis*
 - 6 Leaves and stems pubescent; leaflets (1.5-) 2.5-5× as long as wide *B. leucophaea* var. *leucophaea*
 - 4 Flowering pedicels 3-10 mm long, subtended by caducous bracts 4-7 mm long and 1-2 mm wide; flowers white.
 - 7 Calyx 4.5-6.5 mm long; corolla 13-16 (-18) mm long; petioles 5-10 (-20) mm long *B. albescens*
 - 7 Calyx 7-8 mm long; corolla 20-25 mm long; petioles (of the lower leaves at least) 10-20 mm long.
 - 8 Legume usually 15-20 (-30) mm in diameter, thin-walled and brittle; [of NC south through GA to FL and AL] *B. alba*
 - 8 Legume usually 10-12 (-15) mm in diameter, rigid and tough; [of c. TN, c. KY, and MS westward] *B. leucantha*
 - 3 Flowers yellow.
 - 9 Flowering pedicels 14-18 (-30) mm long, subtended by persistent bracts 10-25 mm long and 7-10 mm wide; flowers pale-yellow (to cream-white).
 - 10 Petioles of median leaves 4-10 mm long *B. bracteata*
 - 10 Petioles of median leaves 2-4 mm long.
 - 11 Leaves and stems glabrous; leaflets 1.5-2.5× as long as wide *B. leucophaea* var. *laevicaulis*
 - 11 Leaves and stems pubescent; leaflets (1.5-) 2.5-5× as long as wide *B. leucophaea* var. *leucophaea*
 - 9 Flowering pedicels 2-10 mm long, subtended by caducous bracts 2-10 mm long and 1-2 mm wide; flowers bright yellow.
 - 12 Leaflets mostly 1-2.5 (-4) cm long, 1-2.5× as long as wide, the petiolules 0-1 mm long; corolla 12-16 mm long; racemes numerous, terminating most of the branches *B. tinctoria*
 - 12 Leaflets mostly 4-9 cm long, 1.5-4× as long as wide, the petiolules 2-10 mm long; corolla 20-28 mm long; racemes solitary (-3) or numerous.
 - 13 Inflorescences of racemes of (3-) 5-25 (or more) flowers; stipules persistent or caducous.
 - 14 Plant persistently cinereous-pubescent; stipules (some of them at least) persistent; plants blackening on drying *B. cinerea*
 - 14 Plant puberulent when young, soon glabrate to glabrous; stipules caducous; [of MS westward]; plants not blackening on drying *B. sphaerocarpa*
 - 13 Inflorescence **either** of solitary axillary flowers **or** flowers in clusters of 2-4 in axils **or** in terminal racemes of 2-4 (-10) flowers; stipules caducous.
 - 15 Petiolules 2-3 mm long; leaflets 1-2.5× as long as wide; [of LA, AR, TX, and OK] *B. nuttalliana*
 - 15 Petiolules 4-10 mm long; leaflets 1.7-5× as long as wide; [of SC, GA, FL, and AL].
 - 16 Leaflets 3-5× as long as wide, usually < 1.5 cm wide; flowers usually solitary or in clusters of 2-3; fruits broadly ellipsoid or subspheroidal, < 2× as long as wide; [se. SC south through GA Coastal Plain to ne. FL] *B. lanceolata* var. *lanceolata*

- 16 Leaflets 1.7-3.2 (-5)× as long as wide, the larger typically > 2 cm wide; flowers in racemes of (1-) 3-10 flowers; fruits usually ellipsoid, often > 2× as long as wide; [FL Panhandle, s. AL, and c. peninsular FL].....*B. lanceolata* var. *tomentosa* {add *B. megacarpa* and *B. riparia* to key}

Key B – fruiting *Baptisia*

- 1 Legume 5-11 mm in diameter.
- 2 Legume cylindric, 20-30 (-35) mm long, 7-9 mm in diameter, yellow-brown, leathery in texture.....*B. albescens*
- 2 Legume globose or subspheroidal, 7-25 mm long, 5-11 mm in diameter, black, woody in texture.
- 3 Leaflets mostly 1-2.5 (-4) cm long.....*B. tinctoria*
- 3 Leaflets 3.5-10 cm long.
- 4 Leaflets 3-5× as long as wide, usually < 1.5 cm wide; infructescence nodes (fruits or aborted fruits) usually 1-3; fruits broadly ellipsoid or subspheroidal, <2× as long as wide; [se. SC south through GA Coastal Plain to ne. FL].....*B. lanceolata* var. *lanceolata*
- 4 Leaflets 1.7-3.2 (-5)× as long as wide, the larger typically > 2 cm wide; infructescence nodes (1-) 3-10; fruits usually ellipsoid, often > 2× as long as wide; [FL Panhandle, s. AL, and c. peninsular FL].....*B. lanceolata* var. *tomentosa*
- 1 Legume 8-25 mm in diameter.
- 5 Pod drying tan, thin-walled and brittle.....*B. megacarpa*
- 5 Pod drying black to blackish-brown, leathery or tough.
- 6 Stems puberulent (sometimes inconspicuously so) or villous.
- 7 Legume (20-) 30-40 (-50) mm long, 15-25 mm in diameter; pedicels 14-18 (-30) mm long, subtended by persistent bracts 10-25 mm long and 7-10 mm wide
- 8 Petioles of median leaves 4-10 mm long.....*B. bracteata*
- 8 Petioles of median leaves 2-4 mm long.....*B. leucophaea* var. *leucophaea*
- 7 Legume 10-35 mm long, 8-15 mm in diameter; pedicels 2-10 mm long, subtended by caducous bracts 2-10 mm long and 1-2 mm wide.
- 9 Petiolules 2-5 mm long; stipules (some of them at least) persistent.....*B. cinerea*
- 9 Petiolules 4-10 mm long; stipules caducous.....*B. lanceolata* var. *lanceolata*
- 6 Stems glabrous and generally glaucous as well.....*B. alba*, *B. leucantha*, *B. leucophaea* var. *laevicaulis*, *B. australis* var. *aberrans*, *B. australis* var. *australis* {add *B. nuttalliana* and *B. riparia* to fruiting key}

Baptisia alba (Linnaeus) Ventenat, Thick-pod White Wild Indigo. Dry woodlands, pine flatwoods, roadsides. May-Jul; Jun-Oct. NC south to n. peninsular FL, west to AL. *B. leucantha* (see below) is a western sibling, treated as either a species or a variety. In fruit, it is easily separated from *B. albescens* and most other *Baptisia* by its nearly spheroidal legume. *B. alba* and *B. albescens* have been nomenclaturally confused; Isely (1986a) corrects the application of the epithet "*alba*." [= S, WH3; = *B. alba* var. *alba* – I, K, SE; = *B. lactea* (Rafinesque) Thieret var. *obovata* (Larisey) Isely – C (by implication), X, Y; = *B. lactea* var. *pendula* (Larisey) B.L. Turner – Q; = *B. pendula* Larisey – RAB; > *B. pendula* var. *pendula* – Z; > *B. pendula* var. *obovata* Larisey – Z]

Baptisia albescens Small, Narrow-pod White Wild Indigo, Spiked Wild Indigo. Dry woodlands, pine flatwoods, roadsides. May-Jul; Jun-Oct. Se. VA south through NC, SC, and GA to n. FL, e. AL and e. TN. The fruits are unlike any of our other species in being cylindric, about 3× as long as the diameter, and yellowish-brown (rather than black) when mature. [= I, K, S, SE, Va, WH3; = *B. alba* – C, F, G, Q, RAB, W, X, Y, misapplied; > *B. alba* – Z; > *B. albescens* – Z]

Baptisia arachnifera Duncan, Hairy Rattleweed, Hairy Wild Indigo. Sandhills. Endemic to GA (Wayne and Brantley counties). Unmistakable for its simple leaves and dense "cobwebby" pubescence. [= I, K, Q, SE, X, Y]

Baptisia australis (Linnaeus) R. Brown var. *aberrans* (Larisey) M. Mendenhall, Eastern Prairie Blue Wild Indigo, Glade Wild Indigo. Glades, barrens, and open woodlands over limestone (or other calcareous rocks) and diabase (or other mafic rocks), in areas that were formerly prairies, barrens, glades, or oak savannas. Apr-May; Jun-Aug. Sw. KY, c. and se. TN, nw. GA, and c. NC. Blue-flowered *Baptisia* from mafic glades, barrens, and former prairies and oak savannas east of the Mississippi River has proven problematic to taxonomists. Larisey (1940a) treated *B. australis* and *B. minor* as separate species, and placed eastern plants resembling *B. minor* in *B. minor* var. *aberrans* Larisey, but without providing very satisfying characters for separating it from typical *B. minor* of mw. North America. RAB apparently (though tacitly) included *B. minor* within *B. australis*. Isely (1981, 1990) treated blue-flowered *Baptisia* as *B. australis* var. *australis* and var. *minor*, regarding var. *minor* as reaching its eastern limit in MO (the two varieties thus allopatric), and stating that "sporadic collections within the range of var. *australis* have the pods and some of the vegetative characters of var. *minor*... most of these collections are from dry or sterile habitats, e.g., cedar glades, that var. *australis* typically does not inhabit" (Isely 1990). His treatment of *australis* and *minor* at the varietal level seems largely based on the existence of *minor*-like plants within his concept of the range of *australis*. NC plants from glade-like sites are morphologically more similar to midwestern prairie *B. minor*, occur in similar habitats, and grow with a large number of other plants with midwestern phylogeographic affinities, such as *Eryngium yuccifolium* var. *yuccifolium*, *Echinacea laevigata* (an eastern sibling of *E. purpurea*), *Solidago ptarmicoides*, *Solidago rigida* ssp. *glabrata* (an eastern sibling of *S. rigida* ssp. *rigida*), *Silphium terebinthinaceum*, and others. The affinities of these plants seem to be with *B. minor*; "shoehorning" them into the more eastern *B. australis*, which they do not resemble in morphology, habitat, or (indeed) range is not a desirable disposition. Eastern plants referable to *B. minor* do, however, as noted by Larisey and Isely, differ from midwestern plants in leaflet size and shape, branching, and pod shape; they are best treated as an eastern, relictual variety in the complex, *B. australis* var. *aberrans* Larisey. Mendenhall (1994a, 1994b) found that the "*aberrans*" entity warranted taxonomic recognition, and indeed that it is less closely related to *B. australis* s.s. and *B. minor* than they are to one another; she chose to treat the three entities as varieties under *B. australis*. For now, the best treatment seems to be to follow Mendenhall, and acknowledge the existence of three varietal entities, with the phylogenetic affinities uncertain. The range of *B. australis* var. *minor* is thus largely midwestern, from se. NE,

s. MO, and e. and c. KS south to w. AR, e. and c. OK, and ne. TX. [= K, X; = *Baptisia minor* Lehmann var. *aberrans* Larisey – Z; < *B. australis* (Linnaeus) R. Brown – RAB, S; < *B. australis* var. *australis* – I, Q, SE; < *B. australis* var. *minor* (Lehmann) Fernald – C, G, Mo; < *B. minor* – F]

Baptisia australis (Linnaeus) R. Brown var. *australis*, Tall Blue Wild Indigo, Streamside Blue Indigo. Riverbank scour areas, gravel bars, and disturbed areas (where persisting from cultivation). Apr-Jun; Jun-Aug. Native to w. and n. VA, w. MD, WV, w. PA, e. and c. KY, ne. TN, se. IN, and s. OH, and possibly native to other states, the original range somewhat obscured by its frequent cultivation. [= C, G, K, Mo, Va, X; = *B. australis* – F, W, Z; < *B. australis* var. *australis* – I, Q, SE; < *B. australis* – Pa, RAB, S]

Baptisia bracteata Elliott, Creamy Wild Indigo. Dry ridgetop woodlands and forests, sandhills, other dry woodlands. Mar-Apr; May-Jun. Ne. AL northwest through n. GA and n. SC to w. NC. The more western *B. leucophaea* Nuttall is better treated as a species than as *B. bracteata* var. *leucophaea* (Nuttall) Kartesz & Gandhi (Mendenhall 1994b). [= Q, RAB, S, W, X, Z; = *B. bracteata* var. *bracteata* – C, I, K, SE]

Baptisia calycosa Canby, Florida Wild Indigo. Dry pine flatwoods, sandhills. Endemic to ne. FL (Clay and St. Johns counties) and also reported for Lowdes County, GA (Kartesz 2010) (this record needing confirmation). [= Q, S, Z; = *B. calycosa* var. *calycosa* – I, K, SE, WH3, Y] {synonymy incomplete: X}

Baptisia cinerea (Rafinesque) Fernald & Schubert, Carolina Wild Indigo. Sandhills, other dry sandy woods. Late Apr-Jun; Jun-Jul. Though common in the Coastal Plain of the Carolinas, *B. cinerea* is a narrow endemic, ranging only from s. VA south to s. SC. The large, yellow flowers are very showy. In fall, the leaves do not drop, but stay attached to the stems, the whole plant turning an ashy gray; these dried plants are conspicuous through the following winter. The report in Jones & Coile (1988) of *B. cinerea* in GA is in error; the specimen is of *B. lanceolata*. [= C, F, G, I, K, Q, RAB, SE, Va, X; = *B. villosa* (Walter) Nuttall – S, Z, misapplied]

Baptisia hirsuta Small, Hairy Wild Indigo, Panhandle Wild Indigo. Hammocks, dry pine flatwoods and sandhills. Endemic to FL Panhandle (Escambia, Holmes, Okaloosa, Santa Rosa, and Walton counties) and adjacent AL (Covington County). May; Jun-Sep. [= Q, S, Z; = *B. calycosa* Canby var. *villosa* Canby – I, K, SE, WH3, Y] {synonymy incomplete: X}

Baptisia lanceolata (Walter) Elliott var. *lanceolata*, Gopherweed. Sandhills, dry pine flatwoods. Apr-May; Jun-Nov. S. SC south to ne. FL and sw. GA, a Southeastern Coastal Plain endemic. Small (1933) alleges that *B. lanceolata* ranges north to NC, but no documentation is known. The plant is reminiscent of *B. cinerea*, but forms larger, bushier plants and is separable by characters in the key. [= I, K, Q, SE, X; < *B. lanceolata* – RAB, WH3; = *B. lanceolata* – S, Z]

Baptisia lanceolata (Walter) Elliott var. *tomentosa* (Larisey) Isely. Sandhills. Panhandle FL and adjacent s. AL; disjunct in c. peninsular FL. Two forms have been recognized, the "narrow-leaved form," endemic to the Apalachicola Lowlands portion of the FL Panhandle, and the "typical form", occupying the FL Panhandle, s. AL, and disjunct in c. peninsular FL (Isely 1981). Mendenhall (1994b) included broad-leaved and narrow-leaved forms of var. *tomentosa* in her study, which provided some support for the taxonomic recognition of these unnamed entities. [= I, K, SE, Y; = *B. lanceolata* var. *elliptica* (Small) B.L. Turner – Q; = *B. elliptica* Small – S; < *B. lanceolata* – WH3; > *B. elliptica* var. *elliptica* – Z; > *B. elliptica* var. *tomentosa* Larisey – Z]

Baptisia lecontei Torrey & A. Gray, Leconte's Wild Indigo. Sandhills, pine flatwoods. Sc. GA south to e. Panhandle FL and s. peninsular FL. [= I, K, Q, S, SE, WH3, X, Y, Z]

Baptisia leucantha Torrey & A. Gray. Woodlands, prairies, roadsides. W. MY, MI, WI, MN, and e. NE, south to AL, MS, LA, e. TX, and sw. OK; alleged by S to occur in NC, presumably based on misinterpreted material of *B. alba*. [= S, X; = *B. lactea* (Rafinesque) Thieret var. *lactea* – C, Q, Y; = *Baptisia alba* var. *macrophylla* (Larisey) Isely – I, K1, K2, Mo, SE; > *B. leucantha* var. *leucantha* – Z; > *B. pendula* Larisey var. *macrophylla* Larisey – Z]

Baptisia leucophaea Nuttall var. *laevicaulis* A. Gray ex Canby. Pinelands, coastal prairies. Apr-May. [= *B. bracteata* var. *laevicaulis* (A. Gray ex Canby) Isely – I, K2, SE; < *B. bracteata* Muhlenberg ex Elliott var. *leucophaea* (Nuttall) Kartesz & Gandhi – K1, Mo; < *B. bracteata* var. *glabrescens* (Larisey) Isely – Y; < *B. leucophaea* var. *glabrescens* Larisey – Z]

Baptisia leucophaea Nuttall var. *leucophaea*. Pinelands, woodlands. Apr-May. Nw. IN west to s. MN and e. NE, south to w. KY, c. MS, c. LA, se. LA (Turner 2006), and e. TX. [= *B. bracteata* var. *leucophaea* – I, K2, SE; < *B. leucophaea* var. *leucophaea* – F,

G, Q; < *B. bracteata* Muhlenberg ex Elliott var. *leucophaea* (Nuttall) Kartesz & Gandhi – K1, Mo; < *B. bracteata* var. *glabrescens* (Larisey) Isely – C, Y; < *B. leucophaea* var. *glabrescens* Larisey – Z]

Baptisia megacarpa Chapman ex Torrey & A. Gray, Apalachicola Wild Indigo, Bigpod Wild Indigo. Moist forests of floodplains and lower slopes. Late Apr-early Jun; Jun-Jul. E. Panhandle FL and sw. GA west to se. AL. [= Z; < *B. megacarpa* Chapman ex Torrey & A. Gray – I, K, Q, S, SE, WH3, X, Y; > *B. megacarpa* – Z]

Baptisia nuttalliana Small. Woodlands and prairies. S. AR and se. OK south to se. LA (Florida parishes) and se. TX. [= I, K1, K2, Q, S, SE, Y, Z] {synonymy incomplete}

Baptisia perfoliata (Linnaeus) R. Brown ex W.T. Aiton, Catbells, Gopherweed. Sandhills. Apr-May; May-Jul. S. SC to e. GA; disjunct in c. peninsular FL (Orange and Osceola counties); disjunct in wc. AL (Sumter County) (Keener 2007; Woods & Diamond 2014), where believed to be introduced. [= I, K, Q, RAB, S, SE, WH3, X, Y, Z]

Baptisia riparia Larisey, Ochlockonee Wild Indigo. Moist forests of floodplains. Late Apr-early Jun; Jun-Jul. Endemic to e. Panhandle FL (all known collections from the Ochlockonee River). Provisionally accepted as a species, as seemingly very distinct from *B. megacarpa*, with which it has generally been lumped. [< *B. megacarpa* Chapman ex Torrey & A. Gray – I, K, Q, S, SE, WH3, X, Y; > *B. riparia* var. *riparia* – Z; > *B. riparia* var. *minima* Larisey – Z] {not yet keyed}

Baptisia simplicifolia Croom. Pine flatwoods. Endemic to Panhandle FL (Franklin, Gadsden, Leon, Liberty, and Wakulla counties) (Wunderlin & Hansen 2004). [= I, K, Q, S, SE, WH3, X, Y, Z]

Baptisia sphaerocarpa Nuttall. Woodlands and prairies. S. MS west to se. MO, e. OK, and e. TX. [= I, K, Mo, SE; > *B. sphaerocarpa* – Z; > *B. viridis* Larisey – Z] {synonymy incomplete}

Baptisia tinctoria (Linnaeus) Ventenat, Honesty-weed, Rattleweed. Sandhills, pine flatwoods, xeric woodlands, ridges, woodland edges, and roadbanks. Apr-Aug; Jul-Nov. Widespread in eastern United States, from NY and MN south to GA. The most widespread and common of our species of *Baptisia*, *B. tinctoria* is readily recognizable from its small, yellow flowers, small leaflets, and small fruits. The taxa synonymized need further investigation. [= C, I, K, Pa, Q, RAB, S, SE, Va, W, X; > *B. tinctoria* var. *projecta* Fernald – F, G, Z; > *B. tinctoria* var. *tinctoria* – F, G, Z; > *B. tinctoria* var. *crebra* Fernald – F, Z; > *B. tinctoria* – S; > *B. gibbesii* Small – S]

22. *Crotalaria* Linnaeus 1753 (Rattlebox)

A genus of about 600 species, annual and perennial herbs, nearly cosmopolitan in tropical and temperate regions (especially diverse in Africa). References: Leverett & Woods (2012)=V; Windler (1974)=Z; Isely (1986b)=Y; Ward (2009, 2010)=X; Isely (1998)=I. Key adapted in part from SE.

- 1 Leaves trifoliolate; erect annual herb, typically 1-2 m tall.
 - 2 Leaflets obovate to elliptic-oblong, 1.5-3.5× as long as wide; legume conspicuously curved (or straight in *C. incana*).
 - 3 Legume 10-15 mm in diameter, pilose; stem pubescence spreading *C. incana*
 - 3 Legume 5-6 mm in diameter, minutely puberulent; stem pubescence appressed *C. pallida* var. *obovata*
 - 2 Leaflets lanceolate, often narrowly so, 3-15× as long as wide; legume straight or nearly so (or upcurved at the tip).
 - 4 Corolla 8-10 mm long; legume 4-6 mm in diameter, upcurved at tip *C. lanceolata*
 - 4 Corolla 18-20 mm long; legume 15 mm in diameter, not upcurved *C. ochroleuca*
- 1 Leaves unifoliolate; plants of various habits, mostly either perennial, smaller, or both.
 - 5 Corolla 1.7-3.0 cm long; leaflets 4-15 cm long; stipules not decurrent on the stem and not conspicuously foliose; [exotic annual herbs, in disturbed habitats].
 - 6 Legume pubescent [*C. juncea*]
 - 6 Legume glabrous.
 - 7 Bracts of the inflorescence 2-3 mm long, caducous; leaflets 4-8 cm long *C. retusa*
 - 7 Bracts of the inflorescence 5-8 mm long, persistent; leaflets 5-15 cm long *C. spectabilis*
 - 5 Corolla 0.7-1.4 cm long; leaflets 1-8 cm long; stipules of at least the upper leaves conspicuously decurrent on the stem, giving the impression of a downward-pointing arrowhead (this feature sometimes inconspicuous or essentially absent in *C. maritima* and *C. rotundifolia*); [native perennial or annual herbs, in natural or disturbed habitats].

- 8 Plant an erect annual; stems with spreading pubescence, the longer hairs 1-2 mm long; leaflets of the upper portion of the plant (4-) avg. 6 (-8)× as long as wide; [mostly of the Piedmont and Mountains (and Coastal Plain of VA)] *C. sagittalis*
- 8 Plant a decumbent, sprawling, or erect perennial; stems with appressed or spreading pubescence, the longer hairs <1.2 mm long; leaflets of the upper portion of the plant averaging either (1-) avg. 1-2 (-4)× or (5-) avg. 8-10 (-15)× as long as wide; [mostly of the Coastal Plain].
- 9 Leaflets glabrous above; leaflets of the upper portion of the plant usually (5-) 10 (-15)× as long as wide; plant erect or ascending *C. purshii*
- 9 Leaflets pubescent above (the hairs sometimes sparse – check with hand lens); leaflets of the upper portion of the plant usually (1-) 2 (-4)× as long as wide; plant decumbent to low-ascending.
- 10 Stem pubescence appressed *C. maritima*
- 10 Stem pubescence spreading *C. rotundifolia*

* *Crotalaria incana* Linnaeus, Shake-shake. Disturbed areas; native of the tropics, variously interpreted as pantropical or only Paleotropical. Also in peninsular FL, from Alachua County southward. [= I, K, S, SE, WH3, X]

* *Crotalaria juncea* Linnaeus, Sunn Hemp. Grown as a crop, and occurring as a waif in field edges (W. Barger, pers. comm., 2012). [= I, SE, WH3] {add to synonymy}

* *Crotalaria lanceolata* E. Meyer, Lanceleaf Rattlebox. Sandy fields, roadsides, other disturbed areas; native of Africa. Jul-Oct; Aug-Nov. [= I, K, RAB, SE, V, WH3, X]

Crotalaria maritima Chapman, Low Rattlebox, Rabbitbells. Sandy forests and woodlands, roadsides. E. SC south to s. FL, and west to e. LA, endemic to the Southeastern Coastal Plain. [= S, X; = *Crotalaria rotundifolia* Walter ex J.F. Gmelin var. *rotundifolia* – Z; < *C. rotundifolia* – C, I, K, SE, WH3, Y; < *C. angulata* – F, G, RAB, apparently misapplied]

* *Crotalaria ochroleuca* G. Don, Slenderleaf Rattlebox. Roadsides and sandy fields; native of Africa. Jul-Aug; Aug-Oct. All naturalized southeastern US material appears to be *C. ochroleuca*, not *C. brevidens* var. *intermedia* (M. Woods, pers. comm., 2011). [= I, K, SE, V, WH3, X; ? *C. intermedia* – RAB, misapplied; ? *C. brevidens* Bentham var. *intermedia* (Kotschy) Polhill, misapplied]

* *Crotalaria pallida* Aiton var. *obovata* (G. Don) Polhill, Smooth Rattlebox. Roadsides and fields; native of Africa. Jul-Sep; Aug-Oct. [= I, K, SE, V, WH3, X; ? *C. mucronata* – RAB, misapplied; ? *C. striata* A.P. de Candolle – S, misapplied]

Crotalaria purshii A.P. de Candolle, Coastal Plain Rattlebox, Pursh's Rattlebox. Mesic to dry pinelands, sandy openings, roadsides. May-Jul; Jul-Sep. A Southeastern Coastal Plain endemic: se. VA south to n. FL, c. peninsular FL, and west to e. LA, with scattered locations inland. [= C, G, I, K, RAB, S, SE, V, Va, W, WH3, X; > *C. purshii* var. *purshii* – F; > *C. purshii* var. *bracteolifera* Fernald – F]

* *Crotalaria retusa* Linnaeus, Rattleweed. Disturbed areas; native of the Old World tropics. Jul-Sep; Aug-Oct. [= F, G, I, K, RAB, S, SE, WH3, X]

Crotalaria rotundifolia Walter ex J.F. Gmelin, Low Rattlebox, Rabbitbells. Sandy forests and woodlands, roadsides. Se. VA south to c. peninsular FL, west to se. LA; also widespread in Mexico. [= V, X; < *C. rotundifolia* – C, I, K, SE, WH3, Y; < *C. angulata* – F, G, RAB, misapplied; = *C. rotundifolia* – S; = *Crotalaria rotundifolia* Walter ex J.F. Gmelin var. *vulgaris* Windler – Va, Z]

Crotalaria sagittalis Linnaeus, Common Rattlebox. Woodlands, woodland edges, openings, fields. Jun-Aug; Jul-Sep. MA and VT west to s. MI, s. WI, and c. MN, south to c. SC, s. AL, s. MS, TX, Mexico and Central America; West Indies. [= C, G, I, K, Mo, Pa, RAB, S, SE, V, Va, W, WV; > *C. sagittalis* var. *sagittalis* – F; > *C. sagittalis* var. *oblonga* Michaux – F]

* *Crotalaria spectabilis* Roth, Showy Rattlebox. Fields, roadsides, disturbed areas; native of s. Asia. Jul-Sep; Aug-Oct. [= C, F, G, I, K, Mo, RAB, SE, V, Va, WH3, X; ? *C. retzii* A.S. Hitchcock – S]

23. *Lupinus* Linnaeus 1753 (Lupine)

A genus of about 200-250 species, annual herbs, perennial herbs, and shrubs, of temperate and tropical regions in North America, Mediterranean Europe, South America, and Africa (especially diverse in w. North America and South America). References: Isely (1998)=I.

- 1 Leaves unifoliolate; leaves and stems evergreen, overwintering (absent in midsummer); plant conspicuously pubescent.
 - 2 Standard with a white to creamy eyespot; hairs of the legume 1.5-3 mm long, villous or sericeous.
 - 3 Legumes 27-42 mm long, 8.1-8.5 mm wide; plants to 19 dm tall; living plants silvery; [of FL peninsula] [*L. cumulicola*]
 - 3 Legumes 35-47 mm long, 6.3-7.6 mm wide; plants to 7 dm tall; living plants grey-green; [of se. NC south to s. FL, west to s. MS] *L. diffusus*
 - 2 Standard with a red or deep purple eyespot; hairs of the legume 3-5 mm long, villous.
 - 4 Hairs of the petioles 1.5-2.5 mm long; corolla pinkish to lavender; plants 2-6 dm tall; [of se. NC southward to n. FL, west to se. LA] *L. villosus*
 - 4 Hairs of the petioles 0.5-1 (-1.5) mm long; corolla blue; plants 8-15 dm tall; [of FL Panhandle] *L. westianus*
- 1 Leaves palmately compound; leaves and stems deciduous, dying back in winter; plant inconspicuously pubescent.
 - 5 Corolla yellow; plant annual; [alien] [*L. luteus*]
 - 5 Corolla blue; plant perennial or annual; [native or alien].
 - 6 Leaflets 5-9, linear, 5-9× as long as wide; plant annual; [alien] [*L. angustifolius*]
 - 6 Leaflets 7-11, oblongate, 3-5× as long as wide; plant perennial; [native]
 - 7 Stem short; leaves clustered, nearly whorled; leaflets narrow; racemes long exserted; flowers small; [plants of e. GA southward and westward] *L. perennis* ssp. *gracilis*
 - 7 Stem elongate; leaves alternate; leaflets broad; racemes only moderately exserted; flowers large; [plants of n. SC northward] *L. perennis* ssp. *perennis*

* *Lupinus angustifolius* Linnaeus, Narrowleaf Lupine. Fields, disturbed areas; native of Mediterranean Europe. [= I, K, WH3]
Lupinus cumulicola Small. Sandhills and Florida scrub, old fields, roadsides, pastures, and scraped areas, as long as the disturbance is not too frequent Endemic to the central ridge of peninsular FL. The species rank of this taxon is strongly corroborated by Atchison et al. (2014). [= K1, K2, S; < *L. diffusus* – I, SE, WH3]
Lupinus diffusus Nuttall, Blue Sandhill Lupine. Sandhills, sandy roadsides. Mar-May; Jun-Jul. Se. NC south to s. FL, west to s. MS. I concur with Duncan & McCartney (1992) in recognizing *L. cumulicola* Small of peninsular FL as distinct from *L. diffusus*. Moreover, Atchison et al. (2014) show that at least an additional taxon (here listed as *Lupinus species 1*) should be segregated from *L. diffusus* s.l. [*L. diffusus* – I, K1, K2, RAB, S, SE, WH3]
Lupinus luteus Linnaeus, Yellow Lupine. Disturbed areas; native of Mediterranean Europe. [= I, K, SE, WH3]
Lupinus perennis Linnaeus ssp. *gracilis* (Nuttall) Dunn, Southern Sundial Lupine. Sandhills and sandy or dry rocky roadsides. E. GA (immediately across the Savannah River from SC), south to n. FL and west to s. AL. The validity of this taxon is uncertain; the differences may be only clinal. [= K, SE; < *L. perennis* – C, G, Pa, RAB, WH3; = *L. perennis* var. *gracilis* (Nuttall) Chapman – I; = *L. nuttallii* S. Watson – S]
Lupinus perennis Linnaeus ssp. *perennis*, Northern Sundial Lupine. Sandhills, sandy roadsides, other dry (and usually sandy and nutrient-poor) habitats. Apr-May; Jun-Jul. ME west to MN, south to n. SC, w. VA, e. WV, IN, and IL. [= SE; < *L. perennis* – C, G, RAB, Va, W; > *L. perennis* var. *perennis* – F, I, WV; > *L. perennis* var. *occidentalis* S. Watson – F, WV; > *L. perennis* ssp. *perennis* var. *perennis* – K; > *L. perennis* ssp. *perennis* var. *occidentalis* – K; = *L. perennis* – S]

Lupinus species 1. Xeric sands. FL peninsula, north to Lake County, just south of our area (Atchison et al. 2014). Under study by E. Bridges and collaborators (E. Bridges, pers. comm., 2015). [< *L. diffusus* Nuttall – I, K1, K2, S, SE, WH3] {not yet keyed}
Lupinus villosus Willdenow, Pink Sandhill Lupine. Sandhills, sandy roadsides. Apr-May; Jun-Aug. Se. NC south to n. FL, west to se. LA. [= I, K, RAB, S, SE, WH3]
Lupinus westianus Small, Gulf Coast Lupine. Coastal dunes, sandhills. Endemic to Panhandle FL. *L. aridorum* McFarlane ex Beckner (sometimes erroneously lumped with or separated at only varietal rank from *L. aridorum*) is endemic to sand pine scrub in the central FL peninsula. [= *L. westianus* var. *westianus* – I, K, WH3; < *L. westianus* – S]

24. *Cytisus* Desfontaines 1798 (Broom)

A genus of about 65 species, shrubs and herbs, of Eurasia. References: Isely (1998)=I.

* *Cytisus scoparius* (Linnaeus) Link, Broom, Scotch Broom, Besom, Ginster. Roadbanks, woodland borders, disturbed areas; native of Europe. Apr-Jun; May-Jul. [= C, F, G, I, Pa, RAB, S, SE, Va, W, WV; > *C. scoparius* var. *scoparius* – K]

25. *Genista* Linnaeus 1753 (Dyer's Greenweed)

A genus of about 80-90 species, shrubs, herbs, and small trees, native to Eurasia. References: Isely (1998)=I.

* *Genista tinctoria* Linnaeus, Dyer's Greenweed, Dyer's Broom. Disturbed areas; native of Europe. Jun-Sep. Not cited in Harvill et al. (1992), but described as naturalized in sterile soils south to VA in C, F, and G. [= C, F, G, I, K]

26. *Ulex* Linnaeus 1753 (Gorse)

A genus of 10-20 species, shrubs, of Europe and n. Africa. References: Isely (1998)=I.

* *Ulex europaeus* Linnaeus, Gorse, Furze. Disturbed areas; native of Europe. Jun. Not cited in Harvill et al. (1992), but naturalized in sandy soils in York County, VA. Also reported from WV and PA. [= C, F, G, I, K, SE]

27. *Amorpha* Linnaeus 1753 (Indigo-bush, Leadplant)

A genus of about 15 species, shrubs, of temperate North America. References: Straub, Sorrie, & Weakley (2009)=X; Wilbur (1964)=Z; Wilbur (1975)=Y; Isely (1998)=I.

- 1 Short shrubs, usually 0.3-1 (-1.5) m tall; petioles 1-15 (-20) mm long, usually shorter than the width of the contiguous leaflets (except in *A. confusa*); leaflets usually slightly or conspicuously revolute.
- 2 Leaflet mucros mostly swollen apically; plant usually evidently and rather densely pubescent or puberulent (except *A. herbacea* var. *floridana*, of s. GA and FL).
 - 3 Upper portions of the plant (stems and leaves) glabrescent; calyx tube glabrous to sparsely or densely minutely strigillose; fruit glabrous; [of s. GA southward]..... *A. herbacea* var. *floridana*
 - 3 Upper portions of the plant (stems and leaves) conspicuously pubescent; calyx tube densely puberulent to short pilose; fruit densely to sparsely puberulent (rarely glabrate); [widespread in our area]..... *A. herbacea* var. *herbacea*
- 2 Leaflet mucros mostly tapered apically; plant usually glabrous or sparsely pubescent.
 - 4 Leaflets (10-) 15-25 (-35) mm long, (7-) 9-15 (-18) mm wide; standard intense (rarely light) bright blue; petiole (6-) 8-15 (-20) mm long; racemes mostly paniced, (1-) 3-5 (-8) per flowering branch, 10-20 (-45) cm long; flowering Jun-Jul *A. confusa*
 - 4 Leaflets (3-) 6-10 (-15) mm long, (2-) 3-5 (-8) mm wide; standard reddish-purple; petiole 1-3 (-5) mm long; racemes solitary (less commonly paniced), 1 (-4) per flowering branch, (2-) 3-5 (-6) cm long; flowering Apr-May *A. georgiana*
- 1 Taller shrubs, usually 1-3 (-4) m tall, petioles 10-30 mm long, usually exceeding the width of the contiguous leaflets; leaflets not revolute, or slightly so.
 - 5 Calyx lobes (1.2-) 2.0-3.5 mm long (thus approaching, equal to, or exceeding the length of the calyx tube); racemes 3-8 (-15) cm long *A. schwerinii*
 - 5 Calyx lobes (0-) 0.2-1.2 mm long (thus distinctly shorter than the calyx tube); racemes 5-20 (-25) cm long.
 - 6 Calyx lobes obsolete to very small, (0-) 0.2-0.6 (-0.8) mm long; plants glabrous to glabrate; leaflets usually not mucronate, the midrib commonly terminating in a sessile or shortly exserted (0.2-0.4 mm), slightly enlarged, glandular tip; leaflets relatively few, (9-) 11-15 (-19) *A. glabra*
 - 6 Calyx lobes small, 0.2-1.2 mm long (the lowermost lobe usually 0.8-1.2 mm long); plants pubescent or puberulent, usually conspicuously so; leaflets usually mucronate, the midrib usually slender, exserted, 0.5-1.5 mm long and tapering; leaflets relatively many, 9-23 (-31).
 - 7 Foliage remaining green when dried; leaflets (7-) 9-23 (-31) per leaf, dull to somewhat shiny above; [widespread in our area]..... *A. fruticosa*
 - 7 Foliage blackening when dried; leaflets (7-) 9-15 (-19) per leaf, usually shiny above; [of s. SC and southward]..... *A. nitens*

Amorpha confusa (Wilbur) S.C.K. Straub, Sorrie, & Weakley, Savanna Indigo-bush. Pine savannas. (May-) Jun-Jul; Aug-Oct. *A. confusa* is a narrow endemic of the se. Coastal Plain of NC (Brunswick, Columbus, and Bladen counties) and immediately adjacent SC (Horry County). It is restricted to moist loamy savannas, especially on the Foreston soil series, a habitat now largely destroyed by fire suppression, real estate development, and conversion of savannas to pine tree farms. [= X; = *Amorpha georgiana* Wilbur var. *confusa* Wilbur – I, K, SE, Y, Z; < *A. georgiana* – GW, RAB; ? *A. cyanostachya* auct. non M.A. Curtis – S, in part]

Amorpha fruticosa Linnaeus, Tall Indigo-bush. Riverbanks, forests, woodlands, marsh edges, sometimes in disturbed sites. Apr-Jun; Jun-Oct. [= C, G, GW, I, K, Mo, Pa, RAB, SE, Va, W, WH3, Y; > *A. fruticosa* var. *fruticosa* – F; > *A. fruticosa* var. *tennesseensis* (Shuttleworth) E.J. Palmer – F; > *A. curtissii* Rydberg – S; > *A. fruticosa* – S; > *A. tennesseensis* Shuttleworth – S; > *A. virgata* Small – S]

Amorpha georgiana Wilbur, Georgia Indigo-bush. Pine savannas, sandy river terraces. Late Apr-Jun; Jul-Oct. *A. georgiana* is endemic to the Coastal Plain of sc. NC, SC, and se. GA, primarily in the fall-line Sandhills region, but rarely found on younger terraces (as far east as Pender County, NC). Much of its habitat has been destroyed. [= X; = *Amorpha georgiana* Wilbur var. *georgiana* – I, K, SE, Y, Z; < *A. georgiana* – GW, RAB]

Amorpha glabra Desfontaines ex Poirlet, Appalachian Indigo-bush, Mountain Indigo. Dry to dry-mesic ridgetop and slope forests, primarily in the Blue Ridge escarpment. May-Jul; Jul-Oct. Endemic to the Southern Appalachian mountains (and nearby provinces) of n. AL, ne. GA, w. NC, nw. SC, and e. and c. TN. [= I, K, RAB, S, SE, W, Y]

Amorpha herbacea Walter var. **floridana** (Rydberg) Wilbur, Florida Indigo-bush. Pine flatwoods and sandy river terraces. Se. GA (Echols County) south into FL (Sorrie 1998b). [= Y, Z; < *A. herbacea* var. *herbacea* – I, K, SE, WH3; = *A. floridana* Rydberg – S]

Amorpha herbacea Walter var. **herbacea**, Dwarf Indigo-bush. Pine savannas, pine flatwoods, sandhills, other open forests and disturbed sites. May-Jul; Jul-Oct. Endemic to FL, GA, SC, and NC, mostly limited to the Coastal Plain. [= Y, Z; < *A. herbacea* var. *herbacea* – I, K, SE, WH3; < *A. herbacea* – RAB, W; = *A. herbacea* – S]

Amorpha nitens Boynton, Dark Indigo-bush. Sandy woodlands, rocky slopes, bottomland forests. Apr-Jun. S. SC south to GA, west to LA, north in the interior to w. KY, s. IL, AR, and e. OK. First reported for SC by Nelson & Kelly (1997). [= I, K, S, SE, Y]

Amorpha schwerinii C. Schneider, Piedmont Indigo-bush. Forests and woodlands, primarily rather xeric and rocky (though not exclusively so). Apr-Jun; Jun-Oct. Endemic to the Piedmont (rarely adjacent provinces) of sc. NC, c. SC, nc. GA, e. AL, and ne. MS. [= I, K, RAB, S, SE, Y]

28. *Dalea* Lucanus 1758 (Prairie-clover)

A genus of about 165 species, herbs and shrubs, of temperate and tropical America, especially dry areas and most diverse in Mexico. References: Barneby (1977)=Z; Ward (2004c)=Y; Isely (1998)=I. Key adapted from SE.

- 1 Spikes corymbosely aggregated, capitate, surrounded by an involucre of 3-4 series of sterile bracts; [subgenus *Dalea*, section *Kuhnistera*].
 - 2 Leaflets elliptic to oblanceolate, 1.5-2 mm wide; spikes 10-13 mm in diameter; [of FL peninsula]..... [*D. adenopoda*]
 - 2 Leaflets linear to filiform, < 1 mm wide; spikes 8-10 mm in diameter; [of se. NC south to c. peninsular FL, west to e. LA].
 - 3 Leaflets 5-9 (-15); petals (other than the standard) mostly 3.7-4.5 mm long..... *D. pinnata* var. *pinnata*
 - 3 Leaflets usually 3; petals (other than the standard) mostly 4.8-6.8 mm long *D. pinnata* var. *trifoliata*
- 1 Spikes not corymbosely disposed, ovoid to cylindric, with or without a few subtending, sterile bracts.
 - 4 Corolla subpapilionaceous, with apparent, differentiated wings and keel; stamens 9-10; annual herb; [alien, of disturbed habitats]; [subgenus *Dalea*, section *Dalea*]..... [*D. leporina*]
 - 4 Corolla not papilionaceous, the wings and keel not differentiated; stamens 5; perennial herb; [native, primarily of calcareous glades and Coastal Plain pinelands]; [subgenus *Dalea*, section *Kuhnistera*].
 - 5 Leaflets 15-25; leaflets 2.5-3.5× as long as wide *D. foliosa*
 - 5 Leaflets 3-9; leaflets 3-10 (or more)× as long as wide.
 - 6 Plants slightly to obviously pubescent (at least the spikes obviously pubescent); leaflets commonly involute or tubular, and > 10× as long as wide; corolla purple or pink.
 - 7 Leaflets 5-7 (-9); spikes lengthening and loosening in fruit, often becoming sinuous; plants decumbent to ascending, stems normally branching only below the middle *D. gattereri*
 - 7 Leaflets 3-5 (-7); spikes remaining compact; plants decumbent or ascending, stems normally branching only below the middle (*D. cahaba*), or ascending to erect, the stems branching above the middle (*D. purpurea* var. *purpurea*).
 - 8 Interfloral bracts with pubescence along the keel and margins; plants decumbent to ascending, stems normally branching only below the middle..... *D. cahaba*
 - 8 Interfloral bracts with pubescence in a transverse band only; plants ascending to erect, the stems branching above the middle *D. purpurea*
 - 6 Plants glabrous (except that the calyx lobes may be pubescent); leaflets broad and flat or narrow and involute; corolla pink-purple or white.
 - 9 Calyx tube not incised on the ventral (upper) side; blade of the standard cordate; corolla white; [of calcareous habitats of inland provinces of GA, AL, TN, WV and westward] *D. candida*
 - 9 Calyx tube deeply incised on the ventral (upper) side; blade of the standard not cordate; corolla pink-purple or white; [of the Coastal Plain of GA southward and westward].

- 10 Leaflets linear, folded, or involute and terete-filiform; spikes globose ca. 6-12 mm long and in diameter; bracts much shorter than the calyx; corolla usually bright pink-purple (less commonly white or lavender) *D. feayi*
- 10 Leaflets elliptic to oblanceolate, flat or folded; spikes ovoid to cylindric, 7-40 mm long; bracts as long as or longer than the calyx; corolla pink or white.
- 11 Plants spreading or decumbent; leaves widely spaced, generally lacking axillary fascicles; bract tips recurved in bud; calyx 2.7-3.3 mm long; flowers white; [of sc. and sw. GA west to se. LA] *D. mountjoyae*
- 11 Plants erect-ascending to sprawling; leaves more densely spaced, generally with well-developed axillary fascicles; bract tips not recurved in bud; flowers pink or white; [of the GA Coastal Plain, se. AL, and south through e. FL Panhandle to the s. FL peninsula].
- 12 Leaflets of primary stem leaves mostly 5; corolla white *D. albida*
- 12 Leaflets of primary stem leaves mostly 7-9; corolla pink (rarely white) *D. carnea*

Dalea adenopoda (Rydberg) Isely, Summer-farewell. Sandhills, scrub. Endemic to the FL peninsula, from just south of our area southwards. [= I, K2, SE; = *D. pinnata* (J.F. Gmelin) Barneby var. *adenopoda* (Rydberg) Barneby – WH3; > *Kuhnistera adenopoda* Rydberg – S; > *Kuhnistera truncata* Small – S] {not yet keyed}

Dalea albida (Torrey & A. Gray) D.B. Ward, White-tassels. Pinelands. Jul-Nov. E. GA (near the SC border) west to se. AL, south to ne. FL, n. peninsular FL, and e. FL Panhandle. [= Y; = *Dalea carnea* (Michaux) Poiret var. *albida* (Torrey & A. Gray) Barneby – I, K, SE, WH3, Z; = *Petalostemon albidus* (Torrey & A. Gray) Small – S]

Dalea cahaba J. Allison, Cahaba Prairie-clover. Dolomitic Ketona glades. May-Jun; Jun-Sep. Endemic to c. AL (Bibb County) (Allison & Stevens 2001). [= K2]

Dalea candida Michaux ex Willdenow, White Prairie-clover. Limestone glades and barrens. Late May-Aug. WV, KY, IN, WI, MN, and SK south to nw. GA, e. TN, w. AL, sc. MS, s. LA, and ne. TX. [= I, Mo, SE (excluding *D. occidentalis*); = *D. candida* var. *candida* – C, K, Z; = *Petalostemum candidum* (Michaux ex Willdenow) Michaux – F, G; = *Petalostemon candidus* (Michaux ex Willdenow) Michaux – S]

Dalea carnea (Michaux) Poiret, Pink-tassels. Dry sandy pinelands. Jun-Nov. Se. GA south to s. peninsular FL. [= Y; = *Dalea carnea* (Michaux) Poiret var. *carnea* – I, K, SE, WH3, Z; = *Petalostemon carneus* Michaux – S]

Dalea feayi (Chapman) Barneby, Feay's Prairie-clover. Sandhills. Jun-Oct. E. GA (vicinity of the Altamaha River); FL peninsula; Panhandle FL (vicinity of the Apalachicola River). [= I, K, SE, WH3, Z; = *Petalostemon feayi* Chapman – S]

Dalea foliosa (A. Gray) Barneby, Cedar Glade Prairie-clover. Calcareous glades. Late Jun-Sep. C. TN, n. AL, IL, and OH (?). [= C, I, K, SE, Z; = *Petalostemum foliosum* A. Gray – F, G; = *Petalostemon foliosus* A. Gray – S]

Dalea gattingeri (A. Heller) Barneby, Gattinger's Prairie-clover. Limestone glades and barrens. May-Aug. C. TN, nw. GA, n. AL, s. MO, and n. AR (Sundell et al. 1999). [= I, K, Mo, SE; = *Petalostemon gattingeri* (A. Heller) A. Heller – S]

* *Dalea leporina* (Aiton) Bullock, Hare's-foot Dalea, Foxtail Dalea. Disturbed areas; native of w. North America. [= I, K, Mo, SE, Z; ? *Parosela alopecuroides* (Willdenow) Rydberg – S]

Dalea mountjoyae M. Woods, Sprawling White-tassels. Wet pine savannas. Aug-Sep. Sc. and sw. GA west to se. LA. The combination at the specific level in *Dalea* using the epithet 'gracilis' is preoccupied; a replacement name is supplied by Woods (2013). [= *Dalea carnea* (Michaux) Poiret var. *gracilis* (Nuttall) Barneby – I, K, SE, WH3, Z; = *Petalostemon gracilis* Nuttall – S; = *Dalea gracilis* (Nuttall) D.B. Ward – Y]

Dalea pinnata (J.F. Gmelin) Barneby var. *pinnata*, Summer Farewell, Eastern Prairie-clover. Sandhills and other dryish pinelands, especially in loamy sands. Aug-Nov. Sc. and se. NC south through SC and GA to c. peninsular FL and e. Panhandle FL. [= I, K, SE, WH3, Z; < *Petalostemum pinnatum* (J.F. Gmelin) Blake – RAB; < *Kuhnistera pinnata* (J.F. Gmelin) Kuntze – S]

Dalea pinnata (J.F. Gmelin) Barneby var. *trifoliata* (Chapman) Barneby. Sandhills, dry to moist longleaf pine flatwoods. Sep-Nov. E. GA (near the Savannah River) south and west to w. Panhandle FL, s. AL, and s. MS. [= I, K, SE, WH3, Z; < *Kuhnistera pinnata* (J.F. Gmelin) Kuntze – S; = *Petalostemon pinnatus* (J.F. Gmelin) Blake ssp. *trifoliatus* (Chapman) Wemple]

Dalea purpurea Ventenat, Purple Prairie-clover. Prairies, glades, and open woodlands. NY and ON west to BC, south to KY, TN, n. AL, c. MS, TX, and NM. [= *D. purpurea* var. *purpurea* – C, I, K1, Mo, SE, Z; = *Petalostemum purpureum* (Ventenat) Rydberg – F, G; = *Petalostemon purpureus* (Ventenat) Rydberg – S]

29. *Zornia* J. F. Gmelin 1792 (*Zornia*)

A genus of about 50-90 species, perennial herbs, of tropical and warm temperate regions. References: Isely (1998)=I.

Identification notes: The palmately 4-foliolate leaves are unique in the flora of our area.

Zornia bracteata Walter ex J.F. Gmelin, Viperina. Flatwoods, sandhills, sandy roadsides. Jun-Aug; Jul-Oct. Se. VA south to s. FL, west to TX and e. Mexico, endemic to the Southeastern Coastal Plain. [= C, F, G, K, RAB, S, SE, Va, WH3]

30. *Chapmannia* Torrey & A. Gray 1838 (*Alicia*)

A genus of about 7 species, perennial herbs, shrubs and trees, of tropical America and Africa, most closely related in the Southeastern flora to *Stylosanthes* and the introduced *Arachis* (Lewis et al. 2005). References: Isely (1998)=I.

Chapmannia floridana Torrey & A. Gray, Alicia. Longleaf pine sandhills, Florida scrub. Apr-May. N. FL (Clay County) south to s. FL. [= I, K, S, WH3]

31. *Stylosanthes* Swartz 1788 (*Pencil-flower*)

A genus of about 25-50 species, annual and perennial herbs, pantropical and less commonly temperate. References: Isely (1998)=I.

Stylosanthes biflora (Linnaeus) Britton, Sterns, & Poggenburg, Pencil-flower. Sandhills, dry to moist (but not wet) pine savannas and flatwoods, dry forests, woodlands, woodland borders, glades, barrens, rock outcrops. Jun-Aug; Jul-Oct. S. NY west to OH, s. IL, and KS, south to c. peninsular FL and e. TX. The large, adnate stipules are distinctive. Variation in this species (see synonymy) needs additional study. [= C, I, K1, K2, Mo, Pa, RAB, SE, Va, W, WH3, WV; > *S. biflora* var. *biflora* – F, G; > *S. biflora* var. *hispidissima* (Michaux) Pollard & Ball – F, G; > *S. riparia* Kearney – G, S; > *S. riparia* var. *riparia* – F; > *S. riparia* var. *setifera* Fernald – F; > *S. biflora* – S]

32. *Arachis* Linnaeus 1753 (*Peanut*)

A genus of about 60 species, annual and perennial herbs, native of South America (especially Brazil). References: Isely (1998)=I.

- 1 Petiole 2.5-3.5 cm long; corolla 1.8-2 cm long; perennial *A. glabrata*
- 1 Petiole 5-10 cm long; corolla 1.1.5 cm long; annual *A. hypogaea*

* *Arachis glabrata* Bentham, Grassnut. Disturbed areas; native of South America, planted on roadsides and spreading. Jul-Oct. Anderson (2007) states that this is “naturalized and spreading”; the species is also reported for Charlton County, GA (Carter, Baker, & Morris 2009) and Baldwin County, AL (Keener, 2012; Barger et al. 2012). [= I, SE, WH3; = *A. prostrata* Bentham – K1, misapplied; = *A. glabrata* var. *glabrata* – K2]

* *Arachis hypogaea* Linnaeus, Peanut. Fields; commonly cultivated, rarely persistent; native of South America. Jul-Oct. This remarkable plant bears normal aerial flowers, but following pollination the pedicels elongate and arch downward, the legume soon buried and developing underground. [= C, F, I, K1, K2, Mo, RAB, S, SE, WH3]

33. *Aeschynomene* Linnaeus 1753 (*Joint-vetch*)

A genus of about 175 species, herbs and shrubs, pantropical and warm temperate. References: Arrighi et al. (2013); Carulli, Tucker, & Dill (1988)=Z; Rudd (1955)=Y; Isely (1998)=I. Key adapted in part from SE.

- 1 Prostrate perennial; leaves with 3-19 leaflets [of dry, sandy or disturbed areas].
- 2 Leaves with 8-18 leaflets; leaflets 3-4 mm long; [rare alien, of disturbed areas]..... [*A. histrix* var. *incana*]
- 2 Leaves with 3-7 (-9) leaflets; leaflets 4-12 mm long; [relatively common native, of dry sandy pinelands]..... *A. viscidula*
- 1 Erect or ascending annual; leaves with 21-51 or more leaflets; [of moist to wet habitats].
- 3 Leaflets with 2-4 longitudinal nerves; mature fruit stipe 1.5-3 mm long *A. americana* var. *americana*

- 3 Leaflets with 1 longitudinal nerve; mature fruit stipe 4-25 mm long.
- 4 Mature fruit stipe 12-25 mm long; corolla (10-) 12-15 mm long; fruit segments 5-7 mm long, 4.5-6.5 mm wide; paired bracts subtending each flower toothed (rarely entire); standard greenish-yellow with distinct dark-red veins; leaflets 6-25 mm long, 2-5 mm wide *A. virginica*
- 4 Mature fruit stipe 4-8 (-10) mm long; corolla 7-13 (-15) mm long; fruit segments 4-6 mm long, 3.5-6 mm wide; paired bracts subtending each flower toothed or entire; standard pale orange or reddish-orange, the veins usually indistinct; leaflets 2.5-25 mm long, 1-4 mm wide.
- 5 Paired bracts subtending each flower entire (rarely toothed); leaflets 2.5-13 mm long, 1-2.5 mm wide; fruit segments 4-5 mm wide, 3.5-5 mm wide *A. indica*
- 5 Paired bracts subtending each flower toothed (rarely entire); leaflets 6-25 mm long, 1.5-4 mm wide; fruit segments 5-6 mm wide, 5-6 mm wide *A. rudis*

Aeschynomene americana Linnaeus var. *americana*, Shyleaf. Moist, disturbed sites. S. GA (Jones & Coile 1988, SE), s. AL, s. LA south to Central America; West Indies; se. Asia. [= I, SE, Y; < *A. americana* – K, S, WH3]

* *Aeschynomene hystrix* Poirlet var. *incana* (Vogel) Benth. Disturbed areas; native of tropical America. Probably introduced on ship's ballast at Pensacola in the 19th century, but seemingly established as it was recollected in Escambia County, FL, in 1985 (Isely 1990). [= K, WH3; = *A. hystrix* var. *incana* – SE, orthographic variant]

Aeschynomene indica Linnaeus, Southern Joint-vetch Marshes, ditches, disturbed wetlands. Jul-Oct. Apparently native to se. North America, from NC west to AR, south to s. FL and TX, now widespread in the tropics and subtropics of the Old World and New World. Perry, Ware, & McKenney-Mueller (1998) discuss the occurrence of this species in VA. Apparently a tetraploid derivative of *A. evenia* and *A. scabra* (Arrighi et al. 2013). [= GW, I, K, Mo, SE, Va, WH3, Y, Z; < *A. virginica* – S]

* *Aeschynomene rudis* Benth. Frisolillo. Roadside ditches, rice fields, disturbed wetlands; native of South America. Jul-Oct. Native to South America, introduced in se. United States, recently becoming a weed. A diploid, and one of the parents of *A. virginica* (Arrighi et al. 2013). [= I, K, Mo, SE, WH3, Y, Z]

Aeschynomene virginica (Linnaeus) Britton, Sterns, & Poggenburg, Northern Joint-vetch, Sensitive Joint-vetch. Fresh to brackish tidal marshes and adjacent ditches, fields, and disturbed areas. Jul-Oct. NJ to ne. NC. Generally not weedy in most of its range, but in NC (now) found mostly in weedy situations, such as ditches or fields hydrologically connected to tidal waters. See Tyndall, Holt, & Lam (1996) and Belden & Van Alstine (2003) for additional information on habitat, population biology, and survey techniques. See Baskin et al. (1998) for additional information about seed germination and viability. Apparently a tetraploid derivative of *A. rudis* and *A. scabra* (Arrighi et al. 2013). [= C, F, G, I, K, Pa, RAB, SE, Va, Y, Z; < *A. virginica* – S (also see *A. indica*)]

Aeschynomene viscidula Michaux, Sticky Joint-vetch. Dry sandy areas, such as sandhills, dry pinelands, and barrier islands. From s. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009; SE), panhandle FL, s. AL, s. MS, and s. TX south to s. FL; Mexico south through Central America to South America; West Indies. [= I, K, SE, WH3, Y; = *Secula viscidula* (Michaux) Small – S]

34. *Indigofera* Linnaeus 1753 (Indigo)

A genus of about 700 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan in tropical and warm temperate regions. References: Isely (1998)=I.

- 1 Leaflets borne alternately or irregularly on the rachis.
- 2 Stipules subulate, < 1.5 mm wide; legumes divergent to deflexed, spaced on the rachis; flowers 6-10 per inflorescence [*I. miniata*]
- 2 Stipules deltate to lanceolate, 2-3 mm wide; legumes deflexed, crowded on the rachis; flowers many per inflorescence *I. spicata*
- 1 Leaflets borne opposite on the rachis.
- 3 Stem pubescence hirsute or pilose with long brownish hairs *I. hirsuta*
- 3 Stem pubescence strigose-appressed.
- 4 Legume 7-9 mm long, ovoid, not falcate, indehiscent, with 2-3 seeds; corolla 6-9 mm long; [native species] *I. caroliniana*
- 4 Legume 15-36 mm long, linear-cylindric, slightly to strongly falcate (or straight in *I. decora*), dehiscent, with 3-12 or more seeds; corolla either 5-6 mm long or 15-18 mm long; [introduced species].
- 5 Corolla 15-18 mm long; legume 30-40 mm long, straight; leaflets 2.5-4 cm long [*I. decora*]
- 5 Corolla 5-6 mm long; legume 15-36 mm long, slightly to strongly falcate; leaflets (0.5-) 1-3 cm long.
- 6 Legume 15-20 mm long, strongly falcate *I. suffruticosa*
- 6 Legume 28-36 mm long, slightly falcate [*I. tinctoria*]

Indigofera caroliniana P. Miller, Wild Indigo, Carolina Indigo. Sandhills, Florida scrub, maritime forests, other sandy forests and woodlands. Jun-Aug; Jul-Oct. E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. [= I, K1, K2, RAB, S, SE, WH3]

* *Indigofera decora* Lindley, Chinese Indigo. Planted horticulturally and spreading to nearby roadbanks, potentially invasive; native of China. Jun-Jul (-Sep). In GA (Oglethorpe County). [= K2]

* *Indigofera hirsuta* Linnaeus, Hairy Indigo. Sandy disturbed areas, such as wildlife "food fields"; native of the Old World tropics. First reported for SC by Nelson & Kelly (1997). Also known from other scattered locations in the Southeast, such as s. MS (Leonard, 2006, pers. comm.) and AL (Diamond & Woods 2009). [= I, K1, K2, SE, WH3]

Indigofera miniata Ortega. Dunes, dry disturbed areas. S. KS south to s. TX, disjunct eastward in FL and (?) GA (where reported by Chapman 1883). [= *I. miniata* - I, K1, K2; > *I. leptosepala* Nuttall ex Torrey & A. Gray - S; > *I. miniata* var. *leptosepala* (Nuttall ex Torrey & A. Gray) B.L. Turner - SE, WH3]

* *Indigofera spicata* Forsskål, Trailing Indigo. Dry, disturbed areas, hammocks, dunes; native of Africa. Reported for Camden County, GA (Carter, Baker, & Morris 2009) and Mobile County, AL (Barger et al. 2012). [= I, K1, SE, WH3; ? *I. hendecaphylla* Jacquin - K2]

*? *Indigofera suffruticosa* P. Miller, West Indian Indigo. Disturbed areas, dry sandy woodlands, formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in our area; native of the New World tropics, including s. FL. [= I, K1, K2, S, SE, WH3; ? *I. anil* Linnaeus]

* *Indigofera tinctoria* Linnaeus, African Indigo. Formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in our area; native of Africa. Both this species and *I. suffruticosa* were cultivated as an important export crop in the Coastal Plain of GA, SC, and (less so) NC in the seventeenth and eighteenth centuries. [= I, K1, K2, S, SE, WH3]

35. *Wisteria* Nuttall 1818 (*Wisteria*)

A genus of about 6 species, woody vines, shrubs, and small trees, of temperate e. Asia and e. North America. Some research suggests that the Asian species should be placed in a separate genus (see Isely 1998 and Stritch 1984). References: Isely (1998)=I; Valder (1995)=Z; Stritch (1984)=Y.

Identification notes: Twining direction can be determined by looking at (or imagining) the vine twining around a branch or pole. Look at the pole or branch from the base (from the direction from which the vine is growing). If the vine is circling the branch or pole in a clockwise direction, that is dextrorse; if counterclockwise, that is sinistrorse. Identification of the two alien species and their hybrids is uncertain. Genetic sorting of morphological characters and horticultural selection mean that morphology is only poorly correlated with genetic origin. Trusty et al. (2007) found that 24 of 25 individuals tested from scattered sites around the Southeast showed genetic admixture (sometimes complicated) between *W. floribunda* and *W. sinensis*. Probably the great majority of material in the Southeast could be called *W. ×formosa*; the below key may work poorly or not at all for some material encountered.

- 1 Legume and ovary glabrous; pedicels 5-10 (-15) mm long; standard reflexed near the middle; seeds reniform; leaflet margins plane; leaflet apices acute to slightly acuminate; [native species of swamps and bottomland forests and thickets].....*W. frutescens*
- 1 Legume and ovary velvety pubescent; pedicels 15-20 mm long; standard reflexed at the base; seeds lenticular; leaflet margins undulate; leaflet apices mainly strongly acuminate; [introduced species, naturalized in a wide variety of situations].
 - 2 Standard 20-23.5 mm long, 21-23 mm wide; leaflets (7-) 9-11 (-13) per leaf; raceme to 33 cm long, with 25-95 flowers opening nearly simultaneously; vine twining clockwise (dextrorse; from lower left ascending to upper right) *W. sinensis*
 - 2 Standard 16-18 mm long, 16-18 mm wide; leaflets 7-17 (-19) per leaf; raceme to 132 cm long, with 25-170 flowers opening nearly simultaneously or sequentially; vine twining counter-clockwise (sinistrorse; from lower right ascending to upper left).
 - 3 Auricles of the standard's callosity 1.1-1.2 mm long; leaflets (11-) 13-17 (-19) per leaf; raceme to 132 cm long, with the 50-170 flowers opening successively from base to the tip of the inflorescence, those at the base withering before those at the tip have opened *W. floribunda*
 - 3 Auricles of the standard's callosity 0.7-0.8 mm long; leaflets 7-17 per leaf; racemes to 36 cm long.....*W. ×formosa*

* *Wisteria floribunda* (Willdenow) A.P. de Candolle, Japanese Wisteria. Commonly cultivated, escaped to urban, suburban, and rural forests and woodlands; native of Japan. Apr-Jul; Jul-Nov. [= C, F, G, I, K, Pa, RAB, SE, Va, WH3, Z; = *Kraunhia floribunda* (Willdenow) Taubert - S; = *Rehsonia floribunda* (Willdenow) Stritch - Y]

* *Wisteria ×formosa* Rehder [= *W. floribunda* × *sinensis*], Hybrid Asian Wisteria. Cultivated, escaped to urban, suburban, and rural forests and woodlands, commonly cultivated and escaped; a cross of species native to China and Japan. Apr-Jul; Jul-Nov. Trusty et al. (2007, 2008) reveal that much of the invasive *Wisteria* in southeastern United States involves complex hybrids and backcrosses involving *W. floribunda* and *W. sinensis*. [= Va, WH3; = *Rehsonia ×formosa* (Rehder) Stritch - Y]

Wisteria frutescens (Linnaeus) Poiret, American Wisteria, Swamp Wisteria, Atlantic Wisteria. Swamp forests, wet thickets. Apr-May; Jun-Sep. E. VA south to n. peninsular FL, west to TX, north in the interior to AR, s. IN, and s. MO. The issue of the distinctiveness of *W. frutescens* and *W. macrostachya* needs further study. Harvill et al. (1992) reports *W. macrostachya* from Northumberland and Shenandoah counties, VA. [= GW, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; > *W. frutescens* - C, F, G, Z; > *W.*

macrostachya (Torrey & A. Gray) Nuttall ex B.L. Robinson & Fernald – C, F, G, Z; > *Kraunhia frutescens* (Linnaeus) Greene – S; > *Kraunhia macrostachya* (Torrey & A. Gray) Small – S]

* ***Wisteria sinensis*** (Sims) A.P. de Candolle, Chinese Wisteria. Commonly cultivated, escaped to urban, suburban, and rural forests and woodlands; native of China. Apr-Jul; Jul-Nov. [= C, F, I, K, Mo, Pa, RAB, SE, Va, WH3; = *Rehsonia sinensis* (Sims) Stritch – Y]

36. *Tephrosia* Persoon 1807 (Goat's-rue)

A genus of about 350-400 species, perennial herbs, of tropical and warm temperate regions of the Old World and New World. References: Isely (1998)=I; Ward (2004c)=Z; Wood (1949)=Y. Key adapted from SE.

- 1 Corolla bicolor, the standard yellow and the wings pink; racemes terminal; stems erect; stamens monadelphous; leaves with (9-) 13-23 (-37) leaflets.
 - 2 Inflorescence reduced, foliose, flowers solitary or in small clusters overtopped by leaves; plants < 25 cm tall; leaflets generally < 10 mm long and < 5 mm wide; [restricted to the West Gulf Coastal Plain of sw. GA, adjacent FL and westward] *T. mohrii*
 - 2 Inflorescence terminal, not foliose and overtopped by leaves; plants > 25 cm tall; leaflets generally > 10 mm long and > 5 mm wide; [widespread in our area] *T. virginiana*
- 1 Corolla unicolor, initially white or pink, darkening in age to a dark maroon or purple; racemes opposite the leaves (the uppermost appearing terminal); stems decumbent or ascending; stamens diadelphous; leaves with (3-) 5-23 (-27) leaflets.
 - 3 Upper stamen fused with the staminal sheath for part or most of its length (submonadelphous); leaves with (9-) 13-23 (-27) leaflets; [plants from s. AL westward] *T. onobrychoides*
 - 3 Upper stamen completely separate from the staminal sheath (diadelphous); leaves with (3-) 5-17 (-19) leaflets; [plants collectively widespread in our area].
 - 4 Inflorescences with 1-several reduced leaves, mainly borne terminally on the principal axis or branches; bracts generally deciduous *T. rugelii*
 - 4 Inflorescences lacking leaves (sometimes with 1 reduced leaf), mainly borne leaf-opposed; bracts persistent.
 - 5 Petiole 1-4x as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence strongly flattened (2-angled, or rarely, 3-angled) in cross-section; leaflets averaging 25 mm long and 12 mm wide *T. florida*
 - 5 Petiole 1/3-1x as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence terete or inconspicuously 2-4-angled in cross-section; leaflets averaging smaller.
 - 6 Leaves with (3-) 5-7 leaflets; petiole 0-5 mm long; stem and fruit hairs < 0.5 mm long *T. chrysophylla*
 - 6 Leaves with (7-) 9-17 (-19) leaflets; petiole 2-15 mm long; some stem and fruit hairs > 0.5 mm long.
 - 7 Inflorescence with 1-3 (-5) nodes; plants inconspicuously pubescent with gray hairs (the hairs appressed or spreading, short to fairly long); leaflets (3-) avg. 5-6 (-7) mm wide, mostly acute; [plants of the Coastal Plain of NC and SC] *T. hispidula*
 - 7 Inflorescence with 2-20 nodes; plants conspicuously tawny long-pilose with rusty brown hairs; leaflets (6-) avg. 8 (-12) mm wide, mostly obtuse; [plants widespread in our area] *T. spicata*

Tephrosia chrysophylla Pursh, Sprawling Goat's-rue. Sandhills. E. GA s. to s. FL, and west to s. MS. Rather frequent hybrids between *T. chrysophylla* and *T. florida* are intermediate in morphology and have been found in AL, FL, GA, and MS; they have been given a hybrid binomial, *T. xintermedia* (Small) G.L. Nesom & Zarucchi, replacing the later name *T. xfloridana* (Vail) Isely, which has been in regular use in the southeastern United States (Nesom & Zarucchi 2009). [= I, K, SE, WH3, Y; > *Cracca chrysophylla* (Pursh) Kuntze – S; > *Cracca carpenteri* Rydberg – S; > *Cracca chapmanii* (Vail) Small – S]

Tephrosia cinerea (Linnaeus) Persoon, Ashen Hoary-pea. Disturbed areas; native of South America. Reported from an 19th century ballast collection from Mobile, AL. [= I, K2, SE; = *Cracca cinerea* (Linnaeus) Morong – S] {not keyed; rejected as a component of our flora}

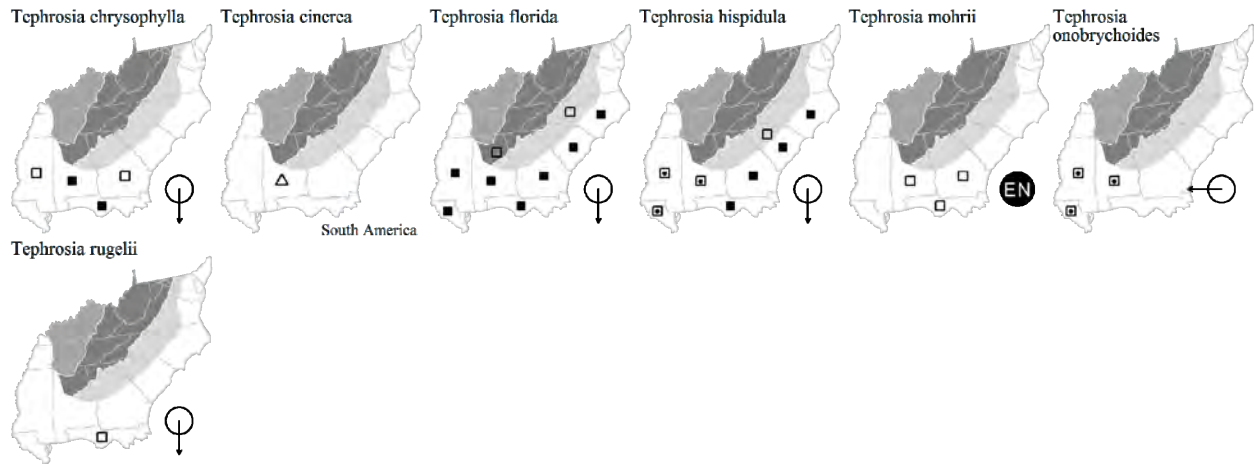

Tephrosia florida (F.G. Dietrich) C.E. Wood, Florida Goat's-rue. Pine savannas and other pinelands. May-Jul; Jun-Sep. E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. See *T. chrysophylla* for discussion of hybrids between *T. chrysophylla* and *T. florida*. [= I, K, RAB, SE, WH3, Y; = *Cracca ambigua* (M.A. Curtis) Kuntze – S]

Tephrosia hispidula (Michaux) Persoon. Pine savannas and other pinelands. May-Aug; Jul-Oct. E. NC (se. VA?) south to c. peninsular FL, west to se. LA, a Southeastern Coastal Plain endemic. Fernald (1950) reports this species from se. VA. [= F, I, K, RAB, SE, WH3, Y; = *Cracca hispidula* (Michaux) Kuntze – S]

Tephrosia mohrii (Rydberg) Godfrey, Dwarf Goat's-rue. Sandhills, dry savannas. GA and westward in the East Gulf Coastal Plain. Perhaps not distinct from *T. virginiana*, but not easily dismissed as "little more than a freak" (Wood 1949); see Godfrey & Kral (1958). [= K; < *T. virginiana* – I, SE, WH3, Y; = *Cracca mohrii* Rydberg – S; = *T. virginiana* var. *mohrii* (Rydberg) D.B. Ward – Z]

Tephrosia onobrychoides Nuttall. Dry pinelands. S. AL, n. AR, e. OK, south to s. LA, and sc. TX. [= I, K, SE, Y; = *Cracca onobrychoides* (Nuttall) Kuntze – S]

Tephrosia rugelii Shuttleworth ex B.L. Robinson. Sandhills. Ne. and Panhandle FL (Jefferson County) south to s. FL. [= I, K, SE, WH3; = *Cracca rugelii* (Shuttleworth ex B.L. Robinson) A.A. Heller – S]

Tephrosia spicata (Walter) Torrey & A. Gray. Sandhills, woodlands. Jun-Aug; Jul-Oct. S. DE south to s. FL, west to w. LA, north in the interior to se., sc., and sw. TN and se. KY. [= C, G, K, RAB, SE, Va, W, WH3, Y; > *T. spicata* var. *semitonsa* Fernald – F; > *T. spicata* var. *spicata* – F; = *Cracca spicata* (Walter) Kuntze – S]

Tephrosia virginiana (Linnaeus) Persoon, Virginia Goat's-rue. Sandhills, other pinelands, xeric and/or rocky woodlands and forests, outcrops, shale barrens and other barrens, dry roadbanks. May-Jun; Jul-Oct. S. NH west to WI, se. MN, and c. KS, south to c. peninsular FL, c. TX, and nw. TX. [= C, I, K1, K2, Mo, Pa, RAB, SE, Va, W, WV; > *T. virginiana* var. *glabra* Nuttall – F, G; > *T. virginiana* var. *virginiana* – F, G; < *T. virginiana* – I, SE, WH3, Y (also see *T. mohrii*); = *Cracca virginiana* Linnaeus – S; = *T. virginiana* var. *virginiana* – Z]

37. Abrus Adanson 1763 (Precatory Bean)

A genus of about 17 species, woody vines and shrubs, of the Old World tropics, now pantropical. References: Isely (1998)=I.

* **Abrus precatorius** Linnaeus, Precatory Bean, Rosary Pea, Crab's Eye, Jequirity. Disturbed areas; native of the Paleotropics. The species does occur in peninsular FL, as far as north as Marion County, at the southern edge of the Flora area. It was also apparently reported for GA, AL, and AR by Isely (1998) and Kartesz (1999), but this is actually based on mislabeling in Map 64 in Isely (1998). The beautiful black-and-red beans have been traditionally used for jewelry and rosaries; they are extremely poisonous, though, and should be used with caution. [= I, K, WH3; = *Abrus abrus* (Linnaeus) L.F. Wight – S]

38. Canavalia Adanson 1763

A genus of about 50 species, perennial or annual herbs or vines, pantropical. References: Isely (1998)=I.

Canavalia rosea (Swartz) A.P. de Candolle, Baybean. Ocean beaches. Pantropical, north to Dixie County on the west coast and Volusia County on the east coast of FL. [= I, K, SE, WH3; ? *Canavali lineata* (Thunberg) A.P. de Candolle – S, misapplied]

39. Galactia P. Browne 1756 (Milkpea)

A genus of about 50-60 species, perennial herbs, of tropical and warm temperate regions, primarily American. References: Duncan (1979)=Z; Isely (1998)=I; Ward & Hall (2004)=Y.

Identification notes: Definite identification of the taxa from key lead 4 on is problematic. Note also that the traditional application of *G. regularis* and *G. volubilis* is reversed.

- 1 Leaves with (5-) 7 (-9) leaflets; flowers white.....**G. elliotii**

- 1 Leaves with 3 leaflets; flowers white, pink, red, or purple.
 - 2 Plant erect, with 4-6 (-8) leaves..... *G. erecta*
 - 2 Plant prostrate, trailing, or twining, generally with numerous leaves.
 - 3 Legumes villous with hairs 1-1.5 mm long; corolla when fresh bright reddish purple and white (drying dark on herbarium specimens); stems villous with hairs > 0.5 mm long *G. mollis*
 - 3 Legumes glabrous, or pubescent with hairs < 1 mm long; corolla pink to pink-purple (drying pale or the petals dropping on herbarium specimens); stems glabrate to villosulous with hairs < 0.5 mm long.
 - 4 Inflorescences generally exserted, (2-) 4-15 (-20) cm long, the flowers well distributed along half or more of the length of the inflorescence axis; flower buds generally 5-8 mm long; corolla 8-12 (-14) mm long; plants twining (rarely trailing) *G. regularis*
 - 4 Inflorescences short or exserted, if exserted then the flowers generally from nodes crowded into the upper half of the axis; flower buds 5-10 mm long; corolla (11-) 12-16 (-18) mm long; plants trailing or twining.
 - 5 Internodes short, 1-2 cm long, the stem thus appearing leafy; inflorescences with 1-3 flowers (or also with solitary axillary flowers); [plants of Coastal Plain of SC southward] *G. minor*
 - 5 Internodes generally longer; inflorescences with 1-3 or more flowers; [plants collectively widespread in our area].
 - 6 Stems glabrescent to conspicuously pubescent with spreading hairs < 0.5 mm long; leaflets 1.5-3.5 (-4) cm long, the undersurface with hairs 0.4-0.7 mm long; [plants of e. GA southward] *G. floridana*
 - 6 Stems antrorse- or retrorse-strigose; leaflets 1.5-5 (-7) cm long, the undersurface strigose with hairs < 0.3 mm long; [plants widespread in our area]..... *G. volubilis* var. *volubilis*

Galactia elliotii Nuttall, Elliott's Milkpea. Moist forests. Jul-Sep; Aug-Oct. S. SC south to s. FL. [= I, K, RAB, S, SE, WH3, Y, Z]

Galactia erecta (Walter) Vail, Erect Milkpea. Sandhills. May-Jul; Jul-Sep. Se. NC south to Panhandle FL, west to e. TX. [= I, K, RAB, S, SE, WH3, Y, Z]

Galactia floridana Torrey & A. Gray, Florida Milkpea. Sandhills and other xeric sands. S. GA south to s. FL, west to s. MS. [= Y; < *G. floridana* - I, K, SE, Z (also see *G. volubilis* var. *fasciculata*); = *G. floridana* var. *floridana* - S; < *G. volubilis* - WH3]

Galactia minor W.H. Duncan, Little Milkpea. Sandhills. Jun-Aug; Jul-Oct. Sc. NC south to Panhandle FL, west to s. MS. [= Y, Z; = *G. microphylla* (Chapman) H.J. Rogers ex Isely - I, K, SE; < *G. regularis* (Linnaeus) Britton, Sterns, & Poggenburg - RAB (misapplied); = *G. floridana* Torrey & A. Gray var. *microphylla* Chapman - S; < *G. volubilis* - WH3]

Galactia mollis Michaux. Sandhills. May-Jul; Jul- Sep. Se. NC south to c. peninsular FL, west to Panhandle FL and se. AL. [= I, K, RAB, S, SE, WH3, Y, Z]

Galactia regularis (Linnaeus) Britton, Sterns, & Poggenburg. Dry forests and woodlands. Jul-Sep; Aug-Oct. Se. PA west to MO and OK, south to s. FL and se. TX. [= Mo, WH3, Y, Z; > *G. volubilis* (Linnaeus) Britton - C, F, G, Pa, RAB, WV (misapplied); > *G. macreei* M.A. Curtis - C, F, G, RAB; = *G. volubilis* - I, K, S, SE, misapplied]

Galactia volubilis (Linnaeus) Britton var. *volubilis*. Sandhills, other dry forests and openings. Jun-Aug; Jul-Oct. NJ and s. PA west to c. AR, south to s. FL and LA. Var. *baltzelliana* D.B. Ward & D.W. Hall and var. *fasciculata* (Vail) D.B. Ward & D.W. Hall are localized endemics of the FL Peninsula. Duncan (1979) describes additional forms of this taxon (which he treated under the name *G. glabella*) that he considered to potentially warrant description as varieties or species; they need further study. [= Y; < *G. regularis* (Linnaeus) Britton, Sterns, & Poggenburg - C, F, G, I, K, Pa, RAB, SE (misapplied); > *G. regularis* - S, misapplied; > *G. brevipes* Small - S; > *G. brachypoda* Torrey & A. Gray - S; < *G. volubilis* - WH3; < *G. glabella* Michaux - Z]

40. *Lackeya* Fortunato, L.P. Queiroz, & G.P. Lewis 1996

A monotypic genus, a perennial woody or semi-woody vine, of the Southeastern United States. References: Fortunato, de Queiroz, & Lewis (1996)=Z; Lewis et al. (2005)=Y; Maxwell (1979)=X; Isely (1998)=I.

Lackeya multiflora (Torrey & A. Gray) Fortunato, L.P. Queiroz, & G.P. Lewis. Alluvial forests, prairies. Jun-Jul. GA west to e. TX, north in the interior to w. TN, w. KY, and AR (sometimes attributed to FL, but excluded by Wunderlin & Hansen 2008). [= Y, Z; = *Dioclea multiflora* (Torrey & A. Gray) C. Mohr - C, G, I, K, Ky, S, SE; > *Galactia mohlenbrockii* R.H. Maxwell var. *mohlenbrockii* - X; > *G. mohlenbrockii* var. *halei* (Alph. Wood) R.H. Maxwell - X]

41. *Clitoria* Linnaeus 1753 (Butterfly Pea, Pigeonwings)

A genus of about 60 species, of tropical and warm temperate regions of the New and Old World. References: Isely (1998)=I; Fantz (2000, 2002b)=Z.

Identification notes: *Centrosema* and *Clitoria* are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large “standard” is lowermost. They are often confused; see key under *Centrosema*.

- 1 Leaves 5-7-foliolate; standard 3.5-4 cm long[*C. ternatea* var. *ternatea*]
- 1 Leaves 3-foliolate; standard 4.5-5.5 cm long.
 - 2 Leaves glabrescent beneath, at maturity the hairs confined or very nearly so to the major veins *C. mariana* var. *mariana*
 - 2 Leaves moderately to densely pubescent beneath, the hairs erect and pilose to suberect and sericeous, at maturity occurring across the leaf surface; [endemic to FL peninsula] *C. mariana* var. *pubescentia*

Clitoria mariana Linnaeus var. *mariana*, Butterfly Pea, She-pea. Dry woodlands and openings, roadsides. Jun-Aug; Jul-Oct. NY (Long Island), NJ west to s. OH, s. IL, MO, and OK, south to c. peninsular FL, TX, and South America; disjunct in s. AZ. Var. *pubescentia* Fantz is endemic in c. and s. peninsular FL (see below). A third variety, var. *orientalis* Fantz, is endemic in se. Asia. [= Mo, Va, Z; < *C. mariana* – C, F, G, I, K, Pa, RAB, SE, W, WH3; < *Martusia mariana* (Linnaeus) Small – S]

Clitoria mariana Linnaeus var. *pubescentia* Fantz, Florida Butterfly Pea. Scrub, sandhills, dry flatwoods. Endemic to the c. and s. FL peninsula. [= Z; < *C. mariana* – I, K, SE, WH3; < *Martusia mariana* (Linnaeus) Small – S]

* *Clitoria ternatea* Linnaeus var. *ternatea*, Blue-pea. Disturbed areas; native of the Paleotropics. Weakly naturalized in s. GA (Isely 1998) and southward. [= Z; < *C. ternatea* – I, K, S, SE, WH3]

42. *Centrosema* (A.P. de Candolle) Bentham 1837 (Spurred Butterfly Pea)

A genus of about 40 species, perennial vining herbs, of tropical and warm temperate regions of the Western Hemisphere. References: Isely (1998)=I; Fantz (2002a).

Identification notes: *Centrosema* and *Clitoria* are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large “standard” is lowermost. They are often confused; the following key includes both genera for easy differentiation.

- 1 Leaves 1-foliolate; petioles conspicuously winged [*Centrosema sagittatum*]
- 1 Leaves 3-7-foliolate; petioles not winged.
 - 2 Leaflets 5-7-foliolate; [rare alien].....[*Clitoria ternatea* var. *ternatea*]
 - 2 Leaflets 3-foliolate; [natives, collectively common and widespread].
 - 3 Calyx tube 10-13 mm long, much longer than the lobes; bracteoles 3-7 mm long, not enclosing the calyx tube; legume 3-5 cm long, 5-7 mm broad; standard 4-6 cm long, not spurred
 - 4 Leaves glabrescent beneath, at maturity the hairs confined or very nearly so to the major veins; [widespread in our area]..... *Clitoria mariana* var. *mariana*
 - 4 Leaves moderately to densely pubescent beneath, the hairs erect and pilose to suberect and sericeous, at maturity occurring across the leaf surface; [endemic to FL peninsula] *Clitoria mariana* var. *pubescentia*
 - 3 Calyx tube 4-5 mm long, shorter than or about as long as the lobes; bracteoles 5-12 mm long, partly enclosing the calyx tube; legume 6-12.5 cm long, 3-6 mm broad; standard 2.5-3.5 cm long, spurred near the base.
 - 5 Lower calyx lobe 5-8 mm long, subulate to lanceolate; upper (bifurcate) calyx lobe 3-4 mm long; bracteoles 5-7 mm long; stems to 3 m long; [of n. FL southward].....*Centrosema arenicola*
 - 5 Lower calyx lobe 8-11 mm long, subulate; upper (bifurcate) calyx lobe 7-8 mm long; bracteoles 8-12 mm long; stems to 1.5 m long; [widespread in our area]*Centrosema virginianum*

Centrosema arenicola (Small) F.J. Hermann, Sand Butterfly-pea. Longleaf pine sandhills. N. FL (Columbia, Dixie, and Duval counties) south to s. FL. [= K, WH3; = *C. arenicolum* – I, orthographic variant; > *Bradburya arenicola* Small – S; > *Bradburya floridana* Britton – S]

* *Centrosema sagittatum* (Humboldt & Bonpland ex Willdenow) Brandege ex L. Riley, Arrowleaf Butterfly-pea. Disturbed areas; native of tropical America. [= K2, WH3] {add to synonymy}

Centrosema virginianum (Linnaeus) Bentham, Spurred Butterfly Pea. Dry woodlands and openings. Jun-Aug; Jul-Oct. S. NJ south to s. FL, west to KY, sc. MO, AR, and TX. Very variable in leaflet length:width ratio, with forms with very narrow leaflets prevalent southwards (10:1 or greater), especially in peninsular FL (and in the West Indies); these perhaps warrant taxonomic recognition as *C. virginianum* var. *angustifolium* (A.P. de Candolle) Grisebach. Further study is needed. [= C, G, I, K,

Mo, RAB, SE, Va, W, WH3; > *C. virginianum* var. *virginianum* – F; > *C. virginianum* var. *ellipticum* Fernald – F; = *Bradburya virginiana* (Linnaeus) Kuntze – S; > *C. virginianum* var. *angustifolium* (A.P. de Candolle) Grisebach]

43. *Apios* Fabricius 1759 (Groundnut)

A genus of about 6 species, perennial vines, of temperate e. Asia and e. North America. Our two species are sister to one another, and otherwise most closely related to *A. delavayi* Franchon (Himalayan) and *A. fortunei* Maximowicz (of Japan, China, and Taiwan) (Li et al. 2014). References: Li et al. (2014); Woods (2005)=Z; Isely (1998)=I. Key based on Z.

- 1 Petiole 20-58 mm long; flower deep maroon to pale maroon and white; style glabrous; legume 6-10 (-12) cm long; seed 5-6 mm long; tubers several in a chain, each 2-10 cm in diameter *A. americana*
- 1 Petiole 70-75 mm long; flower pale green and rose-purple; style bearded; legume 12-15 (-18) cm long; seed 7.2-11.0 mm long; tuber 1, 15-20 cm in diameter *A. priceana*

***Apios americana* Medikus, Common Groundnut.** Marshes (tidal and non-tidal), wet thickets, streambanks, bottomland forests. Jun-Aug; Jul-Sep. NS, NB, and QC west to MN and SD, south to s. FL and TX. [= C, GW, I, K, Mo, Pa, RAB, SE, Va, W, WH3, Z; > *A. americana* var. *americana* – F, G; > *A. americana* var. *turrigera* Fernald – F, G; = *Glycine apios* Linnaeus – S]

***Apios priceana* B.L. Robinson, Kentucky Groundnut, Price's Potato-bean.** Mixed oak woods, especially over limestone. Sw. KY, c. TN, ne. MS, and n. and c. AL. [= C, F, G, I, K, SE, Z; = *Glycine priceana* (B.L. Robinson) Britton – S]

44. *Mucuna* Adanson 1763 (Velvetbean)

A genus of about 100 species, perennial herbs, annual herbs, and woody vines, of tropical regions of Old World and New World. References: Moura et al. (2013)=Z; Isely (1998)=I.

* ***Mucuna pruriens* (Linnaeus) A.P. de Candolle.** Velvetbean, Bengal Bean, Florida Bean. Disturbed areas, fields, cultivated and sporadically established in disturbed areas; native of se. Asia. [= I, SE, WH3, Z; > *M. pruriens* var. *pruriens* – K; > *Stizolobium deeringianum* Bort – S; > *M. deeringiana* (Bort) Merrill]

45. *Rhynchosia* Loureiro 1790 (Snoutbean)

A genus of about 200-230 species, perennial herbs, of tropical and warm temperate regions, nearly cosmopolitan. References: Woods & Key (2009)=Y; Grear (1978)=Z; Isely (1998)=I.

- 1 Leaves unifoliolate (rarely with a few upper leaves trifoliolate).
 - 2 Plant prostrate, trailing, usually with many leaves; stipels absent; [plant very rare in our area, probably introduced]..... *R. michauxii*
 - 2 Plants erect or ascending, usually with fewer than 6 leaves; stipels present; [plant common in the Coastal Plain in our area] *R. reniformis*
- 1 Leaves trifoliolate (rarely with a few lowermost leaves unifoliolate, these generally withering before flowering and fruiting).
 - 3 Plant trailing or twining; pubescence of the lower leaf surface mostly restricted to the veins.
 - 4 Calyx 2.5-3 (-4) mm long, clearly shorter than the corolla; [plants of e. GA southward]..... *R. minima*
 - 4 Calyx 8-14 mm long, about as long as the corolla; [plants collectively widespread in our area].
 - 5 Calyx 10-14 mm long; inflorescence (including peduncle) 5-25 cm at anthesis, elongating further in fruit, with flowers scattered; [MS and w, TN westward] *R. latifolia*
 - 5 Calyx 8-10 (-12) mm long; inflorescence (including peduncle) 1-2 cm long at anthesis, elongating to 4 (-8) cm, the flowers tightly packed; [collectively widespread in our area].

- 6 Pubescence of petiole of mostly incurved hairs 0.2-0.4 mm long; terminal leaflet 1-3 (-3.5) cm long; plants generally trailing; [of ne. FL southward] *R. cinerea*
- 6 Pubescence of petiole of mostly spreading hairs 0.5-0.6 mm long; terminal leaflet (2-) 2.5-5 cm long; plants generally twining; [widespread in our area] *R. difformis*
- 3 Plant erect; pubescence of the lower leaf surface not restricted to the veins (except in the rare upright forms of *R. difformis* keyed below).
- 7 Terminal leaflet suborbicular, 1.0-1.3× as long as wide; plants ascending to erect *R. difformis*
- 7 Terminal leaflet elliptic 1.6-2.5× as long as wide; plants erect.
- 8 Plant lavishly branched, bushy (with something of the aspect of a *Baptisia*); terminal leaflets 0.5-2.0 cm long; pubescence of the lower leaf surface sparse, not velvety to the touch; flowers solitary (-3) in leaf axils *R. cytisoides*
- 8 Plant unbranched or with few well-developed branches in its upper portion; terminal leaflets (2.0-) 2.5-5 cm long; pubescence of the lower leaf surface grayish tomentose and velvety to the touch; flowers many, in racemes.
- 9 Inflorescence a single exserted terminal raceme, 5-20 cm long; stipules caducous; [plants of s. SC southward] *R. mollissima*
- 9 Inflorescences several and axillary, each 1-3 cm long (or with a short terminal inflorescence also); stipules persistent; [plants widespread in our area] *R. tomentosa*

Rhynchosia cinerea Nash, Sandhill Snoutbean. Sandhills, scrub. Ne. FL (Columbia County) south to s. FL. [= I, K, S, SE, WH3, Y]

Rhynchosia cytisoides (Bertoloni) Wilbur, Royal Snoutbean, Broom Snoutbean. Sandhills. May-Jun. Panhandle FL and s. AL west to MS. [= I, K, SE, WH3, Y; = *Pitcheria galactioides* Nuttall - S]

Rhynchosia difformis (Elliott) A.P. de Candolle. Sandhills. Jun-Aug; Jul-Oct. Se. VA south to c. peninsular FL, west to e. TX. [= C, F, G, I, K, Mo, RAB, SE, Va, WH3, Y; = *R. tomentosa* - S, misapplied]

Rhynchosia latifolia Nuttall. Pinelands and woodlands, roadsides. May-Jul. W. TN, s. MO, and OK south to c. MS, s. LA, and se. TX. [= I, K2, Mo, SE]

Rhynchosia michauxii Vail. Sandhills, dry hammocks, disturbed areas. Jun-Aug; Aug-Oct. Se. NC (one record) and e. GA (one record) south to s. peninsular FL, west to Panhandle FL. The disjunct sites are of uncertain origin. [= I, K, S, SE, WH3, Y; = *R. americana* (Houston ex P. Miller) M.C. Metz - RAB (the identification as *R. americana* based on misidentification of the specimen)]

Rhynchosia minima (Linnaeus) A.P. de Candolle. Hammocks, dry pine flatwoods, coastal sands. E. GA, south to s. FL, west to s. TX. The species also occurs in the Old World, and the New World distribution is sometimes considered a result of introduction. [= I, K, SE, WH3, Y; = *Dolicholus minimus* (Linnaeus) Medikus - S]

Rhynchosia mollissima (Elliott) S. Watson. Sandhills, scrub. Jun-Aug; Aug-Oct. Se. SC (Beaufort County, documented by an old specimen [GH] by Mellichamp from the vicinity of Bluffton, where it was probably native) and e. GA south to c. peninsular FL. [= S; = *Rhynchosia tomentosa* (Linnaeus) Hooker & Arnott var. *mollissima* (Elliott) Torrey & A. Gray - I, K, SE, WH3, Y; = *R. mollissima* (Elliott) S. Watson - S]

Rhynchosia reniformis A.P. de Candolle, Dollarweed. Sandhills. Jun-Sep; Aug-Oct. Se. NC south to s. FL, west to e. TX; disjunct (introduced?) in e. TN (Chester, Wofford, & Kral 1997). [= K, RAB, SE, WH3, Y; = *R. simplicifolia* (Walter) Wood - S]

Rhynchosia tomentosa (Linnaeus) Hooker & Arnott. Xeric woodlands and forests, sandhills, edges, open areas. Jun-Aug; Aug-Oct. DE south to n. peninsular FL, west to LA, and north in the interior to e. and c. TN. [= *Rhynchosia tomentosa* (Linnaeus) Hooker & Arnott var. *tomentosa* - C, I, K, SE, WH3, Y; < *R. tomentosa* - F, G, RAB, Va, W; > *R. erecta* (Walter) A.P. de Candolle - S; > *R. intermedia* (Torrey & Gray) Small - S]

46. *Erythrina* Linnaeus 1753 (Coral Bean)

A genus of about 120 species, trees, shrubs, and perennial herbs, of tropical and subtropical regions of the Old and New World. References: Isely (1998)=I.

- 1 Leaflets not lobed; [cultivated tree, persistent] [*E. crista-galli*]
- 1 Leaflets hastately lobed; [native herb or shrub] *E. herbacea*

* *Erythrina crista-galli* Linnaeus, Coral tree. Cultivated, disturbed areas, roadside ditches; native of South America. [= I, K, SE; = *Micropteryx crista-galli* (Linnaeus) Walpers - S]

Erythrina herbacea Linnaeus, Coral Bean, Cardinal-spear. Maritime forests, dry sandy woodlands, sandhills in the outer Coastal Plain. May-Jul; Jul-Sep. Se. NC south to FL, west to se. TX, and south to e. Mexico (Tamaulipas and e. San Luis Potosi). [= I, K, RAB, SE, WH3; > *E. herbacea* - S; > *E. arborea* (Chapman) Small - S]

47. *Pueraria* A.P. de Candolle 1825 (Kudzu)

A genus of about 15 species, perennial vining herbs and shrubs, of tropical and subtropical Asia. References: Isely (1998)=I; Ward (1998)=Z.

* *Pueraria montana* (Loureiro) Merrill var. *lobata* (Willdenow) van der Maesen & S. Almeida, Kudzu. Roadsides, waste areas; native of e. Asia. Jul-Oct. Kudzu was strongly promoted in the 1920's and 1930's in the Southeastern United States as a stabilizer of eroded areas. Hundreds of Kudzu Clubs formed, and Kudzu Songbooks were published. It is now notorious as a weed and symbol of the South. Despite its notoriety in the popular press, kudzu is an ecologically relatively trivial (though conspicuous) weed, since it rarely produces viable seeds in our area, and generally does not invade high quality natural areas. The thickened rhizome can weigh as much as 150 kg, and is the source of a high quality cooking starch prized in the Orient. The purple flowers smell like artificial grape flavoring. The leaves are very frost-sensitive. [= I, K, Mo, Va, WH3, Z; = *P. lobata* (Willdenow) Ohwi – C, F, G, Pa, RAB, SE, W, WV; = *P. thunbergiana* (Siebold & Zuccarini) Benth – S]

48. *Amphicarpa* Elliott ex Nuttall 1818 (Hog-peanut)

A genus of 5-6 species, of e. and se. Asia, North America, and montane Africa. It now appears that 2-3 semi-cryptic taxa should be recognized in what has traditionally been considered a single species of *Amphicarpa* (Callahan 1997, Parker 1996). The genus name has been corrected to *Amphicarpa* from the frequently used *Amphicarpa*. References: Callahan (1997)=Y; Parker (1996)=Z; Isely (1998)=I.

Identification notes: Producing inflorescences of two types, one with chasmogamous flowers and aerial legumes, the other with cleistogamous flowers and subterranean legumes.

- 1 Petiole 3.5-5.3 cm long; petiolute of the terminal leaflet (not including the rachis extending from the point of connection of the lateral leaflets to the joint marking the beginning of the petiolute of the terminal leaflet) 1.0-1.4 mm long; terminal leaflet 4.2-5.2 cm long *A. bracteata* var. *bracteata*
- 1 Petiole 6.0-6.8 cm long; petiolute of the terminal leaflet 1.7-1.9 mm long; terminal leaflet 5.5-6.1 cm long *A. bracteata* var. *comosa*

Amphicarpa bracteata (Linnaeus) Fernald var. *bracteata*, Hog-peanut. {Mt, Pd, Cp (DE, GA, NC, SC, VA, WV) {FL}: dry to moist forests, thickets; common (rare in FL?). Jul-Sep; Aug-Oct. Widely distributed in eastern North America but more common eastwards. {The distributions and habitats of the two varieties in our area require herbarium and field investigation}. [= K1, K2, Y, Z; < *Amphicarpa bracteata* – C, I, Mo, SE, Va, WH3; = *Amphicarpa bracteata* var. *bracteata* – F, G, orthographic variant; < *Amphicarpa bracteata* – Pa, RAB, orthographic variant; < *Falcata comosa* (Linnaeus) Kuntze – S] {not mapped separately at this time}

Amphicarpa bracteata (Linnaeus) Fernald var. *comosa* Fassett, Hog-peanut. {Mt, Pd, Cp (DE, GA, NC, SC, VA, WV): dry to moist forests, thickets; common. Jul-Sep; Aug-Oct. Widely distributed in eastern North America, but more common westwards. {The distributions and habitats of the two varieties in our area require herbarium and field investigation}. [= K1, K2, Y, Z; < *Amphicarpa bracteata* – C, I, Mo, SE, Va, WH3; = *Amphicarpa bracteata* var. *comosa* – F, G, orthographic variant; < *Amphicarpa bracteata* – Pa, RAB, orthographic variant; < *Falcata comosa* (Linnaeus) Kuntze – S] {not mapped separately at this time}

49. *Glycine* Willdenow 1802 (Soybean, Soya)

A genus of about 10-20 species, annual and perennial herbs, of Asia and Australia. References: Isely (1998)=I.

* *Glycine max* (Linnaeus) Merrill, Soybean. Abundantly cultivated, rarely persisting as a waif; native of e. Asia. Jul-Oct. One of the most important legume crops in the world. [= F, I, K, Mo, RAB, SE]

50. *Lablab* Adanson 1763 (Hyacinth-bean)

A genus of a single species, an annual to perennial herb, native of the Old World tropics. References: Isely (1998)=I.

* *Lablab purpureus* (Linnaeus) Sweet, Hyacinth-bean. Disturbed areas; native of Africa. Cultivated and rarely may escape or persist as a waif in disturbed areas; it is reported from se. PA (Rhoads & Klein 1993). [= I, K, Mo, SE, WH3; = *Dolichos lablab* Linnaeus]

51. *Vigna* Savi 1824 (Cow Pea)

A genus of about 100-150 species, annual and perennial herbs, pantropical, rarely extending into warm temperate regions. References: Isely (1998)=I; Maréchal, Mascherpa, & Stainier (1978)=Z.

- 1 Corolla yellow, 1.5-1.7 cm long; leaves somewhat fleshy-thickened; [plant native or introduced in maritime situations]; [section *Vigna*] *V. luteola*
- 1 Corolla pink to purple, 1.5-2.5 cm long; leaves herbaceous; [plant a cultivated introduction]; [section *Catiang*] *V. unguiculata*

Vigna luteola (Jacquin) Benth, Wild Cow Pea. Edges of freshwater tidal marshes, beaches, hammocks, disturbed areas, railroad embankments, low fields, in the outer Coastal Plain. Jul-Sep; Aug-Oct. Se. NC south to s. FL, west to se. TX, and in the New World tropics. Often weedy in appearance, and its nativity at a particular location difficult to judge. [= GW, I, K, RAB, WH3, Z; ? *V. repens* (Linnaeus) Kuntze – S; = *V. marina* (Burm.) Merrill (the correct name according to some authors, based on uncertain typification)]

* *Vigna unguiculata* (Linnaeus) Walpers, Black-eyed Pea, Field Pea, Cow Pea. Cultivated in commercial and home gardens, rarely persistent or occurring as a waif in disturbed areas; native of tropical Africa. Jun-Aug; Jul-Sep. [= I, K, Mo, RAB, WH3; ? *V. sinensis* (Linnaeus) Savi – F, S; > *V. unguiculata* var. *unguiculata* – Z]

52. *Phaseolus* Linnaeus 1753 (Bean)

A genus of about 50-65 species, annual and perennial herbs, of tropical and warm temperate America (now widely distributed worldwide in cultivation). References: Isely (1998)=I; Maréchal, Mascherpa, & Stainier (1978)=Z; Freytag & Debouck (2002)=Y. Key based on SE.

- 1 Raceme axes slender, flexuous; [plants native perennials]; [section *Paniculati*; subsection *Volubili*].
 - 2 Stems trailing; leaflets 1-4 cm long, strongly 3-lobed, suborbicular; leaflet surfaces strongly reticulate-veined; [plants of sandhill habitats] *P. sinuatus*
 - 2 Stems climbing and twining on other vegetation (or trailing); leaflets 3-10 cm long, lobed or not, ovate; leaflet surfaces only slightly reticulate; [plants of various habitats]
 - 3 Leaflets unlobed; vines climbing; [widespread] *P. polystachios*
 - 3 Leaflets lobed; vines trailing or climbing; [restricted to n. FL southward] *P. smilacifolius*
- 1 Raceme axes stout, stiff; [plants alien annuals, only weakly naturalized].
 - 4 Corolla 1.5-2 cm long, scarlet red or bright lavender; racemes exserted; plants twining; [section *Coccinei*] [*P. coccineus* ssp. *coccineus*]
 - 4 Corolla ca. 1 cm long, pink-purple, greenish white, or bicolored pink and white; racemes short or exserted; plants bushy-erect (rarely twining).
 - 5 Legumes distinctly flattened at maturity, 15-20 mm wide; corolla usually greenish white; [section *Paniculati*; subsection *Volubili*] [*P. lunatus*]
 - 5 Legumes nearly terete at maturity, about 8 mm in diameter; corolla usually pink-purple, at least in part; [section *Phaseoli*] [*P. vulgaris*]

* *Phaseolus coccineus* Linnaeus ssp. *coccineus*, Scarlet Runner Bean. Infrequently cultivated, mostly as an ornamental in home gardens, rarely found as a waif; native of tropical America. [= Z; < *P. coccineus* – C, F, G, I, K, SE; > *P. coccineus* ssp. *coccineus* var. *coccineus* – Y]

* *Phaseolus lunatus* Linnaeus, Lima Bean. Frequently cultivated (both commercially and in home gardens), rarely found as a waif; native of tropical America. [= I, K, S, SE, WH3, Y, Z; > *P. limensis* Macfadyen – F]

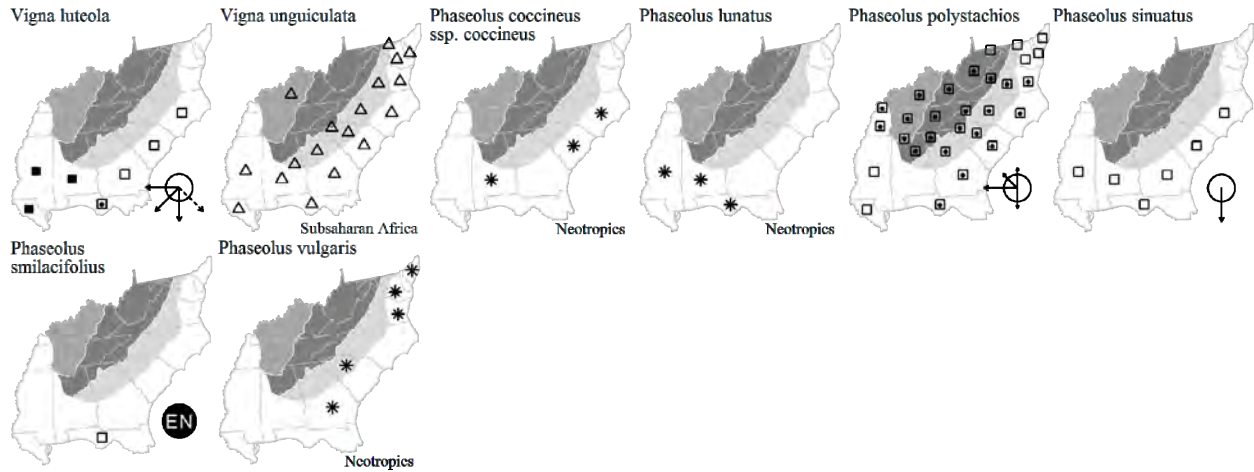

Phaseolus polystachios (Linnaeus) Britton, Sterns, & Poggenburg, Wild Bean, Wild Kidney Bean. Thickets, woodlands. Jul-Sep; Aug-Oct. S. ME west to OH, IL, and MO, south to s. FL and TX. [= C, G, I, Pa, RAB, SE, Va, W, WV; > *P. polystachios* var. *polystachios* – F; > *P. polystachios* var. *aquiloni* Fernald – F; = *P. polystachios* var. *polystachios* – K, Mo, WH3; = *P. polystachyus* – S, orthographic variant; = *P. polystachyus* ssp. *polystachyus* – Y; = *P. polystachyus* var. *polystachyus* – Z]

Phaseolus sinuatus (Nuttall) Torrey & A. Gray, Sandhills Bean. Sandhills. Jul-Sep; Aug-Oct. Sc. NC south to s. FL, west to s. MS, a Southeastern Coastal Plain endemic. Freytag & DeBouck (2002) describe *P. sinuatus* and *P. polystachios* as being “very distinct and there seems to be no intergradation”, yet treat them as only subspecifically distinct; I choose to recognize them as species. Not always easy to distinguish in sterile condition from *Strophostyles*. [= I, RAB, S, SE, W; = *P. polystachios* (Linnaeus) Britton, Sterns, & Poggenburg var. *sinuatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – K1, K2, WH3; = *P. polystachyus* ssp. *sinuatus* (Nuttall) Freytag – Y; = *P. polystachyus* var. *sinuatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – Z]

Phaseolus smilacifolius Pollard, Smilax Bean. Ne. FL south to nc. peninsular FL. This taxon needs additional study; it is sometimes regarded as a hybrid of *P. polystachios* × *P. sinuatus*. Abbott & Judd (2000) regarded the 100% germination rate of

its seeds as evidence supporting specific status. [= S; = *P. ×smilacifolius* Pollard (pro sp.) – WH3; = *P. polystachyus* (Linnaeus) Britton, Sterns, & Poggenburg ssp. *smilacifolius* (Pollard) Freytag – Y] {add Z synonymy}

* ***Phaseolus vulgaris*** Linnaeus, Garden Bean, Green Bean, Snap Bean, String Bean, Kidney Bean, Pole Bean, Bush Bean. Frequently cultivated (both commercially and in home gardens), rarely found as a waif; native of tropical America. [= C, F, G, I, K, S, SE, WH3; > *P. vulgaris* var. *vulgaris* – F; > *P. vulgaris* var. *humilis* Alefeld – F; < *P. vulgaris* var. *vulgaris* – Z]

53. ***Strophostyles*** Elliott 1823 (Sand Bean, Woolly Bean, Wild Bean)

A genus of 3 species, annual and perennial herbs, of North America. References: Pelotto & Martínez (1998)=Z; Isely (1998)=I. Key adapted from SE.

- 1 Legumes 2-4 cm long, permanently pubescent; corolla 5-8 mm long; leaves permanently pubescent on the upper surface; seeds glabrous..... *S. leioperma*
- 1 Legumes 3-8 cm long, glabrate at maturity; corolla 8-15 mm long; leaves usually glabrate on the upper surface; seeds pubescent.
 - 2 Bracteoles (immediately subtending the calyx) 2-3 mm long, equaling or exceeding the calyx tube; leaflets usually prominently 3-lobed; terminal leaflet 2.5-3.5 cm wide; plant an annual..... *S. helvola*
 - 2 Bracteoles (immediately subtending the calyx) 0.5-1.0 (-1.5) mm long, shorter than the calyx tube; leaflets not lobed; terminal leaflet 0.3-2.0 cm wide; plant a perennial..... *S. umbellata*

Strophostyles helvola (Linnaeus) Elliott, Annual Sand Bean. Coastal dunes, beaches, dry sandy woodlands, disturbed areas. Jun-Sep; Aug-Oct. QC west to MN and SD, south to n. peninsular FL and e. TX. See Isely (1986b) for a discussion of the orthography of the epithet. [= C, G, K2, Mo, Pa, RAB, S, Va, WH3, WV; = *S. helvola* (Linnaeus) Elliott – K1, SE, W, Z, orthographic variant; > *S. helvola* var. *helvola* – F; > *S. helvola* var. *missouriensis* (S. Watson) Britton – F]

Strophostyles leioperma (Torrey & A. Gray) Piper, Small-flowered Sand Bean. Prairies, glades, barrens, sand bars, disturbed areas. Jun-Sep; Aug-Oct. IN, WI, MN, and ND, south to FL Panhandle, AL, MS, LA, TX, NM, and AZ; also scattered eastward presumably as introductions. [= C, F, G, K1, K2, Mo, Pa, SE, WH3, Z; = *S. pauciflora* (Bentham) S. Watson – S]

Strophostyles umbellata (Muhlenberg ex Willdenow) Britton, Perennial Sand Bean. Dry sandy or rocky woodlands, disturbed areas. Jun-Sep; Aug-Oct. S. NY west to s. IN, s. MO, and KS, south to c. peninsular FL and s. TX. [= C, F, G, K1, K2, Mo, Pa, RAB, S, SE, Va, W, WH3, Z; > *S. umbellata* var. *umbellata* – F; > *S. umbellata* var. *paludigena* Fernald – F]

54. ***Macroptilium*** (Bentham) Urban 1928

A genus of about 20 species, annual and perennial herbs, of tropical and subtropical America. References: Isely (1998)=I.

* ***Macroptilium lathyroides*** (Linnaeus) Urban, Wild Bushbean. Disturbed areas; native of tropical America. [= I, K, SE, WH3; = *Phaseolus lathyroides* Linnaeus]

55. ***Kummerowia*** Schindler 1912 (Korean-clover, Japanese-clover)

A genus of 2 species, annual herbs, native to temperate e. Asia. *Kummerowia* differs from *Lespedeza* in its annual habit (vs. perennial), conspicuous stipules (vs. not conspicuous), inflorescence branching pattern (see Akiyama & Ohba 1985), and leaflets with striate, parallel, lateral veins (vs. with reticulate lateral veins). It is now generally regarded as distinct from *Lespedeza* at the generic level, though they are closely related. References: Akiyama & Ohba (1985)=Z; Isely (1998)=I. Key based closely on SE.

- 1 Mid-stem leaves with petioles 4-10 mm long; leaflets emarginate at the apex; leaflets conspicuously spreading-ciliate; stems antrorsely appressed-strigose; calyx covering 1/3-1/2 of the legume..... *K. stipulacea*

1 Mid-stem leaves with petioles 1-2 (-4) mm long; leaflets not emarginate at the apex; leaflets inconspicuously appressed-ciliate; stems retrorsely appressed-strigose; calyx covering 1/2-4/5 of the legume *K. striata*

* *Kummerowia stipulacea* (Maximowicz) Makino, Korean Lespedeza, Korean-clover. Fields, roadsides, disturbed areas; native of e. Asia. Jul-Sep; Aug-Nov. [= I, K, Mo, Pa, SE, Va, Z; = *Lespedeza stipulacea* Maximowicz – C, F, G, RAB, W, WV]

* *Kummerowia striata* (Thunberg) Schindler, Japanese-clover, Common Lespedeza. Fields, roadsides, disturbed areas; native of e. Asia. Jul-Sep; Aug-Nov. [= I, K, Mo, Pa, SE, Va, WH3, Z; = *Lespedeza striata* (Thunberg) Hooker & Arnott – C, F, G, RAB, S, W, WV]

56. *Lespedeza* Michaux 1803 (Lespedeza)

A genus of about 40 species, perennial herbs and shrubs, of temperate regions of e. Asia and e. North America. References: Clewell (1966a)=Z; Clewell (1966b)=Y; Isely (1986b)=X; Akiyama (1988)=Q; Clewell & Stickel (1990); Isely (1998)=I. Key based primarily on Z and SE. [also see *Kummerowia*]

Identification notes: Many species of *Lespedeza* hybridize, and most combinations may occur in our area. Some of the hybrids have been named in the past as varieties or species. Hybrids generally occur in mixed populations with both parents and can usually be identified by their intermediate morphology (identification much easier in the field where context is apparent than in the herbarium). See Isely (1990) and Clewell (1966a) for additional hints about identification of hybrids.

- 1 Plants annual; stipules ovate to ovate-lanceolate, conspicuous; leaflets with striate, parallel, lateral veins [*Kummerowia*]
- 1 Plants perennial, stipules subulate, setaceous, or lanceolate, not conspicuous; leaflets with reticulate lateral veins, joining before reaching the margin.
 - 2 Leaflets distinctly widest toward the tip, 3-5× as long as wide, the base and apex very differently shaped (the base narrowly cuneate, the tip rounded, truncate or even retuse); racemes reduced, with 2-3 flowers, shorter than the subtending leaves; [plants alien] *L. cuneata*
 - 2 Leaflets generally widest near the middle, 1-8 (-10)× as long as wide, the base and apex shaped similarly (i.e., both rounded, or both cuneate); racemes with 3-many flowers, shorter or longer than the subtending leaves; [plants native, except *L. virgata*].
 - 3 Midrib of leaflets distinctly excurrent as a spinose bristle 0.5-1.5 mm long; [plant a rare introduction] *L. virgata*
 - 3 Midrib of leaflets not excurrent, or only as an obscure mucro, not at all spinose; [plants native].
 - 4 Plants trailing at maturity (young stems erect to arching-ascending up to 2 dm tall, then lopping over); stems slender, wiry; corolla pink to purple.
 - 5 Pubescence of the stem spreading (pilose) *L. procumbens*
 - 5 Pubescence of the stem appressed (strigose).
 - 6 Calyx of legumes produced from cleistogamous flowers 1/4-1/3 as long as the pod; stems usually lacking axillary leaves; keel subequal to the wings, or shorter; stipules 2-4 (-5) mm long *L. repens*
 - 6 Calyx of legumes produced from cleistogamous flowers ca. 1/5 as long as the pod; stems often with axillary leaves distinctly smaller than the primary leaves; keel usually longer than the wings; stipules 3-5 (-6) mm long *L. frutescens*
 - 4 Plants erect at maturity; stems generally stout, stiff; corolla pink, purple, white, cream, or mixed.
 - 7 Plants in flower.
 - 8 Corolla primarily white or cream (often with a purplish throat).
 - 9 Raceme peduncles short (shorter than the subtending leaf), the inflorescence itself barely if at all exceeding the subtending leaf; calyx lobes 6-10 mm long; leaflets (2-) 2.5-5 (-8)× as long as wide *L. capitata*
 - 9 Raceme peduncles elongate (often longer than the subtending leaf), the inflorescence itself well-exserted beyond the subtending leaf; calyx lobes 3-7 mm long; leaflets either narrower or wider (see below).
 - 10 Leaflets 4-8 (-10)× as long as wide *L. angustifolia*
 - 10 Leaflets 1.3-1.8× as long as wide.
 - 11 Leaves closely strigose on both surfaces with hairs 0.2-0.5 mm long, silvery when fresh; leaflets 1-2 cm long; petiole of midstem leaves not generally > 1 cm long, about the same length as the rachis; [plants of the Coastal Plain and, in NC and SC, the lower Piedmont] *L. hirta* var. *curtissii*
 - 11 Leaves glabrate, or strigose above only, at least some of the hairs (especially those on the veins below) > 0.5 mm long, green or grey (to somewhat silvery) when fresh; leaflets 1.5-4 (-5) cm long; petiole of midstem leaves 1-1.5 (-2) cm long, much exceeding the rachis; [plants widespread in our area] *L. hirta* var. *hirta*
 - 8 Corolla primarily pink or purple.
 - 12 Peduncles of the racemes of chasmogamous (petaliferous) flowers longer than the subtending leaves; keel > 1 mm longer than the wings.
 - 13 Stems to 7 dm long, not bushy-branched; petioles of medial leaves 0.5-2 cm long; chasmogamous panicles with 4-7 flowers; corolla 6-8 mm long; chasmogamous legumes glabrate or inconspicuously strigulose, 5-7 mm long; [native] *L. frutescens*

- 13 Stems 10-30 dm long, bushy-branched; petioles of medial leaves 2-4 cm long; chasmogamous panicles with 5-15 flowers; corolla 8-15 mm long; chasmogamous legumes strigose, 7-8 mm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section *Macrolespedeza*].
- 14 Calyx lobes equal to or shorter than the calyx tube; corolla 8-11 mm long; leaflets 1.5-2 × as long as wide; racemes erect or strongly ascending; stems 1-several per crown, brown when young..... *L. bicolor*
- 14 Calyx lobes longer than the calyx tube (at least the lowest lobe); corolla (10-) 12-15 mm long; leaflets 2-3 × as long as wide; racemes lax and drooping; stems many per crown, purplish when young..... *L. thunbergii*
- 12 Peduncles of the racemes of chasmogamous (petaliferous) flowers shorter than the subtending leaves; keel about as long as or shorter than the wings; [native].
- 15 Upper surface of the leaflets glabrous (sometimes strigose along the midrib only); pubescence of the stem appressed; leaflets 1.5-3 × as long as wide *L. violacea*
- 15 Upper surface of the leaflets pubescent; pubescence of the stem appressed or spreading; leaflets 1.3-7 × as long as wide.
- 16 Leaflets 1.3-3 (-3.5) × as long as wide *L. stuevei*
- 16 Leaflets (4-) 5-7 × as long as wide *L. virginica*
- 7 Plants not in flower.
- 17 Leaflets of average, mid-stem leaves > 4 × as long as wide (*L. capitata* keyed here and below).
- 18 Petioles of mid-stem leaves ca. 10 mm long *L. virginica*
- 18 Petioles of mid-stem leaves 1-3 mm long.
- 19 Leaflets 4-8(-10) × as long as wide; pubescence of the stems and leaves usually not silvery-cinereous *L. angustifolia*
- 19 Leaflets (2-) 2.5-5 (-8) × as long as wide; pubescence of stems and leaves usually silvery-cinereous *L. capitata*
- 17 Leaflets of average, mid-stem leaves < 3.5 × as long as wide (*L. capitata* keyed here and above).
- 20 Leaflets (2-) 2.5-5 (-8) × as long as wide; leaf rachis (the apparent petiolule of the terminal leaflet) longer than the petiole..... *L. capitata*
- 20 Leaflets 1.3-3 (-3.5) × as long as wide; leaf rachis shorter than the petiole (or about equal in *L. hirta* var. *curtissii*).
- 21 Central axis not strongly dominant, branches divaricate, irregular; stems slender, wiry *L. frutescens*
- 21 Central axis strongly dominant, branches ascending, mostly on the upper stem; stems stout, stiff.
- 22 Stems 10-30 dm tall, 1-many from the base; medial leaf petiole 2-4 cm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section *Macrolespedeza*].
- 23 Calyx lobes equal to or shorter than the calyx tube; leaflets 1.5-2 × as long as wide; racemes erect or strongly ascending; stems 1-several per crown, brown when young..... *L. bicolor*
- 23 Calyx lobes longer than the calyx tube (at least the lowest lobe); leaflets 2-3 × as long as wide; racemes lax and drooping; stems many per crown, purplish when young *L. thunbergii*
- 22 Stems 3-15 (-20) dm tall, 1-few from the base; medial leaf petiole 0.7-2.5 cm long; [native].
- 24 Leaflets (1.3-) 1.8-3 (-3.5) × as long as wide.
- 25 Upper surface of the leaflets pubescent; pubescence of the stem appressed or spreading *L. stuevei*
- 25 Upper surface of the leaflets glabrous (sometimes strigose along the midrib only); pubescence of the stem appressed..... *L. violacea*
- 24 Leaflets 1.3-1.8 × as long as wide.
- 26 Leaves closely strigose, the hairs 0.2-0.5 mm long, silvery when fresh; leaflets 1-2 cm long; [plants of the Coastal Plain and, in NC and SC, the lower Piedmont] *L. hirta* var. *curtissii*
- 26 Leaves glabrate, or strigose above only, at least some of the hairs > 0.5 mm long, green or grey when fresh; leaflets 1.5-4 (-5) cm long; [plants widespread in our area] *L. hirta* var. *hirta*

Lespedeza angustifolia (Pursh) Elliott, Narrow-leaved Lespedeza. Sandhill-pocosin ecotones and dry to moist savannas, mountain bogs. Aug-Oct; Sep-Nov. MA south to c. peninsular FL, west to s. MS, essentially a Southeastern Coastal Plain endemic, rarely disjunct inland to w. NC, c. GA, and ec. TN (Chester, Wofford, & Kral 1997). [= C, G, I, K, Pa, RAB, S, SE, Va, W, WH3, Y, Z; > *L. angustifolia* - F; > *L. hirta* var. *intercursa* Fernald - F]

* *Lespedeza bicolor* Turczaninow, Bicolor Lespedeza, Shrubby Lespedeza. "Wildlife food plots," roadsides, forests; native of e. Asia. Jun-Sep; Aug-Nov. [= C, I, K, Mo, Pa, Q, RAB, S, SE, Va, W, WH3, WV]

Lespedeza capitata Michaux, Bush-clover. Woodlands and woodland borders, wet meadows, fens, prairies. Aug-Oct; Sep-Nov. ME and s. ON west to MN, SD, and NE, south to FL Panhandle and TX. [= C, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, Y, Z; > *L. capitata* var. *capitata* - F, G, WV; > *L. capitata* var. *stenophylla* Bissell & Fernald - F, G, WV; > *L. capitata* var. *velutina* (E.P. Bicknell) Fernald - F, G; > *L. capitata* var. *vulgaris* Torrey & A. Gray - F, WV]

* *Lespedeza cuneata* (Dumont-Cours.) G. Don, Sericea Lespedeza, Chinese Lespedeza. Roadbanks, "wildlife food plots", disturbed areas, floodplains, creekbanks, and invading other natural habitats; native of e. Asia. Jul-Sep; Oct-Nov. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV]

Lespedeza frutescens (Linnaeus) Elliott, Violet Lespedeza. Woodlands and woodland borders. Jul-Sep; Oct-Nov. MA and NY west to MI, WI, IA, and KS, south to ne. FL, FL Panhandle, AL, MS, AR, and TX. Known in many floras as *L. violacea* (see synonymy), that name actually is the correct name for the species traditionally known as *L. intermedia*. [= K, Mo, S, Va; = *L. violacea* (Linnaeus) Persoon - C, F, G, I, Pa, RAB, SE, W, WV, Y, Z, misapplied; < *L. violacea* - WH3]

Lespedeza hirta (Linnaeus) Hornemann var. *curtissii* (Clewell) Isely, Silvery Lespedeza. Sandhills and dry to moist savannas. Aug-Oct; Sep-Nov. Se. VA south to s. FL, west to Panhandle FL and se. AL, barely extending onto the Piedmont in NC, SC, and GA. Clewell (1966a) discusses apparent intergrades between the two varieties in s. NJ. [= C, I, SE, Va, X; < *L. hirta* - G, RAB, S, WH3; = *L. hirta* var. *appressipilis* Blake - F (as to intent, but not the type); = *L. hirta* ssp. *curtissii* Clewell - K, Y, Z]

Lespedeza hirta (Linnaeus) Hornemann var. **hirta**, Hairy Lespedeza. Woodlands and woodland borders. Aug-Oct; Sep-Nov. S. ME and s. ON west to MI, n. IL, c. MO, and OK, south to c. peninsular FL and TX. [= C, I, SE, Va, X; < *L. hirta* – G, Pa, RAB, S, W, WH3, WV; > *L. hirta* var. *hirta* – F; > *L. capitata* var. *calycina* (Schindler) Fernald – F; = *L. hirta* ssp. *hirta* – K, Mo, Y, Z]

Lespedeza procumbens Michaux, Downy Trailing Lespedeza. Woodlands and woodland borders, hammocks. Jul-Sep; Aug-Nov. MA, NH, and NY west to IL, MO, and KS, south to Panhandle FL and TX. [= C, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV, Y, Z; > *L. procumbens* var. *procumbens* – F; > *L. procumbens* var. *elliptica* Blake – F]

Lespedeza repens (Linnaeus) W. Barton, Smooth Trailing Lespedeza. Woodlands and woodland borders. Jul-Sep; Aug-Nov. CT and NY west to n. OH, s. WI, MO, and KS, south to n. peninsular FL, Panhandle FL, and c. TX. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV, Y, Z]

Lespedeza stuevei Nuttall, Velvety Lespedeza. Woodlands and woodland borders. Jul-Sep; Aug-Nov. MA south to n. peninsular FL, west to c. and n. TX, north in the interior to NC, TN, s. IN, s. IL, c. MO, and nc. KS. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV, Y, Z; = *L. stuevei* – S, orthographic variant]

* **Lespedeza thunbergii** (A.P. de Candolle) Nakai. "Wildlife food plots," roadbanks; native of e. Asia. Reported for Macon County, NC by Pittillo & Brown (1988). [= C, F, G, I, K, Mo, Pa, Q, SE, WH3]

Lespedeza violacea (Linnaeus) Persoon, Wand Lespedeza. Woodlands and woodland borders. Jul-Sep; Aug-Nov. S. ME and s. ON west to MI and se. MN, south to ne. FL, Panhandle FL, and e. TX. Known in many floras as *L. intermedia*, this species is actually correctly named *L. violacea*. [= K, Mo, S, Va; = *L. intermedia* (S. Watson) Britton – C, F, G, I, Pa, RAB, SE, W, WV, Y, Z; < *L. violacea* – WH3]

* **Lespedeza virgata** (Thunberg) A.P. de Candolle. Roadbanks; native of e. Asia. Clewell & Stickel (1990) report the occurrence of this species in NC. [= I, K]

Lespedeza virginica (Linnaeus) Britton, Virginia Lespedeza. Sandhills, woodlands, and woodland borders. Jul-Sep; Aug-Nov. MA and NH west to MI, WI, IA, and KS, south to Panhandle FL and c. TX. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV, Y, Z]

57. Desmodium Desvaux 1813 (Tick-trefoil, Tick-clover, Beggar's-ticks, Stick-tights)

A genus of about 300 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan (but lacking from Europe). In our area, *Desmodium* is a complex genus. Some of the species in our area are confusing and can be identified only with difficulty. References: Isely (1998)=I; Krings (2004). Key based on SE, C, RAB, F, and Krings (2004). Some parts adapted with little change from SE. Some parts, especially Key D, will likely be substantially revised, based on additional herbarium and field testing. [also see *Hylodesmum*]

- 1 Longest calyx lobes shorter than the calyx tube; stipe of the loment 4-20 mm long, about 3× or more as long as the calyx; mature leaves without stipels at the base of the petiolules of the leaflets; leaves subverticillate at the top of the stem (alternate in *D. pauciflorum*); stamens monadelphous; lower margin of the loment incised to the upper suture..... [see *Hylodesmum*]
- 1 Longest calyx lobes longer than the calyx tube; stipe of the loment absent or nearly so, included within the calyx; mature leaves retaining stipels at the base of the petiolules of the leaflets; leaves alternate; stamens diadelphous; lower margin of the loment not incised to the upper suture.
- 2 Leaflets narrow, the terminal leaflet < 10 mm wide, and also 4-12× as long as wide, typically thick and strongly reticulate; petioles of midstem leaves 1-10 (-15) mm long; [primarily of the Coastal Plain and lower Piedmont (rarely Mountains) in our area]..... **Key A**
- 2 Leaflets broader, the terminal leaflet > 15 mm wide, or < 4× as long as wide, typically thin and not reticulate; petioles of midstem leaves various, but > 15 mm long if leaflet proportions are narrow; [collectively widespread in our area].
- 3 Stems trailing vinelike along the ground, and/or the plants stoloniferous-rhizomatous..... **Key B**
- 3 Stems erect or ascending, not vinelike.
- 4 Stipules persistent (most or all of the stipules persisting through the year), 4-20 mm long, ovate to amplexicaul-clasping (to lance-attenuate, and if so, generally longer than 8 mm long, except in *D. floridanum*); leaflets 1.5-3× as long as wide..... **Key C**
- 4 Stipules caducous (most or all of the stipules falling soon after expansion of the leaves), 2-6 (-8) mm long, mostly linear-subulate or lance-attenuate (in some species narrowly ovate to triangular); leaflets 1-8 (-10)× as long as wide..... **Key D**

Key A: *Desmodium* with very narrow leaflets

- 1 Petioles (0-) 1-3 (-4) mm long, the leaves thus subsessile; leaflets 5-10 mm wide, strongly pubescent on the lower surface *D. sessilifolium*
- 1 Petioles 3-15 mm long, the leaves thus obviously petiolate; leaflets 2-5 (-8) mm wide, glabrate or inconspicuously puberulent on the lower surface.
 - 2 Loment segments flat to distinctly concave along the upper (suture) margin; [of dry to mesic habitats] *D. strictum*
 - 2 Loment segments slightly convex along the upper (suture) margin; [of boggy, wet, or mesic habitats] *D. tenuifolium*

Key B: *Desmodium* with trailing stems or stoloniferous-rhizomatous habit

- 1 Flowers in axillary clusters; leaflets broadly obovate, 0.5-1 cm long *D. triflorum*
- 1 Flowers in axillary or terminal racemes; leaflets rotund, broadly ovate, broadly elliptic, or narrowly elliptic, the larger > 1 cm long.
 - 2 Flowers in simple terminal racemes; leaflets mostly > 2.5× as long as wide *D. incanum*
 - 2 Flowers either in axillary racemes or in terminal panicles; leaflets mostly 0.9-2.0× as long as wide.
 - 3 Stipules ovate, persistent, slightly to strongly clasping at the base, 6-12 mm long.
 - 4 Leaflets ovate, 1.2-1.9× as long as wide; flowers white to yellowish; loment uncinat-puberulent only along the sutures *D. ochroleucum*
 - 4 Leaflets ovate, 0.8-1.1× as long as wide; flowers blue-purple; loment uncinat-puberulent over the surface *D. rotundifolium*
 - 3 Stipules lanceolate to linear (or deltate in *D. humifusum*), usually quickly deciduous, not clasping at the base, 2-8 mm long.
 - 5 Terminal leaflet 1.4-2.0× as long as wide, 3.0-7.0 cm long; loment segments 6-8 mm long; stipules 4-8 mm long, ovate to lance-acuminate *D. humifusum*
 - 5 Terminal leaflet 0.9-1.2× as long as wide, 1.5-2.3 cm long; loment segments 4-5 mm long; stipules lanceolate, 1-5 mm long *D. lineatum*

Key C

- 1 Loment segments nearly symmetrical along the axis of the loment (the isthmi more or less equal above and below, thus each segment diamond-shaped, rounded-diamond-shaped, or essentially elliptical), each segment 3-3.5 mm long; annual from a taproot; [of NC and southward] *D. tortuosum*
- 1 Loment segments asymmetrical along the axis of the loment (the isthmi deeper below than above, thus each segment triangular, rounded-triangular, or semi-circular), each segment 5-11 mm long; perennial; [collectively widespread in our area].
 - 2 Corolla 6-7 mm long; loment with 2-4 segments, each 5-7 mm long; lower leaves often 1-foliolate; [of se. SC and southward] *D. floridanum*
 - 2 Corolla 8-13 mm long; loment with 4-6 segments, each 6.5-11 mm long; lower leaves usually 3-foliolate; [collectively widespread in our area].
 - 3 Stem densely spreading pilose (at least the upper stem) and also uncinat-puberulent; loment segments 6.5-10 mm long *D. canescens*
 - 3 Stem glabrous or uncinat-puberulent; loment segments 9-11 mm long
 - 4 Leaves glabrous or nearly so *D. cuspidatum* var. *cuspidatum*
 - 4 Leaves evidently pubescent *D. cuspidatum* var. *longifolium*

Key D

- 1 Corolla 8-11 mm long; petioles mostly 1-8 mm long; [plants of the Mountains of VA and possibly NC] *D. canadense*
- 1 Corolla 3-8 (-9) mm long (or 8-10 mm long in *D. laevigatum*); petioles mostly longer, mostly 10-60 mm long (except *D. ciliare* and *D. obtusum*); [plants collectively widespread in our area].
 - 2 Loment with 1-3 segments, rounded below.
 - 3 Leaflets cinereous on the lower surface; corolla 6-7 mm long; loment with 3 (-4) segments *D. nuttallii*
 - 3 Leaflets not cinereous on the lower surface; corolla 3.5-6 mm long; loment with 1-2 (-3) segments; ["*Desmodium ciliare* group"].
 - 4 Leaflets 3-5.5× as long as wide *D. ciliare*
 - 4 Leaflets 1.2-3-5× as long as wide.
 - 5 Terminal leaflet usually distinctly longer and narrower than the lateral leaflets; stem (near the middle) sparsely to densely uncinat-pubescent *D. obtusum*
 - 5 Terminal leaflet similar to the lateral leaflets; stem (near the middle) glabrous to pilose, or also with some uncinat-pubescent.
 - 6 Petioles 1-3 (-5) mm long; pedicels 3-8 mm long; stem usually pilose; leaflets sub-appressed pubescent (to glabrate) *D. ciliare*
 - 6 Petioles 10-25 mm long; pedicels 8-15 mm long; stem glabrous (to sparsely uncinat-puberulent); leaflets glabrous or with only a few scattered hairs *D. marilandicum*
 - 2 Loment with 3-5 segments, mostly obtusely angled below.
 - 7 Leaves densely villous on the lower surface; stem densely pubescent with uncinat or non-uncinat hairs.
 - 8 Leaflets 1.5-2.0 (-2.2)× as long as wide; loment usually curved (the upper margin convex); loment with 2-4 segments; loment segments 4-5 mm long *D. nuttallii*
 - 8 Leaflets 1.0-1.5 (-1.9)× as long as wide; loment straight; loment with (3-) 4-5 (-6) segments; loment segments (4-) 5-8 (-9) mm long.
 - *D. viridiflorum*
 - 7 Leaves glabrous to moderately appressed-villous on the lower surface; stem glabrate, pilose or uncinat pubescent.
 - 9 Bracts (subtending clusters of 2-3 flowers) usually villous; plants moderately to densely villous; loment usually incurved (the upper margin convex); loment with 2-4 segments, each segment 4-5 mm long *D. nuttallii*

- 9 Bracts (subtending clusters of 2-3 flowers) not villous; plants glabrous or slightly to moderately villous or pilose; loment usually nearly straight; loment with 3-5 segments, each segment 4-8.5 mm long.
- 10 Corolla 8-10 mm long; pedicels usually 10-15 (-20) mm long; stems and leaves glabrous; leaflets distinctly pale on the lower surface *D. laevigatum*
- 10 Corolla 6-8 (-9) mm long; pedicels 3-12 mm long; stems and leaves pubescent or glabrate (but pubescent at least on the leaves); leaflets green or slightly pale on the lower surface; ["*Desmodium paniculatum* group"].
- 11 Leaflet lower surface glabrous, except for the conspicuous uncinete puberulence on the veins; stems and petioles glabrous or uncinete-puberulent; [plant of the Coastal Plain and possibly lower Piedmont] *D. fernaldii*
- 11 Leaflet lower surface strigose to conspicuously sub-appressed-villous, and sometimes also uncinete-puberulent; stems and petioles glabrate to conspicuously pilose or uncinete-puberulent; [plants collectively widespread in our area].
- 12 Leaflets (2.5-) 3-8 (-10)× as long as wide; leaflet pubescence usually sparse, of straight, appressed hairs < 0.5 mm long (or sometimes of longer spreading hairs); leaflets usually lacking uncinete pubescence on either surface; mid-stems glabrous or glabrate, the pubescence usually uncinete puberulence.
- 13 Loment segments rounded on the lower margin (thus semicircular to gibbous); leaves sessile to short-petiolate; [plant restricted to Coastal Plain]..... *D. paniculatum* var. *epetiolatum*
- 13 Loment segments angled on the lower margin (thus triangular to sub-rhombic); leaves long-petiolate; [plant widespread in our area] *D. paniculatum* var. *paniculatum*
- 12 Leaflets 1.5-3 (-4)× as long as wide; leaflet pubescence usually evident, of spreading hairs > 0.5 mm long; leaflets usually with uncinete pubescence on the veins of the upper surface; mid-stems pubescent, either pilose or with uncinete pubescence (if not, evidently pubescent on the petioles).
- 14 Stem and petiole pubescence sparsely to densely uncinete-puberulent; upper surface of leaflets commonly uncinete-puberulent on the veins..... *D. glabellum*
- 14 Stem and petiole pubescence pilose; upper surface of leaflets occasionally uncinete-puberulent on the veins *D. perplexum*

Desmodium canadense (Linnaeus) A.P. de Candolle, Showy Tick-trefoil, Canadian Tick-trefoil. Marl marshes, *Thuja* swamps, springs, seeps, hay meadows, streambanks, usually associated with calcareous substrates. Jul-Sep; Aug-Oct. QC and NS west to AB, south to n. VA, sw. VA, NC (?), c. WV, MO, and OK. Small (1933) reports this species for NC; the documentation is not known. [= C, F, G, I, K, Mo, Pa, SE, Va, W, WV; = *Meibomia canadensis* (Linnaeus) Kuntze – S]

Desmodium canescens (Linnaeus) A.P. de Candolle, Hoary Tick-trefoil. Fields, woodland borders, disturbed areas. Jun-Oct; Aug-Nov. MA west to WI and NE, south to n. peninsular FL and TX. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; = *Meibomia canescens* (Linnaeus) Kuntze – S]

Desmodium ciliare (Muhlenberg ex Willdenow) A.P. de Candolle. Fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. MA west to IN, MO, and se. KS, south to s. FL and TX; also in Cuba. [= C, G, I, Mo, Pa, RAB, SE, Va, W, WH3, WV; > *D. ciliare* var. *ciliare* – F, K; > *D. ciliare* var. *lancifolium* Fernald – F, K; = *Meibomia ciliaris* (Muhlenberg ex Willdenow) Blake – S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. *cuspidatum*, Large-bracted Tick-trefoil. Fields, woodland borders, disturbed areas. Jun-Aug; Aug-Oct. VT and MA west to MI and WI, south to FL Panhandle and OK. [= C, F, G, K, SE, Va; < *D. cuspidatum* – I, Mo, Pa, RAB, W, WH3, WV; = *Meibomia grandiflora* (A.P. de Candolle) Kuntze – S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. *longifolium* (Torrey & A. Gray) Schubert. Forests and woodlands. OH west to MN and NE, south to GA and ne. TX. [= C, F, G, K, SE; < *D. cuspidatum* – RAB, I, Mo, Pa]

Desmodium fernaldii Schubert, Fernald's Tick-trefoil. Sandhills, dry flatwoods, woodland borders. Jun-Sep; Aug-Oct. Se. VA south to s. SC (and maybe e. GA and n. FL); Isely (1998) states that reports from the Gulf Coast are based on "glabrate forms of *D. glabellum*," and also suggests that *D. fernaldii* is only weakly differentiated from *D. glabellum*. [= C, F, G, I, K, RAB, SE, Va, W, WH3; < *Meibomia rhombifolia* Vail – S (also see *D. floridanum*)]

Desmodium floridanum Chapman, Florida Tick-trefoil. Sandhills, other dry sandy habitats. Jun-Sep; Aug-Oct. Se. SC south to s. FL. [= I, K, RAB, SE, WH3; < *Meibomia rhombifolia* Vail – S (also see *D. fernaldii*)]

Desmodium glabellum (Michaux) A.P. de Candolle, Tall Tick-trefoil. Fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. ME west to WI and NE, south to n. peninsular FL and TX. [= F, I, K, Mo, Pa, RAB, SE, Va, WH3, WV; < *D. glabellum* – C (also see *D. perplexum*); ? *Meibomia paniculata* (Linnaeus) Kuntze – S, in part; ? *Meibomia pubens* (Torrey & A. Gray) Rydberg – S (also see *D. paniculatum* var. *paniculatum*); < *D. paniculatum* var. *dillenii* (Darlington) Isely – W]

Desmodium humifusum (Muhlenberg ex Bigelow) Beck. Dry, sandy soils. MA (NS?) south to MD and DC (and possibly VA). Perhaps only a hybrid. [= C, F, I, K, Pa, SE; = *D. glabellum* – G, misapplied; = *Meibomia glabella* – S, misapplied]

Desmodium incanum A.P. de Candolle. Lawns, disturbed areas; presumably introduced or adventive from tropical America. A pantropical weedy species. Becoming common in s. AL (Dauphin Island (Barger et al. 2012)). [= I, SE, WH3; > *D. incanum* var. *incanum* – K; = *Meibomia cana* (J.F. Gmelin) Blake – S, illegitimate basionym; = *D. canum* (J.F. Gmelin) Schinz & Thellung, illegitimate basionym] {not yet keyed}

Desmodium laevigatum (Nuttall) A.P. de Candolle, Smooth Tick-trefoil. Dry oak and pine forests, fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. S. NY west to IN and MO, south to n. FL, Panhandle FL, and TX. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; = *Meibomia laevigata* (Nuttall) Kuntze – S]

Desmodium lineatum A.P. de Candolle, Matted Tick-trefoil. Sandhills and other dry forests and woodlands. Jun-Sep; Aug-Oct. Se. MD south to n. peninsular FL, west to TX, rarely inland. [= C, F, G, I, K, RAB, SE, Va, W, WH3, WV; > *Meibomia arenicola* Vail – S; > *Meibomia polymorpha* (A. Gray) Small – S]

Desmodium marilandicum (Linnaeus) A.P. de Candolle, Maryland Tick-trefoil. Fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. MA west to MI and MO, south to n. peninsular FL and TX. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; = *Meibomia marilandica* (Linnaeus) Kuntze – S]

Desmodium nuttallii (Schindler) Schubert, Nuttall’s Tick-trefoil. Fields, woodland borders, disturbed areas. Jul-Sep; Aug-Oct. NY west to IN, south to n. peninsular FL, FL Panhandle, AL, and AR. [= F, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; < *D. viridiflorum* – C, G; < *Meibomia viridiflora* (Linnaeus) Kuntze – S (also see *D. viridiflorum*)]

Desmodium obtusum (Muhlenberg ex Willdenow) A.P. de Candolle, Stiff Tick-trefoil. Dry pine woodlands, fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. MA west to s. MI, south to Panhandle FL and TX. [= I, K, Mo, Pa, RAB, SE, Va, W, WH3; = *D. rigidum* (Elliott) A.P. de Candolle – C, F, G, WV; = *Meibomia rigida* (Elliott) Kuntze – S]

Desmodium ochroleucum M.A. Curtis ex Canby, White Tick-trefoil, Creamflower Tick-trefoil. Dry woodlands, especially over calcareous substrates. Jun-Aug; Aug-Oct. NJ (?), DE, and MD south to sc. and sw. NC, GA, TN, AL, Panhandle FL, MS, and MO. [= C, F, G, I, K, Mo, RAB, SE, Va, W, WH3; = *Meibomia ochroleuca* (M.A. Curtis ex Canby) Kuntze – S]

Desmodium paniculatum (Linnaeus) A.P. de Candolle var. *epetiolum* Schubert. Pine savannas and flatwoods, bogs. Jun-Sep; Aug-Oct. Var. *epetiolum* ranges from se. VA south to se. NC or e. SC. It may reflect hybridization between *D. paniculatum* var. *paniculatum* and another species. Further study is needed. [= F, I, K, SE, VA; < *D. paniculatum* – C, RAB; < *D. paniculatum* var. *paniculatum* – W]

Desmodium paniculatum (Linnaeus) A.P. de Candolle var. *paniculatum*. Fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. S. ME west to s. ON, MI, and NE, south to s. FL and TX. [= F, I, K, SE, Va; < *D. paniculatum* – C, Mo, Pa, RAB, WH3, WV; > *Meibomia chapmanii* (Britton) Small – S; = *D. paniculatum* var. *pubens* Torrey & A. Gray – G; > *Meibomia paniculata* (Linnaeus) Kuntze – S; >> *Meibomia pubens* (Torrey & A. Gray) Rydberg – S (also see *D. glabellum*); < *D. paniculatum* var. *paniculatum* – W]

Desmodium perplexum Schubert, Perplexing Tick-trefoil. Fields, woodland borders, disturbed areas. Jul-Sep; Aug-Oct. [= F, I, K, Mo, Pa, RAB, SE, Va, WH3, WV; < *D. glabellum* – C; ? *Meibomia dillenii* (Darlington) Kuntze – S; < *D. paniculatum* var. *dillenii* (Darlington) Isely – W]

Desmodium rotundifolium A.P. de Candolle, Roundleaf Tick-trefoil. Dry forests and woodlands. Jun-Aug; Aug-Oct. VT and MA west to s. MI, south to ne. FL, Panhandle FL, LA, and MO. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; ? *Meibomia michauxii* Vail – S]

Desmodium sessilifolium (Torrey) Torrey & A. Gray, Sessile-leaf Tick-trefoil. Dry woodlands. Jul-Aug; Aug-Oct. RI west to s. MI and KS, south to NC, Panhandle FL, MS, and TX. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WH3; = *Meibomia sessilifolia* (Torrey) Kuntze – S]

Desmodium strictum (Pursh) A.P. de Candolle, Pineland Tick-trefoil, Pinebarren Tick-trefoil. Sandhills, other dry woodlands. Jul-Aug; Aug-Oct. S. NJ south to s. FL, west to w. LA. [= C, F, G, I, K, Mo, RAB, SE, Va, W, WH3; = *Meibomia stricta* (Pursh) Kuntze – S]

Desmodium tenuifolium Torrey & A. Gray, Slimleaf Tick-trefoil. Savannas, wet pine flatwoods. Jul-Aug; Aug-Oct. Se. VA south to c. peninsular FL, west to w. LA. [= C, F, G, I, K, RAB, SE, Va, WH3; = *Meibomia tenuifolia* (Torrey & A. Gray) Kuntze – S]

*? *Desmodium tortuosum* (Swartz) A.P. de Candolle. Fields, woodland borders, disturbed areas. Jul-Aug; Aug-Oct. E. NC south to s. FL, west to TX; perhaps only introduced in the southeastern United States. [= I, K, RAB, SE, WH3; = *Meibomia purpurea* (P. Miller) Vail – S]

* *Desmodium triflorum* (Linnaeus) de Candolle. Lawns, roadsides; native of the Old World tropics. Reported for Escambia County, FL Panhandle (Kunzer et al. 2009). [= I, K, SE, WH3; = *Sagotia triflora* (Linnaeus) Duchassaing & Walpers – S] {add to synonymy}

Desmodium viridiflorum (Linnaeus) A.P. de Candolle, Velvety Tick-trefoil. Fields, woodland borders, disturbed areas. Jun-Sep; Aug-Oct. DE south to c. peninsular FL, west to TX, and inland to w. VA, w. NC, n. TN, and AR. This species is one of several that is notably uncinately-puberulent on the upper leaf surfaces. [= F, I, K, Mo, Pa, RAB, SE, Va, W, WH3; < *D. viridiflorum* – C, G (also see *D. nuttallii*); < *Meibomia viridiflora* (Linnaeus) Kuntze – S (also see *D. nuttallii*)]

58. *Hylodesmum* H. Ohashi & R.R. Mill 2000

A genus of ca. 15 species, perennial herbs, mainly of e. Asia and e. North America. This group has often been included in *Desmodium* as a section or subgenus, but is now shown to be amply distinct in morphology and also to form a monophyletic group based on molecular analysis. References: Raveill (2006); Ohashi & Mill (2000)=Z.

- 1 Stems dimorphic, the flowering stem normally lacking leaves (rarely with leaves), the sterile stem with a subverticillate cluster of 3-7 leaves near the top; pedicels 10-20 mm long *H. nudiflorum*
- 1 Stems monomorphic, bearing both leaves and flowers, the leaves either subverticillate or not; pedicels 2-10 mm long.
 - 2 Leaves subverticillate, clustered; leaflets conspicuously and strongly acuminate, 5-10 cm long; flowers usually distinctly pink or pink-purple; inflorescence 3-8 dm long, elongate, large, and conspicuous, much exceeding the leaves *H. glutinosum*
 - 2 Leaves alternate, scattered; leaflets acute to slightly acuminate, 3-7 cm long; flowers white; inflorescence 1-2 dm long, small and inconspicuous, often partly obscured by the leaves *H. pauciflorum*

Hylodesmum glutinosum (Muhlenberg ex Willdenow) H. Ohashi & R.R. Mill, Heartleaf Tick-trefoil, Clusterleaf Tick-trefoil. Moist forests, especially nutrient-rich. Jun-Aug; Aug-Oct. NS west to SK, south to Panhandle FL and Mexico. [= Mo, Va, WH3, Z; = *Desmodium glutinosum* (Muhlenberg ex Willdenow) Alph. Wood – C, F, G, I, K, Pa, RAB, SE, W, WV; = *Meibomia acuminata* (Michaux) Blake – S]

Hylodesmum nudiflorum (Linnaeus) H. Ohashi & R.R. Mill, Naked Tick-trefoil. Moist to dry forests. Jul-Aug; Aug-Oct. ME west to MN, south to Panhandle FL, n. peninsular FL, and TX. [= Mo, Va, WH3, Z; = *Desmodium nudiflorum* (Linnaeus) A.P. de Candolle – C, F, G, I, K, Pa, RAB, SE, W, WV; = *Meibomia nudiflora* (Linnaeus) Kuntze – S]

Hylodesmum pauciflorum (Nuttall) H. Ohashi & R.R. Mill, Few-flowered Tick-trefoil. Moist forests. Jun-Aug; Aug-Oct. NY west to OH and IA, south to Panhandle FL and TX. [= Mo, Va, WH3, Z; = *Desmodium pauciflorum* (Nuttall) A.P. de Candolle – C, F, G, I, K, RAB, SE, W, WV; = *Meibomia pauciflora* (Nuttall) Kuntze – S]

59. *Alysicarpus* Necker ex Desvaux 1813 (Alyce Clover)

A genus of about 25-30 species, herbs, native of the Old World tropics. References: Isely (1998)=I.

* *Alysicarpus ovalifolius* (Schumacher) J. Léonard, Alyce Clover. Disturbed areas; native of the Old World Tropics, planted as a forage crop (at least formerly), and rarely naturalized. The VA occurrence is from chrome ore piles in Newport News – presumably a waif. It is possible that *A. vaginalis* (in the strict sense) is represented in our area as well. It differs from *A. ovalifolius* in having a densely congested inflorescence (with rachis internodes shorter than the flowers) vs. a lax inflorescence with the flowers much shorter than the rachis internodes. [= WH3; < *Alysicarpus vaginalis* (Linnaeus) A.P. de Candolle – I, K, SE]

60. *Orbexilum* Rafinesque 1832 (Scurfpea, Sampson's-snakeroot)

A genus of about 11 species, perennial herbs, of s. North America and Mexico (south to Chiapas). References: Turner (2008)=Y; Vincent (2014)=X; Grimes (1988, 1990)=Z; Isely (1998)=I.

- 1 Leaves unifoliolate; [subgenus *Poikadenia*] *O. virgatum*
- 1 Leaves with 3-7 leaflets.

- 2 Leaves palmately (3-) 5-7 foliolate, the leaflets linear to very narrowly oblanceolate, 2-7 cm long, 0.5-2.0 (-3.5) mm wide, > 10× as long as wide; [subgenus *Orbexilum*] *O. lupinellus*
- 2 Leaves pinnately 3-foliolate, the leaflets orbicular, ovate, elliptic or lanceolate, > 8 mm wide, 1-8× as long as wide.
- 3 Leaflets 1.5-7 cm wide, 1-2.5× as long as wide; [subgenus *Orbexilum*].
 - 4 Upper leaf surfaces lacking glands; leaflets 3.7-5.5 cm long; [endemic to Rock Island, Jefferson Co. KY and now considered extinct] *O. stipulatum*
 - 4 Upper leaf surfaces glandular; leaflets 4-12 cm long.
 - 5 Leaflets subcordate, 4-7 cm wide, 1-1.5× as long as wide, glandular-punctate above and below, the apex obtuse; calyx stipitate-glandular; petals 8-10 mm long; [endemic to Polk Co. NC, perhaps extinct] *O. macrophyllum*
 - 5 Leaflets rounded at base, 2-4 cm wide, 1.5-2.5× as long as wide, eglandular or sparsely glandular above, the apex acute; calyx lacking stipitate glands; petals 5-7 mm long; [widely scattered from w. VA and w. NC westward] *O. onobrychis*
- 3 Leaflets 0.8-2 cm wide, 2.5-7.5× as long as wide; [subgenus *Poikadenia*].
 - 6 Flowers 8-10 mm long; [of s. AL westward] *O. simplex*
 - 6 Flowers 5-7 mm long; [collectively widespread in our area].
 - 7 Calyx tube, fruits, and bracts of the inflorescence eglandular (rarely slightly glandular-punctate); leaflets eglandular below (rarely slightly punctate); hairs on calyx 0.7-1.0 mm long; upper 2 calyx teeth 1.0-1.5 mm long, lateral teeth 1.5-2.0 mm long, lower calyx tooth 2.0-3.0 mm long; bracts broadly ovate, 6-10 mm long, 2- 5 mm wide *O. pedunculatum*
 - 7 Calyx tube, fruits, and bracts of the inflorescence conspicuously glandular-punctate; leaflets conspicuously glandular-punctate below; hairs on calyx 0.3-0.5 mm long; upper 2 calyx teeth 0.7-1.0 mm long, lateral teeth 1.2-1.5 mm long, lower calyx tooth 1.7-2.0 mm long; bracts narrowly ovate, 5-8 mm long, 1.0-2.5 mm wide *O. psoralioides*

Orbexilum lupinellus (Michaux) Isely, Lupine Scurfpea. Sandhills. May-Jul; Jul-Oct. This peculiar species is a Southeastern Coastal Plain endemic, ranging from sc. and se. NC, south to c. peninsular FL, s. AL, and e. GA. The very peculiar leaves, palmately 5-7-foliolate with "oblinear" leaflets, make the species unmistakable. First reported for SC by McMillan et al. (2002). [= I, SE, WH3, Y, Z; = *Orbexilum lupinellum* (Michaux) Isely – K1, K2, orthographic variant; = *Psoralea lupinellus* Michaux – RAB; = *Rhytidomene lupinellus* (Michaux) Rydberg – S]

Orbexilum macrophyllum (Rowlee in Small) Rydberg, Bigleaf Scurfpea. Wooded slopes of mountain on Blue Ridge escarpment, precise habitat not known (probably nutrient-rich dry woodlands). Jun; Jul-Aug? This species was discovered on 18 June 1897 and subsequently collected on 8 June 1899 by E.C. Townsend, somewhere on the double peak of Tryon Mountain and White Oak Mountain, Polk County, NC, a phytogeographically interesting area with disjunct, endemic, and relictual species largely of midwestern affinities. It is currently presumed to be extinct, following a number of unsuccessful attempts to relocate it. Isely (1990) states that the assignment of "this distinctive species" to *Orbexilum* is "reasonably assumptive," since fruits have never been seen. [= I, K, S, SE, Y, Z; = *Psoralea macrophylla* Rowlee in Small – RAB, W]

Orbexilum onobrychis (Nuttall) Rydberg, Lanceleaf Scurfpea. Calcareous or mafic woodlands and barrens. Jun-Jul; Aug-Oct. Primarily a species of prairies and prairie-like areas of OH and KY west to se. IA and e. MO. *O. onobrychis* also occurs (at least formerly) as rare disjunct populations south to the mountains and Interior Low Plateau of w. NC, nw. SC, w. VA, e. TN, nw. AL, c. TN, and n. AR. The only report for NC was in the 1800's. [= C, I, K, Mo, S, SE, Va, Y, Z; = *Psoralea onobrychis* Nuttall – F, G, RAB, W]

Orbexilum pedunculatum (P. Miller) Rydberg, Western Sampson's-snakeroot. Open woodlands. May-Jul; Jul-Sep. S. OH, s. IN, s. IL, c. MO, and se. KS, south to sw. NC, sc. SC, sw. GA, w. Panhandle FL, s. AL, s. LA, and e. TX. [= S, Y; = *Orbexilum pedunculatum* (P. Miller) Rydberg var. *pedunculatum* – C, I, K1, K2, Mo, SE, Z; = *Psoralea psoralioides* (Walter) Cory var. *eglandulosa* (Elliott) F.L. Freeman – RAB, F, G, GW, W]

Orbexilum psoralioides (Walter) Vincent, Eastern Sampson's-snakeroot. Longleaf pine savannas, loamy longleaf pine sandhills, open woodlands. May-Jul; Jul-Sep. Primarily on the Atlantic Coastal Plain, ranging from e. VA to ne. FL and Panhandle FL, inland to the Piedmont of NC and SC. Vincent (2014) discusses the nomenclature in detail. [= *Orbexilum gracile* (Torrey & A. Gray) Rydberg – S, Y; = *Orbexilum pedunculatum* (P. Miller) Rydberg var. *psoralioides* (Walter) Isely – K1, K2, Va; = *Psoralea psoralioides* (Walter) Cory var. *psoralioides* – F, G, GW, RAB; = *Orbexilum pedunculatum* var. *gracile* (Torrey & A. Gray) Grimes – C, I, SE, Z; < *Orbexilum pedunculatum* – WH3]

Orbexilum simplex (Nuttall ex Torrey & Gray) Rydberg. Prairies, open woodlands. AR and OK south to s. AL, MS, e. and w. LA, and e. TX; perhaps disjunct in IL. [= I, K, S, SE, Y, Z]

Orbexilum stipulatum (Torrey & Gray) Rydberg. Limestone glades. So far as is known, once endemic to Rock Island in the Ohio River, Jefferson Co., KY, and now presumed extinct because of near obliteration of the only known site by dam-building and industrial construction (Baskin, Isely, & Baskin 1986). [= C, I, K, SE, Y, Z; = *Psoralea stipulata* Torrey & Gray – F, G]

Orbexilum virgatum (Nuttall) Rydberg, Slender Leather-root. Sandhills, pine flatwoods. Se. GA (or SC?) south to ne. FL. A collection by Curtiss is labeled as from South Carolina. [= I, K, S, SE, WH3, Y, Z; = *Psoralea virgata* Nuttall]

61. *Pediomelum* Rydberg 1919 (Buckroot, Prairie-turnip)

A genus of about 22 species, perennial herbs, of North America. References: Allison, Morris, & Egan (2006)=Y; Grimes (1988, 1990)=Z; Isely (1998)=I.

- 1 Flowering calyx 1.5-2.5 mm long, the legume exerted out of it at maturity; leaves 3-5-foliolate; [of MS and KY and westward]; [former genus *Psoralidium*].....*P. tenuiflorum*
- 1 Flowering calyx 7-10 mm long, the legume mostly included within it even at maturity; leaves (1-) 3-7 foliolate; [of TN and AL and eastward].
 - 2 Plants caulescent, 1-2 dm tall; leaves (4-) 5-7-foliolate; [plants of calcareous glades of the Interior (nw. GA, TN, n. AL)]; [subgenus *Disarticulatum*].....*P. subacaule*
 - 2 Plants caulescent, 3-10 dm tall; leaves (1-) 3 (-5)-foliolate; [plants of sandhills of the Coastal Plain and rocky woodlands of the lower Piedmont]; [subgenus *Pediomelum*].
 - 3 Inflorescence loose (much of the axis exposed); leaflets (1-) 3; leaflets < 2× as long as wide, petiolules 5-9 mm long; [of longleaf pine sandhills of the Coastal Plain].....*P. canescens*
 - 3 Inflorescence congested (the axis usually concealed); leaflets 3 (-5); leaflets > 2× as long as wide, petiolules 1.8-3 mm; [of rocky woodlands of the lower Piedmont].....*P. piedmontanum*

Pediomelum canescens (Michaux) Rydberg, Buckroot, Eastern Prairie-turnip, Hoary Scurfpea. Sandhills, pine flatwoods. May-Jul; Jul-Oct. A Southeastern Coastal Plain endemic: se. VA south to c. peninsular FL, Panhandle FL, and s. AL. This uncommon species tends to occur as very widely scattered individuals in sandhill habitats, rarely with more than a few seen at a time. It is related to *P. esculentum* (Pursh) Rydberg, the "prairie potato," prized by early travelers across the prairies for its edible tubers. An interesting collection label (by R.E. Wicker, collected in 1942, the specimen at NCU) mentions both the edible tubers and the characteristically sparse population structure of the species. "Not uncommon near Pinehurst in ... open places in sandy pine woods..., but usually only one plant at a time. Tuber hard, dark brown, about size of a medium-sized Irish potato, somewhat ventral-elongated with roots coming from pointed base. Internal pure white, apparently almost entirely starch... Mr. Wicker says that he rather likes to take a bit of it and chew when fresh, has a rather condiment taste, but does not think it well to eat..." Because of its rarity, *P. canescens* should not (of course) be eaten. Because of its habit, that of a very bushy, tumbleweed-like plant, it superficially most closely resembles various *Baptisia* species, but it is easily separated by its rather dense and soft pubescence (our *Baptisia* are all glabrous or rather inconspicuously puberulent, except the very unifoliolate *B. arachnifera*). [= C, I, K, S, SE, Va, WH3, Z; = *Psoralea canescens* Michaux - F, G, RAB]

Pediomelum piedmontanum J.R. Allison, M.W. Morris, & A.N. Egan, Piedmont Buckroot. Open, rocky woodlands in the lower Piedmont. Late May-late Jun (-late Jul); Jul-Aug (-Sep). Apparently endemic to the lower Piedmont of c. SC and e. GA. See Allison, Morris & Egan (2006) for additional details. [= Y]

Pediomelum tenuiflorum A.N. Egan, Gray Scurf-pea. Prairies. KY to MT, south to TX and n. Mexico; disjunct in MS. A recent study (Egan & Crandall 2008) shows that this species belongs in *Pediomelum*, not *Psoralidium*. [= *Psoralidium tenuiflorum* (Pursh) Rydberg - C, I, K, SE, Z; = *Psoralea tenuiflora* Pursh - F, G]

Pediomelum subacaule (Torrey & A. Gray) Rydberg, Nashville Breadroot. Limestone glades. E. TN and nw. GA west to c. TN and nw. AL. [= I, K, SE, Z; = *P. subacaulis* - S, orthographic variant]

62. *Cullen* Medikus 1787

A genus of ca. 35 species, herbs and shrubs, of the Old World. References: Isely (1998)=I.

1
1

* ***Cullen americanum*** (Linnaeus) Rydberg, Scurf-pea. Waste areas around wool-combing mills, other disturbed areas, perhaps only a waif; native of the w. Mediterranean region (a misnomer). There are other (older) reports from other southeastern states, including FL and MS. [= I, S; = *C. americana* - K1, K2, SE, orthographic variant] {not keyed}

* ***Cullen corylifolium*** (Linnaeus) Medikus, Malaysian Scurf-pea. On ships ballast, probably only a waif; native of s. Asia [= *C. corylifolia* - K1, K2, orthographic variant] {not keyed}

63. *Sesbania* Adanson 1760 (Rattlebox, Sesban)

A genus of about 50-60 species, annual herbs, perennial herbs, shrubs, and trees, of tropical, subtropical, and less commonly warm temperate regions of the Old and New World, here circumscribed to include *Glottidium*, following Lewis et al. (2005).
References: Isely (1998)=I.

- 1 Corolla 8-9 mm long; legume flat; leaves with 8-13 pairs of leaflets *S. vesicaria*
- 1 Corolla 9-25 mm long; legume quadrangular or 4-winged; leaves with 10-35 pairs of leaflets.
 - 2 Legume quadrangular in cross-section, the corners not winged, 15-20 cm long, 0.3-0.5 cm wide; corolla 10-15 (-20) mm long, yellow, often marked with purple; leaves with 15-35 pairs of leaflets; [plant a robust herb, to 4 m tall]..... *S. herbacea*
 - 2 Legume quadrangular or conspicuously 4-winged longitudinally, 3-8 cm long, 0.5-1.5 cm wide; corolla 9-25 mm long, yellow, orange, or scarlet; leaves with 10-20 pairs of leaflets; [plant a shrub, to 4 m tall].
 - 3 Legume quadrangular or slightly flanged, 0.5-0.7 cm wide; corolla 9-12 mm long..... *S. virgata*
 - 3 Legume conspicuously 4-winged longitudinally, 1-1.5 cm wide; corolla 13-25 mm long.
 - 4 Corolla yellow; pedicels 0.5-1.0 cm long; legume blunt or abruptly acuminate to a beak *S. drummondii*
 - 4 Corolla orange or red; pedicels 0.5-1.2 (-1.5) cm long; legume acuminate or tapering to a beak *S. punicea*

Sesbania drummondii (Rydberg) Cory, Rattlebox, Poison-bean. Disturbed areas, spoil, marsh edges, ditches. Native on the Gulf Coast west to s. TX and Mexico, the exact eastern edge of the native range uncertain, perhaps w. FL Panhandle. First reported for GA and SC by Townsend et al. (2000), where clearly introduced. [= GW, I, K1, K2, SE, WH3; = *Daubentonia drummondii* Rydberg – S]

Sesbania herbacea (P. Miller) McVaugh, Sesban, Coffee-weed, Indigo-weed, Peatree. Ditches, wet fields, perhaps native only in the deeper South. Jul-Sep; Aug-Nov. Native distribution uncertain, perhaps e. NC south to s. FL, west on the Coastal Plain and Mississippi Embayment to TX, south into Mexico. [= K1, Mo, WH3; = *S. exaltata* (Rafinesque) Cory – C, F, G, I, K2, RAB, SE; = *Sesbania macrocarpa* Muhlenberg ex Rafinesque – GW; = *Sesban exaltatus* (Rafinesque) Rydberg – S]

* *Sesbania punicea* (Cavanilles) Bentham, Rattlebox, Scarlet Wisteria-tree, Red Sesban. Ditches, wet fields, marshes, ponded wetlands, wet pinelands; presumably native of South America. Jun-Oct; Aug-Nov. [= GW, I, K1, K2, SE, Va, WH3; = *Daubentonia punicea* (Cavanilles) A.P. de Candolle – RAB, S]

Sesbania vesicaria (Jacquin) Elliott, Bladderpod, Bagpod. Ditches, marshes, disturbed wet areas. Jul-Sep; Aug-Nov. The original native distribution of *S. vesicaria* is uncertain; its distribution is from ne. NC south to s. FL, west to e. OK and se. TX, and Isely (1998) states that it is unknown from outside the United States; occurrences in provinces inland of the Coastal Plain seem to represent introductions into artificial wetlands (such as ditches). [= GW, K2, Mo, WH3; = *Glottidium vesicarium* (Jacquin) R.M. Harper – I, K1, RAB, S, SE]

* *Sesbania virgata* (Cavanilles) Poirlet. Disturbed areas; native of South America. Jun-Oct; Aug-Nov. [= I, K1, K2, SE, WH3]

64. *Scorpiurus* Linnaeus 1753 (Scorpion's-tail)

A genus of 2-4 species, herbs, of Mediterranean Europe west into w. Asia. References: Stace (2010)=Z

* *Scorpiurus muricatus* Linnaeus, Caterpillar-plant. Disturbed areas, probably only a waif; native of Mediterranean Europe. [= K1, K2, Z]

65. *Securigera* A.P. de Candolle 1805 (Crown-vetch)

A genus of about 12-13 species, annual and perennial herbs, of Eurasia. This genus is sometimes included in *Coronilla*, but is apparently better separated (Isely 1998). References: Isely (1998)=I.

- 1 Corolla yellow; annual; [rare waif]..... [*S. securidaca*]

1 Corolla white and pink; perennial; [common alien, planted and established]..... *S. varia*

* *Securigera securidaca* (Linnaeus) Degen & Dörfler. Disturbed areas; native of Europe. Reported by Small (1933), but rejected by Isely (1990) on the basis of no material seen to document the occurrence; this taxon's status as part of our flora is uncertain. [= I, SE; = *Bonaveria securidaca* (Linnaeus) Reichenbach – S; = *Coronilla securidaca* Linnaeus – K]

* *Securigera varia* (Linnaeus) Lassen, Crown-vetch. Roadbanks, woodland borders; native of Europe. This species, generally known as *Coronilla varia*, is now widely used to stabilize road-cuts. [= I, Mo, Va; = *Coronilla varia* Linnaeus – C, F, G, K, Pa, RAB, SE, W, WH3, WV]

66. Anthyllis Linnaeus 1753 (Kidney-vetch)

A genus of about 20 species, annual and perennial herbs, of the Mediterranean region. References: Isely (1998)=I.

Anthyllis vulneraria Linnaeus, Kidney-vetch. Disturbed areas; native of Mediterranean Europe. Jun-Aug. [=I, K2]

67. Acmispon Rafinesque 1832 (American Bird's-foot-trefoil, Prairie-trefoil)

A genus of about 8 species, annual and perennial herbs, of temperate North America and South America. New World taxa often referred to *Lotus* are not closely related to *Lotus*, and should be segregated (Degtjareva et al 2006; Allan & Porter 2000). References: Isely (1981)=Z; Isely (1998)=I; Sokoloff (2000); Degtjareva et al. (2006); Allan & Porter (2000); Grant & Small (1996).

1 Leaflets 3-3.5× as long as wide; plants pubescent, the hairs long; [alien] [*A. americanus*]
 1 Leaflets 4-5× as long as wide; plants glabrate, the hairs short; [native of Piedmont of sc. VA, NC, SC, and e. GA].....*A. helleri*

* *Acmispon americanus* (Nuttall) Rydberg, Western Prairie-trefoil. Disturbed areas, waste-combing mills. [= *A. americanum* – S, orthographic variant; < *L. americanus* (Nuttall) Bischoff – F; < *L. purshianus* F.E. & E.G. Clements – G; = *L. unifoliolatus* (Hooker) Benth var. *unifoliolatus* – K; = *L. purshianus* F.E. & E.G. Clements var. *purshianus* – C, I, SE, Z; = *Acmispon americanus* var. *americanus* – Mo]

Acmispon helleri (Britton) A.A. Heller, Carolina Prairie-trefoil. Dry woodlands and openings, originally probably limited to prairie-like sites (fire-maintained, post oak-blackjack oak savannas), generally on clayey soils, now primarily seen on roadbanks, along railroads, and in powerline rights-of-way, where mowing and bush-hogging have replaced fire as the force keeping the habitat open, sunny, and suitable for this plant of prairie affinities. (Jun-) Jul-Aug (-Sep). *A. helleri* is endemic to the Piedmont of extreme sc. VA, NC, SC, and ne. GA. *A. helleri* is clearly closely related to *A. americanus* (= *Lotus unifoliolatus*, = *Lotus purshianus*, = *Lotus americanus*), of prairies of the midwestern states and various habitats farther west, which ranges east to LA, AR, MO, IL, IN, and WI. Isely (1981) reduced *A. helleri* to a variety (in *Lotus*), because it "is but one of many elements within the *L. purshianus* complex and its differences from the rest are less than among the California races," while also stating "since it has no breeding contact with var. *purshianus*, it is reasonably maintained as a species." Since *A. helleri* seems adequately separated from *A. americanus* by its narrower leaflets, glabrate vestiture, and allopatric distribution, I choose to reasonably maintain it as a species. [= S, Va; = *Lotus helleri* Britton – RAB; < *L. americanus* (Nuttall) Bischoff – F; < *L. purshianus* F.E. & E.G. Clements – G; = *L. unifoliolatus* (Hooker) Benth var. *helleri* (Britton) Kartesz & Gandhi – K; = *L. purshianus* F.E. & E.G. Clements var. *helleri* (Britton) Isely – C, I, SE, Z; = *Acmispon americanus* (Nuttall) Rydberg var. *helleri* (Britton) Brouillet – Mo]

68. Lotus Linnaeus 1753 (Birdsfoot-trefoil)

A genus of about 120-130 species, annual and perennial herbs and shrubs, of temperate Eurasia. New World taxa often referred to *Lotus* are not closely related to *Lotus*, and should be segregated (Degtjareva et al 2006; Allan & Porter 2000). References: Isely (1981)=Z; Isely (1998)=I; Degtjareva et al. (2006); Allan & Porter (2000); Grant & Small (1996). [also see *Acmispon*]

1 Leaves 3-foliolate, the upper commonly 1-foliolate; flowers solitary in leaf axils; [native or alien annual herbs] [see *Acmispon*]
 1 Leaves 5-foliolate; flowers in umbels; [alien perennial herbs].
 2 Calyx tube 2.8-3.5 mm long; corolla usually 10-14 mm long; leaflets of the medial leaves mostly 1.5-2.5 (-5)× as long as wide *L. corniculatus*
 2 Calyx tube 1.8-2.8 mm long; corolla usually 8-10 mm long; leaflets of the medial leaves 3-4 (-6)× as long as wide..... *L. tenuis*

* *Lotus corniculatus* Linnaeus, Birdsfoot-trefoil, Eggs-and-Bacon. Fields, roadsides, and waste places; native of Eurasia. Jun-Sep. First reported for GA (Rabun County) by Stiles & Howel (1998). [= C, F, G, K, Mo, Pa, RAB, S, SE, Va, W, WV, Z; < *L. corniculatus* Linnaeus – I]

* *Lotus tenuis* Waldstein & Kitaibel ex Willdenow, Slender Birdsfoot-trefoil. Fields, roadsides, and waste places; native of Eurasia. Jun-Sep. First reported for KY by Poindexter & Thompson (2011) and for DE by Knapp et al. (2011). [= C, K, SE, Z; < *L. corniculatus* Linnaeus – I]

69. *Robinia* Linnaeus 1753 (Locust)

A genus of 5-8 species, shrubs and trees, of e. and sw. North America. The Southern Appalachians are a center of diversity of *Robinia*, with active hybridization, introgression, and formation of local (sterile) races involved; a fully satisfying taxonomic treatment of such a situation is not possible. Isely & Peabody's (1984) treatment seems a reasonable approach, and I have largely followed it here, differing in the rank of some of the taxa. References: Isely & Peabody (1984)=Z; Ashe (1922)=Y; Isely (1998)=I.

Identification notes: The key is differently structured than that in RAB or SE; it is presented as an alternative. This treatment may be altered substantially prior to publication. A variety of hybrids (including some cultivars) are known, including the following: *Robinia* × *longiloba* W.W. Ashe (pro sp.) [*R. hispida* × *viscosa*], known from NC and SC; *Robinia* × *margarettae* W.W. Ashe (pro sp.) [*R. hispida* × *pseudoacacia*], known from NC, SC, and GA; *Robinia* × *ambigua* Poiret (pro sp.) [*R. pseudoacacia* × *viscosa*], known from NC; *Robinia hartwigii* × *hispida*, known from Whiteside Mountain, Jackson County, NC; *Robinia hartwigii* × *viscosa*, known from Whiteside Mountain, Jackson County, NC.

- 1 Corolla white, 1.5-2.0 cm long; peduncles, pedicels, and calyces velvety-puberulent, the hairs neither glandular nor hispid; plant a small to large tree *R. pseudoacacia*
- 1 Corolla pink to pink-purple (rarely white or nearly so), (1.5-) 2.0-2.5 cm long; peduncles, pedicels, and calyces glandular-pubescent, hispid, or with short-stalked to sessile glands; plant a shrub to small tree.
 - 2 Twigs and leafstalks conspicuously hispid with hairs 1-5 mm long, these stiff, thick-based, and typically persistent several years.
 - 3 Plants fruiting abundantly; shrubs 0.6-2 (-3) m tall; leaflets relatively broad, mostly 1.2-1.8× as long as wide *R. hispida* var. *fertilis*
 - 3 Plants sterile (rarely fruiting scantily); shrubs 0.5-1.5 m tall; leaflets relatively narrow, mostly 1.8-2.5× as long as wide *R. hispida* var. *hispida*
 - 2 Twigs and leafstalks either viscid with sessile or short-stalked glands, or densely glandular-pubescent (the hairs 0.5-2 mm long), or tomentulose, or sparsely hispid with weak, non-persistent hairs.
 - 4 Leaflets usually 13-21, permanently but inconspicuously appressed-pubescent beneath; bracts (evident only before anthesis) aristate; plants never with long, hispid pubescence.
 - 5 Twigs and peduncles finely glandular-pubescent with hairs 1 (-2) mm long; plants abundantly pod-forming *R. hartwigii*
 - 5 Twigs and peduncles viscid with sessile or short-stalked glands (the racemes sometimes with some glandular pubescence); plants sterile or forming pods *R. viscosa*
 - 4 Leaflets usually 9-13, initially appressed-silky but later glabrate beneath; bracts (evident only before anthesis) not aristate; plants with or without sparse long, hispid pubescence.
 - 6 Plants fruiting abundantly; shrubs 1-3 m tall *R. hispida* var. *kelseyi*
 - 6 Plants sterile (rarely fruiting scantily); shrubs or small trees, 0.4-3 (-8) m tall.
 - 7 Shrubs or small trees, 1-3 (-8) m tall, much branched, the stems and branches relatively straight, the nodes usually lacking spines; leaflets 1.5-3 cm long *R. hispida* var. *rosea*
 - 7 Shrubs, 0.4-1 m tall, little branched, the stems and branches typically zigzag (bent at each node), the nodes usually with spines; leaflets 1-2 (-3) cm long *R. nana*

Robinia hartwigii Koehne, Granite Dome Locust, Highlands Locust, Hartwig's Locust. Forests and outcrop edges on high elevation granitic domes, also clearings. Jun-Jul; Aug-Sep. Apparently endemic to a small area around Highlands, NC; and disjunct in the Sandhills of SC (Aiken County; Patrick McMillan, pers. comm., 2015). While certainly related to and apparently hybridizing with *R. viscosa*, *R. hartwigii* seems worthy of recognition as a species. The original spelling (Koehne 1913) is "*hartwigii*"; it is not clear why the orthographic variants (see synonymy) arose. [= RAB, S; = *R. viscosa* var. *hartwegii* (Koehne) W.W. Ashe – K1, orthographic variant; = *R. viscosa* var. *hartwigii* – K2, SE, Z; < *R. viscosa* – W; = *R. viscosa* var. *hardwegii* – Y, orthographic variant]

Robinia hispida Linnaeus var. *fertilis* (W.W. Ashe) Clausen, Arnot Bristly Locust. Woodlands and forests. May-Jun; Jul-Aug. Apparently endemic to the Southern Appalachians of w. NC and e. TN. A horticultural selection of var. *fertilis*, the Arnot Bristly Locust, is used as a soil binder. [= C, F, K1, K2, SE, Z; < *R. hispida* – Pa, RAB, W; > *R. fertilis* W.W. Ashe – S; > *R. grandiflora* W.W. Ashe – S, Y; > *R. pedunculata* W.W. Ashe – S]

Robinia hispida Linnaeus var. *hispida*, Common Bristly Locust. Woodlands and forests, and as an escape in disturbed areas and roadsides. May-Jun. Probably originally endemic to the Southern Appalachians (and perhaps adjacent provinces) of NC, SC, GA, and VA, now widely distributed in e. North America as an escape from cultivation. [= C, F, K1, Mo, SE, Z; < *R.*

hispida – Pa, RAB, Va, W, WH3, WV; = *R. hispida* – G, S, Y; < *R. hispida* var. *hispida* – K2; > *R. hispida* – S; > *R. pallida* W.W. Ashe – S; > *R. spectosa* W.W. Ashe – S]

Robinia hispida* Linnaeus var. *kelseyi (Cowell ex Hutchinson) Isely, Kelsey's Locust. Mountain woodlands, introduced elsewhere. Apr-Jul; Jul-Oct. Traditionally considered an endemic originally restricted to w. NC, but SE and Z suggest that var. *kelseyi* may have been only of horticultural origin. [= K1, SE, Z; = *R. kelseyi* Cowell ex Hutchinson – G, RAB, S, Y; < *R. hispida* var. *hispida* – K2; < *R. hispida* – Pa, W]

Robinia hispida* Linnaeus var. *rosea Pursh, Boynton's Locust. Mountain woodlands. Apr-Jul. Originally distributed from w. NC and e. TN south to nw. SC, n. GA, and ne. AL, now occasionally found outside that range as an escape from cultivation. [= C, K1, K2, SE, Z; = *R. boyntonii* W.W. Ashe – G, RAB, S, Y; < *R. hispida* – Pa, W, WH3]

***Robinia nana* Elliott, Dwarf Bristly Locust.** Sandhills, dry rocky forests (especially associated with chestnut oak). Apr-Jun; Jul-Oct. Se. and nc. NC south through SC to GA and AL. This species fruits infrequently. [= *R. elliotii* (Chapman) W.W. Ashe ex Small – F, G; = *R. hispida* Linnaeus var. *nana* (Elliott) A.P. de Candolle – K1, K2, SE, Z; > *R. nana* – RAB, S, Y; > *R. elliotii* – RAB, S, Y; < *R. hispida* – W]

***Robinia pseudoacacia* Linnaeus, Black Locust.** Forests, woodlands, disturbed areas, roadcuts; common (uncommon in DE, rare in FL). Apr-Jun; Jul-Nov. Native in the s. and c. Appalachians, from PA south to GA and AL, now much more widespread, throughout e. and c. North America, also widely cultivated and escaped in Europe. Generally considered a weed tree. [= C, K1, K2, Mo, Pa, SE, Va, W, WH3, Z; = *R. pseudo-acacia* – F, RAB, S, WV, orthographic variant; > *R. pseudo-acacia* var. *pseudo-acacia* – G, orthographic variant; > *R. pseudo-acacia* var. *rectissima* (Linnaeus) Raber – G]

***Robinia viscosa* Ventenat, Clammy Locust.** Mountain forests and woodlands, roadsides, disturbed areas, rare in wild, uncommon as an escape. May-Jul; Jul-Aug. Originally a Southern and Central Appalachian endemic, ranging from PA south through w. MD, w. VA, e. WV, w. NC, and e. TN, to n. GA and n. AL, now much more widespread as an escape from cultivation. Reported for GA Coastal Plain (Marion County) (Carter, Baker, & Morris 2009). [= F, G, Pa, RAB, S, WV; = *R. viscosa* var. *viscosa* – C, K1, K2, SE, Y, Z; < *R. viscosa* – W (also see *R. hartwigii*)]

70. *Glycyrrhiza* Linnaeus 1753 (Licorice)

A genus of about 20 species, herbs, mainly of Eurasia (isolated taxa in North America, South America, and Australia).
References: Isely (1998)=I.

* ***Glycyrrhiza lepidota* Pursh, Wild Licorice, American Licorice.** Disturbed areas; native of w. North America. Described as naturalized in old fields in e. VA in C, F, and G. [= K; > *G. lepidota* Pursh var. *glutinosa* (Nuttall) S. Watson – C, F, G, I; > *G. lepidota* var. *lepidota* – Mo]

71. *Astragalus* Linnaeus 1753 (Milkvetch)

A genus of 2300-2500 species, herbs and shrubs, most diverse in arid regions of w. North America and w. and c. Asia. The habitats of the southeastern species may be characterized as rocky or sandy, "relictual islands" of aridity in the generally moist landscape of eastern North America. References: Barneby (1964)=Z; Isely (1998)=I.

- 1 Legume pilose with > 1 mm or more long; stems conspicuously pubescent, the hairs spreading and simple; plants decumbent, spreading, or ascending, the stems 0.5-4 dm long.
 - 2 Corolla 14-19 mm long; leaflets 17-29; legume bilocular; calyx lobes shorter than the calyx tube; [of calcareous habitats of the interior]..... *A. tennesseensis*
 - 2 Corolla 8-12 mm long; leaflets (5-) 7-15; legume unilocular; calyx lobes equaling or longer than the calyx tube [of dry sandy habitats from SC south]..... *A. villosus*
- 1 Legume glabrous; stems glabrous or inconspicuously pubescent, the hairs appressed, simple or dolabriform; plants erect with stems (3-) 4-15 dm long, or decumbent with stems 1-3 dm long (*A. distortus* var. *distortus* and *A. bibullatus*).
 - 3 Plants erect, stems (3-) 4-15 dm long; legume straight to moderately curved.
 - 4 Lower stipules connate; pubescence dolabriform; legumes 1-1.5 cm long, 4-5 mm in diameter; [typically of dry to mesic soils]..... *A. canadensis* var. *canadensis*
 - 4 Lower stipules free; pubescence simple; legumes either longer or wider (2-3 cm long and 4-6 mm in diameter in *A. michauxii*, 1.5-2.0 cm long and 8-18 mm in diameter in *A. neglectus*); [typically of notably dry, either rocky or sandy, soils].
 - 5 Leaves with 21-31 coriaceous to somewhat fleshy leaflets, many of the leaflets alternate or subopposite; legumes 2-3 cm long, 4-6 mm in diameter; [of dry sandy habitats from NC south] *A. michauxii*
 - 5 Leaves with 11-23 thin-textured leaflets, all of the leaflets usually opposite; legumes 1.5-2 cm long, 8-18 mm in diameter; [of rocky calcareous habitats from VA north] *A. neglectus*
 - 3 Plants decumbent or ascending, stems 1-5 dm long; legume either dry and strongly curved (about 90 degrees), or globose and initially fleshy.

- 6 Legume globose, 1.3-2 cm in diameter, initially fleshy; corolla 18-25 mm long; [of calcareous glades of c. TN].....*A. bibullatus*
- 6 Legume lanceolate, 1.2-2.5 cm long, 4-7 mm wide, strongly curved; corolla 4-15 mm long; [of various dry habitats, either from w. VA northward or from FL west in the Coastal Plain beyond our area].
- 7 Corolla 4-7 mm long; legume 2-3.5 mm wide*A. nuttallianus* var. *nuttallianus*
- 7 Corolla (7-) 8-15 mm long; legume 4-7 mm wide.
- 8 Leaflets mostly 1-2× as long as wide, typically noticeably notched at the tip; mature legume reticulately textured; corolla (7-) 8-11 mm long; [of dry sandy sites in FL and possibly adjacent GA and s. MS].....*A. obcordatus*
- 8 Leaflets mostly 2-3.5× as long as wide, truncate or shallowly notched at the tip; mature legume lacking a reticulately textured surface; corolla 9-15 mm long; [either of shaley habitats from w. VA northward or of woodlands and prairies from MS westward]
- 9 Keel 7-9.5 mm long; legume usually 3-4× as long as wide, often curved 90°, grooved along sutures on both sides.....*A. distortus* var. *distortus*
- 9 Keel 6-7 mm long; legume usually 2.5-3.5x as long as wide, nearly straight or curved < 90°, grooved only along one suture*A. distortus* var. *engelmannii*

Astragalus bibullatus Barneby & E.L. Bridges, Pyne's Ground-plum. Calcareous glades. Endemic to c. TN (Barneby & Bridges 1987). [= I, K, SE; = *Geoprimum crassicaipum* (Nuttall) Rydberg ex Small – S, misapplied; = *A. crassicaipum* Nuttall, misapplied]

Astragalus canadensis Linnaeus var. *canadensis*, Canada Milkvetch. Forests, woodlands, streambanks, rocky slopes and bluffs. Jun-Aug; Jul-Oct. Ranging through much of North America, from QC and Hudson Bay west to BC, south to GA, TX, CO, and Utah; also apparently in Siberia. The other varieties occur farther west. See Barneby (1964) for a detailed discussion of taxonomic and nomenclatural problems involving *A. canadensis*. Barneby comments that "the eastern mountain race [in the Appalachians] is commonly distinguished from var. *canadensis* of the Mississippi Valley and northward by a narrower and more open flowering and fruiting raceme, and the flowers at the same time are relatively small. There is something to be said in favor of recognizing an eastern montane variety, so long as we confine its distinguishing characteristic to a loose raceme." The distribution, as mapped by Barneby, is suggestive of a composite map of two (or more) different taxa, one of them being centered in the Southern and Central Appalachians (extending out into nearby provinces). F and G separate var. *carolinianus*, basing the distinction, however, on a different set of characters, and considering var. *canadensis* to range south to VA (at least). Further study is needed; it seems we may have in our area two taxa worthy of distinction at the varietal level. [= I, K, Mo, SE, Va, Z; < *A. canadensis* – RAB, C, Pa, W; > *A. canadensis* var. *canadensis* – F, G; > *A. canadensis* var. *carolinianus* (Linnaeus) M.E. Jones – F, G; > *A. carolinianus* Linnaeus – S]

Astragalus distortus Torrey & A. Gray var. *distortus*, Ozark Milkvetch, Bent Milkvetch. Shale barrens and other dry, shaley places, westwards in a variety of dry open and wooded habitats. (Late Mar-) May-Jul. *A. distortus* is interpreted by Z (and followed by C and SE) to consist of 2 varieties: var. *distortus*, occurring in the s. Midwest from IL, MO, and OK south to MS, LA, and AR, and disjunct in n. and sc. VA, e. WV, and w. MD, and var. *engelmannii* (Sheldon) M.E. Jones, of TX and ne. LA. The two varieties seem fairly readily distinguishable morphologically in the Midwest. Appalachian var. *distortus* complicates the issue, since it approaches var. *engelmannii* in flower size and matches it in ovule number. The Appalachian plant, with a combination of morphologic characters not matching the two named varieties and far allopatric from them might better be considered a distinct variety. Further study is needed. [= C, I, K, Mo, SE, Va, Z; < *A. distortus* – F, G; = *Holcophacos distortus* (Torrey & A. Gray) Rydberg – S]

Astragalus distortus Torrey & A. Gray var. *engelmannii* (Sheldon) M.E. Jones. Open pine or oak woodlands. Feb-May. AR, TX, and w. LA; disjunct eastward in MS (NatureServe 2007). [= I, K, SE, Z]

Astragalus michauxii (Kuntze) F.J. Hermann, Sandhills Milkvetch, Michaux's Milkvetch. Sandhills. Late Apr-Jun; Jun-Oct (and persisting). Sc. NC south through SC to GA, a Southeastern Coastal Plain endemic (reports from AL and FL are in error). "The Michaux milk-vetch is greatly isolated from any member of the genus morphologically similar" (Barneby 1964). [= I, K, RAB, SE, Z; = *Tium michauxii* (Kuntze) Rydberg – S]

Astragalus neglectus (Torrey & A. Gray) Sheldon, Cooper Milkvetch. Dry calcareous woodlands and barrens, over dolostone and limestone. Jun-Sep. Se. ON west to se. SK and ne. ND, south to w. NY, ne. PA, c. PA, n. OH, s. MI, se. WI, and e. SD; disjunct in w. VA and e. WV (Wieboldt et al. 1998). [= C, F, G, I, K, Pa, SE, Va, Z]

*? *Astragalus nuttallianus* A.P. de Candolle var. *nuttallianus*, Nuttall's Milkvetch. Disturbed blackland prairies; possibly native or native only further westwards (from w. LA and w. AR west to CA and south into Mexico). See Keener (2013) for detailed information. [= I, K2, SE, Z]

Astragalus obcordatus Elliott, Florida Milk-vetch. Sandhills. S. MS south to c. peninsular FL. Reported for s. GA, but no specimen documentation is known (Barneby 1964). [= I, K, SE, WH3, Z; = *Phaca obcordata* (Elliott) Rydberg ex Small – S]

Astragalus tennesseensis A. Gray ex Chapman. Calcareous glades. C. TN, n. AL, n. IL (and formerly c. IN, and possibly MO). [= I, K, SE, Z; >> *A. tennesseensis* – F; >> *A. plattensis* Nuttall – F; > *Geoprimum tennesseense* (A. Gray ex Chapman) Rydberg – S; >> *Geoprimum plattense* (Nuttall) Rydberg – S]

Astragalus villosus Michaux, Bearded Milkvetch, Southern Milkvetch. Sandhills and other dry, sandy places. May-Jun; Jun-Aug. A Southeastern Coastal Plain endemic: s. SC south to Panhandle FL, west to s. MS. This species is described by Barneby (1964) as "a lowly but delightful little astragalus." [= I, K, RAB, SE, WH3, Z; = *Phaca intonsa* (Sheldon) Rydberg ex Small – S]

72. *Cicer* Linnaeus 1753 (Chick Pea, Garbanzo)

A monotypic genus, of Mediterranean Europe, w. Asia. References: Isely (1998)=I.

* *Cicer arietinum* Linnaeus, Chick Pea, Garbanzo. Disturbed areas; native of Mediterranean Europe and w. Asia. Described by Isely (1998) as "an occasional recurrent waif." [= I, K2, SE]

73. *Trifolium* Linnaeus 1753 (Clover)

A genus of about 240-250 species, annual and perennial herbs, nearly cosmopolitan (primarily north temperate). References: Zohary & Heller (1984)=Z; Isely (1998)=I. Draft key adapted from various published sources, including SE and C.

- 1 Flowers bright yellow (fading brown); [section *Chronosemium*].
 - 2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long..... *T. aureum*
 - 2 Leaves pinnately trifoliolate (the lateral leaflets essentially sessile, the terminal leaflet with a petiolule 0.8-3 mm long; heads 5-13 mm in diameter; flowers 2.5-5 mm long.
 - 3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; petiolule of the terminal leaflet 1-3 mm long *T. campestre*
 - 3 Standard inconspicuously veined; heads 5-8 mm in diameter, generally with 5-15 (-20) flowers; flowers 2.5-3.5 mm long; petiolule of the terminal leaflet ca. 1 mm long..... *T. dubium*
- 1 Flowers not bright yellow.
 - 4 Flowers borne on distinct pedicels, (1-) 2-10 mm long, these often curving or reflexing in age; flowers white, fading pink with age in most species; [native and alien species]; [section *Lotoidea*].
 - 5 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.
 - 6 Calyx lobes narrowly triangular, about as long as the calyx tube; peduncles axillary along the stolons; stipules scarious-membranaceous; [plant an abundant introduced weed]..... *T. repens*
 - 6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].
 - 7 Peduncle terminal, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long *T. calcaricum*
 - 7 Peduncle terminal at tip of erect flowering branches, subtended by a pair of opposite or subopposite, short-petioled leaves; pedicels (2-) 4-8 mm long *T. stoloniferum*
 - 5 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).
 - 8 Calyx lobes narrowly triangular, about as long as the calyx tube (or longer in *T. hybridum*); stipules scarious-membranaceous; [plants introduced].
 - 9 Calyx lobes not scarious-margined, straight, equal to or longer than the tube *T. hybridum*
 - 9 Calyx lobes scarious-margined, becoming divergent and twisted, about equal to the tube..... *T. nigrescens*
 - 8 Calyx lobes subulate to lanceolate, distinctly longer than the calyx tube; stipules green, foliaceous; [plants rare natives].
 - 10 Flowers 4-6 mm long; calyx lobes lanceolate, foliaceous, 3-nerved, 0.4-0.8 mm wide..... *T. carolinianum*
 - 10 Flowers 8-12 mm long; calyx lobes subulate, setaceous, 1-nerved, < 0.4 mm wide.
 - 11 Leaflets 3-7× as long as wide; stems prostrate; flowers creamy white and purple-veined; plant a perennial; [plants of shale barrens and other rock outcrops, from VA northward]..... *T. virginicum*
 - 11 Leaflets 1-2.8× as long as wide; stems erect, ascending, or decumbent; flowers white or purplish; plant an annual or biennial; [plants of a variety of natural woodlands, collectively widespread in our area]
 - 12 Plant decumbent; terminal petiole 5.7-8.2 cm long; sepal lobes 0.2-0.37 cm long; peduncles 0.23-0.31× as long as the terminal petiole..... *T. kentuckiense*
 - 12 Plant ascending to erect; terminal petiole 0.3-3.5 cm long; sepal lobes 0.3-0.7 cm long; peduncles 0.4-4.2× as long as the terminal petiole..... *T. reflexum*
 - 4 Flowers sessile or on very short pedicels (usually < 1 mm long); flowers pink, purplish, white, or scarlet; [alien species].
 - 13 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.
 - 14 All flowers with petals; fruiting heads enlarging, becoming a reddish brown, pubescent ball ca. 2 cm in diameter, remaining aerial; [section *Vesicaria*]..... *T. fragiferum*
 - 14 Only 2-5 outer flowers of the head with petals, the others lacking petals and sterile; fruiting heads becoming a subterranean bur, buried by curvature and growth of the peduncle; [section *Trichocephalum*]..... *T. subterraneum*
 - 13 Plants not stoloniferous, the leaves clustered at or near ground level and/or produced on aerial stems.

- 15 Heads subtended by a pseudo-involucre of 2 (-3) enlarged stipules and/or opposite or subopposite leaves; [section *Trifolium*].
- 16 Flowers white (fading pink), 7-8 mm long; calyx tube **both** externally glabrous **and** 20-nerved *T. lappaceum*
- 16 Flowers red, pink-purple, or bicolored, **either** 11-20 mm long **or** 4-6 mm long; calyx tube not **both** externally glabrous **and** 20-nerved (externally pubescent, or 10-nerved, or both).
- 17 Flowers 4-6 mm long..... *T. striatum*
- 17 Flowers 11-20 mm long.
 - 18 Stipules gradually tapering to a long slender tip, longer than the fused part; calyx densely hirsute; stem soft pubescent with deflexed to spreading hairs *T. hirtum*
 - 18 Stipules abruptly narrowed to a short awn; calyx glabrous to pilose; stem appressed pubescent..... *T. pratense*
- 15 Heads not subtended by a pseudo-involucre of leaves or expanded stipules.
- 19 Heads axillary, sessile, in the axils of subtending leaves; calyx tube glabrous (except for a few hairs at apex); [section *Lotoidea*].... *T. glomeratum*
- 19 Heads terminal or axillary; calyx tube pubescent.
 - 20 Calyx bladderly-inflated in fruit; corolla resupinate (inverted 180 degrees, such that the standard is lowermost); [section *Vesicaria*].
 - 21 Inflorescence with a prominent peduncle; head lobed in fruit *T. resupinatum*
 - 21 Inflorescence sessile to shortly peduncled; head spherical in fruit..... *T. tomentosum*
 - 20 Calyx not bladderly-inflated in fruit; corolla orientation normal (standard uppermost).
 - 22 Corolla 3-6 mm long; [section *Trifolium*]..... *T. arvense*
 - 22 Corolla 10-18 mm long.
 - 23 Corolla crimson, 10-13 (-15) mm long; floral bracts absent; heads 1-1.5 (-2) cm in diameter; [section *Trifolium*]..... *T. incarnatum*
 - 23 Corolla white, 15-18 mm long; floral bracts present; heads 2.5-3 cm in diameter; [section *Mistyllus*] *T. vesiculosum*

* *Trifolium angustifolium* Linnaeus, Narrowleaf Clover. Waste areas near wool-combing mills, perhaps only a waif; native of Mediterranean Europe and w. Asia. Reported for SC (Kartesz 1999), based on specimen at NCU. [= I, K1, K2] {not yet keyed}

* *Trifolium arvense* Linnaeus, Rabbitfoot Clover. Disturbed areas, shale barrens; native of the Mediterranean region. Apr-Aug. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV]

* *Trifolium aureum* Pollich, Large Hop Clover, Yellow Clover. Fields, roadsides, disturbed areas; native of Eurasia. May-Aug. [= C, I, K, Mo, Pa, SE, Va, W; = *T. agrarium* Linnaeus – F, G, RAB, S, WV, misapplied]

Trifolium calcaricum J.L. Collins & Wieboldt. Limestone glades, woodlands, and barrens. In c. TN (Chester, Wofford, & Kral 1997). For additional information, see Collins & Wieboldt (1992). [= I, K, Va]

* *Trifolium campestre* Schreber, Hop Clover. Roadsides, fields, lawns, disturbed areas; native of Eurasia. Apr-Oct. [= C, I, K, Mo, Pa, RAB, SE, Va, W, WH3, WV; ? *T. procumbens* Linnaeus – F, G, S, misapplied]

Trifolium carolinianum Michaux, Wild White Clover, Carolina Clover. Open woodlands, woodland edges, pine savannas, thin soils around rock outcrops, disturbed areas. Apr-Jul. Se. NC south to n. FL, west to MO, OK, and c. TX. [= C, F, G, I, K, Mo, RAB, SE, W, WH3; > *T. carolinianum* – S; > *T. saxicola* Small – S]

* *Trifolium cernuum* Brotero, Nodding-head Clover. Waste areas near wool-combing mills, perhaps only a waif; native of Mediterranean Europe and n. Africa. [= K] {not yet keyed}

* *Trifolium depauperatum* Desvaux var. *depauperatum*, Cowbag Clover, Balloon-sack Clover, Poverty Clover. Waste areas near wool-combing mills, perhaps only a waif; native of w. North America (BC south to CA). [= I, K] {not yet keyed}

* *Trifolium dubium* Sibthorp, Low Hop Clover, Little Hop Clover. Roadsides, lawns, disturbed areas; native of Europe. Apr-Oct. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV]

* *Trifolium fragiferum* Linnaeus, Strawberry Clover. Disturbed areas; native of Middle East. Introduced in c. GA (Jones & Coile 1988) and reported from an old collection from se. PA (Rhoads & Klein 1993). [= C, F, G, I, K, SE]

* *Trifolium glomeratum* Linnaeus, Cluster Clover. {habitat}; native of Mediterranean region. Also reported for SC by Kartesz (1999), but the specimen is actually *T. cernuum*. [= I, K1, K2, S, SE]

* *Trifolium gracilentum* Torrey & A. Gray. Waste areas near wool-combing mills, perhaps only a waif; native of w. North America. [> *T. gracilentum* var. *gracilentum* – K1, K2] {not yet keyed; add synonymy}

* **Trifolium hirtum** Allioni, Rose Clover. Roadsides, disturbed areas; native of Eurasia and n. Africa. Apr-Jul. A report for VA has no documentation. [= C, G, I, K, Mo, RAB, SE, WH3]

* **Trifolium hybridum** Linnaeus, Alsike Clover. Lawns, fields, roadsides, disturbed areas; native of Europe. Apr-Oct. [= C, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV; > *T. hybridum* var. *hybridum* – F; > *T. hybridum* var. *elegans* (Savi) Boiss. – F]

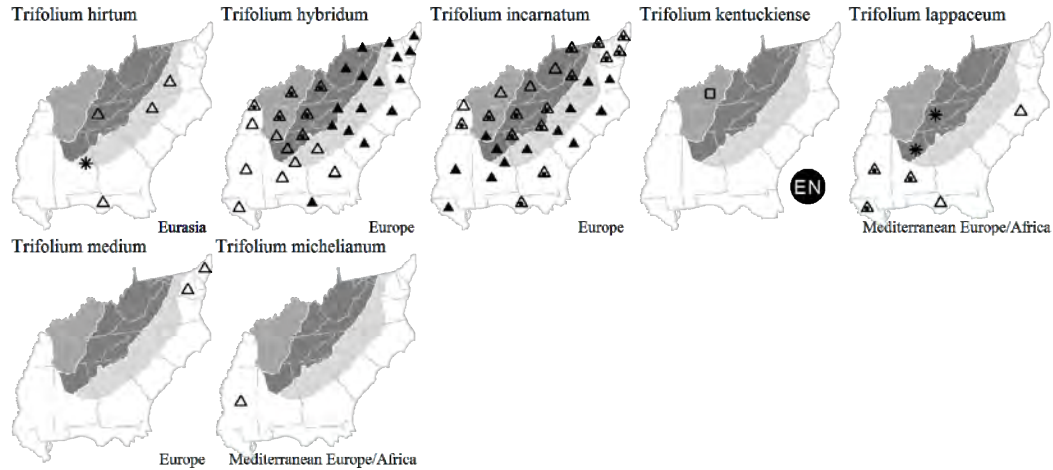

* **Trifolium incarnatum** Linnaeus, Crimson Clover. Fields, disturbed areas; native of Europe. Apr-Sep; Jun-Oct. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV]

Trifolium kentuckiense Chapel & Vincent, Kentucky Clover. Dry limestone woodlands. So far as is known, endemic to 2 counties in the Bluegrass Region of Kentucky (Franklin and Woodford counties) (Chapel & Vincent 2013). See Chapel & Vincent (2013) for additional detail.

* **Trifolium lappaceum** Linnaeus, Lappa Clover, Burdock Clover. Disturbed areas; native of Mediterranean Eurasia and Africa. Apr-Aug. [= I, K, RAB, S, SE, WH3]

* **Trifolium medium** Linnaeus, Zigzag Clover. Reported as introduced in MD and NJ (Kartesz 1999; Kartesz 2010). Native of Europe. [= K] {not keyed; rejected as a component of our flora}

* **Trifolium michelianum** Savi, Big-flower Clover. Disturbed areas; native of Mediterranean Europe. [> *T. michelianum* var. *balansae* (Boiss.) Ponert – K2] {not keyed}

* **Trifolium nigrescens** Viviani, Ball Clover. Disturbed areas; native of Mediterranean Europe and n. Africa. Introduced in c. TN (Chester, Wofford, & Kral 1997). [= I, K, S, SE, WH3]

* **Trifolium pratense** Linnaeus, Red Clover. Fields, roadsides, disturbed areas; native of Europe. Apr-Oct. [= C, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV; > *T. pratense* var. *pratense* – F; > *T. pratense* var. *sativum* (P. Miller) Schreber – F]

Trifolium reflexum Linnaeus, Buffalo Clover. Open woodlands, woodland edges, dry shaly places. Apr-May. This species appears to have declined very significantly in recent decades. [= C, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV; > *T. reflexum* var. *reflexum* – F, G; > *T. reflexum* var. *glabrum* Lojacono – F, G]

* **Trifolium repens** Linnaeus, White Clover, Dutch Clover, Ladino Clover. Lawns, roadsides, disturbed areas; native of Eurasia. Apr-Nov. [= C, F, G, I, K, Pa, RAB, S, SE, Va, W, WH3, WV]

* **Trifolium resupinatum** Linnaeus, Persian Clover, Reversed Clover. Lawns and disturbed areas; native of Mediterranean region and w. Asia. Apr-Sep. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, WH3]

* **Trifolium spumosum** Linnaeus, Pink Clover. Disturbed areas; rare, native of Mediterranean Europe. [= K, WH3] {not yet keyed}

Trifolium stoloniferum Muhlenberg ex Eaton, Running Buffalo-clover. Dry upland woodlands and prairies. WV, OH, n. IN, IL, MO, and e. KS, south to KY and AR, now extirpated from significant portions of its range. [= C, F, G, I, K, Mo, S, SE, WV]

- * *Trifolium striatum* Linnaeus, Knotted Clover. Roadsides, disturbed areas, waste areas near wool-combing mills; native of Europe. Apr-Aug. [= C, F, G, I, K, Mo, RAB, S, SE]
- * *Trifolium subterraneum* Linnaeus, Subterranean Clover. Disturbed areas, waste areas near wool-combing mills; native of Europe, Asia, and n. Africa. Reported for NC and SC by Isely (1990); reported for Piedmont of GA by Jones & Coile (1988), and collected in MS (Stone County) (S.W. Leonard, pers. comm. 2007). [= I, K, SE]
- * *Trifolium tomentosum* Linnaeus. Waste areas near wool-combing mills, other disturbed areas; native of Mediterranean region. Reported for NC by Isely (1998). [= I, K, WH3]
- * *Trifolium vesiculosum* Savi, Arrowleaf Clover. Roadsides, disturbed areas; native of s. Europe. First reported for South Carolina by Hill & Horn (1997). [= I, K, Mo, SE, WH3]
- Trifolium virginicum* Small, Kates Mountain Clover, Shale-barren Clover. Shale barrens, also on outcrops or glades over limestone, diabase, and ultramafic rocks. May-Aug. Sc. PA through w. MD south to w. VA and e. WV. [= C, F, G, I, K, Pa, SE, W, WV]

74. *Ononis* Linnaeus 1753 (Rest-harrow)

A genus of about 70 species, annual and perennial herbs and shrubs, of Europe (especially Mediterranean), w. Asia, and n. Africa. References: Sell & Murrell (2009)=Z; Stace (2010)=Y.

- 1 Stems procumbent to ascending, uniformly hairy; leaflets < 3× as long as wide, obtuse to emarginate [*O. repens* ssp. *repens*]
- 1 Stems ascending to erect, mainly hairy along 1 side, or along 2 opposite sides; leaflets > 3× as long as wide, acute or nearly so [*O. spinosa*]

- * *Ononis repens* Linnaeus ssp. *repens*, Common Rest-harrow. Disturbed areas, probably only a waif; native of Europe. [= Y; = *O. spinosa* Linnaeus ssp. *procurrens* (Wallroth) Briquet – Z; < *O. repens* – K2]
- * *Ononis spinosa* Linnaeus, Spiny Rest-harrow. Disturbed areas, probably only a waif; native of Europe. [= K2, Y; = *O. spinosa* ssp. *spinosa* – Z; > *Ononis campestris* W.D.J. Koch & Ziz]

75. *Melilotus* P. Miller 1754 (Melilot, Sweetclover, Sourclover)

A genus of about 20 species, annual and perennial herbs, of temperate Eurasia and Africa. References: Stace (2010)=Z; Isely (1998)=I. Key based in part on Stace (2010).

- 1 Corolla white *M. albus*
- 1 Corolla yellow.
 - 2 Corolla 2-3.5 mm long; fruits < 3 mm long *M. indicus*
 - 2 Corolla 5-7 mm long; fruits > 3 mm long *M. officinalis*

- * *Melilotus albus* Medikus, White Melilot, White Sweetclover. Fields, roadsides, disturbed areas; native of Eurasia. Apr-Oct. The similar *M. albus* and *M. officinalis* are apparently incompatible (Isely 1998) and differ in less obvious ways than flower color; they should not be synonymized, as was done by Kartesz (1999, 2010). Other differences useful in the determination of faded herbarium specimens are given by Isely (1998) and Yatskievych (2013): corolla 3.5-5 mm long, the wing petals about as long as the keel, ovaries narrowed at base, mature fruits with a network of raised nerves (*M. albus*) vs. corolla 5-7 mm long, the wing petals generally longer than the keel, ovaries noticeably stalked at base, mature fruits with a pattern of cross-nerves or merely with irregular cross-wrinkles (*M. officinalis*). [= I, Mo, Va, WH3, Z; = *M. alba* – C, F, G, Pa, RAB, S, SE, W, WV, orthographic variant; < *M. officinalis* – K1, K2]
- * *Melilotus indicus* (Linnaeus) Allioni, Small Melilot, Sourclover. Roadsides, disturbed areas; native of Mediterranean Europe. Apr-Oct. [= I, K, WH3, Z; = *M. indica* – C, F, G, RAB, S, SE, orthographic variant]

* *Melilotus officinalis* (Linnaeus) Pallas, Yellow Melilot, Yellow Sweetclover, Ribbed Melilot. Fields, roadsides, disturbed areas; native of Eurasia. Apr-Oct. [= C, F, G, I, Mo, Pa, RAB, S, SE, Va, W, WH3, WV, Z; < *M. officinalis* – K1, K2]

* *Melilotus sulcatus* Desfontaines, Mediterranean Sweetclover. Native of Mediterranean Europe. Reported for AL by Kartesz (2010) based on misidentified specimens. {not keyed; not mapped; rejected as a component of our flora}

76. *Medicago* Linnaeus 1753 (Medick, Bur-clover)

A genus of about 80 species, annual and perennial herbs, of Eurasia and Africa. References: Isely (1998)=I. Key based largely on SE.

- 1 Legume 1-seeded, reniform, black at maturity; corolla 2-3 mm long..... *M. lupulina*
- 1 Legume several-seeded, spirally coiled or falcate, tan to dark brown; corolla 3-11 mm long.
- 2 Plants perennial, mostly erect or ascending, 2-8 (-10) dm tall; corolla 6-11 mm long, violet, yellow, or varicolored; legumes spineless..... *M. sativa*
- 2 Plant annual, mostly prostrate or ascending, 1-6 dm tall; corolla 3-6 mm long, yellow; legumes spiny (except lacking spines in *M. orbicularis*).
- 3 Stipules entire or slightly dentate (*M. minima*) or the base only of the stipule lacerate (*M. laciniata*); plants pilose (*M. minima*) or glabrous (*M. laciniata*).
- 4 Stipules lacerate at the base; plant glabrous..... [*M. laciniata*]
- 4 Stipules entire or slightly dentate; plant pilose..... [*M. minima*]
- 3 Stipules lacerate; plants glabrous or sparsely pubescent.
- 5 Legume lacking spines; stipules deeply lacerate, the sinuses extending nearly to the base..... [*M. orbicularis*]
- 5 Legume spiny; stipules either deeply lacerate (*M. polymorpha*) or shallowly lacerate (*M. arabica*).
- 6 Leaflets 0.7-1.1× as long as wide, usually marked with a central dark spot; leaflet tip usually strongly notched; stipules shallowly lacerate, the sinuses extending < ½ way to the base..... *M. arabica*
- 6 Leaflets 1-2× as long as wide, not marked with a central dark spot; leaflet tip not strongly notched; stipules deeply lacerate, the sinuses extending > ½ way to the base..... *M. polymorpha*

* *Medicago arabica* (Linnaeus) Hudson, Spotted Medick, Spotted Bur-clover. Fields, roadsides, disturbed areas; native of Mediterranean Europe. Apr-Aug. [= F, G, I, K, Mo, RAB, S, SE, WH3]

* *Medicago laciniata* (Linnaeus) P. Miller. Waste areas around wool-combing mills; rare, native of Europe, perhaps merely a waif. [= F, I, K]

* *Medicago littoralis* Rohde ex Loiseleur, Shore Medick, Water Medick. Beaches and dunes; native of Mediterranean Europe. Reported for s. AL (H. Horne, 2013, pers. comm.) and Panhandle FL (L. Anderson, 2013, pers. comm.). [=] {add to synonymy}

* *Medicago lupulina* Linnaeus, Black Medick, Yellow Trefoil. Fields, roadsides, disturbed areas; native of Europe. Mar-Dec. [= C, G, I, K, Mo, Pa, RAB, S, SE, Va, W, WH3, WV; > *M. lupulina* var. *lupulina* – F; > *M. lupulina* var. *glandulosa* Neilreich – F]

* *Medicago minima* (Linnaeus) Linnaeus, Downy Bur-clover, Bur Medick. Fields, roadsides, disturbed areas; native of Eurasia. Apr-Aug. [= C, G, I, K, Mo, RAB, S, SE, Va, WH3; > *M. minima* var. *minima* – F; > *M. minima* var. *compacta* Neyraud – F; > *M. minima* var. *longiseta* A.P. de Candolle – F]

* *Medicago orbicularis* (Linnaeus) Bartolini. Lawns, disturbed areas; native of Mediterranean Europe and n. Africa. Apr-Jul. [= G, I, K, RAB, SE, WH3]

* *Medicago polymorpha* Linnaeus, Smooth Bur-clover, Toothed Medick. Fields, roadsides, lawns, disturbed areas; native of Mediterranean Europe. Mar-Apr. [= C, I, K, Mo, RAB, SE, WH3; = *M. hispida* Gaertner – F, G, S]

* *Medicago sativa* Linnaeus, Alfalfa, Lucerne, Blue Alfalfa, Yellow Alfalfa, Sickle Medick. Roadsides, fields, disturbed areas; native of Europe. Apr-Jul. Havananda et al. (2010) explain the complex evolution of the *M. sativa* complex, including its selection for human uses. Small & Jomphe (1989) recognize various subspecies and varieties within the complex. Given the complex human-influenced set of morphotypes, of diploid, allotetraploid, and autotetraploid origin, their interfertility, and the difficulties of associating American material with European wild taxa, I reluctantly take the same approach as Yatskievych (2013) in treating *M. sativa* as a practical unit without taxonomic subdivisions. [= Mo; > *M. sativa* Linnaeus ssp. *sativa* – C, K; > *M. sativa* Linnaeus ssp. *falcata* (Linnaeus) Arcangeli – C, K; > *M. sativa* – F, G, I, Pa, RAB, S, SE, Va, W, WH3, WV; > *M. falcata* Linnaeus – F, G, I, S, SE]

77. *Vicia* Linnaeus 1753 (Vetch, Tare)

A genus of about 150-160 species, annual and perennial herbs, of temperate Eurasia and North America. References: Isely (1998)=I; van de Wouw, Maxted, & Ford-Lloyd (2003)=Y. Key adapted from I.

- 1 Inflorescence nearly sessile, of 1-4 flowers clustered in the leaf axil; [alien species].
 - 2 Leaves with 2-6 leaflets, succulent; leaflets 3-7 cm long; legume with pectinate sutures [*V. narbonensis*]
 - 2 Leaves with 4-20 leaflets, not succulent; leaflets 0.3-3.5 cm long; legume not pectinate (except *V. lutea*).
 - 3 Corolla 5-6 mm long; leaves with 4-6 (-8) leaflets..... *V. lathyroides*
 - 3 Corolla 10-30 mm long; leaflets 6-16 (-20).
 - 4 Calyx lobes conspicuously unequal; legumes pilose with pustulate-based hairs *V. lutea*
 - 4 Calyx lobes more or less equal; legumes glabrous at maturity, or very finely pubescent with non-pustulate-based hairs.
 - 5 Calyx lobes all shorter than the calyx tube; corolla yellow, often streaked with purple, 25-30 mm long *V. grandiflora*
 - 5 Calyx lobes (at least the longer) about as long as the calyx tube; corolla pink, purple, lavender, white, or creamy yellow, 10-25 (-30) mm long.
 - 6 Standard pubescent dorsally; corolla 15-25 (-30) mm long, creamy yellow to purple; legume pubescent, with a basal stipe [*V. pannonica*]
 - 6 Standard glabrous; corolla 10-25 (-30) mm long, pink, purple, lavender, or whitish; legume glabrous, sessile.
 - 7 Calyx 7-11 (-12) mm long; corolla pink-purple to whitish, 10-18 mm long; leaflets 4-10× as long as wide *V. sativa* ssp. *nigra*
 - 7 Calyx 10-15 mm long; corolla generally pink-purple, 18-25 (-30) mm long; leaflets 2-5 (-7)× as long as wide *V. sativa* ssp. *sativa*
- 1 Inflorescence pedunculate, of 2-many flowers along a well-developed raceme; [alien and native species].
 - 8 Peduncles 1-10 mm long; raceme axis 2-10 mm long, with 2-7 (-10) flowers.
 - 9 Plant a robust annual, 10-20 dm tall; tendrils absent; leaves with (2-) 4-6 leaflets; leaflets 5-10 cm long; corolla 20-30 mm long [*V. faba*]
 - 9 Plant a trailing perennial, 3-10 dm tall; tendrils present; leaves with 8-16 leaflets; leaflets 2-3.5 cm long; corolla 10-15 mm long *V. sepium*
 - 8 Peduncles usually >10 mm long; raceme axis usually >10 mm long, with (1-) 2-many flowers.
 - 10 Corolla 10-25 mm long.
 - 11 Stipules dimorphic, one of each pair entire, the other palmately lacerate; flowers 1 (-2) per inflorescence [*V. articulata*]
 - 11 Stipules of a pair alike.
 - 12 Flowers 15-22 (-25) mm long; legumes with a basal stipe 2-5 mm long; leaves with 8-16 leaflets *V. americana* var. *americana*
 - 12 Flowers 8-16 (-18) mm long; legumes with a basal stipe 1-3 mm long; leaves with 8-22 leaflets.
 - 13 Calyx swollen on one side; plant an annual; inflorescence secund.
 - 14 Plant glabrate or with pubescence of incurved or loosely appressed hairs < 1 mm long; lower calyx lobe lanceolate to linear-lanceolate, 1-2 (-3) mm long; leaflets 2-4 mm wide *V. villosa* ssp. *varia*
 - 14 Plant conspicuously villous, the hairs spreading and 1-2 mm long; lower calyx lobe acicular or weak, (2-) 3-4 mm long; leaflets 3-6 mm wide *V. villosa* ssp. *villosa*
 - 13 Calyx not swollen on one side; plant a rhizomatous perennial; inflorescence not secund.
 - 16 Flowers white to lavender, the keel spotted; legumes 4-5 mm wide; inflorescence not secund *V. caroliniana*
 - 16 Flowers blue-violet or purple; legumes 6-8 mm wide; inflorescence generally secund *V. cracca*
 - 10 Corolla 2.5-8 (-10) mm long.
 - 17 Plant a rhizomatous perennial.
 - 18 Leaves with 2-4 (-6) leaflets; [plants of s. SC southward, native, of the Coastal Plain].
 - 19 Legumes 2.5-3.0 cm long; leaflets 1.5-4.5 cm long, oblong to linear, 8-20× as long as wide *V. acutifolia*
 - 19 Legumes 0.8-1.5 cm long; leaflets 1-1.5 cm long, usually elliptic, 2-4 (-10)× as long as wide *V. floridana*
 - 18 Leaves with 10-25 leaflets; [plants collectively widespread in our area, native or alien].
 - 20 Flowers white to lavender, the keel spotted; legumes 4-5 mm wide; inflorescence not secund *V. caroliniana*
 - 20 Flowers blue-violet or purple; legumes 6-8 mm wide; inflorescence generally secund *V. cracca*
- 17 Plant an annual.
 - 21 Legume symmetrically rounded at the apex; inflorescence with 1-2 (-4) flowers *V. tetrasperma*
 - 21 Legume asymmetrically acute at the apex; inflorescence with 1-15 flowers.
 - 22 Leaves with 2-4 leaflets; legume glabrous to inconspicuously puberulent *V. minutiflora*
 - 22 Leaves with (8-) 10-16 leaflets; legume glabrous or finely hirsute.
 - 23 Legume finely hirsute; calyx 2-2.5 mm long; corolla 2.5-4.5 mm long *V. hirsuta*
 - 23 Legume glabrous; calyx 2.8-3.7 mm long; corolla 4.5-8 mm long.
 - 24 Racemes (2-) 4-9 (-12) flowered; corolla blue-purple; leaves with (4-) 8-12 (-14) leaflets *V. ludoviciana* ssp. *ludoviciana*
 - 24 Racemes 1-6-flowered; corolla pinkish-white or lavender; leaves with (6-) 12-14 (-18) leaflets *V. ludoviciana* ssp. *ludoviciana*

V. ludoviciana ssp. leavenworthii

Vicia acutifolia Elliott, Fourleaf Vetch. Pond margins, pine flatwoods, ditches. Apr-May; May-Jun. Se. SC south to s. FL, west to e. Panhandle FL. [= GW, I, K, RAB, S, SE, WH3]

Vicia americana Willdenow var. *americana*, American Vetch, Purple Vetch. Dry rocky or shaly woodlands, forest edges, riverside scours and prairies. May-Jul. Var. *americana* ranges from QC west to AK, south to w. VA, s. WV, MO, OK, TX, Mexico. Var. *minor* Hooker occurs in w. North America. The report for AL (Woods & Diamond 2006) has been shown to be a misidentification (D. Spaulding, pers. comm.). [= C, F, G, I, Mo, SE, Va; = *V. americana ssp. americana* – K; < *V. americana* – Pa, W, WV]

* *Vicia articulata* Hornemann, Monantha Vetch, Oneflower Vetch. Perhaps only cultivated; native of Europe. [=I, K, SE] {not mapped; rejected as a component of our flora}

Vicia caroliniana Walter, Pale Vetch, Wood Vetch, Carolina Vetch. Forests, woodlands, and disturbed areas. Apr-Jun; May-Jul. NY west to WI, south to s. GA, s. MS, and c. TX. [= C, F, G, I, K, Mo, Pa, SE, Va, W, WH3, WV; > *V. caroliniana* – RAB, S; > *V. hugeri* Small – RAB, S]

* *Vicia cracca* Linnaeus, Tufted Vetch, Cow Vetch, Canada-pea. Disturbed areas; native of Europe. May-Aug; Jun-Sep. [= C, G, Mo, Pa, RAB, S, SE, Va; > *V. cracca* var. *cracca* – F, I; > *V. cracca ssp. cracca* – K]

* *Vicia faba* Linnaeus, Horse Bean, Faba Bean, Broad Bean. Disturbed areas; native of Mediterranean Europe. Introduced in se. PA (Rhoads & Klein 1993). [= C, F, G, I, K, SE]

Vicia floridana S. Watson, Florida Vetch. Moist soils of hammocks, ditches, roadbanks. E. GA (McIntosh Co.) south to c. peninsular FL. [= GW, I, K, S, SE, WH3]

* *Vicia grandiflora* Scopoli, Large Yellow Vetch. Disturbed areas; native of Europe. Apr-Jun; May-Jul. [= C, I, F, G, K, Mo, SE, Va, W, WH3; > *V. grandiflora* var. *kitaibeliana* W.D.J. Koch – RAB]

* *Vicia hirsuta* (Linnaeus) S.F. Gray, Tiny Vetch, Hairy Tare. Disturbed areas, native of Europe. Apr-Jun; May-Jul. [= C, F, G, I, K, Mo, Pa, RAB, S, SE, Va, WH3]

* *Vicia lathyroides* Linnaeus, Spring Vetch. Lawns, disturbed areas; native of Europe. Apr-Jun; May-Jul. [= C, I, F, G, K, RAB, SE, Va]

Vicia ludoviciana Nuttall ssp. *leavenworthii* (Torrey & A. Gray) Lassetter & Gunn. Woodlands, prairies, dunes, disturbed areas. MS and MO west to NM and TX. In our area is Race 2 (“*louisianica*” race) of ssp. *leavenworthii* (Isely 1998). [= I, K, Mo, SE] {add to synonymy}

Vicia ludoviciana Nuttall ssp. *ludoviciana*, Louisiana Vetch. Woodlands, prairies, dunes, disturbed areas. AL and Panhandle FL west to OR and CA. In our area is Race 1 (“*ludoviciana*” race) of ssp. *ludoviciana* (Isely 1998). [= I, K, SE; = *V. ludoviciana* – WH3] {add to synonymy}

* *Vicia lutea* Linnaeus, Yellow Vetch. Disturbed areas; native of Europe. [= I, K, SE]

Vicia minutiflora F.G. Dietrich, Smallflower Vetch. Woodlands, dry hammocks. TN, Panhandle FL, and sw. GA west to OK and TX. [= GW, I, K, Mo, SE, WH3, Y; = *V. micrantha* Nuttall ex Torrey & A. Gray – F, G, S]

* *Vicia narbonensis* Linnaeus, Narbonne Vetch. Disturbed areas, probably only a waif; native of Europe. Introduced in MD and DC (Fernald 1950). [= C, F, G, I, K, SE]

Vicia ocalensis Godfrey & Kral, Ocala Vetch. Spring runs, stream margins. Endemic to Marion and Lake counties, n. peninsular FL. [= I, K2, SE, WH3] {not yet keyed}

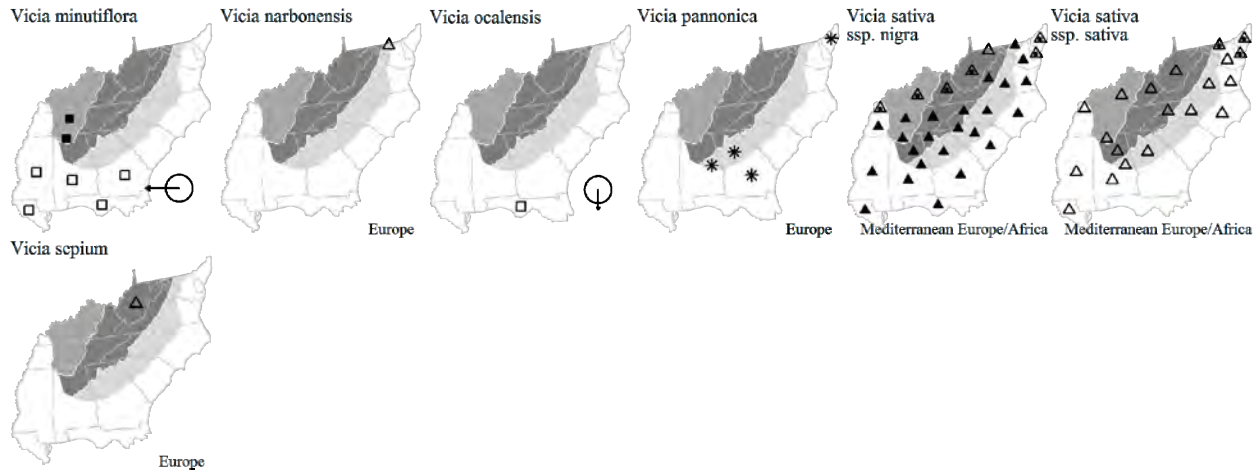

* *Vicia pannonica* Crantz, Hungarian Vetch. Planted in agricultural test plots, perhaps weakly naturalized; native of Europe. Reported for GA, but all known specimens are from agricultural test plots (Wichmann pers. comm. 2013). Reported for NC (Isely 1998). {investigate} [= I, K, SE]

* *Vicia sativa* Linnaeus ssp. *nigra* (Linnaeus) Ehrhart, Narrowleaf Vetch. Disturbed areas; native of Mediterranean Europe. Mar-Jun; May-Jul. [= I, K, Mo, Pa, SE, Va; = *V. angustifolia* Linnaeus – C, RAB, S, W; = *V. sativa* var. *angustifolia* (Linnaeus) Ehrhart; > *V.*

angustifolia var. *angustifolia* – F, G, WV; > *V. angustifolia* var. *segetalis* (Thuill.) Ser. – F, G, WV; > *V. angustifolia* var. *uncinata* (Desvaux) Rouy – F; < *V. sativa* – WH3]

* *Vicia sativa* Linnaeus ssp. *sativa*, Common Vetch. Disturbed areas; native of Mediterranean Europe. Apr-Jun; May-Jul. [= I, K, Pa, SE, Va; = *V. sativa* – C, G, RAB, S; > *V. sativa* var. *sativa* – F; > *V. sativa* var. *linearis* Lange – F]

* *Vicia sepium* Linnaeus, Bush Vetch, Wild Tare. Disturbed areas; native of Europe. Introduced south to WV and in e. PA (Rhoads & Klein 1993). [= C, G, I, SE; > *V. sepium* var. *sepium* – F, K]

* *Vicia tetrasperma* (Linnaeus) Schreber, Slender Vetch, Smooth Tare, Lentil Vetch. Disturbed areas; native of Europe. Apr-Jun; May-Jul. [= C, G, I, K, Pa, RAB, S, SE, Va, WH3; > *V. tetrasperma* var. *tetrasperma* – F; > *V. tetrasperma* var. *tenuissima* Druce – F]

* *Vicia villosa* Roth ssp. *varia* (Host) Corbière, Winter Vetch. Disturbed areas; native of Europe. May-Sep. [= I, K, Mo, Pa, SE, Va; = *V. dasycarpa* Tenore – C, F, G, RAB, W, WV; < *V. villosa* – WH3]

* *Vicia villosa* Roth ssp. *villosa*, Hairy Vetch, Fodder Vetch. Disturbed areas; native of Europe. May-Sep. [= I, K, Mo, Pa, SE, Va; = *V. villosa* – C, F, G, RAB, W, WV; < *V. villosa* – WH3]

78. *Lens* P. Miller (Lentil)

A genus of about 5 species, herbs, of sw. Asia, s. Europe, and n. Africa. References: Isely (1998)=I.

* *Lens culinaris* Medikus, Lentil. Disturbed areas, probably only a waif; native of Mediterranean Europe and w. Asia. [= I, K1, K2]

79. *Lathyrus* Linnaeus 1753 (Wild-pea, Vetchling)

A genus of about 150-160 species, annual and perennial herbs, of nearly cosmopolitan distribution. References: Isely (1998)=I.

- 1 Leaflets > 2, generally 4-12; [native species of various habitats].
 - 2 Foliaceous stipules laterally symmetrical, with 2 approximately equal basal lobes; leaves somewhat fleshy; [plants of ocean beaches and dunes] *L. japonicus*
 - 2 Foliaceous stipules asymmetrical, oblique at the base, the basal lobe well-developed only on one side.
 - 3 Leaflets (8-) 10-14 per leaf, generally irregular arrayed; [plants of dry to mesic forests] *L. venosus*
 - 3 Leaflets (4-) 6 (-8) per leaf, generally paired; [plants of various dry or wet habitats].
 - 4 Racemes with 5-15 flowers; flowers white to cream; [of upland forests and thickets] *L. ochroleucus*
 - 4 Racemes with 2-6 (-9) flowers; flowers pink to purple; [of marshes, bottomlands, and other wet habitats] *L. palustris*
- 1 Leaflets 0-2; [alien species, except *L. pusillus*].
 - 5 Leaflets absent (but with foliaceous stipules) [*L. aphaca*]
 - 5 Leaflets 2.
 - 6 Stems not winged or flanged; corollas 10-15 mm long; flowers 3-10 per inflorescence.
 - 7 Corollas yellow [*L. pratensis*]
 - 7 Corollas red-purple *L. tuberosus*
 - 6 Stems winged; corollas 6-30 mm long; flowers 1-15 per inflorescence.
 - 8 Stems with wings 0-1 (-2) mm wide; corolla 6-14 mm long; flowers 1-3 (-4) per raceme.
 - 9 Legume (in fruit) and ovary (in flower) hirsute with swollen-based hairs; corolla 9-14 mm long *L. hirsutus*
 - 9 Legume (in fruit) and ovary (in flower) glabrous; corolla 6-9 mm long *L. pusillus*
 - 8 Stems with wings 1-3 mm wide; corolla 13-30 mm long; flowers 2-12 per raceme.
 - 10 Stems hirsute with swollen-based hairs; plant an annual; flowers 2-4 per raceme [*L. odoratus*]
 - 10 Stems glabrate; plant a perennial; flowers (3-) 4-12 per raceme.
 - 11 Stipules 4-10 mm wide; leaflets 2-5× as long as wide *L. latifolius*
 - 11 Stipules 2-3 mm wide; leaflets 6-15× as long as wide [*L. sylvestris*]

* *Lathyrus aphaca* Linnaeus, Yellow Vetchling. Disturbed areas; native of Eurasia. Scattered in occurrence in the Southeast, including AL, TN, and KY (Kartesz 1999). [= G, I, K, SE]

* *Lathyrus hirsutus* Linnaeus, Caley Pea, Singletary Pea. Roadsides, fields, disturbed areas; native of Europe. Apr-Jul. [= C, F, G, I, K, Mo, RAB, S, SE, Va, W, WH3]

Lathyrus japonicus Willdenow var. *maritimus* (Linnaeus) Kartesz & Gandhi, Atlantic Beach Pea. Beaches. Jun-Sep. The species is circumboreal, south in eastern North America to NJ (or NC?) and the shores of the Great Lakes. Reported from ocean beaches in Dare County (NC), but without documentation. [= K2; < *L. japonicus* – I; > *L. maritimus* (Linnaeus) Bigelow var. *pellitus* (Fernald) Gleason – C, G; > *Lathyrus japonicus* Willdenow var. *pellitus* Fernald – F, K1; > *L. japonicus* var. *glaber* (Seringe) Fernald – Pa]

* *Lathyrus latifolius* Linnaeus, Everlasting Pea, Perennial Sweet Pea. Roadsides, fencerows, disturbed areas; native of Europe. May-Oct. [= C, F, G, I, K, Mo, Pa, RAB, SE, Va, W, WV]

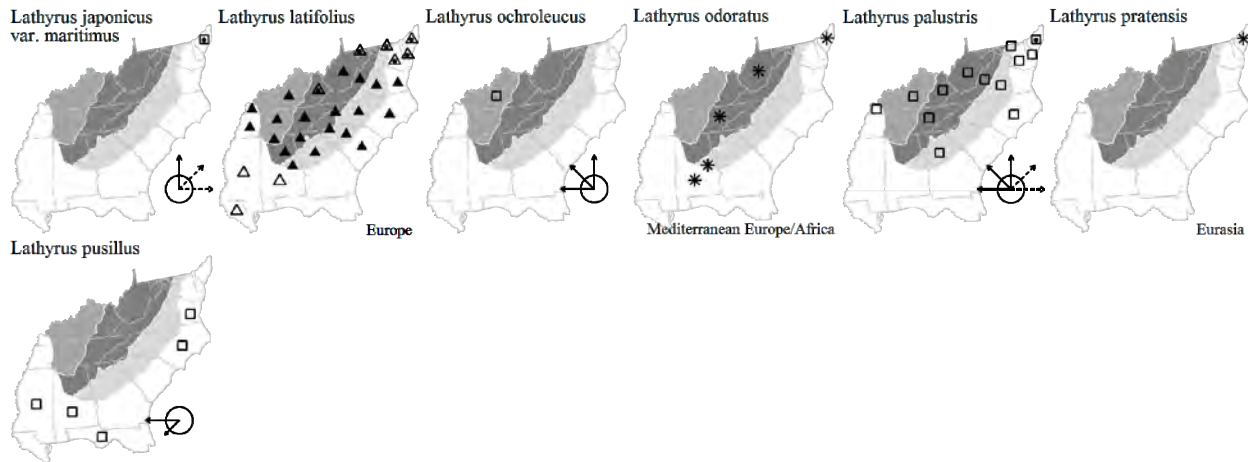

Lathyrus ochroleucus Hooker, Cream Vetchling. Dry forests and thickets. QC to AK, south to n. NJ, PA, w. KY, s. IL, IA, NE, ID, and WA. [= C, F, G, I, K2]

* *Lathyrus odoratus* Linnaeus, Sweet Pea. Cultivated, and occasionally persisting; native of s. Europe. [= C, F, G, I, K, SE, WV]

Lathyrus palustris Linnaeus, Marsh Pea, Marsh Vetchling. Freshwater marshes, calcareous fens, bottomland forests, marshes, streambanks. May-Aug; Jul-Sep. Circumboreal, ranging in North America south to DE, VA, ne. NC, ec. GA, OH, IN, MO, CO, and CA. [= I, K, Mo, Pa, RAB, SE, Va; > *L. palustris* var. *palustris* – C, F, G, WV; > *L. palustris* var. *myrtifolius* (Muhlenberg ex Willdenow) A. Gray – F, G, WV; > *L. palustris* var. *linearifolius* Seringe – G; > *L. myrtifolius* Muhlenberg ex Willdenow – S]

* *Lathyrus pratensis* Linnaeus, Meadow Pea. Disturbed areas; native of Eurasia. Reported for VA on the basis of "personal communication" (Kartesz 1999). {investigate} [= C, F, I, K]

Lathyrus pusillus Elliott, Tiny Pea. Open areas in bottomlands, disturbed areas. Apr-Jul. E. VA, MO and KS, south to FL Panhandle and TX. [= F, G, I, K, Mo, RAB, S, SE, Va, WH3]

* *Lathyrus sylvestris* Linnaeus, Perennial Pea. Cultivated, and occasionally persisting, and more rarely naturalizing; native of Europe. Jun-Sep. Reported as naturalizing in se. TN along a roadcut (Hart, Shaw, & Estes 2012). [= C, F, G, I, K, Mo, Pa, SE, WV]

* *Lathyrus tuberosus* Linnaeus, Tuberous Vetchling. Disturbed areas; native of Europe. Jun-Jul. Introduced in e. TN (Chester, Wofford, & Kral 1997), WV (Strausbaugh & Core 1978), and KY. [= C, F, G, I, K, Mo, Pa, SE, WV]

Lathyrus venosus Muhlenberg ex Willdenow, Forest Pea, Bush Vetch. Dry to mesic slope and bottomlands forests and woodlands, rocky bars and outcrops along rivers, somewhat (but not at all strictly) associated with base-rich soils. May-Sep. S. ON west to MN and SK, south to c. NC, wc. GA, and MO. [= I, K, Mo, Pa, RAB, S, SE, Va, W; > *L. venosus* var. *venosus* – C, F, G, WV; > *L. venosus* var. *intonsus* Butters & St. John – C, F, G, WV; > *L. venosus* var. *meridionalis* Butters & St. John – F; "*L. palustris* var. *meridionalis*" – WV]

80. *Pisum* Linnaeus 1753 (Pea)

A genus of 2-5 species, annual herbs, native to w. Asia and the Mediterranean region. References: Isely (1998)=I.

* ***Pisum sativum*** Linnaeus, Pea, Garden Pea, English Pea. Commonly cultivated in home gardens, rarely found as a waif; native of w. Asia and Mediterranean Europe. Mar-May. [= I, K, Mo, SE, WH3; > *P. sativum* var. *sativum* – F; > *P. sativum* var. *arvense* (Linnaeus) Poiret – F, RAB]

146. POLYGALACEAE R. Brown 1814 (Milkwort Family) [in FABALES]

A family of 17-21 genera and 800-1000 species, trees, shrubs, woody vines, and herbs, nearly cosmopolitan, but most diverse in tropical and subtropical areas. References: Abbott (2011); Pastore & Abbott (2012); Miller (1971b); Eriksen & Persson in Kubitzki, Bayer, & Stevens (2007).

Identification notes: The Polygalaceae has a distinctive flower structure which can be confusing. The corolla consists of **3 fused petals**, partly fused into a tube, and also fused with the stamens. The lower petal is called the **keel**; it is usually boatlike, and also lacerate, fringed, or lobed at its tip (in most species). The calyx is 5-lobed, the lobes usually of 3 distinct sizes. The two lateral sepals are called **wings**; they are generally large and petaloid (colored like petals). The upper sepal is usually the next largest; the two lower sepals are usually the smallest.

- 1 Corolla keel blunt, lacking a crest or beak..... **1. *Asemeia***
- 1 Corolla keel appendaged, with a lobed or tufted crest.
 - 2 Flowers in terminal spikes, racemes, or corymbs **3. *Polygala***
 - 2 Flowers axillary; plants perennial..... **2. *Polygaloides***

1. *Asemeia* Rafinesque 1833 (Milkwort)

A genus of ca. 28 species, herbs and shrubs, neotropical north to the se. United States. References: Pastore & Abbott (2012)=Y; Abbott (2011)=Z; Bernardi (2000)=X.

Asemeia grandiflora (Walter) Small, Showy Milkwort. Sandhills, dry sandy soils of roadsides and fields. May-Jul. S. NC south to s. FL, west to s. MS; West Indies, Mexico to Central America. Sometimes included in the neotropical *P. violacea* Aublet (Nicaragua to Paraguay), or alternatively subdivided into varieties or species (see synonymy). [= Y, Z; > *Polygala grandiflora* Walter var. *grandiflora* – K1; < *Polygala violacea* Aublet – K2, WH3, X; = *Polygala grandiflora* – RAB; > *A. grandiflora* (Walter) Small – S; > *Asemeia cumulicola* Small – S; > *Asemeia leiodes* (Blake) Small – S; > *Asemeia miamiensis* Small – S]

2. *Polygaloides* Haller 1768 (Milkwort)

A genus of 6-7 species, herbs, all but our one species of Europe and n. Africa. References: Abbott (2011)=Z.

Polygaloides paucifolia (Willdenow) J.R. Abbott, Gaywings, Fringed Polygala, Flowering Wintergreen, Bird-on-the-wing. Moist to dry forests, mostly at moderate to high elevations. Apr-Jun; Jun-Sep. NB and QC west to SK, south to CT, NY, WI, and in the Appalachians south to w. NC, nw. SC, n. GA, and e. TN. [= Z; = *Polygala paucifolia* Willdenow – RAB, C, F, G, K1, K2, Pa, W, WV; = *Trichisperma paucifolia* (Willdenow) Nieuwland – S]

3. *Polygala* Linnaeus 1753 (Milkwort)

A genus of 300-400 species, trees, shrubs, and herbs, nearly cosmopolitan in distribution. The circumscription of the genus and its monophyly are uncertain, even after the removal of some elements that are not closely related to the core of *Polygala* (Abbott 2011). References: Pastore (2013); Smith & Ward (1976)=Z; Haines (2010)=Y; Eriksen & Persson in Kubitzki, Bayer, & Stevens (2007).

- 1 Fresh flowers orange, yellow, greenish-yellow, or greenish white (if greenish white, then the inflorescence a terminal many-brached cyme); [subgenus *Polygala*, series *Decurrentes*].
- 2 Inflorescence a dense pom-pom-like raceme, terminating leafy branches.
- 3 Fresh flowers lemon-yellow or greenish yellow; subulate bracts of the inflorescence 4.5-6.5 mm long; plants 3-10 (-15) cm tall; lobes of lower petal (keel) 1.5-2.5 mm long..... *P. nana*
- 3 Fresh flowers bright orange or bright yellow; subulate bracts of the inflorescence 2-4 mm long; plants 5-80 cm tall; lobes of lower petal (keel) 0.5-1.1 mm long.
- 4 Racemes ca. 1.5 cm in diameter; flowers bright orange (rarely individual plants within a population with bright yellow flowers); plants 5-40 cm tall; [widespread]..... *P. lutea*
- 4 Racemes ca. 2.5 cm in diameter; flowers bright yellow; plants 30-80 cm tall; [of FL]..... *P. rugelii*
- 2 Inflorescence a terminal, many-branched cyme, the many individual branches loosely to densely flowered.
- 5 Fresh flowers cream-white to greenish-white; [of GA southward]..... *P. baldunii* var. *baldunii*
- 5 Fresh flowers bright yellow; [collectively widespread in the Coastal Plain of our area].
- 6 Plants 4.5-12 dm tall, the stem solitary; basal leaves 3.5-14 cm long, linear-lanceolate, about 15-20× as long as wide, persistent as a basal rosette; stem leaves linear-subulate, sharp-tipped, much reduced from the basal leaves, becoming bractlike upward; seeds glabrous, 0.7-0.9 mm long..... *P. cymosa*
- 6 Plants 1-4 dm tall, the stems 1-several from the base; basal leaves 3-7 cm long, spatulate, about 10× as long as wide, usually not persistent after flowering; stem leaves narrowly spatulate to linear, blunt-tipped, only slightly reduced from the basal leaves; seeds pubescent, 0.5-0.7 mm long..... *P. ramosa*
- 1 Fresh flowers pink, purple, white, or green (if green or white, then the inflorescence a simple raceme, not a many-branched cyme).
- 7 Leaves few, clustered near the tip of the stem; wings 13-20 mm long; stamens 6; [of moist soils of forests in the Mountains]..... [see *Polygaloides*]
- 7 Leaves many, evenly distributed along the stem, or not at least strongly clustered near the tip; wings < 10 mm long; stamens 8; [collectively of a wide variety of habitats, but generally not as above, either in more open, drier, or non-montane habitats].
- 8 Leaves whorled, at least at the principal lower nodes; annual, from a slender taproot; [subgenus *Polygala*, series *Polygala*].
- 9 Racemes 3-6 mm in diameter, pointed in outline.
- 10 Racemes 2-5 cm long, becoming interrupted below through persistence of the fruits on the axis; wings equaling the fruit..... *P. ambigua*
- 10 Racemes 0.5-1.5 cm long, the fruits falling promptly, thus the inflorescence compact and truncate below; wings shorter than the fruit.
- 11 Seeds finely pubescent; pedicels ¼-½ as long as the fruit; raceme peduncles 0.5-4 cm long..... *P. verticillata* var. *isocycla*
- 11 Seeds hirsute; pedicels ½-½ as long as the fruit; raceme peduncles 2-7 cm long..... *P. verticillata* var. *verticillata*
- 9 Racemes 8-15 mm in diameter, rounded in outline (somewhat rounded in *P. hookeri*).
- 12 Racemes loosely flowered, with ca. 10 flowers per cm of length; raceme 7-12 mm in diameter, the tip pointed in outline (obconical apically); full raceme (including the portion with dropped fruits) to 6 cm long..... *P. hookeri*
- 12 Racemes densely flowered, with ca. 20 flowers per cm of length; raceme 7-20 mm in diameter, the tip rounded to truncate in outline; full raceme (including the portion with dropped fruits) to 4.5 cm long.
- 13 Bracts of the inflorescence ca. 1 mm long; wings 1.5-2.5 mm wide, acute or short-mucronate at the tip; raceme peduncle (0.8-) 3-5 cm long..... *P. brevifolia*
- 13 Bracts of the inflorescence 1.5-3 mm long; wings 3-4 mm wide, acuminate, the tips cuspidate; raceme peduncle 0-0.8 (-4.0) cm long..... *P. cruciata*
- 8 Leaves all alternate; **either** annual, from a slender taproot, the stems solitary, **or** biennial to perennial, from a taproot, the stems solitary to several, **or** perennial, from a thick rhizome, the stems several.
- 14 Leaves glaucous, somewhat succulent, linear; corolla 7-10 mm long, > 2× as long as the wings; [subgenus *Polygala*]..... *P. incarnata*
- 14 Leaves green, herbaceous, usually broader than linear; corolla < 5 mm long, roughly equal to or shorter than the wings.
- 15 Perennial or biennial, usually several stems arising together from a rhizome or taproot.
- 16 Wings white, 2-3 mm long; flowers sessile or subsessile; plants from a thick crown.
- 17 Larger leaves mostly 15-35 mm wide; capsules 3.5-4.2 mm long; seeds 3.0-3.5 mm long..... *P. senega* var. *latifolia*
- 17 Larger leaves mostly 2-15 mm wide; capsules 2.5-3.5 mm long; seeds ca. 2.5 mm long..... *P. senega* var. *senega*
- 16 Wings pink, 4-7 mm long; flowers pedicelled; plants from a taproot.
- 18 Corolla keel entire at the tip; wings 5-7 mm long, reniform-orbicular; plants lacking cleistogamous flowers..... [see *Asemeia*]
- 18 Corolla keel fringed at the tip; wings 4-6 mm long, elliptic; plants producing cleistogamous flowers in loose subterranean or surficial racemes..... *P. polygama*
- 15 Annual, the stems solitary.
- 19 Corolla about 0.5× as long as the wings..... *P. sanguinea*
- 19 Corolla about 1× as long as the wings.
- 20 Inflorescence bracts dropping from the axis promptly following flowering..... *P. mariana*
- 20 Inflorescence bracts persistent.
- 21 Wings 3-5 mm long; pedicels 1.5-2.5 mm long; racemes 8-13 mm in diameter..... *P. curtissii*
- 21 Wings 2-2.5 mm long; pedicels 0.5-1.5 mm long; racemes 5-6 mm in diameter..... *P. nuttallii*

Polygala ambigua Nuttall, Loose Milkwort. Fields, woodlands, openings. Jun-Sep. ME west to MI, south to GA, AL, and OK. Through most of its range *P. ambigua* has wings 1.3-1.7 mm long; plants from se. VA south to SC and from the Ozarks have wings 2.0-2.6 mm long. These plants have been named as a variety of *P. verticillata*, var. *dolichopectera* Fernald. They may warrant taxonomic recognition, but need additional study, including resolution of our Coastal Plain plants and those of the Ozarks. [= C, G, K1, K2, S; = *P. verticillata* Linnaeus var. *ambigua* (Nuttall) Wood – Mo, Pa, RAB; > *P. verticillata* var. *ambigua* – F, WV; > *P. verticillata* var. *dolichopectera* Fernald – F, WV; < *P. verticillata* – W]

Polygala appendiculata Vellozo, Swamp Milkwort. Bogs and pond margins. Ne. and Panhandle FL west to e. TX; Mexico, Central America, and South America; Cuba. Pastore (2013) establishes that the correct name for this species is *P.*

appendiculata. [= *P. leptocaulis* Torrey & A. Gray – GW, S; = *P. tenella* Willdenow – K2, WH3, misapplied] {not yet keyed; synonymy incomplete}

Polygala balduinii Nuttall var. *balduinii*, White Milkwort, Baldwin's Milkwort. Wet pine savannas. E. GA south to s. FL, west to s. MS; e. TX; Cuba; the Bahamas (Andros Island). Var. *carteri* (Small) R.R. Smith & D.B. Ward occurs in s. FL. [= GW, Z; < *Polygala balduinii* – K1, K2, WH3; = *Pilostaxis balduinii* (Nuttall) Small – S, orthographic variant; = *Pylostachya balduinii* (Nuttall) Small]

Polygala boykinii Nuttall var. *boykinii*, Boykin's Milkwort. Longleaf pine flatwoods and savannas. Var. *sparsiflora* Wheelock occurs in s. FL. [= K1, K2; = *P. boykinii* – S; < *P. boykinii* – WH3] {not yet keyed; synonymy incomplete}

Polygala brevifolia Nuttall, Shortleaf Milkwort, Little-leaf Milkwort. Pine savannas, pocosin margins, pocosin interiors after fire. Jun-Oct. NJ south to Panhandle FL, west to s. MS. [= C, F, G, GW, K1, K2, RAB, S, WH3]

Polygala chapmanii Torrey & A. Gray. Pine savannas, seepage bogs. Panhandle FL and sw. GA west to s. MS. [= GW, K1, K2, S, WH3] {not yet keyed; synonymy incomplete}

Polygala crenata C.W. James. Wet pine flatwoods, bogs, bayheads. FL Panhandle and AL west to TX; reported for GA (B.A. Sorrie, pers. comm.). [= GW, K1, K2, WH3] {not yet keyed; synonymy incomplete}

Polygala cruciata Linnaeus, Drumheads. Bogs, damp or wet soil in openings. Jun-Oct. ME west to MN, south to e. VA, w. NC, n. AL, and TN. Two varieties or subspecies are sometimes recognized. [= C, G, GW, RAB, S, Va, W, WH3, WV; > *P. cruciata* var. *aquilonia* Fernald & Schubert – F, K1, K2; > *P. cruciata* var. *cruciata* – F, K1, K2; > *P. ramosior* (Nash) Small – S; > *P. cruciata* ssp. *aquilonia* (Fernald & Schubert) A. Haines – Y; > *P. cruciata* ssp. *cruciata* – Y]

Polygala curtissii A. Gray, Appalachian Milkwort. Mafic barrens, old fields, thickets, openings. Jun-Oct. DE and se. PA (Rhoads & Block 2007) west to OH, south to SC, GA, and MS. [= C, F, G, K1, K2, Pa, RAB, S, Va, W, WV]

Polygala cymosa Walter, Tall Pinebarren Milkwort. Pond-cypress savannas, Coastal Plain depression ponds, clay-based Carolina bays, other sites with seasonally flooded hydrology. May-Jul. E. NC south to s. FL, west to s. MS; disjunct in s. DE. [= C, F, G, GW, K1, K2, RAB, WH3, Z; = *Pilostaxis cymosa* (Walter) Small – S; = *Pylostachya cymosa* (Walter) Small]

Polygala hookeri Torrey & A. Gray, Hooker's Milkwort. Pine savannas. Jun-Aug. Sw. GA and adjacent Panhandle FL, west to s. MS; disjunct in se. NC and ne. SC. [= GW, K1, K2, RAB, S, WH3]

Polygala incarnata Linnaeus, Pink Milkwort, Procession-flower. Pine savannas, woodlands, fields. Late Apr-Nov. NY (Long Island) and se. PA (Rhoads & Block 2007) west to MI, WI, and IA, south to s. FL and TX; Mexico; Central America. [= C, F, G, GW, K1, K2, Mo, Pa, RAB, Va, W, WH3; = *Galypola incarnata* (Linnaeus) Nieuwland – S]

Polygala leptostachys Shuttleworth ex A. Gray, Georgia Milkwort. Sandhills. Ne. FL south to c. peninsular FL, west to sw. GA (Jones & Coile 1988), s. AL (Sorrie & LeBlond 2008), s. MS (Sorrie & Leonard 1999). [= K1, K2, S, WH3] {not yet keyed; synonymy incomplete}

Polygala lewtonii Small, Lewton's Milkwort, Sand Sweethearts. Sandhills. Feb. N. FL peninsula (Marion County) south to c. FL. [= K1, K2, S, WH3] {not yet keyed; synonymy incomplete}

Polygala lutea Linnaeus, Orange Milkwort, Red-hot-poker. Wet savannas, ditches, bogs, other wet areas. Apr-Oct. NY (Long Island), se. PA (Rhoads & Block 2007), and NJ south to s. FL, west to e. LA. [= C, F, G, GW, K1, K2, Pa, RAB, Va, WH3, Z; = *Pilostaxis lutea* (Linnaeus) Small – S; = *Pylostachya lutea* (Linnaeus) Small]

Polygala mariana P. Miller, Maryland Milkwort. Bogs, pine savannas, other open wet habitats. Jun-Oct. S. NJ south to c. peninsular FL, west to TX; disjunct inland in sw. TN (Chester, Wofford, & Kral 1997). [=C, G, GW, K1, K2, RAB, Va, WH3; > *P. mariana* – F, S; > *P. harperi* Small – F, S]

Polygala nana (Michaux) A.P. de Candolle, Dwarf Milkwort, Candyroot. Longleaf pine flatwoods, other open moist areas. E. GA south to s. FL, west to e. TX, with scattered populations inland to n. SC, w. NC, nw. GA, n. AL, c. TN (Chester, Wofford, & Kral 1997), and ne. MS. This species is primarily a Coastal Plain species of the deeper south; *P. nana* may be introduced in parts of our area. [=GW, K1, K2, RAB, WH3, Z; = *Pilostaxis nana* (Michaux) Rafinesque – S; = *Pylostachya nana* (Michaux) Rafinesque]

Polygala nuttallii Torrey & A. Gray, Nuttall's Milkwort. pocosins, pine savannas, also in depression ponds (in Augusta and Rockingham counties, VA). Jun-Aug. MA south to ne. FL and e. Panhandle FL; disjunct inland in w. VA, c. TN (Chester, Wofford, & Kral 1997), sc. KY, and allegedly c. AR. [=C, F, G, K1, K2, Pa, RAB, S, W, WH3]

Polygala polygama Walter, Bitter Milkwort, Racemed Milkwort. sandhills, woodlands, woodland borders. May-Jul; Jun-Jul. NS, ON, and MN south to s. FL and TX. Two varieties are sometimes recognized. [=K1, K2, Pa, RAB, Va, W, WH3; > *P. polygama* Walter var. *obtusata* Chodat – C, F, G, WV; > *P. polygama* var. *polygama* – C, F, G; > *P. polygama* – S; > *P. aboriginum* Small – S]

Polygala ramosa Elliott, Short Pinebarren Milkwort, Low Pinebarren Milkwort. Wet savannas, pocosin margins, bogs. Jun-Sep. S. NJ south to s. peninsular FL, west to e. TX; disjunct inland (as in Henderson County, NC). [=C, F, G, GW, K1, K2, RAB, Va, WH3, Z; = *Pilostaxis ramosa* (Elliott) Small – S; = *Pylostachya ramosa* (Elliott) Small]

Polygala rugelii Shuttleworth ex Chapman. Wet pine flatwoods. Extreme e. Panhandle FL and n. peninsular FL south to s. FL. [=GW, K1, K2, WH3, Z; = *Pilostaxis rugelii* (Shuttleworth ex Chapman) Small – S]

Polygala sanguinea Linnaeus, Blood Milkwort, Field Milkwort. Bogs, fens, seeps, woodlands, openings, woodland borders. May-Aug. NS and MN, south to nw. SC, n. GA, and LA. [=C, F, G, GW, K1, K2, Mo, Pa, RAB, Va, W, WV; ? *P. viridescens* Linnaeus – S]

Polygala senega Linnaeus, Seneca Snakeroot. Woodlands and openings, especially over calcareous or mafic rocks. May-Jun. QC west to AB, south to n. GA, TN, AR, and SD. Two varieties have often been recognized; Trauth-Nare & Naczi (1998) studied the two named varieties and concluded that the taxa should be recognized at the specific level. No coherent and conclusive basis for the recognition of two taxa has yet been published, though, so they are here reluctantly combined. Further study is needed. [=C, K1, K2, Mo, RAB, S, Va, W; > *Polygala senega* Linnaeus var. *latifolia* Torrey & A. Gray – F, G, Pa, WV; > *Polygala senega* Linnaeus var. *senega* – F, G, Pa, WV]

Polygala setacea Michaux, Coastal Plain Milkwort. Pine flatwoods and bogs. E. GA and Panhandle FL south to s. FL. Reported by Small (1933) as occurring north to NC and west to s. MS (apparently an error). [=GW, K1, K2, S, WH3] {not yet keyed; synonymy incomplete}

Polygala verticillata Linnaeus var. *isocycla* Fernald, Whorled Milkwort. Cp (FL), Mt (WV), {Mt, Pd, Cp (DE, GA, NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. Jun-Sep. The validity and relative distributions, habitats, phenology of the two varieties need additional assessment in the herbarium and the field.} VT west to MB, south to Panhandle FL (Kunzer et al. 2009), s. FL, and TX. [=C, F, G, K1, Pa, WH3, WV; < *P. verticillata* var. *verticillata* – RAB; = *P. verticillata* – S, apparently misapplied; < *P. verticillata* – K2, Mo, Va, W]

Polygala verticillata Linnaeus var. *verticillata*, Whorled Milkwort. Mt (WV), {Mt, Pd, Cp (DE, GA, NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. Jun-Sep. The validity and relative distributions, habitats, phenology of the two varieties need additional assessment in the herbarium and the field.} ME west to MI, south to w. VA, w. NC, and TN. [=C, F, G, K1, Pa, WV; < *P. verticillata* var. *verticillata* – RAB; = *P. pretzii* Pennell – S; < *P. verticillata* – K2, Mo, Va, W]

147. ROSACEAE A.L. de Jussieu 1789 (Rose Family) [in ROSALES]

A family of about 85-95 genera and 2000-3000 species, trees, shrubs, and herbs, nearly cosmopolitan, but mainly boreal and temperate. References: Phipps in FNA (2014); Potter et al. (2007); Eriksson et al. (2003); Kalkman in Kubitzki (2004); Erter (2007).

Subfamily Rosoideae

- Tribe Ulmarieae: 1. *Filipendula*
- Tribe Roseae: 2. *Rosa*
- Tribe Rubeae: 3. *Rubus*
- Tribe Sanguisorbeae: 4. *Agrimonia*, 5. *Poterium*, 6. *Poteridium*, 7. *Sanguisorba*
- Tribe Potentilleae: 8. *Argentina*, 9. *Potentilla*, 10. *Aphanes*, 11. *Dasiphora*, 12. *Drymocallis*, 13. *Fragaria*, 14. *Sibbaldia*
- Tribe Colurieae: 15. *Geum*

Subfamily Amygdaloideae

- Tribe Amygdaleae: 16. *Prunus*
- Tribe Neillieae: 17. *Neillia*, 18. *Physocarpus*
- Tribe Sorbarieae: 19. *Sorbaria*
- Tribe Spiraeae: 20. *Aruncus*, 21. *Spiraea*
- Tribe Exochordeae: 22. *Exochorda*
- Tribe Kerrieae: 23. *Kerria*, 24. *Neviusia*, 25. *Rhodotypos*
- Tribe Gilleniae: 26. *Gillenia*
- Tribe Maleae: 27. *Amelanchier*, 28. *Crataegus*, 29. *Pyracantha*, 30. *Sorbus*, 31. *Pyrus*, 32. *Rhaphiolepis*, 33. *Eriobotrya*, 34. *Pseudocdonia*, 35. *Chaenomeles*, 36. *Photinia*, 37. *Pourthiaea*, 38. *Aronia*, 39. *Cydonia*, 40. *Malus*

- 1 Herbs or subshrubs (if woody at base, then < 3 dm tall).
 - 2 Leaves simple..... **Key A**
 - 2 Leaves compound (at least the lower and better developed) **Key B**
- 1 Trees, shrubs, or woody vines (with arching “canes” or climbing, arching, or scrambling stems).
 - 3 Leaves simple..... **Key C**
 - 3 Leaves compound **Key D**

Key A – Herbs and subshrubs with simple leaves

- 1 Leaves crenate, unlobed; inflorescence of a solitary flower; [tribe *Rubeae*] **3. *Rubus repens***
- 1 Leaves 3-many lobed; inflorescences cymose.
 - 2 Leaf blades 0.3-1.0 cm long and wide, deeply 3-lobed, each lobe further lobed or deeply toothed; petals 0; [tribe *Potentilleae*]..... **10. *Aphanes***
 - 2 Leaf blades 3-8 cm long and wide, 3-lobed, each lobe toothed; petals 5; [tribe *Colurieae*] **15. *Geum lobatum***

Key B – Herbs and subshrubs with compound leaves

- 1 Leaves 2- to 3-ternately compound; [tribe *Spiraeae*] **20. *Aruncus***
- 1 Leaves 1-compound, either simply pinnately compound or simply palmately compound,
 - 2 Principal (basalmost) leaves pinnately compound, with (5-) 7-many leaflets (stem leaves sometimes 3-foliolate, especially in *Geum*).
 - 3 Principal leaves with leaflets of markedly disparate shape and size (large leaflets alternating with much smaller leaflets, or a large terminal leaflet and much smaller lateral leaflets).
 - 4 Lateral leaflets alternating between small and large, the terminal leaflet similar in size and shape to the larger lateral leaflets; terminal leaflet < 3 cm wide; hypanthium **either** conical or turbinate, armed with hooked bristles, the pistils 2, **or** hemispheric, the pistils >5.
 - 5 Leaves glabrous or sparsely pubescent beneath; flowers many in racemes; hypanthium conical or turbinate, armed with hooked bristles, the pistils 2; [tribe *Sanguisorbeae*]..... **4. *Agrimonia***
 - 5 Leaves silvery sericeous beneath; flowers solitary and axillary; hypanthium hemispheric, the pistils >5; [tribe *Potentilleae*]..... **8. *Argentina***
 - 4 Leaflets variable in size and shape, usually the terminal leaflet much larger than any of the lateral leaflets; terminal leaflet 3-20 cm wide; hypanthium either saucer-shaped or hemispheric to conical; pistils 5 or more.
 - 6 Pistils 5-15, in a circle on a saucer-shaped hypanthium, ripening into upright fruits that resemble follicles but are indehiscent; corolla white or pink; plant 10-20 dm tall; [tribe *Ulmarieae*] **1. *Filipendula***
 - 6 Pistils many, densely covering the hemispheric to conical hypanthium, ripening into achenes terminated by the persistent style; corolla white, cream, pale yellow, bright yellow, lavender, maroon, or purple; plant 2-10 dm tall; [tribe *Colurieae*] **15. *Geum***

- 3 Principal leaves with leaflets of generally similar shape and size (the lowest leaflets may be smaller but of similar shape and tothing to the other leaflets).
- 7 Foliage and stems viscid-pubescent with brownish hairs; inflorescence a cyme; petals 5, cream-colored; [tribe *Potentilleae*] **12. *Drymocalis***
- 7 Foliage not viscid-pubescent (if hairy, the hairs not brown or viscid); inflorescence of very many (>100) small flowers in a spike, the rachis hidden by the tightly packed flowers; petals 0; [tribe *Sanguisorbeae*].
- 8 Leaflets pinnatifid (each leaflet incised nearly to the midvein); stamens 2 or 4 per flower **[6. *Poteridium*]**
- 8 Leaflets toothed (the incisions not nearly to the midvein); stamens **either 4 or 15-20** per flower (in well-developed, staminate flowers).
- 9 Leaflets 0.8-2 cm long; spike 1-2 cm long, 1-2× as long as broad, globose; stamens 15-20 per flower (in well-developed staminate flowers), the filaments 3-4 mm long; sepals green to pinkish-purple; [cultivated, occasionally escaped] **5. *Poterium***
- 9 Leaflets 3-10 cm long; spike 6-30 cm long, elongate; stamens 4 per flower, the filaments 8-10 mm long; sepals white (sometimes fading greenish); [native] **7. *Sanguisorba***
- 2 Principal (basal-most) leaves palmately compound, with 3-7 (-9) leaflets.
- 10 Principal leaves sessile, 3-foliolate; fruit of follicles; leaves cauline; [tribe *Gillenieae*] **26. *Gillenia***
- 10 Principal leaves distinctly petiolate, the petiole often longer than the leaflets, 3-7 (-9)-foliolate; fruit of achenes; leaves basal and cauline.
- 11 Principal leaves 5-7 (-9)-foliolate; [tribe *Potentilleae*] **9. *Potentilla***
- 11 Principal leaves 3-foliolate.
- 12 Plants in flower.
- 13 Petals yellow.
- 14 Pistils 2-6; [tribe *Colurieae*] **15. *Geum***
- 14 Pistils (10-) numerous; [tribe *Potentilleae*] **9. *Potentilla***
- 13 Petals white (or slightly pinkish).
- 15 Calyx lobes not subtended by bractlets; [tribe *Rubeae*] **3. *Rubus pubescens***
- 15 Calyx lobes subtended by 5 sepaloid bractlets; [tribe *Potentilleae*].
- 16 Leaves evenly serrate with many serrations; [widespread] **13. *Fragaria***
- 16 Leaves with 3 (-5) teeth at the apex, otherwise entire; [Mountains] **14. *Sibbaldia***
- 12 Plants in fruit (or sterile).
- 17 Leaflets entire, except for 3 (-5) teeth at the apex; [Mountains] ; [tribe *Potentilleae*] **14. *Sibbaldia***
- 17 Leaflets evenly serrate or crenate, each well-developed leaflet with > 7 teeth.
- 18 Calyx lobes not subtended by bractlets.
- 19 Fruit an aggregate of dry, non-adherent achenes; leaflets obtuse at apex; [tribe *Colurieae*] **15. *Geum***
- 19 Fruit an aggregate of fleshy, adherent drupelets; leaflets acuminate at apex; [tribe *Rubeae*] **3. *Rubus pubescens***
- 18 Calyx lobes subtended by 5 sepaloid bractlets; [tribe *Potentilleae*].
- 20 Fruit an aggregate of dry achenes **9. *Potentilla***
- 20 Fruit an accessory fruit of achenes borne on the surface of a fleshy, red receptacle.
- 21 Fresh fruit reddish inside; leaflets serrate, 2.5-12 cm long; sepaloid bracts narrowing to apex, untoothed ... **13. *Fragaria***
- 21 Fresh fruit whitish inside; leaflets crenate, 2-4 cm long; sepaloid bracts widest at apex, 3-5-toothed **9. *Potentilla indica***

Key C – Shrubs and trees with simple leaves

- 1 Ovary superior; fruit dehiscent (aggregate of follicles, or capsule) or indehiscent (drupe, aggregate of drupelets, aggregate of achenes).
- 2 Leaves opposite; fruit a drupe; [tribe *Kerrieae*] **25. *Rhodotypos***
- 2 Leaves alternate; fruit various (see below).
- 3 Leaves large, > 10 cm wide, palmately veined, and pinnately lobed; fruit an aggregate of drupelets; [tribe *Rubeae*] **3. *Rubus odoratus***
- 3 Leaves smaller, < 8 cm wide, pinnately veined, **either** not lobed **or** basally pinnately lobed; fruit a drupe, a capsule, an aggregate of follicles, or an aggregate of achenes.
- 4 Leaves singly serrate, not lobed basally.
- 5 Gynoecium of separate carpels; fruit an aggregate of follicles; [tribe *Spiraeae*] **21. *Spiraea***
- 5 Gynoecium of fused carpels; fruit either a fleshy drupe or a capsule.
- 6 Ovary 5-angled in ×-section; fruit a 5-angled capsule; leaves obovate, obviously broadest towards the tip; [tribe *Osmaronieae*] **22. *Exochorda***
- 6 Ovary circular in ×-section; fruit a fleshy spherical drupe; leaves generally broadest near or below the middle; [tribe *Amygdaleae*] **16. *Prunus***
- 4 Leaves doubly serrate, also often lobed towards the base.
- 7 Corolla yellow; stems arching, green; fruit an aggregate of drupe-like achenes (dry and indehiscent); [tribe *Kerrieae*] **23. *Kerria***
- 7 Corolla white to pink or rose; stems not both arching and green; fruit various (see below).
- 8 Inflorescence a dense, umbel-like corymb; leaf apices rounded to acute; fruit an aggregate of 5 follicles; [tribe *Neillieae*] **18. *Physocarpus***
- 8 Inflorescence a raceme or a leafy panicle; leaf apices acuminate.
- 9 Fruit a single follicle; [alien, planted, and rarely naturalized, as in e. VA]; [tribe *Neillieae*] **17. *Neillia***
- 9 Fruit an aggregate of 2-4 drupe-like achenes; [rare native of calcareous habitats in sc. TN, nw. GA, n. AL, and disjunct westward in AR and MO]; [tribe *Kerrieae*] **24. *Nevisia***
- 1 Ovary inferior; fruit indehiscent (pome); [tribe *Pyreae*].
- 10 Upper surface of leaves bearing dark glandular trichomes along the midrib (most easily seen with a 10× hand lens); shrubs **38. *Aronia***
- 10 Upper surface of leaves lacking dark glandular trichomes along the midrib; shrubs and trees.
- 11 Ovary and fruit 10-locular; inflorescence a raceme (rarely a fascicle); pome < 1 cm in diameter **27. *Amelanchier***
- 11 Ovary and fruit 5-locular; inflorescence a cyme, umbel, or fascicle (lacking an elongated central axis); pome 0.7-10 cm in diameter.

- 12 Styles distinct; exocarps (carpels within pericarp) bony and seedlike; trees and shrubs, with thorns **28. *Crataegus***
 12 Styles usually connate at base; exocarps leather or papery and easily opened to expose seeds; small trees, unarmed, or armed with sharp spur branches.
 13 Pome globose to ovoid, lacking stone cells; anthers yellow to white; styles connate at the base; leaves blunt to acuminate; [apples and crabapples]..... **40. *Malus***
 13 Pome globose or pyriform, with stone cells; anthers reddish; styles distinct; leaves acute to acuminate; [pears]..... **31. *Pyrus***
 {add to KEY under 1b: **35. *Chaenomeles*, 39. *Cydonia*, 33. *Eriobotrya*, 36. *Photinia*, 37. *Pourthiaea*, 29. *Pyracantha*, [32. *Rhaphiolepis*}**

Key D – Shrubs and trees with compound leaves

- 1 Leaflets < 5 mm wide, entire; densely-branched shrub to 1 m tall; flowers yellow; [tribe *Potentilleae*] **11. *Dasiphora***
 1 Leaflets > 10 mm wide, serrate or crenate; shrubs, trees, or woody vines (see below); flowers white, pink, or purplish (rarely yellow in *Rosa*).
 2 Leaves 1-pinnately compound, generally with > 11 leaflets; inflorescence a terminal panicle or corymb with numerous (> 100) flowers, the petals white and < 4 mm long; fruit a pome or follicle; upright tree or shrub with unarmed stems.
 3 Inflorescence a panicle; fruit a follicle; shrub, to 2 m tall; [tribe *Sorbarieae*]..... **19. *Sorbaria***
 3 Inflorescence a corymb; fruit a pome; tree, generally > 2 m tall; [tribe *Pyreae*]..... **30. *Sorbus***
 2 Leaves palmately or 1-pinnately compound, generally with < 11 leaflets; inflorescences axillary or terminal panicles or corymbs with few (<15) flowers, the petals white, pink, or purplish (rarely yellow) and > 6 mm long; fruit a hip or aggregate of drupelets; arching or upright shrubs or climbing or sprawling woody vines, the stems usually armed with prickles.
 4 Fruit a hip, developing from a globose to urceolate hypanthium, enclosing the ovaries and achenes, except for the apical orifice; leaflets usually acute to obtuse at the apex; leaflet margins crenulate or serrulate; [tribe *Roseae*]..... **2. *Rosa***
 4 Fruit an aggregate of drupelets, developing from a flattish or hemispheric hypanthium, with the ovaries and drupelets exposed; leaflets usually acuminate at the apex; leaflet margins serrate or doubly serrate; [tribe *Rubeae*]..... **3. *Rubus***

1. *Filipendula* P. Miller 1754 (Queen-of-the-Prairie)

A genus of about 15 species, herbs, north temperate in e. and nw. North America, Europe, and Asia. References: Schanzer in FNA (2014); Schanzer (1994)=Y; Robertson (1974)=Z.

- 1 Lateral leaflets lobed and toothed; flowers pink; fruit straight; rootstock with long subterranean runners; [native plant of wetlands, also sometimes cultivated]; [section *Albicoma*]..... ***F. rubra***
 1 Lateral leaflets merely coarsely toothed; flowers white; fruit twisted; rootstock short, without runners; [introduced species, sometimes escaped]; [section *Filipendula*]..... ***F. ulmaria***

Filipendula rubra (Hill) B.L. Robinson, Queen-of-the-Prairie. Fens, wet meadows, seeps, over mafic or calcareous rocks. Jun-Jul; Jul-Sep. PA west to n. IL and MN, south to WV, w. VA, w. NC, e. TN (Roane County, fide Gattinger 1901), and MO (reports from GA appear to be unsubstantiated). The closest relatives are the other two members of section *Albicoma*: *F. palmata* (Pallas) Maximowicz and *F. angustifolia* (Turczaninow) Maximowicz, both of ne. Asia. [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, WV, Y, Z]

* ***Filipendula ulmaria*** (Linnaeus) Maximowicz, Meadowsweet, Queen-of-the-Meadow. Disturbed areas; native of Europe. Late Jun-Jul. Cultivated and sometimes escaped or persistent. It is reported for KY, WV, PA, and NJ (Kartesz 1999). [= FNA, Pa, WV, Y; > *F. ulmaria* var. *ulmaria* – C, F, G; > *F. ulmaria* ssp. *ulmaria* – K]

2. *Rosa* Linnaeus 1753 (Rose)

A genus of more than 100 species, shrubs or woody vines; mainly of north temperate regions. Many cultivars cannot be readily identified to species. References: Lewis, Erter, & Bruneau in FNA (2014); Joly & Bruneau (2007)=Y; Lewis (2008); Robertson (1974)=Z; Kalkman in Kubitzki (2004). Key adapted in part from FNA and Y.

- 1 Stipules adnate to the petiole only basally, for < ½ their length; vigorous climbing vines, 3-5 (-10) m tall; petals white.
 2 Stems brown-tomentose, stipitate-glandular; terminal leaflet petiolules 3-5 mm; pedicels tomentose, 3-6 mm; hypanthia subglobose, white tomentose; [section *Bracteatae*]..... ***R. bracteata***
 2 Stems glabrous, eglandular; terminal leaflet petiolules 9-13 mm; pedicels glabrous, 12-30 mm; hypanthia cupulate, densely setose [section *Laevigatae*] ***R. laevigata***
 1 Stipules adnate to the petiole > ½ their length; vigorous climbing vines or shrubs, 0.3-4 m tall; petals white, pink, rose-purple, or yellow.
 3 Styles connate into a column which protrudes from the orifice by 3-6 mm (sometimes separating in fruit); stipule margins and auricles deeply lacinate (or entire to ciliate in *R. setigera*); vines, climbing and scrambling to 4 m tall; [section *Systylae*].
 4 Leaflets 3-5; stipule margins and auricles mostly entire or ciliate; inflorescences laxly corymbose; flowers 3-5 cm in diameter, petals single, rose-purple to pink; carpels 20-25, styles glabrous, exserted 5-6 mm beyond the orifice; [native] ***R. setigera***
 4 Leaflets (5-) 7-9; stipule margins and auricles deeply lacinate; inflorescences paniculate; flowers 1.5-2.5 cm in diameter, petals single or double, white to shades of pink; carpels 6-20; styles glabrous or pubescent, exserted 3-5 mm beyond the orifice; [alien].
 5 Pedicels 18-25 mm, glabrous, eglandular; flowers 2-2.5 cm in diameter, hypanthium elongate-ovoid, 4-6.5 mm x 2-3 mm, eglandular; carpels 12-20, styles pubescent, exserted 3.5-5 mm beyond orifices (1.5-2 mm in diameter) of flat discs (3-4 mm in diameter) ***R. luciae***
 5 Pedicels 5-12 mm, tomentose, stipitate glandular at least near the base; flowers 1.5-2.5 cm in diameter; hypanthium 2 mm × 1-1.5 mm, eglandular or stipitate-glandular; carpels 6-11, styles glabrous, exserted 3-4 mm beyond the orifice (0.5-1 mm in diameter) of conical discs (2-3 mm in diameter) ***R. multiflora***

- 3 Styles distinct, usually only the stigmas protruding from the orifice, by 0-4 mm; stipule margins and auricles entire to serrate, not lacinate; shrubs, erect or arching, to 0.3-5 m tall.
- 6 Sepals entire, tapering to apex, persistent on fruit and erect or nearly erect; flowers generally solitary, or with 1-3 laterals.
- 7 Fruit dark red when ripe, 20-25 mm in diameter; petals 3-5 cm long; pedicel subtended by a clasping bract; [section *Cassiorhodon*]...
..... *R. rugosa*
- 7 Fruit blackish when ripe, 8-16 mm in diameter; petals 1-2.5 cm long; pedicel lacking a clasping bract, though often with a modified 3-foliolate leaf; [section *Pimpinellifoliae*]..... [*R. spinosissima*]
- 6 Sepals either lobed or with broadened apices, or if entire then spreading, reflexed, or deciduous from fruit; flowers solitary or corymbose.
- 8 Inflorescence of a solitary flower (rarely with a few laterals), the paired bracts on the pedicel caducous; [section *Gallicae*].
- 9 Leaves not glandular-ciliate (or only remotely so); leaves not rugose..... [*R. ×damascena*]
- 9 Leaves glandular-ciliate; leaves rugose *R. gallica*
- 8 Inflorescence either corymbose, or of a solitary flower and its pedicel subtended by persistent bracts.
- 10 Sepals disparate in size and shape, the outer pinnatifid with leafy segments; orifice of the hypanthium ca. 1 mm in diameter, the styles slightly exserted; [aliens]; [section *Caninae*].
- 11 Stems to 5 m tall, prickles all similar; leaflets abaxially glabrous or rarely pubescent on midveins, eglandular; bracts 6-18 mm × 4-5 mm, glabrous; sepals abaxially eglandular *R. canina*
- 11 Stems to 3 m tall, prickles of varying sizes; leaflets abaxially pubescent or tomentose, rarely glabrous, glandular; bracts 13-15 mm × 5-7 mm, tomentose; sepals abaxially densely stipitate-glandular.
- 12 Stipules 10-16 (-20) mm × 3-4 mm, margins densely glandular-ciliate; leaflet blades 15-30 (-60) mm × 8-22 (-50) mm, abaxial surfaces tomentose; glands of the leaves resin-scented; bracts persistent, tomentose, margins ciliate-glandular; pedicels (11-) 20-35 mm long, densely stipitate-glandular; flowers 3.5-5 cm in diameter; hips dark red, 10-15 mm × 10-12 mm, sepals caducous before hips mature..... *R. tomentosa*
- 12 Stipules 6-10 mm × 2-4 mm, margins mostly stipitate-glandular; leaflet blades 10-22 mm × 8-15 mm, abaxial surfaces glabrous or pubescent; glands of the leaves apple-scented; bracts caducous, glabrous, margins stipitate-glandular; pedicels 6-9 mm long, densely stipitate- or setose-glandular; flowers 2.5-4 cm in diameter; hips red, 10-25 mm × 10-22 mm, sepals subpersistent.
- 13 Upper branches with prickles of uniform length and no hairs or bristles; hips 10-12 mm long, 7-9 mm in diameter; sepals deciduous before or as the hip matures; styles usually glabrous; styler orifices 2.5-4 mm in diameter (1/6-1/5 the diameter of the rim) *R. rubiginosa* var. *nemoralis*
- 13 Upper branches with prickles of variable length and hairs or bristles present or absent; hips 10-25 mm long mm long, 10-22 mm in diameter; sepals deciduous as or after the hip matures; styles usually villous; styler orifices ca. 4 mm in diameter (ca. 1/3 the diameter of the rim) *R. rubiginosa* var. *rubiginosa*
- 10 Sepals alike, all entire or with a few scarcely leafy teeth near the base; orifice of the hypanthium ca. 2-4 mm in diameter, the opening blocked by the stigmas; [natives and aliens]; [section *Cinnamomeae*].
- 14 Petals 10 or more (flowers 'doubled'); [alien] [*R. cinnamomea*]
- 14 Petals 5; [native to North America (some populations may be locally introduced)].
- 15 Hypanthium glabrous.
- 16 Long and straight prickles present throughout the stems *R. acicularis* ssp. *sayi*
- 16 Prickles absent from the stems, or present and short or curved.
- 17 Infrastipular prickles stout and broad-based *R. virginiana*
- 17 Infrastipular prickles absent or not especially stout or broad-based.
- 18 Lower leaf surface with generally < 2 hairs per mm²; infrastipular prickles always absent on new stems; bristles always present on new stems; leaflets 7-9 *R. arkansana*
- 18 Lower leaf surface with generally > 2 hairs per mm²; infrastipular prickles present or absent on new stems; bristles generally absent on new stems; leaflets 5-7 *R. blanda*
- 15 Hypanthium with glands.
- 19 Bristles present on new branches.
- 20 Infrastipular prickles absent *R. arkansana*
- 20 Infrastipular prickles present.
- 21 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infrastipular prickles, lacking internodal prickles or aciculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) *R. carolina* ssp. *carolina*
- 21 Fertile branches armed with straight, thin or often stout, circular or flattened infrastipular prickles, with internodal prickles of small prickles, aciculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, or upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular *R. carolina* ssp. *subserrulata*
- 19 Bristles absent on new branches.
- 22 Leaflets 3.5-5× as long as wide; leaves with (5-) 7-9 (-11) leaflets; [c. MS westward] *R. foliolosa*
- 22 Leaflets 1-3× as long as wide; leaves with (3-) 5-7 (-9) leaflets; [collectively widespread].
- 23 Hypanthium typically with > 86 glands; terminal leaflet oblong, generally with 20-30 small teeth per side *R. palustris*
- 23 Hypanthium typically with < 86 glands; terminal leaflet ovate, elliptic, or obovate, with 10-18 (-23) small teeth per side.
- 24 Bristles absent on new stems; auricles > 3.8 mm long; stipules > 1.1 mm wide; infrastipular prickles stout, broad-based, and often curved *R. virginiana*
- 24 Bristles present or absent on new stems; auricles < 3.8 mm long; stipules < 1.1 mm wide; infrastipular prickles slender and not especially broad-based or curved.
- 25 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infrastipular prickles, lacking internodal prickles or aciculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) *R. carolina* ssp. *carolina*

- 25 Fertile branches armed with straight, thin or often stout, circular or flattened infrastipular prickles, with internodal prickles of small prickles, aciculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular *R. carolina* ssp. *subserrulata*

Rosa acicularis Lindley ssp. *sayi* (Schweinitz) W.H. Lewis, Prickly Rose. Rocky forests. Jun. NS west to AK, south to MA, NY, MI, nw. IL, IA, SD, NM, AZ, and BC; disjunct in WV (Cronquist 1991, Harmon, Ford-Werntz, & Grafton 2006). [= FNA, K1, K2, WV; = *R. acicularis* var. *bourgeauiana* (Crépin) Crépin – C, F; < *R. acicularis* – G, Y]

*? *Rosa arkansana* Porter. Rocky slopes and dry woodlands. May-Jul. Reported from North Carolina portion of the Great Smoky Mountains National Park. [= C, FNA, K2, Y; > *R. arkansana* var. *suffulta* (Greene) Cockerell – F, K1]

Rosa blanda Aiton, Smooth Rose, Meadow Rose. Rocky forests. May-Jun; Aug-Sep. QC west to MB, south to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), MD, VA, WV (Harmon, Ford-Werntz, & Grafton 2006), OH, IN, IL, MO, KS, and MT. [= C, F, FNA, G, Pa, Va, Y; > *R. blanda* var. *blanda* – K1, K2]

* *Rosa bracteata* J.C. Wendland, McCartney Rose, Chickasaw Rose. Disturbed areas, suburban borders, persistent after cultivation; native of China. May-Nov; Jul-Nov. [= C, F, FNA, G, K1, K2, RAB, S, Va, WH3, Z]

* *Rosa canina* Linnaeus, Dog Rose. Pastures, old fields, fencerows, roadsides; native of Europe. May-Jun; Sep-Oct. [= C, F, FNA, G, K1, K2, Pa, RAB, S, Va, W, WV, Z]

Rosa carolina Linnaeus ssp. *carolina*, Carolina Rose. Upland forests, woodlands, pastures, roadsides. May-Jun; Aug-Oct. NB and ON south to FL and TX. [= FNA, K2, Va; < *R. carolina* – C, G, Pa, RAB, W, WH3, Y, Z; > *R. carolina* var. *carolina* – F; > *R. carolina* var. *grandiflora* (Baker) Rehder – F; > *R. carolina* var. *villosa* (Best) Rehder – F; < *R. carolina* var. *carolina* – K1; > *R. carolina* – S; > *R. lyoni* Pursh – S; > *R. serrulata* Rafinesque – S]

Rosa carolina Linnaeus ssp. *subserrulata* (Rydberg) W.H. Lewis, Carolina Rose. Glades and barrens. May-Jul; Aug-Oct. PA, IN, ON, and MI, and MO, south to SC, AL, and TX. [= FNA, K2, Va; < *R. carolina* – C, G, Pa, RAB, W, Y, Z; > *R. carolina* var. *carolina* – F; ? *R. carolina* var. *grandiflora* (Baker) Rehder – F; ? *R. carolina* var. *villosa* (Best) Rehder – F; < *R. carolina* var. *carolina* – K1; ? *R. carolina* – S; ? *R. lyoni* Pursh – S; ? *R. serrulata* Rafinesque – S]

* *Rosa chinensis* Thunberg, Chinese Rose. Suburban woodlands; native of China. Reported for AL, MS, and VA (Kartesz 2010). [= K1, K2] {not yet keyed}

* *Rosa cinnamomea* Linnaeus, Cinnamon Rose. Disturbed areas; native of Eurasia. Jun-[= F, FNA, G, K, Pa, Z; ? *R. majalis* Herrmann – C]

* *Rosa* × *damascena* P. Miller (pro sp.) [*R. gallica* Linnaeus × *moschata* J. Herrmann], Damask Rose. Disturbed areas, persistent after cultivation; native of Europe. May-Jun; Sep-Oct. [= K; = *R. damascena* P. Miller – RAB]

* *Rosa* × *dumetorum* Thuillier (pro sp.) [= *R. canina* Linnaeus × *R. obtusifolia* Desvaux]. {KY} Introduced in KY. [= K1, K2] {not yet keyed}

Rosa foliolosa Nuttall in Torrey & Gray, White Prairie Rose. Prairies. May-Jul. SE. KS and w. OK south to w. AR, and e. and c. TX; disjunct in c. MS. [= FNA, K1, K2]

* *Rosa gallica* Linnaeus, French Rose. Disturbed areas; native of Europe. May-Jul; Sep-Oct. There is a question as to whether the name *R. gallica* can be used; if not, it would be replaced by *R. austriaca*. Represented by many cultivated forms, some involving complex hybridization with other species. *R. x damascena* P. Miller is apparently a hybrid of *R. gallica* and *R. moschata* J. Herrmann. [= C, F, FNA, G, K, Pa, RAB, Z; = *R. austriaca* Crantz]

* *Rosa glauca* Ourret, Red-leaf Rose. Disturbed areas; native of c. and s. Europe. May-Jul. Reported for SC (Kartesz 1999). [= FNA; ? *R. ferruginea*; = *R. ferruginea* – K2, orthographic error; = *Rosa rubrifolia* Villars – K1] {not yet keyed}

* *Rosa laevigata* Michaux, Cherokee Rose. Roadsides, moist forests; native of China. Late Mar-Jun; Sep-Oct. Apparently introduced into the se. United States very early, where encountered by André Michaux in the 1790s and named as an apparent native species. [= FNA, K, RAB, S, WH3, Z]

- * ***Rosa luciae*** Franchet & Roehbrune ex Crépin, Memorial Rose, Dorothy Perkins Rose, Lucie Rose. Roadbanks, railroad embankments, disturbed areas; native of e. Asia. May-Jul; Sep-Oct. See Duncan (1985) for documentation for GA. [= FNA, Va; > *Rosa wichuriana* Crépin – C, F, G, K1, K2, Pa, W, WH3, Z; > *R. wichuriana* – RAB, orthographic variant]
- * ***Rosa moschata*** J. Herrmann, Musk Rose. Allegedly introduced in AL. [= K1, K2, S] {not yet keyed; investigate}
- * ***Rosa multiflora*** Thunberg ex Murray, Multiflora Rose. Pastures, thickets, bottomlands, upland forests, bogs; native of Asia, aggressively invasive. May-Jun; Sep-Oct. [= C, F, FNA, G, K1, K2, Pa, RAB, S, Va, W, WH3, WV, Z]
- Rosa palustris*** Marshall, Swamp Rose. Swamp forests, bogs, fens, seeps, streamsides, tidal swamps, beaver ponds. May-Jul (-Aug); Sep-Oct. NB and ON south to c. peninsular FL, MS, and AR. [= C, F, FNA, G, GW, Pa, RAB, Va, W, WH3, WV, Y, Z; > *R. palustris* – K1, K2, S; > *R. floridana* Rydberg – S; > *R. lancifolia* Small – S; > *R. obtusiuscula* Rydberg – K1, K2, S]
- * ***Rosa rubiginosa*** Linnaeus var. ***nemoralis*** (Léman) Thory, Eglantine Rose, Sweetbriar Rose. Pastures, disturbed areas; native of Europe. May-Jun; Sep-Oct. [= FNA; < *R. rubiginosa* – K2, S, Va; = *Rosa micrantha* Borrer ex J.E. Smith – C, F, G, K1, K2, Pa, RAB, S, W, Z]
- * ***Rosa rubiginosa*** Linnaeus var. ***rubiginosa***, Eglantine Rose, Sweetbriar Rose. Pastures, disturbed areas; native of Europe. May-Jun; Sep-Oct. The name *R. eglanteria* was formally rejected in favor of *R. rubiginosa* (Brummitt 2005). [= FNA; < *R. rubiginosa* – K2, S, Va; = *R. eglanteria* Linnaeus – C, F, G, K1, Pa, RAB, W, WV, Z, rejected name]

- * ***Rosa rugosa*** Thunberg, Japanese Rose, Rugosa Rose. Coastal dunes, disturbed areas, cultivated and sometimes escaped; native of Asia. Jun-Jul (-Oct). [= C, F, FNA, G, K1, K2, Pa, WV, Z]
- Rosa setigera*** Michaux, Climbing Prairie Rose. Stream banks, pastures; nativity uncertain in portions of our area. May-Jun; Sep-Oct. ME west to WI and NE, south to FL and TX. [= C, FNA, K2, Pa, RAB, S, Va, W, WH3; > *R. setigera* var. *setigera* – F, G, K1, WV, Z; > *R. setigera* var. *tomentosa* Torrey & A. Gray – F, G, K1, WV, Z]
- * ***Rosa spinosissima*** Linnaeus, Scotch Rose. Cultivated and rarely escaped; native of Eurasia. May-Jun. [= F, FNA, G, K1, K2; > *R. pimpinellifolia* Linnaeus – C]
- * ***Rosa tomentosa*** J.E. Smith, Harsh Downy-rose. Disturbed areas; native of Europe. Reported for NC and TN by Kartesz (2010). [= C, F, FNA, K1, K2, S] {uncertain if naturalized}
- Rosa virginiana*** P. Miller, Virginia Rose. Moist to dry forests and woodlands. May-Jun (-Aug); Aug-Oct. NL (Newfoundland) and ON south to GA, AL, and MO. C. TN (Chester, Wofford, & Kral 1997), e. and c. KY (Clark et al. 2005). [= C, F, FNA, G, Pa, S, Va, W, Y, Z; > *R. virginiana* var. *virginiana* – K]
- * ***Rosa xanthina*** Lindley, Yellow Rose, Manchu Rose. Disturbed areas; native of China. Reported for SC (Kartesz 1999, Kartesz 2010). [= K1, K2] {not yet keyed; uncertain if naturalized; investigate}

3. *Rubus* Linnaeus 1753 (Blackberry, Raspberry, Dewberry, Wineberry, Bramble)

A genus of about 250 species (if treated conservatively) or 2000-3000 microspecies, shrubs (and a few herbs), almost cosmopolitan in temperate areas. References: Alice, Goldman, Macklin, & Moore in FNA (2014); Robertson (1974)=Z; Alice & Campbell (1999); Widrechner (1998); Kalkman in Kubitzki (2004).

Identification Notes: All of our species of *Rubus* except *R. repens*, *R. odoratus*, and *R. pubescens* have biennial stems. The first year the stems remain sterile and are termed **primocanes**. The second year, these stems produce lateral branches with flowers and are termed **floricanes**. Primocane and floricane leaves differ.

- 1 Leaves simple.
 - 2 Leaves palmately lobed, orbicular, coarsely toothed, 9-30 cm long; plant a shrub, 10-20 dm tall; petals deep pink; [subgenus *Anoplobatus* – **mapleleaf raspberries**]..... *R. odoratus*
 - 2 Leaves unlobed, elliptic to ovate-orbicular, finely toothed, 1.5-3 cm long; plant an herb, < 1 dm tall; petals white; [subgenus *Dalibarda* – **Robin-runaway**] *R. repens*
- 1 Leaves 3-9-foliolate (reduced simple leaves may also be present in the inflorescence).
 - 3 Upright stems herbaceous, annual, not differentiated into primocanes and floricanes, unarmed or with a few weak bristles; stipules oblanceolate; [e. WV northward]; [subgenus *Cylactis* – **dwarf raspberries**] *R. pubescens*
 - 3 Upright stems woody, biennial, differentiated into primocanes and floricanes, these usually well-armed with bristles and/or curved prickles; stipules linear; [collectively widespread].
 - 4 Fruit separating from the receptacle, the receptacle remaining on the pedicel; stems either strongly white-glaucous (*R. occidentalis*), or densely beset with slender-based prickles and bristles (*R. idaeus*), or densely pubescent with 3-5 mm long glandular hairs (*R. phoenicolasius*), or if not as above then the leaves pinnately 5-9-foliolate (*R. illecebrosus*); [subgenus *Idaeobatus* – **raspberries**].
 - 5 Floricane leaves pinnately (3-) 5-9-foliolate; aggregate fruit with 50-100 drupelets..... *R. illecebrosus*
 - 5 Floricane leaves 1-3-foliolate; aggregate fruit with 10-60 drupelets.
 - 6 Inflorescence paniculiform, many-flowered; berries sticky, purplish-red, lacking a glaucous bloom..... *R. phoenicolasius*
 - 6 Inflorescence corymbiform, few-flowered; berries not sticky, black or red (rarely purplish or yellow), with a glaucous bloom.
 - 7 Fruit black (rarely yellow); pedicels with stout curved prickles; stems (at least the primocanes) strongly white-glaucous..... *R. occidentalis*
 - 7 Fruit red (rarely purple or yellow); pedicels with narrow straight bristles and sometimes also glandular hairs; stems green.
 - 8 Inflorescence without glandular hairs or gland-tipped bristles; [alien, cultivated, sometimes escaped or persistent]..... *R. idaeus* var. *idaeus*
 - 8 Inflorescence with glandular hairs and gland-tipped bristles; [native in Mountains of NC and VA] *R. idaeus* var. *strigosus*
 - 4 Fruit retaining the receptacle; stems or leaves not as described above, except if beset with slender-based prickles and bristles then also < 1 m tall; [subgenus *Rubus* – **blackberries and dewberries**].
 - 9 Canes very coarse, scrambling, often 2-3 m long, heavily armed; inflorescence cymose-paniculate; branches and pedicels of the floricanes armed with strong, flattened prickles (or nearly straight in *R. bifrons*); [alien, generally in disturbed habitats]; [**alien blackberries**].
 - 10 Leaves compound, the leaflets additionally laciniately divided; leaves green beneath *R. laciniatus*
 - 10 Leaves compound, the leaflets toothed; leaves grayish-tomentose beneath.
 - 11 Prickles nearly straight; stems glabrescent; petals pale pink to deep pink *R. bifrons*
 - 11 Prickles recurved; stems canescent above; petals white to pale pink *R. pascuus*
 - 9 Canes delicate to coarse, arching or trailing, 0-4 m long, unarmed to strongly armed; inflorescence racemiform; branches and pedicels of the floricanes generally unarmed; [native, though often in disturbed habitats].
 - 12 Primocanes prostrate, creeping, or low-arching, rooting at the tip or also at the nodes; [**dewberries**].
 - 13 Stems strongly white-glaucous; fruits with 1-5 (-20) drupelets, glaucous [*R. caesius*]
 - 13 Stems not glaucous; fruits with (5-) 10-50 drupelets, not glaucous.
 - 14 Stems armed with stout-based, usually recurved prickles, bristles lacking *R. flagellaris*
 - 14 Stems primarily armed with narrow-based prickles or even narrower bristles, with or without stout-based prickles as well.
 - 15 Inflorescence racemiform; bristles of the stem nonglandular (very small glandular hairs may be present)..... *R. hispidus*
 - 15 Inflorescence reduced, normally to a single flower per branch of the floricane *R. trivialis*
 - 12 Primocanes erect, ascending, or high-arching, not rooting; [**native blackberries**].
 - 16 Canes armed primarily with bristles or slender-based prickles *R. setosus*
 - 16 Canes armed with heavy, stout-based, often recurved, prickles (or the canes essentially unarmed, the broad-based prickles few or almost absent).
 - 17 Leaflets oblanceolate to obovate, definitely wider beyond the middle, generally obtuse or rounded at the tip; leaves densely white- or gray-tomentose beneath; [primarily of the Coastal Plain]..... *R. cuneifolius*
 - 17 Leaflets lanceolate to ovate, widest below or near the middle, generally acute or acuminate at the tip; leaves glabrous to pubescent beneath, but the pubescence not notably tight and white or gray; [collectively widespread].
 - 18 Pubescence of the inflorescence rachis and pedicels predominantly gland-tipped, glandular hairs often present also on the young primocanes and the branches of the floricanes, the glands flattened to cupulate..... *R. allegheniensis*
 - 18 Pubescence of the inflorescence rachis and pedicels nonglandular or glandular, glandular hairs absent elsewhere, the glands rounded.
 - 19 Leaves glabrous (or very nearly so) beneath; canes with at most few and weak prickles; leaflets of the primocanes with attenuate to caudate apices..... *R. canadensis*
 - 19 Leaves softly pubescent beneath; canes with many and strong prickles; leaflets of the primocanes with acute to acuminate apices *R. pensilvanicus*

Rubus allegheniensis Porter, Allegheny Blackberry. Forests, woodlands, grassy balds. May-Jun; Jul. NS west to MN, south to w. NC, n. GA, and e. TN. [= C, FNA, G, Pa, RAB, Va, W; > *R. allegheniensis* var. *allegheniensis* – F, K1, K2, WV; > *R. allegheniensis* var. *gravesii* Fernald – F, K1, K2, WV; > *R. alumnus* L.H. Bailey – F, K, WV; > *R. concameratus* H.A. Davis & T. Davis – WV; ? *R. nigrobaccus* L.H. Bailey – S; > *R. pugnax* L.H. Bailey – WV; > *R. reravus* L.H. Bailey – F; > *R. rosa* L.H. Bailey – WV]

* ***Rubus bifrons*** Vest, European Blackberry. Disturbed areas, roadsides, thickets, old fields; native of Europe. May-Jun; Jun-Jul. [= C, FNA, G, K, Pa, RAB, Va, W; > *R. bifrons* – F; > *R. procerus* P.J. Mueller – F; > *R. linkianus* Seringe – S]

* ***Rubus caesius*** Linnaeus, European Dewberry. Disturbed areas; native of Europe. May-Jul. Reported for KY (FNA 2014; Kartesz 2010). [= FNA, K2, Pa] {add synonymy}

Rubus canadensis Linnaeus, Smooth Blackberry, Thornless Blackberry. Forests, woodlands, grassy balds, especially common at high elevations. Jun-Jul; Jul-Aug. NL (Newfoundland) west to MN, south (primarily in the Appalachians) to w. NC, e. TN, and n. GA. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV]

Rubus cuneifolius Pursh, Sand Blackberry. Woodlands, forests, disturbed areas. Late Apr-early Jun; Jun-Jul. CT and NY (Long Island) south to s. FL and AL, MS, and se. LA, primarily on the Coastal Plain. [= C, FNA, G, GW, Pa, RAB, S, Va, W, WH3; > *R. cuneifolius* var. *cuneifolius* – F; > *R. cuneifolius* var. *subellipticus* Fernald – F; > *R. longii* Fernald – F, K; > *R. sejunctus* L.H. Bailey – F; > *R. cuneifolius* – K; > *R. probabilis* L.H. Bailey – K]

Rubus flagellaris Willdenow, Common Dewberry. Old fields, woodlands, roadsides, disturbed areas. Apr-May; May-Jul. NS west to MN, south to GA and LA. [= FNA, RAB, Va, W, WH3; > *R. flagellaris* – C, F, G, K, Pa, S, WV; > *R. enslenii* – C, F, G, K, Pa, S, WV; > *R. akermani* Fernald – F; > *R. arundelanus* Blanchard – G; > *R. baileyanus* Britton – F, K, S, WV; > *R. boyntoni* W.W. Bailey – F; > *R. vigil* L.H. Bailey – F; > *R. zaplatus* L.H. Bailey – F]

* ***Rubus idaeus*** Linnaeus var. *idaeus*, Cultivated Red Raspberry. Disturbed areas, commonly cultivated in the cooler portions of our area, rarely escaped or persistent; native of Eurasia. Jun-Aug; Jul-Sep. [= C, F; = *R. idaeus* – G; = *R. idaeus* ssp. *idaeus* – FNA, K]

Rubus idaeus Linnaeus var. *strigosus* (Michaux) Maximowicz, American Red Raspberry. High elevation forests and thickets, adelgid-killed spruce-fir forests. Jun-Aug; Jul-Sep. The species is circumboreal; var. *strigosus* ranges from NL (Newfoundland) west to AK, south to PA, IN, IA, and AZ; disjunct farther south in nw. VA and ne. WV, and in w. NC and e. TN. [= C, Mo, Pa, Va; > *R. idaeus* Linnaeus var. *canadensis* (Richardson) House – F, RAB; > *R. idaeus* var. *strigosus* – F; = *R. strigosus* Michaux – G, WV; = *R. idaeus* ssp. *strigosus* (Michaux) Focke – FNA, K; > *R. carolinianus* Rydberg – S; > *R. idaeus* ssp. *sachalinensis* (Lvl.) Focke – W; > *R. idaeus* ssp. *melanolasius* Focke var. *canadensis* – Z]

* ***Rubus illecebrosus*** Focke, Strawberry-raspberry. Disturbed areas; native of Japan. Jun-Jul; Aug. [= C, F, FNA, G, K, Pa, RAB, WV]

* ***Rubus laciniatus*** Willdenow, Cut-leaved Blackberry, Evergreen Blackberry. Disturbed areas, thickets; native of Europe. May-Jun; Jun-Jul. [= C, F, FNA, K, Pa, RAB, Va, W, WV]

Rubus occidentalis Linnaeus, Black Raspberry, Blackcap. Roadsides, woodlands, thickets, disturbed areas. Apr-Jun; Jun-Jul. QC to ND and e. CO, south to n. GA, c. AL, n. MS, AR, and c. OK. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV, Z]

Rubus odoratus Linnaeus, Eastern Mapleleaf-raspberry, Purple Flowering-raspberry. Rocky upland forests, boulderfields, rock outcrops and clearings, moist roadsides, and thickets, especially on base-rich substrates. Jun-Aug; Jul-Oct. NS west to MI,

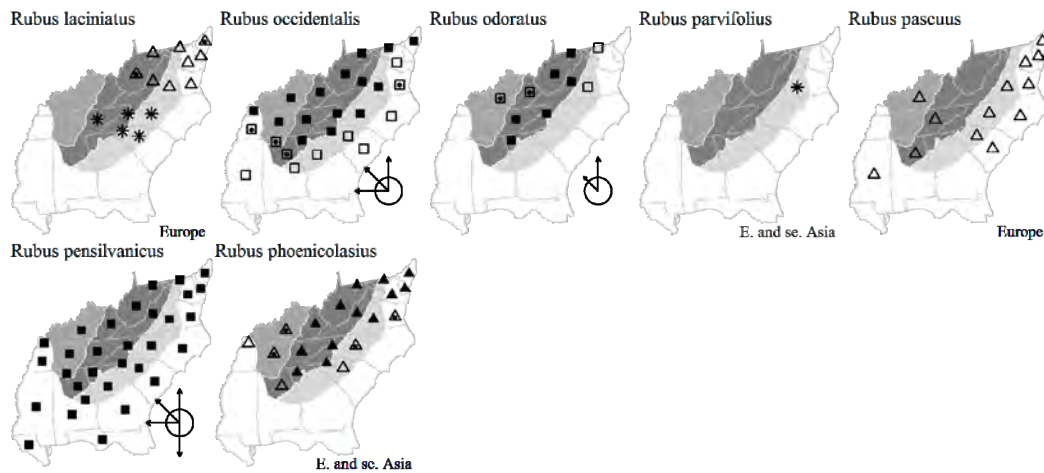

south to w. NC, n. GA, and e. TN. [= C, FNA, G, Pa, RAB, Va, W, Z; > *Rubus odoratus* var. *odoratus* – F, K, WV; > *Rubus odoratus* var. *columbianus* Millspaugh – F, K, WV; = *Rubacer odoratum* (Linnaeus) Rydberg – S]

* ***Rubus parvifolius*** Linnaeus, Japanese Bramble, Australian Raspberry. Disturbed areas; native of e. Asia. May-Jun. [= FNA] {not yet keyed};

* ***Rubus pascuus*** L.H. Bailey, Topsy Blackberry, Chesapeake Blackberry. Disturbed areas, thickets; native of Europe. Jun-Jul; Aug. [= FNA; = *R. discolor* Weihe & Nees – C, K, Pa, Va, misapplied]

Rubus pensilvanicus Poirlet, Pennsylvania Blackberry, Eastern Blackberry. Roadsides, thickets, woodlands. Apr-May; late May-Jul. ME west to MN, south to FL and TX. The most common “highbush” blackberry in most of our area. [= FNA, Va, WH3; = *R. argutus* – W; > *R. pensilvanicus* – C, F, G, K, Pa, WV; > *R. argutus* Link – C, F, G, GW, K, RAB, S; > *R. abactus* L.H. Bailey – WV; > *R. andrewsianus* Blanchard – WV; > *R. barbarus* L.H. Bailey – F; > *R. bellobatus* L.H. Bailey – WV; > *R. betulifolius* Small – RAB, S; > *R. blakei* L.H. Bailey – F; > *R. condensiflorus* L.H. Bailey – F; > *R. congruus* Bailey – F; > *R. cupressorum* Fernald – F; > *R. defectionis* Fernald – F, K; > *R. densissimus* H.A. Davis & T. Davis – WV; > *R. dissitiflorus* Fernald – F; > *R. fatuus* Bailey – F; > *R. floricomus* Blanchard – F, K; > *R. floridus* Trattinick – F, S; > *R. frondosus* Bigelow – F, K, WV; > *R. immanis* L.H. Bailey – K; > *R. jennisonii* L.H. Bailey – WV; > *R. jugosus* L.H. Bailey – F; > *R. laudatus* Berger – K, WV; > *R. leggi* H.A. Davis & T. Davis – WV; > *R. libratus* L.H. Bailey – F; > *R. louisianus* Berger – F; > *R. orarius* Blanchard – C; > *R. ostryifolius* Rydberg – G; > *R. paucillus* L.H. Bailey – F, K; > *R. pergratus* Blanchard – K; > *R. philadelphicus* Blanchard – WV; > *R. praepes* L.H. Bailey – F; > *R. prestonensis* H.A. Davis & T. Davis – WV; > *R. recurvans* Blanchard – F, K; > *R. rosarius* L.H. Bailey – K; > *R. subsolanus* L.H. Bailey – F, WV; > *R. tygartensis* H.A. Davis & T. Davis – WV]

* ***Rubus phoenicolasius*** Maximowicz, Wineberry. Moist forests, roadsides, thickets; native of e. Asia. May-Jun; Jun-Jul. The fruits are viscous to the touch and delicious. This plant is a serious invasive species in moist forests of the cooler portions of our area. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV]

Rubus pubescens Rafinesque, Dwarf Raspberry. Bogs, fens, swamps. May-Jun; Jul. NL (Labrador) to YT, south to e. WV and s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), IN, CO, and WA. [= C, FNA, G, Pa, WV; > *R. pubescens* var. *pubescens* – F, K]

Rubus repens (Linnaeus) Kuntze, Dewdrop, Robin-runaway, Star-violet. Bog margins and mountain swamp forests, often along spring seeps, mostly in dense shade beneath *Rhododendron maximum*. Jun-Sep. NL (Newfoundland) west to MI and MN, south to NJ and OH, and disjunct to WV, sw. VA, and w. NC. [= FNA; = *Dalibarda repens* Linnaeus – C, G, GW, K, RAB, S, W, WV; = *R. dalibarda* Linnaeus – Va]

Rubus setosus Bigelow, Bristly Blackberry. Thickets. Jun-Jul. QC west to MN, south to VA (?) and IL. [= C, FNA, G, Pa; > *R. angustifolius* L.H. Bailey – F; > *R. benneri* L.H. Bailey – F; > *R. elegantulus* Blanchard – K; > *R. groutianus* Blanchard – WV; > *R. nocivus* L.H. Bailey – F; > *R. notatus* L.H. Bailey – WV; > *R. racemiger* L.H. Bailey – F, K, WV; > *R. semisetosus* Blanchard – F, K; > *R. setosus* – F, K, WV]

* ***Rubus triphyllus*** Thunberg. Disturbed areas; native of Japan. [= F, K] {not yet keyed};

Rubus trivialis Michaux, Southern Dewberry, Coastal Plain Dewberry. Roadsides, old fields, thickets, disturbed areas. Mar-Apr; late Apr-May. E. MD south to s. FL, west to TX, north in the interior to MO. [= C, F, FNA, G, GW, K, RAB, Va, W, WH3; > *R. trivialis* – S; > *R. lucidus* Rydberg – S]

4. *Agrimonia* Linnaeus 1753 (Agrimony)

A genus of about 10-15 species, herbs, mainly north temperate. References: Kline & Sørensen in FNA (2014); Kline & Sørensen (2008)=Y; Robertson (1974)=Z; Kalkman in Kubitzki (2004). Key adapted from Y.

- 1 Stem and inflorescence axis lacking sessile or short-stalked glistening glands (but with spreading or ascending non-glandular hairs).
 - 2 Stipules deeply incised, half-ovate; hirsute hairs of the stem 3 mm or longer; 0-1 pair of minor leaflets between major; mature fruiting hypanthium as broad as long or broader; hypanthium ridges rarely with eglandular hairs..... *A. microcarpa*
 - 2 Stipules toothed, not deeply, half-ovate to half-round; hirsute hairs of the stem 3 mm or shorter; 0-3 pair(s) of minor leaflets between major; mature fruiting hypanthium as long as broad or longer; hypanthium ridges usually with hirsute eglandular hairs..... *A. pubescens*
- 1 Stem and inflorescence with glistening glands, these **either** sessile, **or** short-stalked, **or** both (and also with spreading or ascending non-glandular hairs).
 - 3 Glistening glands of the stem and inflorescence axis short stalked, or both short-stalked and sessile
 - 4 Lower inflorescence rachis with mostly erect hirsute eglandular hairs ca. 2 mm long; minor leaflets rarely only one pair between all major leaflet pairs; roots merely fibrous..... *A. gryposepala*
 - 4 Lower inflorescence rachis with mostly ascending hirsute eglandular hairs less than 1 mm long; minor leaflets one pair between major leaflet pairs; roots with fusiform tubers..... *A. rostellata*
 - 3 Glistening glands of the stem and inflorescence axis only sessile.
 - 5 Mid-cauline leaf with 5-7 major leaflets; stipule proximally incised or nearly entire..... *A. striata*
 - 5 Mid-cauline leaf with 7-13 major leaflets; stipule incised along entire margin.
 - 6 Major leaflets obovate to elliptic, apex obtuse to acute; flowers mostly alternate along inflorescence axis; [Coastal Plain pinelands; e. SC south to c. peninsular FL and west to e. TX]..... *A. incisa*
 - 6 Major leaflets lanceolate to narrowly elliptic, apex acuminate to rarely acute; flowers mostly sub-opposite along inflorescence axis; [bottomlands, marshes; CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico]..... *A. parviflora*

* *Agrimonia eupatoria* Linnaeus, Medicinal Agrimony. Fields and disturbed areas, apparently naturalized; native of Eurasia. Jul-Sep. Introduced at scattered localities in ne. North America. [= C, F, FNA, G, K, Y, Z] {not yet keyed};

Agrimonia gryposepala Wallroth, Common Agrimony. Mesic forests, thickets, marshes, bogs, wet meadows, wet forests, especially in base-rich substrates. Jul-Aug; Jul-Oct. ME and ON west to MT, south to NJ, w. NC, e. TN, IN, and KS; also in CA and NM. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, Y, Z]

Agrimonia incisa Torrey & A. Gray, Pineland Agrimony. Pinelands, disturbed areas associated with pinelands. Jul-early Sep. E. SC south to c. peninsular FL and west to e. TX (also reported from NC, but no specimen has been seen). [= C, FNA, K, RAB, S, WH3, Y, Z]

Agrimonia microcarpa Wallroth, Low Agrimony. Dry to moist forests and woodlands. Jul-Sep; Aug-Oct. NJ south to n. FL, west to e. TX. [= C, F, FNA, G, K, Pa, S, Va, W, WH3, Y, Z; = *A. pubescens* Wallroth var. *microcarpa* (Wallroth) H.E. Ahles – RAB; > *A. microcarpa* – S; > *A. platycarpa* Wallroth – S]

Agrimonia parviflora Aiton, Southern Agrimony. Marshes, bottomland forests, wet pastures. Jul-Sep; Jul-Oct. CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, Y, Z]

Agrimonia pubescens Wallroth, Downy Agrimony. Dry to moist forests and woodlands, especially in base-rich soils. Jul-Sep; Aug-Oct. ME west to MI and SD, south to NC, GA, and OK. [= C, F, FNA, G, Pa, Va, Y; = *A. pubescens* var. *pubescens* – RAB; > *A. pubescens* – K, S, W, Z; > *A. bicknellii* (Kearney) Rydberg – K, S, Z]

Agrimonia rostellata Wallroth, Woodland Agrimony. Moist to wet forests and woodlands, especially in base-rich soils. Jul-Aug; Jul-Oct. CT west to IN and KS, south to SC, GA, Panhandle FL, LA, and OK. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, Y, Z]

Agrimonia striata Michaux, Roadside Agrimony. Rich forests, floodplains, fields. Jul-Aug. NL (Newfoundland) west to BC, south to se. PA (Rhoads & Klein 1993; Rhoads & Block 2007), MD, DE, WV, KY, OK, NM, AZ, and Mexico; with scattered occurrences farther south w. NC, GA, AL), where probably adventive. [= C, F, FNA, G, K, Pa, Y]

5. *Poterium* Linnaeus 1753 (Salad Burnet)

A genus of 6 or more species, herbs, of Eurasia, n. Africa, and North America. References: Weakley in FNA (2014); Robertson (1974)=Z; Nordborg (1966, 1967)=Y; Kalkman in Kubitzki (2004).

* *Poterium sanguisorba* Linnaeus var. *polygamum* (Waldstein & Kitaibel) Visiani, Salad Burnet, Garden Burnet, Fodder Burnet. Cultivated as an herb and salad green, escaped to moist, disturbed areas; native of Europe. Jun-Jul. Reported for AL (Diamond & Keener 2012). [= FNA; = *Sanguisorba minor* Scopoli ssp. *muricata* (Spach) Nordborg – K, Y, Z; < *Sanguisorba minor* – C, F,

G, Pa, RAB, WV; < *Poterium sanguisorba* Linnaeus – S; = *Poterium polygamum* Waldstein & Kitaibel; = *Poterium sanguisorba* Linnaeus ssp. *muricatum* (Spach) Rouy]

6. *Poteridium* Spach 1846 (American Burnet)

A genus of 2 species, herbs, of c. and w. North America. References: Weakley in FNA (2014); Robertson (1974)=Z; Nordborg (1966, 1967)=Y; Kalkman in Kubitzki (2004).

* ***Poteridium annuum*** (Nuttall ex Hooker) Spach, Prairie Burnet. Roadsides; native of sc. United States. Apr-May. [= FNA; = *Sanguisorba annua* (Nuttall ex Hooker) Torrey & A. Gray – G, K, RAB, Z]

7. *Sanguisorba* Linnaeus 1753 (Burnet)

A genus of 15 or more species, herbs, of Eurasia, n. Africa, and North America, as here circumscribed to exclude *Poterium* and *Poteridium*. References: Weakley in FNA (2014); Robertson (1974)=Z; Nordborg (1966, 1967)=Y; Kalkman in Kubitzki (2004). [also see *Poteridium* and *Poterium*]

Sanguisorba canadensis Linnaeus, Canada Burnet, American Burnet, White Burnet. Fens, seeps, seepage swamps, spray zones around waterfalls, other seepage wetlands, wet meadows, over mafic or ultramafic rocks (such as amphibolite, greenstone, serpentinite) or calcareous rocks. Jun-Sep. NL (Newfoundland) and NL (Labrador) west to MB, south to NJ, PA, OH, and IN; disjunct southward in KY, nc. VA, and from sw. VA south to sw. NC, ne. TN, and ne. GA. First reported for SC by Hill & Horn (1997) and Hill (1999). [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, WV, Z]

8. *Argentina* Hill 1756 (Silverweed)

A genus of ca. 64 species, herbs, primarily Asian, but extending into Europe. Best separated from *Potentilla*, based on morphological and molecular grounds, based on the work of Dobeš & Paule (2010), Soják (2010), and Feng et al. (2015). References: Ertter, Elven, Reveal, & Murray in FNA (2014); Dobeš & Paule (2010); Soják (2010); Robertson (1974)=Z; Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

* ***Argentina anserina*** (Linnaeus) Rydberg, Silverweed. Lawns, disturbed areas. May-Jun. Circumboreal, south in North America to MA, NY, nw. PA, OH, IN, IL, IA, NE, NM, AZ, and CA; also scattered farther south, apparently as an introduction, as in Sevier County, TN (Chester, Wofford, & Kral 1997), se. PA (Rhoads & Klein 1993; Rhoads & Klein 2007), MD (BONAP 2010), and n. NJ (BONAP 2010). [= K; = *Potentilla anserina* Linnaeus – C, F, G, Pa; > *Potentilla anserina* ssp. *anserina* – FNA]

9. *Potentilla* Linnaeus 1753 (Cinquefoil, Five-fingers, Potentilla)

A genus of 350-400 species, depending on the controversial circumscription. *Potentilla* here excludes *Argentina*, *Dasiphora*, *Drymocallis*, and *Sibbaldia* (for our area), but includes *Duchesnea*, following studies by Dobeš & Paule (2010), Soják (2010), and Eriksson et al. (2003). References: Ertter, Elven, Reveal, & Murray in FNA (2014) [*Potentilla* s.s.]; Ertter & Reveal in FNA (2014) [*Duchesnea*]; Robertson (1974)=Z; Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

- 1 Flowers solitary, on naked, axillary pedicels; leaves **either** palmately 3-5-foliolate **or** pinnately (5-) 7-21 (-31)-foliolate.
- 2 Leaves pinnately (5-) 7-21 (-31)-foliolate.....[see *Argentina*]
- 2 Leaves palmately 3-5-foliolate.
- 3 Leaves 3-foliolate; fruit strawberry-like, fleshy and red, consisting of an expanded fleshy receptacle bearing superficial achenes; [formerly genus *Duchesnea*]..... ***P. indica***
- 3 Leaves primarily 5-foliolate on a plant (some poorly developed leaves may be 3-4-foliolate); fruit a head of achenes, dry; [section *Potentilla*].
- 4 Plants lacking rhizomes; petals (6-) 8-12 mm long; anthers 1.3-2.0 mm long..... ***P. reptans***
- 4 Plants with horizontal rhizomes; petals 4-10 mm long; anthers 0.6-1.0 mm long.
- 5 Terminal leaflet toothed for < 1/2 its length; plant flowering at 1st node of stolon, typically with only 1 leaf and pedicel at each subsequent node; plants often flowering on short stolons obscured by basal leaves; leaflet teeth 2-7 per side of leaflet..... ***P. canadensis***

- 5 Terminal leaflet toothed for > ½ its length; plant flowering at 2nd node of stolon, typically with 2 leaves and 1 pedicel at each subsequent node; plants only flowering on elongating stolons; leaflet teeth 4-8 (-13) per leaflet side..... *P. simplex*
- 1 Flowers in terminal cymes; leaves palmately 3-9-foliolate.
 - 6 Leaves 3-foliolate; [section *Rivales*].
 - 7 Petals and sepals subequal; stamens (15-) 20; achenes usually ridged *P. norvegica*
 - 7 Petals much shorter than the sepals; stamens 5-10 (-15); achenes smooth *P. rivalis*
 - 6 Leaves 5-9-foliolate.
 - 8 Leaves (5-) 7-9-foliolate; petals 8-15 mm long, pale (sulphur) yellow; [section *Rectae*] *P. recta*
 - 8 Leaves 5 (-7)-foliolate; petals 3-7 (-8) mm long, medium yellow; [section *Terminales*].
 - 9 Leaves pubescent beneath, the green surface not concealed; petals 4-5 mm long *P. intermedia*
 - 9 Leaves densely tomentose beneath, the surface concealed; petals **either** 2.5-4 mm long **or** 5-7 (-8) mm long.
 - 10 Pubescence of the stem and veins of the leaf undersurface tomentose only; lower leaf surface silvery-white tomentose; leaves revolute; petals 2.5-4 mm long *P. argentea*
 - 10 Pubescence of the stem and veins of the leaf undersurface tomentose and also with long, spreading hairs; lower leaf surface somewhat to strongly grayish-tomentose; leaves not revolute; petals 5-7 (-8) mm long *P. inclinata*

* *Potentilla argentea* Linnaeus, Silvery Cinquefoil, Silvery Five-fingers, Hoary Five-fingers. Dry fields and roadsides, other disturbed areas; native of Europe. May-Jul. [= C, F, FNA, G, Pa, RAB, Va, W; > *P. argentea* var. *argentea* - K]

Potentilla canadensis Linnaeus, Running Five-fingers. Woodlands, forests, fields, lawns, disturbed areas. Mar-May; Apr-Jun. Two varieties are sometimes distinguished (see synonymy); their distinctiveness and relative habitats and distributions are obscure. Var. *canadensis* is alleged to have the middle leaflet of the larger leaves 1.5-4 cm long and plants silky-pilose, the pubescence appressed or loosely ascending. Var. *villosissima* Fernald is alleged to have the middle leaflet of the larger leaves 3-6 cm long and plants long-villous, the pubescence loosely spreading to reflexed. [= C, FNA, Pa, RAB, W; > *P. canadensis* Linnaeus var. *canadensis* - F, G, K1, K2, Va; > *P. canadensis* Linnaeus var. *villosissima* Fernald - F, G, K1, K2; > *P. pumila* Poiret - S; = *P. caroliniana* Poiret - S]

* *Potentilla inclinata* Villars, Ashy Cinquefoil. Disturbed areas; native of Europe. May-Jun. [= C, FNA, K; ? *P. canescens* Besser - F, G, RAB]

* *Potentilla indica* (Andrews) T. Wolf, Indian-strawberry. Disturbed areas, lawns, gardens, weedy clearings; native of Asia. Feb-frost. *Duchesnea* is apparently not closely related to *Fragaria*, and is best combined with *Potentilla*, which does have other species with accrescent fruits (Eriksson, Donoghue, & Hibbs 1998). The strawberry-like fruit is not sweet; it can also be distinguished from *Fragaria* by its whitish interior flesh. The leaves are more coarsely and crenately toothed than *Fragaria*. [= Va; = *Duchesnea indica* (Andrews) Focke - C, F, G, K, Pa, RAB, S, W, WH3, WV; > *Duchesnea indica* var. *indica* - FNA]

* *Potentilla intermedia* Linnaeus, Downy Cinquefoil. Dry roadsides, other disturbed areas; native of Europe. May-Jul. [= C, F, FNA, G, K, Pa, RAB, Va]

Potentilla norvegica Linnaeus, Strawberry-weed, Rough Cinquefoil. Floodplain forests, alluvial openings; sand bars, pastures, fields, disturbed areas, especially where moist. Late May-frost; Jun-frost. This species is apparently a genetically diverse, circumboreal species complex, with both native and introduced elements now present in our area. [= C, FNA, G, RAB, Va, W, WV; > *P. norvegica* var. *norvegica* - F; > *P. norvegica* ssp. *monspeiliensis* (Linnaeus) Ascherson & Graebner - K, Pa; > *P. monspeiliensis* Linnaeus - S; > *P. norvegica* ssp. *hirsuta* (Michaux) Hylander]

* *Potentilla recta* Linnaeus, Sulphur Five-fingers, Sulphur Cinquefoil. Fields, pastures, roadsides, other disturbed areas; native of Europe. Apr-Jul; May-Aug. [= C, F, FNA, G, K, Pa, RAB, Va, W, WH3, WV]

* *Potentilla reptans* Linnaeus, Creeping Five-fingers. Disturbed areas; native of Eurasia. May-Aug. Also reported for VA (Cronquist 1991, Kartesz 1999) and occurs as well in se. PA (Rhoads & Block 2007). [= C, F, FNA, G, K, Pa, WH3]

* *Potentilla rivalis* Nuttall, Brook Five-fingers. Disturbed areas; native of c. and w. North America. May-Jul. [= C, FNA, G, K; > *P. millegrana* Engelm ex Lehmann - F; > *P. rivalis* var. *millegrana* (Engelm ex Lehmann) S. Watson]

Potentilla simplex Michaux, Old-field Five-fingers. Woodlands, fields, disturbed areas. Apr-Jun; Apr-Jul. NL (Newfoundland) and MN south to Panhandle FL, AL, and TX. [= C, FNA, G, K, Pa, RAB, Va, W, WH3, WV; > *P. simplex* var. *simplex* - F; > *P. simplex* var. *argyrisma* Fernald - F; > *P. simplex* var. *calvescens* Fernald - F; > *P. simplex* - S; > *P. canadensis* - S, misapplied]

10. *Aphanes* Linnaeus 1753 (Parsley-piert)

A genus of about 20 species, herbs, of tropical and temperate Old World. *Aphanes* has usually been accepted by Europeans as distinct from *Alchemilla*, but Kalkman (in Kubitzki 2004) retains it (with some doubt) in *Alchemilla*, as a subgenus and Eriksson et al. (2003) and Gehrke et al. (2008) include it in *Alchemilla* based on molecular evidence. *Aphanes* appears to be monophyletic and is morphologically distinctive; Gehrke et al. (2008) prefer a broad circumscription of *Alchemilla* to naming an additional monophyletic clade of African species as a separate genus. References: McNeill & Erter in FNA (2014); Robertson (1974)=Z; Kalkman in Kubitzki (2004); Eriksson et al. (2003).

- 1 Fruiting hypanthium 1.5-2.5 mm long; leaf blades (4-) 5-10 mm long and wide [*A. arvensis*]
 1 Fruiting hypanthium 1.0-1.5 mm long; leaf blades 2-5 mm long and wide *A. australis*

* *Aphanes arvensis* Linnaeus. Disturbed areas; native of Europe. Apr-Jun. Reported for DE, SC, and TN by Kartesz (1999), but the only documentation consists of generalized range maps published in Hultén & Fries (1986); rejected as a component of those state's flora without additional documentation. [= C, FNA, K; = *Alchemilla arvensis* (Linnaeus) Scopoli - F, G]

* *Aphanes australis* Rydberg, Parsley-piert. Lawns, fields, pastures, roadsides; native of Europe. Late Mar-May. This plant is inconspicuous and often overlooked. [= FNA, S, Va, WH3; = *Aphanes microcarpa* (Boissier & Reuter) Rothmaler - C, K, misapplied; = *Alchemilla microcarpa* Boissier & Reuter - F, G, RAB, W, Z, misapplied; = *Aphanes inexpectatus* W. Lippert]

11. *Dasiphora* Rafinesque 1840 (Shrubby-cinquefoil)

Molecular phylogenetic studies indicate that this genus is more closely related to *Alchemilla*, *Aphanes*, *Drymocallis*, *Fragaria*, *Sibbaldiopsis*, and other genera outside our area than to *Potentilla* (Eriksson et al. 2003). References: Erter & Reveal in FNA (2014); Robertson (1974)=Z; Eriksson et al. (2003); Kalkman in Kubitzki (2004); Erter (2007).

Dasiphora fruticosa (Linnaeus) Rydberg ssp. *floribunda* (Pursh) Kartesz, Shrubby-cinquefoil, Golden-hardhack. Calcareous swamps. Jun-Aug. This species is widespread in the western and northern parts of North America, south to n. NJ, e. and n. PA, s. OH, IN, IL, IA, SD, NM, AZ, and CA. It was reported for western NC ("near Ducktown, in Turtletown, Cherokee County, N.C.") by Gattinger (1901), but corroborating specimen documentation is lacking. [= K; < *Potentilla fruticosa* Linnaeus - C, G, Pa, Z; > *Potentilla fruticosa* var. *fruticosa* - F; < *Dasiphora fruticosa* - FNA; = *Pentaphylloides floribunda* (Pursh) A. Löve]

12. *Drymocallis* Fourrier ex Rydberg 1908 (Drymocallis, Wood-beauty)

A genus of about 30 species, best segregated from *Potentilla*. Molecular phylogenetic studies indicate that this genus is more closely related to *Alchemilla*, *Aphanes*, *Dasiphora*, *Fragaria*, *Sibbaldiopsis*, and other genera outside our area than to *Potentilla* (Eriksson et al. 2003). References: Erter in FNA (2014); Erter (2007)=Z; Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Drymocallis arguta (Pursh) Rydberg, Tall Drymocallis, Tall Wood-beauty, Sticky Cinquefoil. Dry, rocky barrens over greenstone or basalt, other dry, barren sites, fields, dry woodlands. May-Aug. QC west to NT, south to w. VA, IN, MO, and AZ. Reported for e. TN by Gattinger (1901); the documentation unknown. [= FNA, Z; = *Potentilla arguta* Pursh - F, G, Pa, WV; > *P. arguta* var. *arguta* - C; > *P. arguta* ssp. *arguta* - K]

13. *Fragaria* Linnaeus 1753 (Strawberry)

A genus of about 10-24 species, herbs, of temperate Eurasia, North America, and South America. References: Staudt in FNA (2014); Kalkman in Kubitzki (2004).

- 1 Fruit (at least the larger on a plant) usually > 1.5 cm thick; petals 10-15 mm long; leaves evergreen; [cultivated, rarely persistent].....
.....[*F. ×ananassa* var. *ananassa*]
- 1 Fruit 0.5-1.5 cm thick; petals 3-10 mm long; leaves deciduous (at least tardily so); [native].
 - 2 Achenes set in pits on the mature receptacle; calyx lobes appressed to the developing fruit (after petal drop); petals (5-) 7-10 mm long; principal lateral veins diverging from the midrib of the leaflet at an angle of ca. 30 degrees; terminal tooth of leaflets > ½ as wide as the adjacent teeth, as long as or surpassing them in length.....*F. virginiana*
 - 2 Achenes superficial on the mature receptacle; calyx lobes spreading to reflexed from the developing fruit (after petal drop); petals 3-7 mm long; principal lateral veins diverging from the midrib of the leaflet at an angle of ca. 45 degrees; terminal tooth of leaflets < ½ as wide as the adjacent teeth, and surpassed by them in length.
 - 4 Long hairs of the petioles and peduncles ascending to appressed.....*F. vesca* var. *americana*
 - 4 Long hairs of the petioles and peduncles spreading to retrorse.....*F. vesca* var. *vesca*

* *Fragaria ×ananassa* (Weston) Duchesne ex Rozier (pro sp.) var. *ananassa* [*F. chiloensis* × *virginiana*], Garden Strawberry, Cultivated Strawberry. Mar-May. Gardens, persistent on garden edges, commonly cultivated; an octoploid garden hybrid of the two octoploid species, *F. chiloensis* and *F. virginiana*. [= K; < *F. ananassa* – C, WV; < *F. ×ananassa* – F, RAB; = *F. ×ananassa* ssp. *ananassa* – FNA; < *F. chiloensis* Duchesne var. *ananassa* – G]

Fragaria vesca Linnaeus var. *americana* Porter, Woodland Strawberry. Dry rocky woodlands, boulderfields, fields, roadsides, clearings. Apr-Jun. NL (Newfoundland) and BC south to e. VA, w. NC, TN, MO, NE, CO, NM, and AZ. [= C, F, G, Va; < *F. vesca* – RAB; = *F. vesca* ssp. *americana* (Porter) Staudt – FNA, K, Pa, W; = *F. americana* (Porter) Britton – S; > *F. vesca* var. *americana* – WV; > *F. vesca* var. *alba* (Ehrhart) Rydberg – F]

* *Fragaria vesca* Linnaeus var. *vesca*. Fields, disturbed areas; native of Europe. Naturalized from NL (Newfoundland), QC and MI south to PA, WV (?), KY, and IL. [= C, F, G; = *F. vesca* ssp. *vesca* – FNA, K, Pa]

Fragaria virginiana P. Miller, Wild Strawberry. Grasslands, roadsides, pastures, woodlands, grassy balds. Apr-Jun. NL (Newfoundland) west to MB, south to peninsular FL and TX. [= C, Pa, RAB, Va, W, WH3; > *F. virginiana* var. *virginiana* – F, G; > *F. virginiana* var. *illinoensis* (Prince) Gray – F, G; > *F. virginiana* ssp. *virginiana* – FNA, K; > *F. virginiana* ssp. *grayana* (Vilmorin ex J. Gay) Staudt – FNA, K; > *F. virginiana* var. *australis* Rydberg – G; > *F. virginiana* – S; > *F. australis* (Rydberg) Rydberg – S; > *F. grayana* Vilmorin ex J. Gay – S]

14. *Sibbaldia* Linnaeus 1753 (Sibbaldia, Mountain-cinquefoil)

A genus of 5-7 species, subshrubs, circumboreal, of n. Eurasia and n. North America. Our single species has been variously treated in *Potentilla*, *Sibbaldiopsis*, and *Sibbaldia*. Many recent studies (see references) have shown that it is not closely related to *Potentilla*, and falls into a group of genera including *Sibbaldia*, *Comarum*, *Alchemilla*, *Aphanes*, *Drymocallis*, *Dasiphora*, and *Fragaria* (Lundberg et al. 2009; Potter et al. 2007; Eriksson et al. 2003; Eriksson et al. 2015). I here follow Lundberg et al. (2009) and Paule & Soják (2009), who further demonstrate that *Sibbaldiopsis* is embedded in *Sibbaldia* and is best transferred there. Eriksson et al. (2015) show that different components placed in *Sibbaldia* are not closely related; they somewhat equivocally include our species in *Sibbaldia* s.s., but mention the morphological differences and tetraploid chromosome number as making it somewhat discordant in *Sibbaldia* s.s. References: Eriksson et al. (2015) = Y; Ertter & Reveal in FNA (2014); Paule & Soják (2009)=Z; Lundberg et al. (2009); Potter et al. (2006); Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Sibbaldia retusa (O.F. Müller) T. Eriksson, Mountain-cinquefoil, Three-toothed Cinquefoil, Mountain White Potentilla, Wine-leaf Cinquefoil, White Sibbaldia. Grassy balds, crevices of rock outcrops at high (rarely moderate) elevations, high elevation glades, sometimes very locally abundant. Jun-Aug; Jul-Sep. Greenland and NL (Newfoundland) west to NT, south to ND, IA, WI, MI, s. ON, and NS, and in the mountains to w. VA, ne. TN, and ne. GA (at progressively higher elevations southward). Showy in flower, and also in leaf from late summer on, when the leaves tend to turn a rich burgundy red. Though superficially appearing herbaceous, *S. tridentata* is really an evergreen sub-shrub. Bresawar & Walker (2011) discuss the genetic structure of populations in e. United States. The older epithet “*retusa*” (1780, based on a type from Greenland) has priority over “*tridentata*” (1789) (Eriksson et al. 2015). [= Y; = *Sibbaldia tridentata* (Aiton) Paule & Soják – Va, Z; = *Sibbaldiopsis tridentata* (Aiton) Rydberg – FNA, K, S; = *Potentilla tridentata* Aiton – C, F, G, Pa, RAB, W, WV]

15. *Geum* Linnaeus 1753 (Avens)

A genus of 40-60 species, herbs, mainly of north temperate areas. Many researchers have advocated breaking *Geum* into varying numbers of segregate genera; even the most conservative divisions place *G. radiatum* in a genus separate from our other species (such as *Parageum*; see synonymy) and some would place *G. vernum* in *Stylipus*. Molecular studies (Smedmark 2006; Smedmark & Eriksson 2002) make a strong case for a broad circumscription of *Geum*, including *Waldsteinia*, as many of the segregates are complexly and reticulately interrelated. References: Rohrer in FNA (2014) [*Geum*]; Phipps in FNA (2014) [*Waldsteinia*]; Robertson (1974)=Z, Bolle (1933)=Y; Král (1966)=X; Smedmark (2006)=V; Weakley & Gandhi (2008)=Q; Smedmark & Eriksson (2002); Kalkman in Kubitzki (2004). [including *Parageum* and *Waldsteinia*]

- 1 Style deciduous; leaves 3-foliolate or 3-lobed, lacking small leaflets toward the base; [subgenus or genus *Waldsteinia*]
 - 2 Leaves trilobed (the sinuses cleft 1/4 to 3/4 the way to the midrib); leaves rather densely pubescent with stiff hairs, these distributed on the veins and on the intervein surfaces; [of a small area at the southern terminus of the Southern Appalachians in n. GA, nw. SC, and sw. NC] *G. lobatum*
 - 2 Leaves trifoliolate (fully divided), and also typically additionally lobed; leaves sparsely pubescent with stiff hairs, these distributed mostly or strictly on the veins, the intervein surfaces glabrous to very sparsely pubescent; [more widespread].
 - 3 Petals 2.5-4 mm long (about as long as the sepals), 1-1.5 mm wide; [of VA and KY southward] *G. donianum*
 - 3 Petals 4-10 mm (longer than the sepals), 2-6 mm wide; [of VA and KY northward] *G. fragarioides*
- 1 Style persistent; leaves various (see below).
 - 4 Style straight or slightly sinuous, neither jointed nor tightly twisted, the tip straight; basal leaves with a cordate or reniform terminal lobe 7-15 cm wide and 1-several lateral lobes generally < 1 cm long (rarely to 2 cm long); cauline leaves much reduced, flabellate, with clasping base and rounded apex; leaves thick, subcoriaceous, the upper surface dark green and glossy; petals 13-20 mm long, bright yellow; [of crevices and ledges on high elevation cliffs (less commonly grassy balds)]; [subgenus *Micracomastylis*; or genus *Parageum*] ... *G. radiatum*
 - 4 Style with a tight kink or twist, the straight portion above the kink more-or-less deciduous, leaving a hook; basal leaves variable, trifoliolate, pinnatifid, simple or with a large terminal lobe (to 8 cm wide) and much smaller lateral lobes; cauline leaves trifoliolate to simple, mostly sessile or petiolate base, with acute or acuminate apex; leaves herbaceous, the upper surface medium green, not notably glossy; petals 1-10 mm long, white, cream, pale yellow, bright yellow, lavender, maroon, or purple; [of mesic to boggy forests, or less commonly, grassy balds (*G. geniculatum*)].
 - 5 Calyx lobes 2-4 mm long, lacking bractlets between the lobes; head of achenes elevated above the calyx on a 1-2 mm stipe; flowering Apr-May; fruiting May-Jun; [subgenus or genus *Stylipus*] *G. vernum*
 - 5 Calyx lobes 3-15 mm long, with bractlets between the lobes; head of achenes more-or-less sessile; flowering May-Aug; fruiting late May-Sep; [subgenus or genus *Geum*].
 - 6 Portion of the style above the kink 3-7 mm long; calyx campanulate, cup-like in flower and fruit (sometimes becoming slightly and irregularly reflexed late in fruit), the calyx lobes 5-10 mm long, green to purple; petals yellow or often with a substantial suffusion of rose, lavender, or purple; lower portion of style with long, gland-tipped hairs.
 - 7 Portion of the style above the kink 4-7 mm long; calyx lobes 5-10 mm long, green or purple-darkened; [of nw. NC and adjacent TN] *G. geniculatum*
 - 7 Portion of the style above the kink 3-4 mm long; calyx lobes 9-15 mm long, purple; [of ne. WV northward] *G. rivale*
 - 6 Portion of the style above the kink 1-2 mm long; calyx reflexed soon after anthesis, the calyx lobes 3-9 mm long, green; petals white, cream, or yellow; lower portion of style glabrous or with long, eglandular hairs.
 - 8 Larger stipules > 10 mm wide, coarsely toothed or even lobed; mid-cauline leaves very coarsely toothed, with 1-5 teeth per cm of margin *G. virginianum*
 - 8 Larger stipules 2-10 (-12) mm wide, entire to toothed; mid-cauline leaves less coarsely toothed, with 3-7 teeth per cm of margin.
 - 9 Plant in flower.
 - 10 Petals bright yellow, 5-9 mm long *G. aleppicum*
 - 10 Petals white or cream (often drying pale yellow), 2-7 (-7.5) mm long.
 - 11 Petals (3-) 4-7 (-7.5) mm long; pedicels puberulent (sometimes also slightly hirsute); [of moist to dry forests] *G. canadense*
 - 11 Petals (2-) 2.5-4 (-5.5) mm long; pedicels densely hirsute with spreading or slightly reflexed hairs, and also puberulent; [of wetlands] *G. laciniatum*
 - 9 Plant in fruit.
 - 12 Pedicel predominantly puberulent, also sometimes with scattered longer hairs; cauline leaves mostly 3-foliolate or simple; receptacle densely hispid with yellowish, stiff hairs (best seen by removing a several achenes to expose the receptacle surface); [widespread and common in our area, primarily occurring in moist to wet forests] *G. canadense*
 - 12 Pedicel moderately to densely hirsute with spreading to reflexed hairs 1-2.5 mm long, and also puberulent; cauline leaves mostly pinnately compound, the leaflets mostly elongate and often also laciniately divided; receptacle glabrous or sparsely to densely hispid; [rare in our area, primarily northern and/or montane, primarily in bogs and boggy meadows].
 - 13 Hairs on the achene extending upward onto the lower portion of the style; pedicel sparsely hirsute with spreading hairs; receptacle densely hispid *G. aleppicum*
 - 13 Hairs on the achene absent or at least not extending upward onto the lower portion of the style; pedicel densely hirsute with spreading to reflexed hairs; receptacle glabrous to sparsely hispid *G. laciniatum*

Geum aleppicum Jacquin, Yellow Avens. Floodplain forests, bogs, and boggy meadows. Jun-Jul; Jul-Aug. Circumboreal, in North America south to NJ, w. NC, ne. TN (Chester, Wofford, & Kral 1997), IN, IL, IA, and NM. The report for GA (Jones & Coile 1988) is in error. American plants are sometimes separated from Eurasian ones as var. *strictum* (Aiton) Fernald. [= FNA, GW, K, Pa, RAB, Va, W, Y, Z; > *G. aleppicum* var. *strictum* (Aiton) Fernald – C, F, G]

Geum canadense Jacquin, White Avens. Moist slope forests, bottomland forests, swamp forests, tidal swamps, rarely in submesic forests. May-Jul; Jul-Nov. NS west to ND, south to c. GA and TX. Some authors have recognized a number of varieties in *G. canadense* (see synonymy); some (at least) of these may warrant recognition. [= C, FNA, G, GW, Pa, RAB, S, Va, W,

Z; > *G. canadense* var. *canadense* – F, K, WV, Y; > *G. canadense* var. *brevipes* Fernald – F, Y; > *G. canadense* var. *camporum* (Rydberg) Fernald & Weatherby – F, Y; > *G. canadense* var. *grimesii* Fernald & Weatherby – F, Y]

Geum donianum (Trattinick) Weakley & Gandhi, Southern Barren Strawberry. Forests, streambanks. (Jan-) Mar-May; May-Jun. VA and TN south to GA and AL. [= Q, Va; = *Waldsteinia fragarioides* (Michaux) Trattinick var. *parviflora* (Small) Fernald – C, F; = *Waldsteinia fragarioides* ssp. *doniana* (Trattinick) Teppner – K, Z; < *W. fragarioides* – RAB, W, Y; = *W. parviflora* Small – FNA, G; = *Waldsteinia doniana* Trattinick – S; < *Geum fragarioides* (Michaux) Smedmark – V]

Geum fragarioides (Michaux) Smedmark, Northern Barren Strawberry. Forests, streambanks. Late Mar-May; May-Jun. NB west to MN, south to NC, TN, IN, MO, and AR. [= Q, Va; = *Waldsteinia fragarioides* (Michaux) Trattinick var. *fragarioides* – C, F; < *W. fragarioides* – RAB, W, WV, Y; = *W. fragarioides* ssp. *fragarioides* – K, Z; = *Waldsteinia fragarioides* – FNA, G, Pa, S; < *Geum fragarioides* (Michaux) Smedmark = V]

Geum geniculatum Michaux, Bent Avens. Seeps, seepy boulderfield forests, grassy balds, cliff bases, banks of cool streams up to about 5 m wide, at high to moderate elevations on Grandfather Mountain (Avery, Watauga, and Caldwell counties, NC), the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County TN), and Rich Mountain (Watauga County, NC), locally fairly common. Late Jun-Aug; Aug-Sep. *G. geniculatum* is apparently restricted to the few highest peaks in nw. NC and ne. TN: the Roan Mountain massif (Roan High Knob, Roan High Bluff, Round Bald, Jane Bald, Grassy Ridge, Little Hump Mountain, Big Yellow Mountain, and Big Hump Mountain), Grandfather Mountain, and Rich Mountain. It may be found on a few other peaks, such as Snake Mountain. The distribution of this species is peculiar. While limited to the several highest and coldest mountains in the Southern Appalachians, it extends downslope on Roan Mountain and Grandfather Mountain nearly to their bases, in environmental situations that are apparently duplicated on many other Southern Appalachian peaks. Perhaps *G. geniculatum* was more widespread in the Southern Appalachians in the cooler, moister conditions of the post-Pleistocene, but became restricted to the few coldest peaks during the warmer, drier conditions of the Hypsithermal Interval (7000-2000 B.C.). Following climatic cooling, it was able to disperse downslope from its several refugia, but has not dispersed successfully to other peaks. *G. geniculatum* is most closely related to the circumboreal *G. rivale*, with which it shares such characteristics as purplish, non-reflexed sepals, a relatively long terminal style segment, upper pedicel with long glandular hairs, and basal style segment with long glandular hairs. [= FNA, K, RAB, S, W, Y, Z]

Geum laciniatum Murray, Rough Avens. Fens and wet meadows, especially over calcareous or mafic rocks. Jun-Jul; Jul-Aug. Two varieties are sometimes recognized: var. *laciniatum* has glabrous achenes and is generally more northern and more restricted in distribution than var. *trichocarpum*, which has achenes sparsely to densely pubescent with long stiff trichomes, and ranges from NS west to s. ON, south to MD, VA, w. NC, TN, OH, IL, MO, and KS. The difference appears to be that of a single trait, uncorrelated with other traits, and with largely overlapping geographic distributions; the varieties are not recognized here. [= C, FNA, GW, Pa, RAB, Va, W, Y; > *G. laciniatum* var. *laciniatum* – F, G, K, WV, Z; > *G. laciniatum* var. *trichocarpum* Fernald – F, G, K, Z]

Geum lobatum (Baldwin ex Elliott) Smedmark, Lobed Barren Strawberry. Forests, streambanks. Mar-May; May-Jun. Sw. NC south to nw. SC and n. and e. GA. Some populations appear to be morphologically intermediate between *G. lobatum* and *G. donianum*; further study is needed. [= Q, V; = *Waldsteinia lobata* (Baldwin ex Elliott) Torrey & A. Gray – FNA, K, S, Y, Z]

Geum radiatum Michaux, Spreading Avens, Cliff Avens. High elevation rocky summits, in thin soil at tops of cliffs and on ledges (where not trampled), in pockets of soil on nearly vertical portions of cliffs, in open grassy balds, around *Rhododendron catawbiense* in grassy balds, or in grassy areas at bases of cliffs (where succession by shrubs is prevented by accumulation of seepage ice and by stone fall). Jun-Aug; Jul-Sep. Ranging from Ashe County, NC (Phoenix Mountain) south and west to Sevier County, TN (Mount Leconte) and Transylvania County, NC (the Devil's Courthouse), restricted to "pseudo-alpine" rock outcrops and grassy meadows near the summits of the higher peaks of the Southern Blue Ridge, notably Bluff Mountain, Three Top Mountain, Phoenix Mountain, and The Peak (Ashe County, NC), Grandfather Mountain (Watauga and Avery counties, NC), Grassy Ridge (Avery County, NC), Roan High Bluff (Mitchell County, NC), Mount Craig in the Black Mountains (Yancey County, NC), Craggy Pinnacle, Craggy Dome, and Craggy Gardens (Buncombe County), the Devil's Courthouse (Transylvania County, NC), and Mount Leconte (Sevier County, TN). *G. radiatum* is closely related to three other taxa, these siblings also restricted in range and endemic to mountainous areas, collectively showing a relictual distribution: *G. peckii* Pursh (of alpine meadows and moist, rocky slopes of NS and the higher peaks of NH and ME), *G. calthifolium* Menzies ex Smith var. *calthifolium* (of wet snow-melt meadows of w. BC, w. YT, s. AK, and the Aleutians), and *G. calthifolium* var. *nipponicum* (of wet snow-melt meadows of s. Kamchatka and Japan). It is illegal to collect *G. radiatum* without federal and state permits, and there is no justification (scientific or otherwise) for additional collections from known sites. This is one of the few plant species that has been seriously depleted by collection by scientists (several hundred herbarium sheets from Roan Mountain alone!), though recreational over-use of its habitats, and possibly also pollution and break-up of adjoining spruce-fir forests, are the more critical threats to its continued existence. [= FNA, K, RAB, W, Z; = *Sieversia radiata* (Michaux) Greene – S; = *Parageum radiatum* (Michaux) H. Hara – X; = *Acomastylis radiata* (Michaux) Bolle – Y]

Geum rivale Linnaeus, Water Avens, Purple Avens. Calcareous fens, swamps, seepages, and wet meadows. May-Jun. Circumboreal, in North America from NL (Labrador), Keewatin, and BC south to NJ, MD, WV (Pocahontas, Preston, Randolph, and Tucker counties), OH, IN, IL, MN, SD, NM, and WA. It is most closely related (in our area) to *G. geniculatum*. [= C, F, FNA, G, K, Pa, WV, Y]

Geum vernum (Rafinesque) Torrey & A. Gray, Spring Avens. Seepages, swamps, roadsides, disturbed areas, probably both native and introduced in our area, the native occurrences now being supplemented by its spread along roads from farther west. Apr-May; May-Jun. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WV, Y, Z; = *Stylypus vernus* Rafinesque – S]

Geum virginianum Linnaeus, Cream Avens. Bottomland forests, moist slope forests, swamp forests, and extending upslope to mesic or even dry sites, especially over mafic rocks. Jun-Aug; Jul-Nov. MA and NY west to IN, south to SC and TN. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WV, Y, Z; > *G. virginianum* – S; > *G. hirsutum* Muhlenberg ex Link – S]

16. Prunus Linnaeus 1753 (Plum, Cherry, Sloe, Peach, Apricot)

A genus of about 200 species, trees and shrubs, nearly cosmopolitan, but especially in north temperate regions. Liu et al. (2012) make a strong case for combining subgenus *Laurocerasus* into subgenus *Padus*. References: Rohrer in FNA (2014); Robertson (1974)=Z; McVaugh (1951)= Y; Catling, McKay-Kuja, & Mitrow (1999)=X; Liu et al. (2012); Yazbek & Oh (2013); Shaw & Small (2004); Kalkman in Kubitzki (2004).

- 1 Flowers in elongate racemes of (12-) 20-many flowers; [black-cherries, subgenus *Padus*]..... **Key A**
- 1 Flowers solitary, in fascicles, in umbellate or corymbose inflorescences, or in short racemes (*P. mahaleb*) of 1-12 flowers.
- 2 Flowers and fruit pedicellate, the pedicel > 4 mm long; fruit glabrous, ovary glabrous or pubescent initially.
 - 3 Stones globose, not 2-edged; sepals hairy or not; inflorescences subtended by leafy bracts arising from the same bud as the flowers (except *P. pensylvanica*, *P. susquehanae*, and *P. pumila* var. *depressa*); **cherries**..... **Key B**
 - 3 Stones somewhat to strongly flattened, 2-edged; sepals hairy on the upper surface (except *P. domestica*, *P. insititia*, and *P. cerasifera*); inflorescences without leafy bracts arising from the same bud as the flower; **plums** **Key C**
- 2 Flowers and fruit sessile or on a pedicel < 2 mm long
 - 4 Fruit scarlet-red, 1 cm in diameter; twigs densely tomentose; fruit and ovary glabrous or somewhat pubescent (but not velvety); leaves < 5 (-7) cm long; petals white (pink in bud), < 13 mm long; [subgenus *Lithocerasus*, section *Armeniaco-cerasus*]..... [*P. tomentosa*]
 - 4 Fruit yellow, peach, or orange-colored, > 2 cm in diameter; twigs glabrous; fruit and ovary velvety pubescent; leaves > 5 cm long; petals white or pink, > 11 mm long.
 - 5 Leaves 8-15 cm long, > 4× as long as wide, falcate; fruit peach-colored, > 5 cm in diameter; [**peach**; subgenus *Amygdalus*, section *Persica*]..... *P. persica*
 - 5 Leaves 5-10 cm long, 1-1.5× as long as wide, not falcate; fruit yellow to orange, 3-5 cm in diameter; [**apricots**; subgenus *Prunus*, section *Armeniaca*]
 - 6 Twigs reddish-brown; fruits 3-5 cm in diameter, the flesh sweet when ripe [*P. armeniaca*]
 - 6 Twigs bright green; fruits 2-3 cm in diameter, the flesh sour and/or bitter when ripe [*P. mume*]

KEY A – BLACK-CHERRIES, subgenus *Padus*

- 1 Leaves evergreen, entire or serrate with few or rather many (but widely spaced) prominent teeth; petioles lacking 2 glands near junction with leaf blade; [native in maritime situations from e. NC southward, but cultivated and escaped inland]..... *P. caroliniana*
- 1 Leaves deciduous, regularly and rather finely toothed; petioles with 2 glands near the junction with the leaf blade; [collectively widespread, native and alien].
 - 2 Petals 6-10 mm long; hypanthium pubescent within; stone sculptured; [alien, rarely naturalizing] *P. padus*
 - 2 Petals 4-7 mm long; hypanthium glabrous within; stone smooth; [native].
 - 3 Leaf teeth triangular, pointing outward; leaves dull above; sepals conspicuously glandular-eroded on the margin, not persistent on the fruit; colonial, thicket-forming shrub from rhizomes; [montane in our area] *P. virginiana* var. *virginiana*
 - 3 Leaf teeth curved, appressed; leaves shiny above; sepals entire or slightly glandular-eroded on the margin, persistent on the fruit; small to large tree, not clonal; [collectively widespread].
 - 4 Leaves mostly 1.5-2× as long as wide, often blunt-tipped (except in shoot leaves); lower leaf surface rather uniformly pubescent, the midrib lacking conspicuous tufts or fringes; branchlets reddish hairy *P. alabamensis*
 - 4 Leaves mostly 2-2.5× as long as wide, slightly acuminate; lower leaf surface glabrous except for tufts or fringes along the midrib; branchlets glabrous *P. serotina* var. *serotina*

Key B – CHERRIES, subgenera *Cerasus* and *Lithocerasus*

- 1 Plants shrubs, to 1.5 (-3) m tall; [subgenus *Lithocerasus*; section *Microcerasus*].

- 2 Inflorescences of 1-2 flowers; [exotic, persistent from cultivation] [*P. glandulosa*]
- 2 Inflorescences of 2-4 flowers; [native].
- 3 Youngest twigs glabrous; leaf blades (1.6-) 3-4× as long as wide; plants decumbent; stones fusiform, (5.5-) 7.3-9.5 (-10.2) mm long; [plants of calcareous shores and gravel bars] *P. pumila* var. *depressa*
- 3 Youngest twigs minutely pubescent; leaf blades mostly 1.7-2.5× as long as wide; plants erect, stones mostly orbicular, (5.3-) 5.8-7.8 (-9.2) mm long; [plants of acid sandy or rocky upland sites] *P. susquehane*
- 1 Plants trees, well over 3 m tall when mature; [subgenus *Cerasus*].
- 4 Leaf serrations single to double, the tips of the serrations acuminate to attenuate.
- 5 Leaf serrations attenuate; tree with upright form; [subgenus *Cerasus*, section *Sargentiella*] [*P. speciosa*]
- 5 Leaf serrations acuminate; tree usually with weeping form; [subgenus *Cerasus*, section *Microcalymma*] *P. subhirtella*
- 4 Leaf serrations small and obscure or well-developed but rounded to acute.
- 6 Petals 4-7.5 mm long; fruit < 1 cm in diameter; [subgenus *Cerasus*, section *Phyllomahaleb*].
- 7 Inflorescence with a central axis, thus nearly or actually racemose; fruit blackish; leaves 1-1.5× as long as wide; [exotic tree] *P. mahaleb*
- 7 Inflorescence umbellate to corymbose, the central axis absent or poorly developed; fruit red; leaves 2-5× as long as wide; [native tree] *P. pennsylvanica*
- 6 Petals 9-15 mm long; fruit 1.3-2.5 cm in diameter; [subgenus *Cerasus*, section *Eucerasus*].
- 8 Leaves 7-15 cm long, persistently hairy beneath, at least along the midrib and veins; pair of petiolar glands on the petiole near the blade; fruit sweet when ripe *P. avium*
- 8 Leaves 4-8 cm long, glabrous beneath once fully-expanded; pair of petiolar glands on the base of the leaf blade; fruit sour when ripe. *P. cerasus*

KEY C – PLUMS, subgenus *Prunus*

- 1 Flowers 1-2 (-3) per inflorescence; stone somewhat sculptured; [exotic]; [section *Prunus*].
- 2 First-year twigs green, shiny, glabrous; fruits 2-3 cm long, yellow to red when ripe; inflorescence of a solitary flower [*P. cerasifera*]
- 2 First-year twigs brown to gray, dull, often pubescent; fruits either 3-7 cm or 1-2 cm long, blue-black, yellow, or greenish when ripe; inflorescence of 1-3 flowers.
- 3 Fruits 3-7 cm long, blue-black, yellow, or greenish when ripe; leaves 3-8 cm long; twigs somewhat to not at all thorny *P. domestica*
- 3 Fruits 1-2 cm long, blue-black when ripe; leaves 1-3 (-4) cm long; twigs very thorny *P. spinosa*
- 1 Flowers (3-) 4-5 per inflorescence; stone nearly smooth; [native, though some species also cultivated and/or weedy]; [section *Prunocerasus*].
- 4 Leaf teeth gland-tipped (or with a scar where the gland has fallen); sepals with marginal glands (except *P. angustifolia*); fruit yellow to red when ripe.
- 5 Leaves 3-6 cm long, often folded longitudinally; sepals lacking marginal glands *P. angustifolia*
- 5 Leaves 5-13 cm long, not folded; sepals with marginal glands.
- 6 Leaves < 2× as long as wide; petals 10-15 mm long; [of w. VA northward] *P. nigra*
- 6 Leaves > 2× as long as wide; petals 4-7 mm long; [of mw. United States, eastward into KY, TN, MS, and present as an introduction still farther eastward in NC, SC, VA, and GA].
- 7 Leaf teeth triangular, ascending, the gland terminal; flowers opening with the leaves *P. hortulana*
- 7 Leaf teeth depressed, the gland near the sinus; flowers opening before the leaves *P. munsoniana*
- 4 Leaf teeth glandless; sepals without marginal glands; fruit yellow, red, purple-red, purple, or black when ripe
- 8 Petals 10-15 mm long; leaves 6-10 cm long, acuminate; fruit 2-2.5 cm long, red or yellow.
- 9 Leaves narrowly to broadly cuneate at the base; petiole usually lacking glands near its junction with the leaf blade; sepals glabrous on the lower side *P. americana*
- 9 Leaves broadly rounded at the base; petiole usually with glands near its junction with the leaf blade; sepals pubescent on the lower side *P. mexicana*
- 8 Petals 4-9 mm long; leaves 4-8 cm long, obtuse, acute, or slightly acuminate; fruit 1.0-1.5 cm long, dark purple, black (rarely yellow or red).
- 10 Twigs and pedicels pubescent, often densely so; leaf apices acute to obtuse, rarely rounded; leaf blades mostly < 2× as long as wide; shrubs to 2.5 m tall; [Coastal Plain of e. VA, and northward] *P. maritima*
- 10 Twigs and pedicels usually glabrous, but occasionally pubescent; leaf apices acute, sometimes acuminate; leaf blades mostly > 2× as long as wide; shrubs or small trees, 2-6 m tall; [either inland in the Mountains and Piedmont from nw. NC northward, or Coastal Plain, Piedmont, and Mountains of s. NC, SC, GA, FL, AL, MS, LA, and westward].
- 11 Plants often suckering and forming thickets, less often single plants, shrubs or less often trees; leaf apices short acuminate (to merely acute); pedicels usually < 10 mm long; [Mountains and Piedmont from nw. NC and e. TN northward] *P. alleghaniensis* var. *alleghaniensis*
- 11 Plants usually not suckering, often single plants but sometimes in small colonies, generally trees; leaf apices mostly acute; pedicels usually > 10 mm long; [Coastal Plain, Piedmont, and Mountains of s. NC, SC, GA, FL, AL, MS, LA, and westward] *P. umbellata*

Prunus alabamensis C. Mohr, Alabama Black Cherry. Sandhills, other xeric, acidic, sandy or rocky forests and woodlands, often associated with *Pinus palustris* (even in the Piedmont and Mountains). Apr-May; Jul-Aug. C. SC, nw. GA, n. AL south to Panhandle FL and s. AL; the NC record is based on a misidentified specimen. [= K; = *Prunus serotina* Ehrhart var. *alabamensis* (C. Mohr) Little – FNA, RAB, WH3; > *Padus alabamensis* (C. Mohr) Small – S; > *Padus cuthbertii* Small – S; > *Padus australis* Beadle – S; = *Prunus serotina* ssp. *hirsuta* (Elliott) McVaugh – Y, Z]

Prunus alleghaniensis Porter var. *alleghaniensis*, Allegheny Plum, Allegheny Sloe. Dry rocky woodlands, shale barrens, primarily over calcareous or mafic rocks. Broadly Appalachian: MA and NY south to w. VA, w. NC, and e. TN. Var. *davisii* (W. Wight) Sargent is endemic to MI. Generally considered difficult to distinguish from *P. umbellata* other than by distribution. [= K, Va; < *Prunus alleghaniensis* – C, F, G, Pa, W, WV; = *Prunus umbellata* Elliott var. *alleghaniensis* {in press} – FNA]

Prunus americana Marshall, American Wild Plum. Upland forests, bottomland forests, fencerows, usually in mesic situations. Mar-Apr; Jul-Aug. ME to SK, south to n. peninsular FL, LA, OK, NM, and AZ. [= C, FNA, K, Pa, S, Va, W, WH3, WV, Z; = *Prunus americana* var. *americana* – RAB, F, G]

Prunus angustifolia Marshall, Chickasaw Plum. Roadsides, fencerows, abandoned fields, especially sandy. Mar-Apr; May-early Jul. NJ, PA, IN, IL, MO, NE, and CO, south to FL, TX, and e. NM. The original native distribution is unclear; much of its eastern distribution may be the result of early spread by native Americans. [= C, FNA, G, Pa, RAB, S, Va, W, WH3, WV, Z; > *Prunus angustifolia* var. *angustifolia* – F, K]

* ***Prunus armeniaca*** Linnaeus, Apricot. Persistent around old home sites; native of n. China. Apr-May; Jun-Jul. [= C, FNA, K, Pa; = *Armeniaca vulgaris* Lamarck]

* ***Prunus avium*** Linnaeus, Sweet Cherry, Mazzard Cherry, Bing Cherry. Mesic and dry-mesic forests, old fields, other disturbed areas; native of Eurasia. Mar-May; Jun-Jul. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV, Z; = *Cerasus avium* (Linnaeus) Moench]

* ***Prunus campanulata*** Maximowicz, Taiwan Cherry, Formosan Cherry. Suburban woodlands, native of Taiwan. Reported as naturalized in suburban woodlands in the Tallahassee (Leon Co., FL) area (Clewel & Tobe 2011) and Conecuh County, AL (Diamond 2013). {not yet keyed}

Prunus caroliniana (P. Miller) Aiton, Carolina Laurel Cherry. Maritime forests and sandy hammocks in the Coastal Plain, escaped from cultivation to fencerows and suburban forests and thickets in more inland areas. Feb-Apr; Sep-Oct. Se. NC south to FL, west to TX, near the coast. [= FNA, K, RAB, WH3, Z; = *Laurocerasus caroliniana* (P. Miller) M. Roemer – S]

* ***Prunus cerasifera*** Ehrhart, Cherry Plum, Flowering Plum, Purpleleaf Plum. Suburban woodlands; native of Asia. Mar-Apr; Jun-Aug. Introduced at scattered locations; reported for TN, PA, NJ (Kartesz 1999). [= F, FNA, K]

* ***Prunus cerasus*** Linnaeus, Sour Cherry, Pie Cherry. Commonly cultivated, occasionally escaped to disturbed areas; fencerows, suburban forests; native of Eurasia. Apr-May; Jun-Jul. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV, Z; = *Cerasus vulgaris* P. Miller]

* ***Prunus domestica*** Linnaeus, European Plum, Damson, Bullace. Suburban forests; native of Europe. Introduced at scattered locations; reported for Manassas National Battlefield Park (Virginia Botanical Associates 2005); also reported for MD, PA, NJ. Depypere et al. (2009) found that *P. domestica* and *P. insititia* were genetically very similar, but generably separable morphologically; they favored combining the two into a single species based on their similarity, variability and likely origin from complicated hybridization and domestication by man. [= FNA; > *Prunus domestica* ssp. *domestica* – C; > *Prunus domestica* ssp. *insititia* (Linnaeus) C.K. Schneider – C; > *P. insititia* Linnaeus – F, G, Z; > *P. domestica* var. *domestica* – K; > *P. domestica* var. *insititia* (Linnaeus) Fiori & Paoletti – K]

* ***Prunus glandulosa*** Thunberg, Dwarf Flowering Almond. Persisting at abandoned homesites; native of c. and n. China and Japan. Mar-May. [= FNA, K; = *Cerasus glandulosa* (Thunberg) Sokolov]

Prunus hortulana L.H. Bailey, Wild-goose Plum. Successional forests, old fields, fencerows, other disturbed areas. Apr-May; Sep-Oct. Native from s. OH, n. IN, n. IL, se. IA, and e. KS south to c. TN, n. AR, and ne. OK; introduced more widely. [= C, F, FNA, G, K, S, Va, WV, Z]

* ***Prunus mahaleb*** Linnaeus, Mahaleb Cherry, Perfumed Cherry, St. Lucie Cherry, Rock Cherry. Roadsides, old homesites; native of Europe. Apr-May; Jun-Jul. [= C, F, FNA, G, K, Pa, RAB, Va, W, WV, Z; = *Cerasus mahaleb* (Linnaeus) P. Miller]

Prunus maritima Marshall, Beach Plum. Ocean dunes and sandy coastal soils (from e. MD northward), disturbed dune-like area on shore of Chesapeake Bay (in e. VA). Apr-May; Aug-Oct. Native from NB south to e. MD, along the coast; somewhat disjunct in e. VA in an ambiguously native occurrence. [= C, FNA, Pa, Va; > *Prunus maritima* var. *maritima* – K; > *Prunus maritima* – F, G]

Prunus mexicana S. Watson, Big-tree Plum, Mexican Plum. Streamsides, upland forests, fencerows. Mar-Apr; Aug-Oct. IN, IL, and IA, south to AL, MS, LA, TX, and Mexico; reports from farther east are apparently in error and based on pubescent material of *P. americana*. [= C, FNA, G, K, S, Z; = *Prunus americana* Marshall var. *lanata* – F]

* *Prunus mume* (Siebold) Siebold & Zuccarini, Japanese Apricot. Suburban forests; native of s. Japan. Apr-Mar. Documented as naturalizing in Battle Park, University of North Carolina, Chapel Hill, where apparently spread from cultivation and reproducing as early as 1939. [= K2; = *Armeniaca mume* Siebold]

Prunus munsoniana W. Wight & Hedrick, Munson Plum, Wild Goose Plum. Old fields, fencerows, roadsides, old homesites. Apr-May; Jul-Aug. OH, IL, MO, and KS, south to MS and TX; disjunct (introduced?) in GA, NC, VA, and NJ. [= C, F, G, K, S, Va, Z; < *P. rivularis* Scheele – FNA]

Prunus nigra Aiton, Canada Plum. Old fields, hedgerows, forest edges. May; Jun-Aug. NL (Newfoundland) west to MB, south to NY, OH, IN, IL, and IA; apparently disjunct in VA and WV. [= C, F, FNA, G, K, Va, WV]

* *Prunus padus* Linnaeus, European Bird Cherry. Suburban woodlands; native of Europe. Apr-May; Jun-Aug. Cultivated and rarely escaped at least as far south as se. PA (Rhoads & Klein 1993; Rhoads & Block 2007) and DE (Kartesz 1999). [= C, FNA, K, Pa]

Prunus pensylvanica Linnaeus f., Fire Cherry, Pin Cherry. High elevation forests, boulderfield forests, thickets at high elevations resulting from fire or logging. Apr-May; Jul-Sep. NL (Newfoundland) west to BC, south to w. NC, n. GA, e. TN, IN, IL, IA, SD, and CO. [= C, F, FNA, G, Pa, RAB, Va, W, WV, Z; > *Prunus pensylvanica* var. *pensylvanica* – K; = *Prunus pensylvanica* – S (an orthographic variant)]

* *Prunus persica* (Linnaeus) Batsch, Peach. Roadsides, trash-heaps, old fields, disturbed thickets; commonly cultivated and commonly escaped or persistent; native of China. Mar-Apr; Jun-Aug. [= C, F, FNA, G, K, Pa, RAB, Va, W, WH3, WV, Z; = *Amygdalus persica* Linnaeus – S]

Prunus pumila Linnaeus var. *depressa* (Pursh) Gleason, Prostrate Dwarf-cherry, Northern Sand Cherry. Sandy or gravelly shores and islands. Apr-May; Aug. NL (Labrador) west to ON, south to NJ, s. PA (Rhoads & Klein 1993; Rhoads & Block 2007; Kartesz 2010), c. WV, and TN. [= C, G, FNA, K, Pa, X; = *Prunus depressa* Pursh – F; < *Prunus pumila* – WV]

* *Prunus sargentii* Rehder, Sargent Cherry, North Japanese Hill Cherry. Disturbed areas, native of e. Asia. {not yet keyed}

Prunus serotina Ehrhart var. *serotina*, Wild Black Cherry. Rich coves, bottomlands, northern hardwood forests, and in a wide variety of lower elevation habitats from dry to mesic, and weedy in fencerows. Apr-May; Jul-Aug. NS west to ND, south to c. peninsular FL and e. TX. Several other varieties occur in sc. and sw. North America, from c. TX westward. In the Piedmont and Coastal Plain, *P. serotina* is generally a small, scrubby tree of fencerows and an understory tree in forests and woodlands, but in the Mountains reaching large sizes and full canopy stature. [= K, Va; < *Prunus serotina* – C, F, G, Pa, W; < *Prunus serotina* var. *serotina* – FNA, RAB, WH3; < *Padus virginiana* – S, misapplied; = *Prunus serotina* ssp. *serotina* – Y, Z]

* *Prunus speciosa* (Koidzumi) Nakai, Japanese Flowering Cherry, Oriental Cherry. Suburban forests; native of Japan. Apr-May; Jun-Jul. [= FNA; < *P. serrulata* Lindley – K; < *Cerasus serrulata* (Lindley) Loudon; = *Cerasus speciosa* (Koidzumi) H. Ohba]

* *Prunus spinosa* Linnaeus, Sloe, Blackthorn. Suburban woodlands; native of Europe. Mar-May; Aug-Sep. [= C, F, FNA, K2]

* *Prunus subhirtella* Miquel, Higan Cherry, Weeping Higan Cherry, Winter-flowering Cherry. Floodplain forests in suburban areas, other disturbed areas; native of e. Asia, commonly planted, rarely escaped, but locally invasive. (Dec-) Mar-Apr; Jun. [= FNA, K, Va, WH3; > *Prunus subhirtella* var. *pendula* (Maximowicz); = *Cerasus subhirtella* (Miquel) S.Y. Sokolov]

Prunus susquehanae Willdenow, Appalachian Dwarf-cherry, Appalachian Sand Cherry, Susquehanna Cherry. Open rocky or sandy sites. Apr-May; Jul-Aug. Sw. ME and sw. QC west to MB, south to nc. and sw. NC, sc. TN (the Barrens region of the Eastern Highland Rim), and IL. Catling, McKay-Kuja, & Mitrow (1999) supports species status distinct from *P. pumila*, based

on the greater distinctions of this entity from the other three in the complex. [= F, Va, X; = *Prunus pumila* Linnaeus var. *susquehanae* (Willdenow) H. Jaeger – FNA, K, Pa, RAB; = *Prunus pumila* var. *cuneata* (Rafinesque) L.H. Bailey – C, G; = *Prunus cuneata* Rafinesque – S; < *Prunus pumila* – W, Z]

* ***Prunus tomentosa*** Thunberg, Nanking Cherry, Manchu Cherry, Korean Cherry. Disturbed areas, suburban forests and woodlands. Apr-May; jun-Jul. Naturalized at least as far south as MD Piedmont and PA; native of Asia. Apr. [= FNA, K, Pa]

Prunus umbellata Elliott, Hog Plum, Flatwoods Plum. Upland, usually xeric, sandy or rocky forests and woodlands. Mar-Apr; Aug-Sep. S. NC, TN, and AR south to c. peninsular FL and TX. Fox, Godfrey, & Blomquist (1952) report *Prunus mitis* for s. NC (Cleveland County). It is presently unclear how best to treat variation in this complex. [= RAB, WH3, Z; > *Prunus umbellata* Elliott var. *umbellata* – K; > *Prunus umbellata* Elliott var. *injucunda* (Small) Sargent – K; > *Prunus umbellata* – S; > *Prunus mitis* Beadle – S; > *Prunus injucunda* Small – S; = *Prunus umbellata* var. *umbellata* – FNA]

Prunus virginiana Linnaeus var. *virginiana*, Choke Cherry. Forming clonal thickets in oak and northern hardwood forests. Late Apr-Jun; Jul-Aug. NL (Newfoundland) and NL (Labrador) west to MB, south to w. NC, n. GA, AR, and OK. Another variety (or varieties) occur in w. North America. [= FNA, K, Va, Z; < *Prunus virginiana* – RAB, C, F, G, Pa, W, WV; = *Padus nana* (Du Roi) Roemer – S]

Prunus ×yedoensis Matsumora (pro. sp.) [*P. speciosa* × *subhirtella*]. Suburban woodlands; native of e. Asia. Reported as an escape in the DC area. [= K2] {not yet keyed}

17. *Neillia* D. Don 1825 (Lace Shrub)

A genus of about 3 species, shrubs, of e. Asia. Oh & Potter (2005) present strong evidence for the inclusion of *Stephanandra* in *Neillia*. References: Weakley & Wright in FNA (2014); Oh (2006)=Z; Oh & Potter (2005); Kalkman in Kubitzki (2004).

* ***Neillia incisa*** (Thunberg) S.H. Oh, Lace Shrub. Suburban woodlands, establishing from horticultural plantings; native of Japan and Korea. [= FNA, Va, Z; = *Stephanandra incisa* (Thunberg) Siebold & Zuccarini ex Zabel – K1, K2]

18. *Physocarpus* (Cambessèdes) Rafinesque 1838 (Ninebark)

A genus of 3-5 species, shrubs, of North America and ne. Asia. References: Alexander in FNA (2014); Robertson (1974)=Z; Kalkman in Kubitzki (2004).

- 1 Follicles (and carpels, in flower) densely stellate-pubescent (sometimes the pubescence restricted or nearly so to the sutures)..... *P. opulifolius* var. *intermedius*
- 1 Follicles (and carpels, in flower) glabrous or nearly so..... *P. opulifolius* var. *opulifolius*

Physocarpus opulifolius (Linnaeus) Maximowicz var. *intermedius* (Rydberg) B.L. Robinson, Midwestern Ninebark. Limestone river bluffs, mesic hammocks, streambanks; rock outcrops. W. NY west to MN and CO, south to SC, FL, AL, and AR. It is unclear whether the southern species recognized by Small (1933) are best allied with this taxon. Recently collected from limestone bluffs on the Buffalo River, Wayne County, TN (D. Estes, pers. comm., 2012). Additional study is needed. [= C, F, G, K, Z; = *P. intermedius* (Rydberg) C.K. Schneider – FNA; < *P. opulifolius* – RAB, W, WH3; > *Opulaster alabamensis* Rydberg – S; > *Opulaster stellatus* Rydberg – S; > *Opulaster intermedius* Rydberg]

Physocarpus opulifolius (Linnaeus) Maximowicz var. *opulifolius*, Eastern Ninebark. Stream banks, riverside thickets and scour prairies, rock outcrops, cliffs, fens, seepage swamps, especially over mafic or calcareous rocks. May-Jul. QC west to WI, south to SC, TN, and n. IL. [= C, F, G, K, Va, Z; = *P. opulifolius* – FNA; < *P. opulifolius* – Pa, RAB, W, WV; > *Opulaster opulifolius* (Linnaeus) Kuntze – S; > *Opulaster australis* Rydberg – S]

19. *Sorbaria* (Seringe) A. Braun 1860

A genus of 4 species, shrubs, of c. and e. Asia. References: Kalkman in Kubitzki (2004).

* ***Sorbaria sorbifolia*** (Linnaeus) A. Braun, False Spiraea. Disturbed areas; native of Asia. Jun-Jul. Cultivated and naturalized at least as far south as s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), MD, and WV; reports for VA (Massey 1961, repeated in Kartesz 1999) are apparently based only on cultivated plants. [= C, F, G, K, Pa]

20. *Aruncus* Linnaeus 1758 (Goat's-beard)

A genus of 2-3 species, perennial herbs, of temperate North America and Europe. References: Mellichamp in FNA (2014); Robertson (1974)=Z; Kalkman in Kubitzki (2004).

Identification notes: *Aruncus dioicus* can be distinguished from the superficially closely similar *Astilbe biternata* by the following characteristics: trichomes of foliage not glandular (vs. glandular in *Astilbe*), stamens 20 (vs. 10), carpels 3-4 (vs. 2), seeds < 1.5-2 mm long (vs. ca. 4 mm long), terminal leaflets usually unlobed (vs. terminal leaflets usually trilobed).

- 1 Follicles 2.5-3.5 mm long[*A. sylvester*]
- 1 Follicles 1.5-2 mm long.
 - 2 Follicles semi-ovoid, strongly convex on the back, about 1/2 as thick (measured radially) as long; leaves somewhat lustrous, the lower surface glabrous to sparsely pubescent..... *A. dioicus* var. *dioicus*
 - 2 Follicles nearly cylindric, about 1/3 as thick (measured radially) as long; leaves dull, the lower surface pubescent..... *A. dioicus* var. *pubescens*

Aruncus dioicus (Walter) Fernald var. *dioicus*, Eastern Goat's-beard. Moist, nutrient-rich forests and woodland borders. May-Jun; Jun-Sep. NY (?) and PA west to IN, south to NC, SC, GA, and AL. [= C, F, FNA, K, Z; < *A. dioicus* - Pa, RAB, Va, W; = *A. allegheniensis* Rydberg - S]

Aruncus dioicus (Walter) Fernald var. *pubescens* (Rydberg) Fernald, Midwestern Goat's-beard. Moist, nutrient-rich forests and woodland borders. May-Jun; Jun-Sep. W. VA, KY, and IL west to IA, south to n. MS, AR, and ne. OK. The validity of this variety and its attribution to our area (by G, K, and S) need further evaluation. Robertson (1974) states that the "two varieties intergrade completely, and it is questionable whether they should be maintained." [= C, F, FNA, K, Z; < *A. dioicus* - W; = *A. pubescens* Rydberg - S]

* *Aruncus sylvester* Kosteletzky ex Maximowicz. Cultivated. This European species is occasionally cultivated in e. North America and is attributed to our area by Small (1933), on unknown grounds. [= C, G; = *A. dioicus* var. *vulgaris* (Maximowicz) Hara - FNA, K; = *A. aruncus* (Linnaeus) Karsten - S] {no definite evidence of naturalization in our area; rejected}

21. *Spiraea* Linnaeus 1753 (Spiraea, Meadowsweet, Hardhack)

A genus of about 80-120 species, shrubs, of north temperate areas (especially Asia). Many species and hybrids are cultivated, and additional taxa to those treated below may be encountered as persistent or escaped. References: Lis in FNA (2014); Robertson (1974)=Z; Rehder (1940); Uttal (1974); Kalkman in Kubitzki (2004).

- 1 Inflorescence a simple umbel; flowers white; [section *Chamaedryon*]; [alien].
 - 2 Flowers 10-15 mm in diameter.
 - 3 Leaves 2-7 cm long, coarsely serrate and sometimes also slightly 3-lobed; inflorescences with > 6 flowers *S. cantoniensis*
 - 3 Leaves 1-4 (-5) cm long, finely serrulate, not lobed; inflorescences with 3-6 flowers..... *S. prunifolia*
 - 2 Flowers 6-10 mm in diameter.
 - 4 Leaf blades linear to lanceolate, 2.5-4 cm × 0.3-1 cm, > 4× as long as wide; flowers 6-8 mm in diameter *S. thunbergii*
 - 4 Leaf blades ovate to obovate, 3-5 cm × 2-3 cm, < 2× as long as wide; flowers 7-10 mm in diameter *S. ×vanhouttei*
- 1 Inflorescence a compound corymb or panicle; flowers white, pink, or red; [native or alien].
 - 5 Inflorescence a corymb, flat-topped or rounded, broader than long; [section *Calospyra*].
 - 6 Leaves rounded, obtuse, or acute at the apex; petals white (rarely pink); [native].
 - 7 Follicle 2-3 mm long; leaves 1-2× as long as wide, rounded or obtuse at apex, rounded at base; plants 3-8 (-10) dm tall; [of dry or moist forested slopes, or thin soil on rock outcrops, rarely of streambanks]..... *S. corymbosa*
 - 7 Follicle 1-2 mm long; leaves 2-4× as long as wide, acute at apex, cuneate at base; plants 4-25 dm tall; [of rocky riverbanks] *S. virginiana*
 - 6 Leaves long-acuminate at the apex; petals pink (rarely white or red); [alien].
 - 8 Leaves glabrous; flowers usually white (rarely pink); shrub to 8 dm tall *S. ×bumalda*
 - 8 Leaves pubescent on the veins beneath; flowers usually pink (rarely white); shrub to 15 dm tall *S. japonica*
 - 5 Inflorescence a panicle, longer than broad; [section *Spiraea*].
 - 9 Lower leaf surface densely tomentose with white, tawny, or rusty tomentum which obscures the surface.
 - 10 Follicles glabrous; [alien, rare] *S. ×billiardii*
 - 10 Follicles pubescent; [native, common in boggy wetlands] *S. tomentosa*
 - 9 Lower leaf surface glabrous or with a few scattered hairs that do not obscure the surface.
 - 11 Leaves lanceolate to oblong-lanceolate, widest at or below the middle; flowers pink; [alien, rarely escaped or persisting] *S. salicifolia*

- 11 Leaves oblanceolate to obovate or oblong, widest above or at the middle; flowers white (rarely slightly pink); [native, of bogs, stream-banks, swampy areas, or moist to dry rocky areas].
- 12 Leaves 3-5 (-8)× as long as wide, finely and sharply toothed; inflorescence, hypanthium, and sepals pubescent; sepals usually obtuse; twigs yellow-brown to brown..... *S. alba*
- 12 Leaves 2-3× as long as wide, coarsely and bluntly toothed; inflorescence, hypanthium, and sepals usually glabrous or nearly so; sepals usually acute; twigs red-brown to purple-brown..... *S. latifolia*

Spiraea alba Du Roi, Narrowleaf Meadowsweet, Pipestem. Bogs, boggy streambanks, seepages. Jun-Sep; Aug-Oct. QC west to AB, south to NC, IN, and MO. There is considerable disagreement over whether *S. alba* and *S. latifolia* represent two species with some introgression in areas of overlap, two varieties, or a variable or clinal species. [= F, G, Pa, S, W, WV, Z; = *S. alba* var. *alba* – C, FNA, GW, K, Mo, RAB]

* *Spiraea ×billiardii* Herincq [*S. douglassii* × *salicifolia*]. Cultivated, escaped or persisting; introduced from cultivation, one parent from w. North America, one from Eurasia. Also present in KY and TN (D. Estes, pers. comm.). [= K; = *S. ×billardii* – Pa, orthographic variant]

* *Spiraea ×bumalda* Burven [*S. albiflora* × *japonica*]. Cultivated, escaped or persisting; native of cultivation, both parents from Asia. [= FNA, K]

* *Spiraea cantoniensis* Loureiro. Roadsides; native of Asia. May-Jun; Jun-Sep. *S. cantoniensis* has been collected twice on Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also reported for other scattered states in e. North America (AL, AR, LA, NY (Kartesz 1999, FNA). [= FNA, K]

Spiraea corymbosa Rafinesque, Dwarf Spiraea, Rock Spiraea. Rocky forests and woodlands, granitic domes, dry slopes of Piedmont monadnocks, rocky slopes in partial sun. Jun-Aug; Aug-Oct. A Southern and Central Appalachian endemic: sc. PA and w. MD south through w. VA, e. WV, to nw. NC, and perhaps also to e. TN (?), to n. AL(?), apparently fairly common only in w. VA. The species is limited to only a few counties each of NC and WV (Franklin 2004, Strausbaugh & Core 1978), and is not listed for TN in Chester, Wofford, & Kral (1997). Although Mohr (1901) listed the species for AL, it is not listed as a part of the state's woody flora by Clark (1971). *S. corymbosa* is related to *S. lucida* Douglas ex Greene [= *S. betulifolia* var. *lucida* (Douglas ex Greene) C.L. Hitchcock] of the Rocky Mountains, *S. betulifolia* [= *S. betulifolia* var. *betulifolia*] of ne. Asia (Japan, e. Siberia, ne. China, Sakhalin, and the Kurile Islands, and *S. aemiliana* Schneider [= *S. betulifolia* var. *aemiliana* (Schneider) Koidzumi]. The group is often treated as 4 varieties or subspecies of *S. betulifolia*, but the morphological differences and strongly disjunct distribution warrant treatment as a relictual complex of related species; see Uttal (1974), Greene (1892), and others listed in Robertson (1974) for additional discussion and a range of conclusions. [= F, FNA, S, Va, WV; < *S. betulifolia* – RAB; = *S. betulifolia* Pallas var. *corymbosa* (Rafinesque) Maximowicz – C, G, K, Pa, W, Z; = *S. betulifolia* ssp. *corymbosa* (Rafinesque) Taylor & MacBryde]

* *Spiraea japonica* Linnaeus f., Japanese Spiraea. Roadsides, woodland borders, old home-sites; native of Japan and China. May-Aug; Jul-Aug. [= C, F, FNA, G, Mo, Pa, RAB, Va, W, WV, Z; > *S. japonica* var. *fortunei* (Planchon) Rehder – K]

Spiraea latifolia (Aiton) Burkhardt, Broadleaf Meadowsweet. Bogs, seeps, and rock outcrops (glades) over amphibolite, greenstone, olivine, and granite. Jun-Sep; Aug-Oct. NL (Newfoundland) west to MI, south to e. VA and w. NC. [= G, Pa, S, Va, W, WV, Z; = *S. alba* var. *latifolia* (Aiton) H.E. Ahles – C, FNA, GW, K, RAB; = *S. latifolia* var. *latifolia* – F]

* *Spiraea prunifolia* Siebold & Zuccarini, Bridal-wreath Spiraea. Cultivated, escaped or persisting; native of China, Korea, and Taiwan. Apr-Aug; May-Nov. [= C, FNA, G, K, Pa, Va; > *S. prunifolia* var. *prunifolia* – Mo; > *S. prunifolia* var. *plena* C.K. Schneider]

* *Spiraea salicifolia* Linnaeus, Willowleaf Spiraea. Cultivated, escaped or persisting; native of Eurasia. Jun-Aug; Jul-Sep. [= C, FNA, K]

* *Spiraea thunbergii* Siebold ex Blume. Roadsides; native of Asia. Mar-May; Apr-Oct. *S. thunbergii* has been collected from roadside at Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also GA, MS, and MD (FNA). [= C, FNA, K]

Spiraea tomentosa Linnaeus, Hardhack, Steeplebush. Bogs, wet meadows. Jul-Sep; Sep-Oct. NS west to MN, south to SC, ne. GA, e. TN, and AR. [= GW, K, Mo, Pa, RAB, S, Va, W, WV; > *S. tomentosa* var. *rosea* (Rafinesque) Fernald – C, F, FNA, G, Z; > *S. tomentosa* var. *tomentosa* – C, F, FNA, G, Z; ? *S. subcanescens* Rydberg]

* *Spiraea trilobata* Linnaeus var. *trilobata*, Asian Meadowsweet, Three-lobed Spiraea. Disturbed areas; native of e. Asia. Reported by Will Cook from Wake County, NC (Cook, pers. comm. 2011). [] {not yet keyed}

* *Spiraea* \times *vanhouttei* (C. Briot) Carrière [*S. cantoniensis* \times *trilobata*], Bridal-wreath Spiraea. Cultivated, escaped or persisting; introduced from cultivation, the two parents both from Asia. May-Jun; Jun-Oct. [= FNA, K, Z; = *C. vanhouttei* – C, G]

Spiraea virginiana Britton, Virginia Spiraea, Appalachian Spiraea. Riverbanks, riverside shrub thickets, where occasionally flood-scoured. Jun-Jul; Aug-Sep. A Southern Appalachian endemic: sw. PA, WV, and sw. VA south through w. NC and e. TN to nw. GA. Ogle (1991a, 1991b) presents an excellent discussion of the taxonomy, history, and biology of this interesting species. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV, Z; > *S. virginiana* var. *serrulata* Rehder]

22. *Exochorda* Lindley 1858 (Pearlbush)

A genus of about 4 species, shrubs, of e. Asia. References: Haines in FNA (2014); Kalkman in Kubitzki (2004).

* *Exochorda racemosa* (Lindley) Rehder, Pearlbush. Disturbed areas, woodland borders, suburban woodlands; native of China. Mar-Apr. First reported for SC by Hill & Horn (1997) and for AL by Diamond (2014). [= C, FNA, G, K]

23. *Kerria* A.P. de Candolle 1818 (Kerria)

A monotypic genus, a shrub, of China and Japan. References: Henrickson & Weakley in FNA (2014); Kalkman in Kubitzki (2004).

* *Kerria japonica* (Linnaeus) A.P. de Candolle, Kerria, Japanese-rose. Woodland borders, suburban woodlands; native of China. Apr-Jun. Single and "doubled" forms are cultivated. [= C, F, FNA, G, K, Pa]

24. *Neviusia* A. Gray 1858 (Snow-wreath)

A genus of 2 species, shrubs, of se. North America and California. References: Heikens in FNA (2014); Kalkman in Kubitzki (2004).

Neviusia alabamensis A. Gray, Alabama Snow-wreath. Limestone woodlands, where there is seasonal moisture. Mar-May; May-Jul. Sc. TN (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), and n. AL; disjunct in AR and MO. [= K, S]

25. *Rhodotypos* Siebold & Zuccarini 1841 (Jetbead)

A monotypic genus, a shrub, of Japan and China. References: Henrickson in FNA (2014); Kalkman in Kubitzki (2004).

Identification notes: Distinguished by its opposite leaves and black, beadlike fruits.

* *Rhodotypos scandens* (Thunberg) Makino, Jetbead. Suburban woodlands, disturbed areas, roadsides, old house sites, well established locally; native of e. Asia. Late Mar-May; Jun-Sep. [= C, F, FNA, G, K, Pa, Va, WV; ? *R. tetrapetalus* (Siebold) Makino]

26. *Gillenia* Moench 1802 (Indian-physic, Bowman's-root)

A genus of 2 species, herbs, of e. North America. The contention that *Gillenia* is a later homonym of *Gillena* and must therefore be rejected for the later name *Porteranthus* has been ruled against (Robertson 1974; Brummitt 1988; Parkinson 1988). References: Nesom in FNA (2014); Robertson (1974)=Z; Kalkman in Kubitzki (2004).

- 1 Stipules ovate, 10-20 (125) mm long; lower leaf surface densely glandular; leaves trifoliate, the leaflets of the lower leaves lacinate-toothed to divided..... *G. stipulata*
- 1 Stipules linear, 6-8 mm long; lower leaf surface glabrous or sparsely glandular; leaves trifoliate, the leaflets of the lower leaves merely toothed, like the upper leaves..... *G. trifoliata*

Gillenia stipulata (Muhlenberg ex Willdenow) Nuttall, Midwestern Indian-physic. Dry to mesic woodlands and forests, especially over circumneutral soils derived from mafic rocks (such as diabase or greenstone) or calcareous rocks. May-Jun; Jul-Oct. NY to KS, south to nw. GA and TX, and disjunct east of the Blue Ridge in sc. VA, c. NC, and c. GA. [= F, FNA, G, RAB, Va, WV; = *Porteranthus stipulatus* (Muhlenberg ex Willdenow) Britton - C, K, S, W, Z]

Gillenia trifoliata (Linnaeus) Moench, Mountain Indian-physic. Moist forests, roadbanks, forest edges. Apr-Jun; Aug-Oct. ON west to MI, south to SC, AL, nc. GA, and MO. [= F, FNA, G, Pa, RAB, Va, WV; = *Porteranthus trifoliatus* (Linnaeus) Britton - C, K, S, W, Z]

27. Amelanchier Medikus 1789
(Serviceberry, Sarvis, Shadbush, Juneberry, "May Cherry", "Currant")

A genus of about 20-40 species, shrubs and trees, north temperate. References: Campbell, Dibble, Frye, & Burgess in FNA (in press); Robertson (1974)=Z; Kalkman in Kubitzki (2004). Key adapted from FNA.

- 1 Inflorescences 1-3 (-4)-flowered; leaves imbricate in bud, bases cuneate; petioles 2-10 (-15) mm; [WV northward] *A. bartramiana*
- 1 Inflorescences usually 4-many-flowered; leaves conduplicate in bud, bases truncate or rounded to cordate (rarely cuneate); petioles usually at least 10 mm; [collectively widespread].
 - 2 Margins of mature leaves with 2-6 teeth per cm; lateral leaf veins or their forks usually extending into teeth (as readily visible without magnification); ovary summit densely lanuginose.
 - 3 Petals 6-10 mm; hypanthia campanulate *A. humilis*
 - 3 Petals 11-18 mm; hypanthia saucer-shaped *A. sanguinea*
 - 2 Margins of mature leaves with 4-6 (-10) teeth per cm; lateral leaf veins mostly becoming indistinct near margin and not entering teeth; ovary summit glabrous, sparsely pubescent, or densely lanuginose.
 - 4 Ovary summit densely lanuginose; expanding leaves densely tomentose below.
 - 5 Petals 2.6-5.8 mm long, 1-3 mm wide, sometimes andropetalous; plants caespitose; primary stems tending to be stiffly erect *A. nantucketensis*
 - 5 Petals 6-10 mm long, 2.5-4 (-5) mm wide, not andropetalous; plants rhizomatous and in loosely scattered colonies; stems straggling-ascending *A. spicata*
 - 4 Ovary summit glabrous or sparsely pubescent; expanding leaves glabrous to densely tomentose below.
 - 6 Plants rhizomatous, shrubs 0.2-2.5 m tall; petals 2.6-7.7 mm long.
 - 7 Petals 2.6-5.8 mm long, 1-3 mm wide, sometimes andropetalous; leaves elliptic to oblanceolate or oblong-elliptic; sepals ± recurving *A. nantucketensis*
 - 7 Petals 5.9-7.7 mm long, 2.6-3.6 mm wide, rarely andropetalous and much narrower than sterile stamens; leaves elliptic or oval to oblong or often obovate; sepals spreading *A. obovatis*
 - 6 Plants not rhizomatous, shrubs to 8 m tall or trees to 20 m tall; petals (6-) 8-20 mm long.
 - 8 Inflorescences erect; petals 6-12 mm.
 - 9 Young leaves at flowering less than half-expanded and unfolded, green, densely tomentose on the lower surface; proximal flowering pedicels 0.5-2 cm long; sepals erect or loosely spreading *A. canadensis*
 - 9 Young leaves at flowering half-expanded or more and unfolding, often reddish, and sparsely pubescent or glabrescent on the lower surface; proximal flowering pedicels 1-1.5 cm long; sepals ascending to recurving *A. intermedia*
 - 8 Inflorescences drooping; petals 10-20 mm long.
 - 10 Young leaves at flowering folded, green or brownish, and densely tomentose below; proximal flowering pedicels 0.8-1.7 cm long; pomes maroon-purple, insipid *A. arborea*
 - 10 Young leaves at flowering unfolding, reddish, and glabrous (or nearly so) below; proximal flowering pedicels 1.5-3 cm long; pomes blackish purple, sweet *A. laevis*

Amelanchier arborea (Michaux f.) Fernald, Downy Serviceberry. Dry to moist forests, seepage and depression wetlands. Mar-May; May-Aug. NS west to MN, south to Panhandle FL and e. TX (Holmes, Singhurst, & Loos 2014). [= C, F, FNA, G, K2, Pa, Va, W; > *A. arborea* var. *arborea* - K1, RAB, Z; > *A. arborea* var. *alabamensis* (Britton) G.N. Jones - K, Z; > *A. arborea* var. *austromontana* (W.W. Ashe) H.E. Ahles - K1, RAB, Z; > *A. canadensis* - S, misapplied; > *A. alabamensis* Britton - S; < *A. arborea* - WH3]

Amelanchier bartramiana (Tausch) M.J. Roemer, Oblong-fruited Serviceberry. Bogs, sphagnous thickets. Apr-May; Jun-Jul. NL (Labrador) west to MN, south to PA, WV, WI, and MI. [= C, F, FNA, G, K1, K2, Pa]

Amelanchier canadensis (Linnaeus) Medikus, Eastern Serviceberry. Pocosins, acidic wetlands, bogs, wet pine flatwoods, maritime forests. Mar-Apr; May-Jun. NS and NB south to GA, mainly on the Coastal Plain. [= C, FNA, GW, K1, Pa, RAB, Va, W;]

> *A. canadensis* var. *canadensis* – F, Z; > *A. canadensis* var. *subintegra* Fernald – F, Z; < *A. canadensis* – G; = *A. canadensis* var. *canadensis* Michaux –K2; = *A. oblongifolia* (Torrey & A. Gray) Roemer – S]

Amelanchier humilis Wiegand. Rocky, calcareous areas. QC west to ND, south to montane MD, WV, WI, and MI. [= FNA, K1, Pa; < *A. sanguinea* var. *sanguinea* – C, G; > *A. humilis* var. *humilis* – F]

Amelanchier intermedia Spach. Moist to wet areas. May-Jun; Jun-Aug. NL (Newfoundland) west to MN, south to VA, w. NC, and MI. [= F, FNA; < *A. canadensis* (Linnaeus) Medikus – C, G; = *A. ×intermedia* – K1, K2]

Amelanchier laevis Wiegand, Smooth Serviceberry. Mesic to dry forests, high elevation forests, balds. Apr-May; Jun-Jul. NS west to MN, south to e. VA, w. NC, w. SC, AL, w. TN, and IA. [= C, FNA, G, K1, K2, Pa, Va, W, S, Z; = *A. arborea* var. *laevis* – RAB; > *A. laevis* var. *laevis* – F]

Amelanchier nantucketensis E.P. Bicknell, Nantucket Serviceberry. Cliff ledges, rock outcrops. Mar-Apr; Jun. NS and ME south disjunctly to the Potomac River Gorge, n. VA and sc. MD (Knapp et al. 2011). See Dibble & Campbell (1995) and Steury, Fleming, & Strong (2008). [= F, FNA, K1, K2, Va; ? *A. canadensis* × *spicata* – C; > *A. micropetala* (Robinson) W.W. Ashe]

Amelanchier obovalis (Michaux) W.W. Ashe, Coastal Plain Serviceberry. Cp (DE, GA, NC, SC, VA), Pd (SC): pocosins, pine savannas; common (rare in SC Piedmont). Mar-Apr; May-Jun. NJ, DE, and PA south to GA. [= C, F, FNA, G, GW, K1, Pa, RAB, Va, Z; = *A. canadensis* (Linnaeus) Medikus var. *obovalis* Michaux –K2]

Amelanchier sanguinea (Pursh) A.P. de Candolle, Roundleaf Serviceberry, New England Serviceberry. Dry, rocky woodlands and outcrops, especially over mafic or calcareous rocks. Apr-May; May-Jun. ME west to MN, south to w. NC, TN, n. AL, and IA. [= F, FNA, Pa, RAB, S, W, Va, Z; < *A. sanguinea* var. *sanguinea* – C, G, K1, K2]

Amelanchier spicata (Lamarck) K. Koch, Dwarf Serviceberry. Dry, acidic, rocky or sandy sites. Mar-Apr; May-Jun. NL (Newfoundland) west to ND, south to w. NC, w. SC, GA, AL, WI, and MI. [= C, FNA, G, K2, RAB, Va; = *A. stolonifera* Wiegand – F, K1, Pa, S, W, Z]

28. *Crataegus* Linnaeus 1753 (Hawthorn, Haw, Thornapple)
[contributed by Ron Lance]

A genus of 100-500 species, shrubs and small trees, north temperate and Central America, most in e. North America. References: Lance (2014)=X; Phipps in FNA (2014); Phipps (1988)=Z; Beadle in Small (1913)=Q; Phipps, O’Kennon, & Lance (2003)= V ; Phipps (1998)=Y; Phipps, Lance, & Dvorsky (2006)=U; Phipps, O’Kennon, & Dvorsky (2006)= N; Lance (1995); Kalkman in Kubitzki (2004).

Identification notes: All references to leaves and petioles pertain to foliage on short shoots (floreal shoots), unless otherwise specified.

- 1 Leaf blades widest below their midpoint; blade base subcordate, truncate, rounded or abruptly contracted..... **Key A**
- 1 Leaf blades widest at midpoint or beyond midpoint; blade base usually cuneate.
 - 2 Leaves conspicuously glandular on petiole and teeth, especially when young; twigs and branchlets geniculate **Key B**
 - 2 Leaves eglandular, or if glandular then twigs relatively straight, not conspicuously geniculate **Key C**

**Key A – hawthorns with leaf blades widest below midpoint;
blade bases subcordate, truncate, rounded, or abruptly contracted**

- 1 Primary lateral veins of lobed leaves run to sinuses between lobes, as well as to points of lobes.
 - 2 Leaves thin, matte; petiole hairy; sepals elongate ***C. marshallii***
 - 2 Leaves subcoriaceous, glossy; petiole glabrous; sepals broadly triangular.
 - 3 Leaf lobes with few serrations; pyrene 1 per fruit; thorns usually 1-2 cm long..... ***C. monogyne***
 - 3 Leaf lobes with numerous serrations; pyrenes 5 per fruit; thorns usually 3-5 cm long ***C. phaenopyrum***
- 1 Primary lateral veins of lobed leaves run only to lobe points.
 - 4 Leaf blades on terminal shoots commonly 8-12 cm long.

- 5 Inflorescence densely pubescent to tomentose.
- 6 Petiole eglandular; leaves densely pubescent abaxially, veins distinctly impressed adaxially *C. mollis*
- 6 Petiole sparsely glandular; leaves lightly pubescent or glabrate abaxially, veins not so impressed adaxially *C. pennsylvanica*
- 5 Inflorescence slightly pubescent to glabrate.
- 7 Sepals evenly glandular-serrate *C. coccinea*
- 7 Sepals deeply glandular-serrate to pectinate.
- 8 Leaf blades often as wide as long; stamens 20; fruit usually > 12 mm in diameter *C. coccinioides*
- 8 Leaf blades longer than wide; stamens 5-10; fruit usually < 12 mm in diameter *C. holmesiana*
- 4 Leaf blades on terminal shoots usually < 7 cm long.
- 9 Sepals foliaceous, equal or exceeding petal length in flower and persistent on fruit; usually 1 flower per floreal shoot *C. brittonii*
- 9 Sepals not foliaceous, much shorter than petals; flowers usually 3 or more per inflorescence
- 10 Petiole distinctly villous or pubescent, particularly early in growing season.
- 11 Leaves often unlobed; fruit typically > 10 mm in diameter.
- 12 Terminal shoot leaves suborbicular; stamens 20; inflorescence > 10-flowered *C. harbisonii*
- 12 Terminal shoot leaves ovate; stamens 30 or more; inflorescence 3-8 flowered *C. triflora*
- 11 Leaves usually lobed; fruit < 10 mm in diameter.
- 13 Anthers pink to rose; sepals remotely glandular-serrate; calyx collar sessile on mature fruit *C. iracunda*
- 13 Anthers white or cream; sepals deeply glandular-serrate; calyx collar elevated on fruit.
- 14 Leaves densely pubescent; stamens 20 *C. craytonii*
- 14 Leaves villous or sparsely hairy; stamens 10 *C. intricata* var. *biltmoreana*
- 10 Petiole glabrous, or at most only sparsely hairy in spring.
- 15 Calyx collar sessile on mature fruit.
- 16 Petiole distinctly and persistently glandular.
- 17 Leaves mostly unlobed on floreal shoots; terminal shoot leaves shallowly (> 1/3 to midrib) lobed *C. alleghaniensis*
- 17 Leaves shallowly to moderately lobed; terminal shoot leaves lobed 1/3 or more to midrib *C. ignava*
- 16 Petiole eglandular or rarely with 1 or 2 glands in spring.
- 18 Leaf abaxially with hair tufts in main vein axils; bark of trunk coarsely scaly and mottled in color *C. viridis*
- 18 Leaf abaxially lacks hair tufts, either glabrous or hairs scattered along veins; bark of trunk finely scaly, not mottled.
- 19 Leaves mostly ovate; petioles often < 1/3 length of blade *C. aemula*
- 19 Leaves mostly deltate; petioles usually > 1/3 length of blade
- 20 Leaves adaxially scabrate when young, abaxially glabrous; fruit succulent when mature.
- 21 Stamens 5-10 per flower *C. macrosperma*
- 21 Stamens 15-20 per flower *C. schuettei*
- 20 Leaves adaxially slightly scabrate or glabrous, abaxially remotely hairy or glabrous; fruit dense (hard) when mature.
- 22 Stamens 15-20 per flower *C. beata*
- 22 Stamens 5-10 per flower *C. iracunda*
- 15 Calyx collar elevated on mature fruit.
- 23 Petiole eglandular, or rarely remotely glandular in spring; sepals remotely glandular-serrate or subentire.
- 24 Leaves finely crenate-serrate, barely lobed; petiole often nearly as long as blade *C. compacta*
- 24 Leaves sharply or coarsely toothed and lobed; petiole usually < 2/3 as long as blade.
- 25 Anthers < 1 mm long; terminal lobe of leaf elongate *C. gattereri*
- 25 Anthers > 1 mm long; terminal lobe of leaf not conspicuously elongate.
- 26 Leaf blades usually 2-4 cm long *C. pruinosa* var. *parvula*
- 26 Leaf blades often > 4 cm long, particularly in terminal shoots.
- 27 Stamens 10 per flower; calyx slightly elevated in fruit *C. pruinosa* var. *dissona*
- 27 Stamens 20 per flower; calyx distinctly elevated in fruit.
- 28 Leaf base truncate or abruptly tapered; leaves dark green or blue-green *C. pruinosa* var. *pruinosa*
- 28 Leaf base usually truncate to subcordate; leaves dull green or yellow-green *C. pruinosa* var. *rugosa*
- 23 Petiole distinctly and persistently glandular; sepals distinctly glandular-serrate.
- 29 Stamens 5 to 10.
- 30 Anthers white or yellow.
- 31 Sepals glandular-serrate beyond middle; terminal shoot leaves deltate; thorns robust *C. intricata* var. *boyntonii*
- 31 Sepals wholly glandular-serrate; terminal shoot leaves ovate or broadly ovate; thorns slender *C. intricata* var. *intricata*
- 30 Anthers pink, rose, or purple.
- 32 Sepals partly glandular-pectinate; terminal shoot leaves broadly ovate or deltate
- 33 Sepals pectinate near base; leaf lobes obtuse to acute; trunk bark often furrowed *C. buckleyi*
- 33 Sepals pectinate near tip; leaf lobes sharp (acute); trunk bark usually scaly *C. intricata* var. *neobushii*
- 32 Sepals glandular-serrate; terminal shoot leaves ovate or less commonly broadly ovate.
- 34 Anthers rose or purple; sepals finely glandular-serrate *C. intricata* var. *straminea*
- 34 Anthers pink; sepals deeply glandular-serrate.
- 35 Fruit globose, 12-14 mm long, yellow; leaves subcoriaceous *C. intricata* var. *fortunata*
- 35 Fruit obovoid, 10-12 mm long, red or ruddy; leaves thin *C. intricata* var. *rubella*
- 29 Stamens 15-20.
- 36 Leaves mostly unlobed and apex obtuse; terminal shoot leaves shallowly lobed (< 1/3 to midrib) *C. mendosa*
- 36 Leaves shallowly lobed, or if unlobed then apex acute; terminal shoot leaves lobed > 1/3 to midrib.
- 37 Leaves ovate-lanceolate; margin outline nearly straight from about mid-blade to apex.
- 38 Terminal shoot leaves usually with 4 or 5 pairs of distinct lobes; often a suckering shrub *C. incilis*
- 38 Terminal shoot leaves with 3 to 4 pairs of obscure to minor lobes; usually arborescent *C. sargentii*
- 37 Leaves ovate, broadly ovate or near-rhombic; margin outline convex.
- 39 Petiole winged 1/3 or less its length; fruit often < 10 mm diameter; leaf lobes convex on sides *C. pulcherrima*

- 39 Petiole winged 1/2 of length; fruit often 10-15 mm diameter; leaf lobes often truncate on inner side.
 40 Anthers purplish; fruit yellow *C. pallens*
 40 Anthers white or yellow; fruit ruddy to dull red *C. venusta*

**Key B – hawthorns with leaf blades widest at midpoint or beyond midpoint; blade bases acute or cuneate;
 leaves conspicuously glandular on petiole and teeth; twigs and branchlets geniculate**

- 1 Leaf blades usually < 1 cm wide and < 2 cm long (on floreal shoots).
 2 Leaf blades often nearly as wide as long, blade broadly obovate or suborbicular.
 3 Leaves denticulate or remotely toothed, rarely lobed; petiole glabrate; shrub usually < 5 dm tall *C. lepida*
 3 Leaves sharply toothed, often lobed; petiole hairy; shrub usually > 5 dm tall *C. quaesita* var. *egens*
 2 Leaf blades 1.5-2× as long as broad, mostly spatulate or oblanceolate.
 4 Leaves and flower pedicels glabrate *C. lacrimata*
 4 Leaves and flower pedicels pubescent to tomentose
 5 Leaf blade attenuate along most of petiole, margin subentire, obscurely toothed near apex *C. lassa* var. *recurva*
 5 Leaf blade cuneate at base, margin distinctly toothed or dentate near apex
 6 Thorns 1-3 cm long; plant usually < 1 m tall *C. munda*
 6 Thorns 3-6 cm long; plant usually 1-2 m tall *C. pexa*
 1 Leaf blades mostly > 1 cm wide and > 2 cm long.
 7 Leaf margin mostly subentire; may have glandular-denticulate teeth or 3 lobelike points on distal part of blade.
 8 Leaves often with 3 lobelike points near apex.
 9 Leaves persistently tomentose; fruit subglobose *C. lassa* var. *lanata*
 9 Leaves glabrate to pubescent; fruit pyriform *C. lassa* var. *lassa*
 8 Leaves denticulate or subentire to apex, rarely with any lobelike points.
 10 Thorns abundant, present at nearly every node and > 3 cm long *C. lassa* var. *colonica*
 10 Thorns less numerous, many or most < 3 cm long.
 11 Leaves elliptic-obovate, blade attenuate for about half of petiole *C. lassa* var. *integra*
 11 Leaves generally spatulate, blade attenuate for most of petiole *C. lassa* var. *recurva*
 7 Leaf margin toothed along most of margin, the teeth fine, acute, or dentate.
 12 Floreal leaves mostly rhombic or broadly elliptical; branches usually not drooping.
 13 Leaves distinctly sharply toothed and/or lobed; blades broadly ovate on terminal shoots and > 3.5 cm long *C. alleghaniensis*
 13 Leaves with small or blunt teeth, mostly unlobed; blades rhombic, obovate or orbicular on terminal shoots, < 3.5 cm long.
 14 Stamens 10 per flower; terminal shoot leaves broadly rhombic to suborbicular *C. aprica*
 14 Stamens 20 per flower; terminal shoot leaves usually orbicular or broadly obovate *C. sororia*
 12 Floreal leaves nearly all obovate or spatulate; branches drooping or pendulous.
 15 Leaf apex rounded or with an abrupt short point, margins finely or sharply toothed beyond middle of blade; terminal shoot leaves unlobed to very obscurely lobed.
 16 Leaves and inflorescence thinly hairy or glabrate.
 17 Leaves and inflorescence thinly hairy; pyrenes 3-5 per fruit *C. florens*
 17 Leaves and inflorescence essentially glabrous; pyrenes 2-3 per fruit *C. teres*
 16 Leaves and inflorescence densely hairy.
 18 Leaf teeth sharp, conspicuously black-glandular, apex rather jagged-toothed *C. senta*
 18 Leaf teeth small, fine or partly crenate.
 19 Leaves persistently pubescent, apex usually rounded *C. alabamensis*
 19 Leaves pubescent when young, later glabrate, apex with a short point *C. ravenelii*
 15 Leaf apex 3-lobed or with 3-5 distinct points or several larger teeth; terminal shoot leaves moderately to deeply lobed.
 20 Fruit usually < 10 mm diameter, with calyx collar elevated.
 21 Leaf shape often narrowly obovate, lobes and teeth dentate or sharp *C. quaesita* var. *quaesita*
 21 Leaf shape often spatulate, lobes and teeth blunt to subacute *C. quaesita* var. *floridana*
 20 Fruit often 10 mm diameter or more, calyx sessile.
 22 Terminal shoot leaves ovate, tomentose, sharply serrate and deeply cut, pale green or blue-green *C. dispar*
 22 Terminal shoot leaves more obovate, glabrate or pubescent, not deeply lobed, usually medium to dark green.
 23 Leaves partly oblanceolate, usually with 2 pairs of main lateral veins *C. lancei*
 23 Leaves obovate or obovate-rhombic, with 3-5 pairs of main lateral veins.
 24 Leaf base elongated and cuneate; lobes and teeth blunt *C. furtiva*
 24 Leaf base short-cuneate or acute; lobes or teeth acute *C. visenda*

**Key C – hawthorns with leaf blades widest at midpoint or beyond midpoint; blade bases acute or cuneate;
 leaves eglandular, or if glandular then twigs and branchlets not geniculate**

- 1 Leaves spatulate or oblanceolate, < 13 mm wide; fruit < 6 mm diameter; pyrenes < 4 mm long *C. spatulata*
 1 Leaves variously shaped but most > 13 mm wide; fruit > 6 mm; pyrenes > 4 mm long.
 2 Leaves with hair tufts in abaxial main vein axils; [typically of wet or floodplain habitats].
 3 Inflorescence compound, 5-20-flowered; fruit usually < 1 cm, mature in autumn.
 4 Petiole 5-10 mm long; terminal shoot leaves rarely lobed *C. crus-galli* var. *pyracanthifolia*
 4 Petiole > 10 mm long; terminal shoot leaves usually lobed *C. viridis*
 3 Inflorescence simple, 1-5-flowered; fruit > 1 cm diameter, mature in late spring.
 5 Leaf blades mostly 5-7 cm long, elliptic, margin wavy or with uneven, blunt teeth *C. opaca*
 5 Leaf blades usually < 5 cm long, most obovate, margin finely toothed.

- 6 Leaf adaxial surface usually glossy; whitish hair tufts in main vein axils abaxially *C. aestivalis*
 6 Leaf adaxial surface matte; conspicuous reddish hair tufts in main vein axils abaxially *C. rufula*
- 2 Leaves glabrous or with hairs scattered, not in tufts; [typically of upland habitats].
- 7 Pyrenes channeled or pitted on inner side.
- 8 Leaves persistently pubescent, at least on petiole or main veins abaxially
- 9 Sepals glandular-serrate or subentire; inflorescence > 12-flowered; leaves often shallowly lobed *C. calpodendron*
 9 Sepals glandular-pectinate; inflorescence < 10-flowered; leaves dentate-serrate, usually unlobed *C. ×villiae*
- 8 Leaves glabrate or becoming so after maturity
- 10 Pyrenes with a shallow groove or depression; leaf venation vaguely reticulate and impressed adaxially *C. persimilis*
 10 Pyrenes deeply grooved or pitted; leaf venation distinctly reticulate and impressed adaxially.
- 11 Stamens 5-10 per flower; anthers 1-2 mm long *C. macracantha*
 11 Stamens 15-20 per flower; anthers < 1 mm long
- 12 Leaf blades often narrowly obovate or broadly elliptic; fruit 6-8 mm in diameter *C. succulenta* var. *neofluvialis*
 12 Leaf blades mostly broadly obovate or rhombic; fruit 7-12 mm in diameter *C. succulenta* var. *succulenta*
- 7 Pyrenes plane on inner side.
- 13 Sepals foliaceous, equaling petal length in flower and persistent on fruit; flowers usually 1-3 per inflorescence; leaf serrations obtuse or dentate; thorns very slender (about 1 mm in diameter)
- 14 Leaves of terminal shoots broadly elliptic or ovate, often shallowly lobed *C. brittonii*
 14 Leaves of terminal shoots elliptic or obovate, unlobed *C. uniflora*
- 13 Sepals not foliaceous, shorter than petals; flowers 3 or more per inflorescence; leaf serrations acute or finely crenate-serrulate; thorns moderately stout, rarely slender (1.5-3 mm in diameter).
- 15 Thorns short (< 2 cm), or spinose spur shoots present; fruit black; main lateral veins of leaves run to sinuses and lobe tips in lobed leaves *C. brachyacantha*
- 15 Thorns usually > 2 cm long; fruit not black; main lateral leaf veins lead only to lobe tips in lobed leaves.
- 16 Petioles distinctly glandular, usually with 3 or more glands persistent.
- 17 Stamens 5-10 (-15) per flower.
- 18 Fruit flesh hard or dense; calyx collar elevated on fruit; leaves moderately lobed on terminal shoots.
- 19 Anthers white or yellow *C. intricata* var. *intricata*
 19 Anthers pink or purplish.
- 20 Sepals deeply glandular-serrate; anthers pink *C. intricata* var. *rubella*
 20 Sepals finely glandular-serrate; anthers purplish *C. intricata* var. *straminea*
- 18 Fruit flesh soft; calyx collar sessile on fruit; leaves shallowly lobed or unlobed on terminal shoots.
- 21 Leaves orbicular and 6-8 cm wide on terminal shoots; [rare endemic] *C. triflora*
 21 Leaves ovate or obovate on terminal shoots, < 6 cm wide; [collectively more widespread and common].
- 22 Leaf serrations sharp, acute; leaf blades 4-6 cm long *C. alleghaniensis*
 22 Leaf serrations small, crenate; leaf blades 5-8 cm long *C. flava*
- 17 Stamens usually 20 or more per flower.
- 23 Leaves glabrous; anthers pink to purplish.
- 24 Calyx collar sessile on fruit; leaves acutely lobed on all shoots *C. ignava*
 24 Calyx collar often elevated on fruit; some floreal leaves unlobed.
- 25 Leaves shallowly lobed or unlobed on terminal shoots, apex obtuse *C. mendosa*
 25 Leaves shallowly to moderately lobed on terminal shoots, apex usually acute *C. pulcherrima*
- 23 Leaves pubescent, at least abaxially; anthers whitish; calyx collar sessile on fruit.
- 26 Sepals remotely glandular-serrate; petiolar glands sessile; fruit usually 8-12mm diameter *C. collina*
 26 Sepals deeply glandular-serrate; petiolar glands stalked; fruit usually >12mm diameter
- 27 Leaves thin; inflorescence simple, 3-5-flowered; stamens usually 30 or more *C. triflora*
 27 Leaves firm; inflorescence compound, > 5-flowered; stamens 20.
- 28 Terminal shoot leaves 4-5cm wide, unlobed; sepals often erect in fruit *C. ashei*
 28 Terminal shoot leaves 5-8cm wide, shallowly lobed or with lobelike points; sepals patent in fruit *C. harbisonii*
- 16 Petioles eglandular, or occasionally with 1 or 2 glands deciduous or obscure after spring.
- 29 Petiole often half as long as the leaf blade (or longer); sepals broadly triangular.
- 30 Stamens 10 per flower; leaf blades with 4-6 pairs of main lateral veins; calyx sessile on mature fruit *C. dodgei*
 30 Stamens 20 per flower; leaf blades with 3-4 pairs of main lateral veins; calyx collar often elevated on fruit.
- 31 Flowers 8-10 mm wide; fruit ellipsoid *C. margaretae* var. *brownii*
 31 Flowers 12-17 mm wide; fruit subglobose.
- 32 Leaf blades 20-30 mm long, often elliptic, apex acute *C. margaretae* var. *angustifolia*
 32 Leaf blades 30-40 mm long, usually rhombic or obovate, apex obtuse *C. margaretae* var. *margaretae*
- 29 Petiole usually 1/3 or less as long as the leaf blade; sepals elongate.
- 33 Leaves mostly ovate or broadly elliptic.
- 34 Petiole and leaf underside glabrous or sparsely hairy *C. aemula*
 34 Petiole and leaf underside pubescent to tomentose *C. mollis* var. *meridionalis*
- 33 Leaves mostly obovate or oblong-elliptic.
- 35 Lateral main veins of leaves impressed adaxially, prominent abaxially.
- 36 Leaves usually with 7-9 pairs of deeply impressed main lateral veins; branches often ashy gray *C. punctata*
 36 Leaves usually with 4-6 pairs of moderately impressed main lateral veins; branches dark gray.
- 37 Sepals subentire; leaves glabrous *C. disperma*
 37 Sepals glandular-serrate; leaves pubescent abaxially, at least when young
- 38 Leaves toothed near base; stamens usually 20; anthers white to yellowish; 3-5 pyrenes *C. collina*
 38 Leaves subentire near base; stamens usually 10; anthers red; 2-3 pyrenes *C. persimilis*
- 35 Lateral main veins of leaves not impressed adaxially, somewhat obscure abaxially
- 39 Leaves of terminal shoots often suborbicular; 3-5 styles and pyrenes *C. mohrii*

- 39 Leaves of terminal shoots elliptic to broadly obovate; 1-3 styles and pyrenes
 40 Leaves, petioles, pedicels glabrate *C. crus-galli* var. *crus-galli*
 40 Leaves, petioles, pedicels pubescent
 41 Stamens 20 per flower; anthers usually white or cream *C. berberifolia* var. *berberifolia*
 41 Stamens 10 per flower; anthers usually yellow or pink *C. berberifolia* var. *engelmannii*

Crataegus aemula Beadle, Rome Hawthorn. Upland hardwood and pine-hardwood forests, over sandstone, calcareous rock or circumneutral clay soils, uncommon but sometimes locally abundant. Apr; Sep. Nw. GA and ne. AL principally, disjunct in McCormick Co, SC. Related to *C. iracunda* Beadle, but foliage of *C. aemula* differs in having frequent rounded bases, thin texture, yellow-green coloration; fruits red, 12-18 mm diameter. *C. aemula* has been shown to be triploid, possibly apomictic, producing a high percentage of fertile seed with little seedling variation. The possibility of its being of hybrid origin between *C. iracunda* Beadle and *C. collina* Chapman has been suggested. [= FNA, K, Q, X; <*C. macrosperma*- S]

Crataegus aestivalis (Walter) Torrey & A. Gray, Mayhaw, Eastern Mayhaw. Swamp forests, generally where flooded for much of the year, often flowering and fruiting while standing in water, often associated with *Taxodium distichum*, *Nyssa aquatica*, *Nyssa biflora*, and *Planera aquatica*, uncommon but sometimes locally abundant; occasionally growing as groves or stands in 'mayhaw flats'. Mar-Apr; Jun-Jul. Se. NC south to n. FL and se. AL. A historic record of *C. aestivalis* in VA appears to be based on a single specimen collected 22 July 1934 by M.L. Fernald & B. Long, in Princess Anne County; this specimen is actually *C. crus-galli*. A related species, *C. opaca* Hooker & Arnott, occurs west of the range of *C. aestivalis*, in similar habitats. Plants with copious growth of reddish pubescence on the leaf undersides are included under *C. rufula*. The fruits of all three species are traditionally gathered for preserves, pies, and jelly. See Phipps (1988) for extensive additional discussion of *C. aestivalis* and relatives. [= FNA, K, RAB, X, Z, FNA; <*C. aestivalis* - S]

Crataegus alabamensis Beadle, Alabama Hawthorn. Upland pine and pine-oak forests over clay soil. Apr; Aug-Sep. S. AL, reported from n. FL. The typical form of *C. alabamensis* has crenate-serrate, pubescent foliage and tomentose inflorescence parts. The similar *C. ravenelii*, *C. florens*, *C. atrita*, and *C. teres* are progressively more glabrate and of wider ranges; these interpreted as varieties of *C. alabamensis* in Lance (2011, 2014) and separate species in Phipps & Dvorsky (2008). [= FNA, X, V; <*C. flava* Aiton - K, RAB, S; >*C. adunca* Beadle - Q; >*C. atrita* Beadle - Q; >*C. florens* Beadle - Q; >*C. fortis* Beadle - Q]

Crataegus alleghaniensis Beadle, Allegheny Hawthorn. Upland pine and pine-oak forests with clay soils. Apr; Aug-Sep. E. c. and ne. GA to c. and n. AL; reported from n. MS, e. TN, sw NC. Broadly considered, this species includes a variety of morphological forms; a narrower view might hold some to specific levels. Alternatively, the overall intermediate morphology suggests possible hybrid origin of most or all of these entities, perhaps between members of the *Intricatae* and *Apricae* series. Generally, leaves are sharply serrate and shallowly incised-lobed; stamens 10-20 per flower and anthers pink to purple; fruit 8-12 mm, red, with soft flesh. The stamen counts vary from 10 in typical *C. alleghaniensis* to 12-20 in related forms sharing much of the same range. [= FNA, U, X; >*C. agrestina* Beadle - Q; >*C. alleghaniensis* - Q; >*C. cullasagensis* W.W. Ashe - Q; >*C. frugiferans* Beadle (= *C. rigens* Beadle) - Q; <*C. flava* Aiton - RAB; >*C. alleghaniensis* var. *alleghaniensis* - X; >*C. alleghaniensis* var. *mira* (Beadle) R.W. Lance - X]

Crataegus aprica Beadle, Sunny Hawthorn. Upland pine forests, pine-oak forests, mixed hardwood forests over rocky or sandy substrates, abandoned fields, roadsides. Late Mar-Apr; Sep. Se. VA and NC south to s. GA and n. FL, west to e. AL. This species is most common in the upper Piedmont and Southern Appalachians of NC and SC, and sporadic in the Coastal Plain. The 10 stamens separate this species from the closely related and similar *C. sororia*, and both these taxa have long been included under the collective name of *C. flava* Aiton in many earlier treatments (see discussion of *C. flava*). [= FNA, W, X, Phipps 2007; >*C. aprica* - Q; <*C. flava* Aiton - RAB; >*C. shallotte* W.W. Ashe]

Crataegus ashei Beadle, Ashe Hawthorn. Prairies, hardwood forests, pine-hardwood flats, especially over calcareous clay soils. Core of range is central MS, where this species is locally common in Scott and Smith counties; sporadic in c. and s. AL, e. LA, se. AR (s. TN?). Related to *C. triflora* Chapman and *C. harbisonii* Beadle. [= FNA, Q, U, X; <*C. harbisonii* Beadle - K]

Crataegus beata Sargent, Rochester Hawthorn. A northern species, distributed from NY to WV, w. to OH, MI; one historical record from VA. Allied closely to *C. iracunda* Beadle, and perhaps better treated as a variety of that species. [= F, FNA, G, K, X]

Crataegus berberifolia Torrey & Gray var. *berberifolia*, Barberry Hawthorn. Mixed hardwood and pine forests. Apr-May; Aug-Oct. C. VA south to n. FL, west to TX, MO; most common in LA, s. AR, e. TX. Closely related to and sometimes intergrading with *C. crus-galli*; differing from that species by consistent pubescence on foliage, twigs, floral and fruit parts; 10-stamened forms of the normally 20-stamened *C. berberifolia* have been called *C. engelmannii* Sargent, here treated as *C. berberifolia* var. *engelmannii*. [= C, FNA, K, Q, S, X]

Crataegus berberifolia Torrey & Gray var. *engelmannii* (Sargent) Eggleston. Mixed hardwood and pine forests of uplands, usually in subxeric to xeric habitats, especially over basic to calcareous soils. Apr-May; Aug-Oct. Foliage similar to the typical variety in most respects except for tendency to be more scabrate-pubescent and reticulately veined; presence of 10 stamens per flower is typical. Appears most common in MO and AR, mixed sporadically with the species eastward to e. TN, c. NC; suspected of some intergradation with *C. crus-galli* in mixed populations. [= FNA, X; > *C. engelmannii* Sargent – Q; > *C. berberifolia* var. *engelmannii* (Sargent) Eggleston; > *C. torva* Beadle – Q; > *C. sinistra* Beadle – Q]

Crataegus brachyacantha Sargent & Englemann, Blueberry Hawthorn. Open pinelands. Apr; Sep. In sw. GA, one historic record, disjunct from a main range farther west (primarily LA and e. TX). The only eastern hawthorn bearing black fruit, appearing blue due to an exterior waxy bloom. [= FNA, K, Q, S, Y, X]

Crataegus brittonii Eggleston, Britton's Hawthorn. Thinly forested hills and slopes, bluffs, rock outcrops, disturbed lands, roadsides, streamsides. Apr-May; Sep-Oct. Range apparently limited to sw NC and adjacent NC Piedmont to c. SC, e. and n. GA. Allied closely to *C. uniflora* Muenchhausen and possibly only a derivative of it. Leaf shape often ovate to elliptic. [= FNA, K, S; > *C. uniflora* – Q; > *C. uniflora* var. *brittonii* (Eggleston) R.W. Lance – X; > *C. arenicola* W.W. Ashe; > *C. rhodella* W.W. Ashe – Q]

Crataegus buckleyi Beadle, Buckley's Hawthorn. Upland pine and hardwood forests, rock outcrops. Apr-May; Aug-Oct. W. NC, w. SC, n. GA west to n. AL. Related to *C. intricata* Lange; distinguished primarily by purplish anthers, glandular-serrate calyx lobes, russet fruit and small (3-6 cm long × 2-4 cm wide) leaves with blunt lobes. [= FNA, Q, X; < *C. flabellata* – RAB; < *C. intricata* Lange – C, K]

Crataegus calpodendron (Ehrhart) Medikus, Pear Hawthorn. Mixed hardwood forests, open slopes, wooded ravines, streamsides, especially over basic or calcareous rocks. May-early Jun; Sep-Oct. From a generally northern range, the southern limits extend down the Appalachian region and adjacent Piedmont of VA to n. GA, c. AL, n. MS, and AR. Often found as a solitary specimen or in small local populations. One of the latest hawthorns in our area to flower. Fruit production appears scant in its southern range. [= C, FNA, K, Pa, RAB, S, W, X; > *C. calpodendron* var. *calpodendron* – F, G; > *C. calpodendron* var. *microcarpa* (Chapman) E.J. Palmer – F, G; > *C. calpodendron* var. *globosa* (Sargent) E.J. Palmer – F, G; > *C. chapmanii* Beadle – Q; > *C. tomentosa* Du Roi]

Crataegus coccinea Linnaeus, Scarlet Hawthorn. Deciduous forest understories, pastures, upland thickets. May; Oct. Distributed southward along the Appalachian Plateau from a predominately northern range. The combination of large, pubescent leaves (9-12 cm long) on terminal shoots, evenly toothed calyx lobes and 5-10 stamens per flower are distinctive. *C. coccinea* may attain treelike proportions, to 10 m tall. [= C, FNA, RAB, X; > *C. pennsylvanica* W.W. Ashe – F, G, Pa; > *C. pedicellata* Sargent – K, W; > *C. coccinea* – Pa]

Crataegus coccinioides W.W. Ashe, Kansas Hawthorn, Broadleaf Hawthorn. Reported from a single county in WV. Apparently conspecific with *C. dilatata* Sargent, which was formerly thought to range from PA to areas northward, and *C. coccinioides* being a mid-western entity, IL to se KS. May; Oct. *C. coccinioides* is occasionally cultivated. [= C, FNA, Pa, X; > *C. dilatata* Sargent; > *C. locuples* Sargent]

Crataegus collina Chapman, Hillside Hawthorn. Hardwood and pine-oak forests of hills and valleys, brushy lands. Mar-Apr; Aug-Oct. Sw. VA west to KS, south to c. GA, s. AL, c. MS, AR and OK. Closely allied to *C. punctata*, but more southern in range and at lower elevations. The fruits rarely reach 12 mm in diameter, whereas those of *C. punctata* often range from 12-23 mm. *C. collina* occupies sub-xeric uplands in the Appalachian Region and is tolerant of lowland floodplains in GA, AL, TN. It is one of the earliest hawthorns to flower in spring. Foliage may be conspicuously pubescent in some local genotypes. [= S, W, X; < *C. punctata* Jacquin – C, RAB; > *C. collina* var. *collina* – F, FNA, G; > *C. collina* var. *collicola* (W.W. Ashe) – F, G; > *C. collina* – Q; > *C. ingens* Beadle – Q; > *C. amnicola* Beadle – Q]

Crataegus compacta Sargent, Clustered Hawthorn. Rocky hardwood forests, mountain pastures. May; Sep-Oct. NY to Ontario, MI and s. to w. VA, WV, OH. This northern species is known in VA from only 3 counties. It is closely allied to *C. pruinosa*, varying by its compact inflorescences, small anthers and long-petioled leaves with crenate-serrulate margins. There is also an affinity suggested by morphology to the more southerly-distributed *C. gattingeri*. [= F, FNA, G, X]

Crataegus craytonii Beadle, Crayton Hawthorn. Wooded slopes, roadsides, streamsides. Late Apr-May; Sep. W. NC to n. GA, n. AL, possibly e. TN; an ambiguous record in New Kent County, VA. Closely related to *C. intricata* Lange; differs by a combination of 20 stamens and copiously pubescent foliage and inflorescence. [= FNA, Q, X]

Crataegus crus-galli Linnaeus var. *crus-galli*, Cockspur Hawthorn. Pastures, thickets, disturbed woodlands and forests, fencerows. Apr-May; Sep-Oct. Ranges throughout the eastern US, except c. and s. peninsular FL, sometimes forming extensive colonies. *C. crus-galli* is variable in the size and shape of leaves and minor flower and fruit characters, this accounting for an extensive synonymy, with most earlier names applied by Charles Sargent. Plants having 3 to 5 styles and as many pyrenes have been alternatively placed under *C. reverchonii* Sargent, these also exhibiting a tendency to have smaller, suborbiculate leaves on terminal shoots. Typical forms of *C. crus-galli* tend to have 1 to 2 styles and pyrenes, and with a range of leaf shapes from narrow to nearly suborbiculate. [= C, FNA, W, X; < *C. crus-galli* – Pa, RAB; > *C. crus-galli* – K; > *C. macra* Beadle – Q; > *C. regalis* Beadle var. *regalis* – F; > *C. algens* Beadle – Q; > *C. arborea* Beadle – K; > *C. canbyi* Sargent; > *C. crus-galli* var. *crus-galli* – F, G; > *C. crus-galli* var. *exigua* (Sargent) Eggleston – G; > *C. crus-galli* var. *macra* (Beadle) E.J. Palmer – F, G; ? *C. crus-galli* – S]

Crataegus crus-galli Linnaeus var. *pyracanthifolia* (Aiton) Sargent. Bottomland forests, swamp borders, lowlands, at times locally abundant. Apr-May; Oct. DE south to n. FL, west to MO, e. TX. The narrow leaves may be glabrous or pubescent on the lower surface, varying as local genotypes. [= FNA, X; > *C. crus-galli* var. *pyracanthifolia* (Aiton) Sargent – F, G; > *C. limnophylla* Sargent – K; > *C. pyracanthoides* Beadle var. *arborea* (Beadle) E.J. Palmer – G; > *C. pyracanthoides* Beadle – Q]

Crataegus dispar Beadle, Aiken Hawthorn. Upland pine or pine-oak forests under sub-xeric to xeric conditions, in well-drained clay or sandy soils. Late Mar-Apr; Sep. Nc. & sc. SC and adjacent e. GA; single sporadic collections known from Panhandle FL and ne. AL. A distinctive species with deeply incised and serrated, tomentose, pale bluish-green leaves. [= FNA, K, Q, V, X]

Crataegus disperma W.W. Ashe, Two-seed Hawthorn. Upland forests, pastures, brushy hillsides. May; Sep-Oct. PA west to IN, south in the Appalachians to VA and e. KY. *C. disperma* is of presumed hybrid origin between *C. crus-galli* and *C. punctata*, since characters appear intermediate. It sometimes appears in mixed populations of the putative parent species, but its reproductive biology is poorly known. Similar to other hawthorns of presumed hybrid origin, it may be apomictic but no large local populations are known. [= F, FNA, K, X; > *C. ×disperma* W.W. Ashe – K]

Crataegus dodgei W.W. Ashe, Dodge Hawthorn. Mesic hardwood forests, streamside thickets, pastures. May; Sep-Oct. A northern species predominately of the Great Lakes Region east to CT, sporadic southward in the Appalachians to WV, VA, and nw. NC (Ashe County). Plants in NC and VA having acutely lobed leaves may correspond to var. *flavida* (Sargent) P.G. Smith & J.B. Phipps; typical var. *dodgei*, having more obtuse lobes, may also be represented in NC and VA. Synonymous to *C. dodgei* is *C. mercerensis* Sargent, known from WV and having mostly unlobed leaves. [= FNA, Pa; > *C. dodgei* var. *dodgei* – X; > *C. dodgei* var. *flavida* (Sargent) P.G. Smith & J.B. Phipps – X; > *C. mercerensis* Sargent]

Crataegus fecunda Sargent, St. Clair Hawthorn. Rich forests. Apr; Sep-Oct. KY, s. IL, and MO south to ne. AR, along the Mississippi and Ohio Rivers. Not recently seen and possibly extinct. [= FNA; = *C. ×fecunda* – X] {not yet keyed}

Crataegus flava Aiton, Yellow Hawthorn. Dry woodlands. A taxon originally described from a cultivated plant in Europe, assumed native from central SC s. to n. FL but few naturally-occurring plants have been located which match the type specimen; hybrid origin involving some member of the *Pulcherrimae* or *Intricatae* series is suspected. The name *C. flava* Aiton has been misapplied to members of the *Lacrimatae* and *Apricae* series for more than a century. [= FNA, Q, X; < *C. flava* Aiton – K, RAB, S; > *C. elliptica* Aiton]

Crataegus florens Beadle, Mississippi Hawthorn. Pine and pine-oak forests, subxeric to mesic habitats with sandy or clay soils. Apr; Aug-Sep. E. NC south to n. FL, west to LA. Inflorescences slightly pilose-pubescent; leaves slightly pubescent or

glabrate; stamens 10-20 per flower; fruit 10-20 mm; 3-5 styles and pyrenes. [= V, FNA; < *C. flava* Aiton – K, RAB, S; > *C. atrita* Beadle – Q, X; > *C. florens* Beadle – Q; > *C. fortis* Beadle – Q; > *C. insidiosa* Beadle – Q; < *C. alabamensis* var. *florens* (Beadle) Lance – X]

Crataegus furtiva Beadle, Albany Hawthorn. Upland pine forests, pine-oak scrub, sandhills, disturbed woodlands, abandoned fields. Late Mar-Apr; late Aug-Sep. Se. NC to c. AL, s. to peninsular FL. The most definitive morphological traits are the heavily white-pubescent floral and early vegetative parts and obovulate, 3-lobed leaves. [= FNA, X, V; ? *C. furtiva* – Q]

Crataegus gattingeri W.W. Ashe, Gattinger's Hawthorn. Upland hardwood forests, pastures. Apr-May; Sep-Oct. PA to n. GA, w. to MO, AR; extending s. into coastal plain in AL, MS, LA, AR. This taxon bears some resemblance to the northerly *C. compacta* Sargent in its small anthers and elongate terminal lobe of the leaves, and alternately considered a synonym or variety of *C. pruinosa* (Wendl.) K. Koch. The entity *C. georgiana* Sargent may represent an intermediate of *C. gattingeri* and *C. iracunda* Beadle. [= F, FNA; < *C. flabellata* – RAB; > *C. gattingeri* var. *gattingeri* – G; > *C. pruinosa* var. *gattingeri* (W.W. Ashe) Lance – Va, X; > *C. gattingeri* var. *rigida* E.J. Palmer – G; > *C. georgiana* Sargent – Q]

Crataegus harbisonii Beadle, Harbison's Hawthorn. Hardwood forest understories, over limestone or other calcareous materials. Endemic to c. and w. TN and currently known only from Davidson and Obion Counties, TN. Late Apr-May; Sep-Oct. The related species *C. ashei* has a more southern distribution in AL, MS, and LA. [= FNA, Q, S, T, U, X; < *C. harbisonii* Beadle – K]

Crataegus holmesiana W.W. Ashe, Holmes's Hawthorn. Woodland edges, pastures, fencerows. Reported for WV; sporadic from NY to WI. May; Sep-Oct. Allied to *C. coccinea* L. and possibly of hybrid origin. [= F, FNA, K, S, X]

Crataegus ignava Beadle, Valley Head Hawthorn. Upland pine and pine-oak forests, clay soils. Apr; Aug-Sep. Ec. SC to sw. GA, north to n. AL and n. GA. Related to *C. alleghaniensis* Beadle, and perhaps of a similarly suspect hybrid origin. Alternatively may be considered a variety of *C. alleghaniensis*, but *C. ignava* is the most frequently seen allied entity across our area. Inflorescences are glabrate; stamens 15-20; anthers pink to rose. [= FNA; > *C. ignava* – Q; > *C. extraria* Beadle – Q; > *C. impar* Beadle – Q; > *C. alleghaniensis* Beadle var. *ignava* (Beadle) R.W. Lance – X; > *C. alleghaniensis* var. *extraria* (Beadle) R.W. Lance – X]

Crataegus incilis Beadle, Cutleaf Beautiful Hawthorn. Mixed pine and hardwood forests, wooded hills, rocky woods. Late Mar-Apr; Aug-Sep. Sw. GA and Panhandle FL, west to s. MS, north to ne. AL. *C. incilis* is a usually shrubby relative of *C. pulcherrima* with a strong suckering habit and slender shoots exhibiting thin, distinctly incised leaves. The 4 or 5 pairs of lobes per leaf, acute or cuneate leaf base and 5-8 mm fruit are also characteristic. It is locally abundant in the vicinity of lower Little River Canyon, AL and sporadically elsewhere in the known range. [= FNA; > *C. concinna* Beadle – Q; = *C. pulcherrima* W.W. Ashe var. *incilis* (Beadle) R.W. Lance – X]

Crataegus intricata Lange var. *biltmoreana* (Beadle) R.W. Lance, Biltmore Hawthorn. Wooded hills, rock outcrops, thickets. Late Apr-May; Sep-Oct. VT south to c. GA, west to AR, MO. Distinguished by hairiness of its vegetative and floral parts and deeply glandular-serrate calyx lobes. [= X; = *C. biltmoreana* Beadle – FNA; ; > *C. biltmoreana* Beadle – F, G, Q; > *C. confusa* Sargent – F; > *C. villicarpa* Sargent – F; > *C. stonoi* Sargent – F]

Crataegus intricata Lange var. *boyntonii* (Beadle) Kruschke, Boynton's Hawthorn. Upland forest understories, pastures, rock outcrops, shrubby thickets. W. NC, n. SC west to n. GA. Apr-May; Sep-Oct. Differs from typical var. of *C. intricata* by having an abundance of broadly ovate to deltoid leaves 5-8 cm long × 3-5 cm wide, and more robust thorns. Possibly represents a southern Appalachian endemic form of *C. intricata*. [= C, K, Q, X; < *C. intricata* Lange – FNA; < *C. flabellata* – RAB; = *C. boyntoni* – F, G, orthographic variant; > *C. ravida* W.W. Ashe]

Crataegus intricata Lange var. *fortunata* (Beadle) R.W. Lance, Yellow-fruited Entangled Hawthorn. Hardwood forest edges, rock outcrops, thickets. May; Sep-Oct. PA and WV; disjunct in w. NC. Yellow fruit, pink anthers and rather thick-textured leaves distinguish this taxon from other regional varieties of *C. intricata*. Known in NC only from Chimney Rock Mountain in Rutherford County. [= X; <? *C. padifolia* Sargent var. *padifolia* – FNA; = *C. fortunata* Sargent] {add to synonymy}

Crataegus intricata Lange var. *intricata*, Entangled Hawthorn. Pastures, wooded hills, rock outcrops, thickets. Late Apr-May; Aug-Oct. Widespread range from northern states s. to c. SC, c. GA, c. AL, n. MS, west to AR and OK; most common in Appalachian region. Broadly defined, a variable taxon incorporating numerous minor local forms. Basic defining characters are 10 stamens, pale anthers, hard greenish or ruddy-blushed fruits with an elevated calyx, glabrous, slightly glandular foliage and slender thorns; habit frequently shrubby. Significant entities are segregated into several varieties. [= C, K, S, W, X; < *C. intricata*

Lange – FNA; ; < *C. flabellata* – RAB; > *C. intricata* var. *intricata* – F, G; > *C. lentula* W.W. Ashe – F; > *C. rubescens* W.W. Ashe – F; > *C. virgata* W.W. Ashe – F; < *C. intricata* – Pa; > *C. foetida* W.W. Ashe]

Crataegus intricata* Lange var. *neobushii (Sargent) Kruschke. Bush Hawthorn. Wooded hills, pastures, thickets. Late Apr-May; Sep-Oct. W. NC and n. GA west to AR and MO. The sharply toothed and lobed leaves and pink anthers are distinctive. [= X; = *C. neobushii* Sargent – FNA; > *C. cuprea* Sargent; > *C. leioclada* Sargent]

Crataegus intricata* Lange var. *rubella (Beadle) Kruschke, Little Red Hawthorn. Hardwood forests, rock outcrops, thickets. Late Apr-May; Sep-Oct. PA west to se. MO, south to n. SC, c. GA, and AR. Distinguished by shallowly lobed or unlobed leaves, oblong red fruit, purplish anthers. [= Va, X; < *C. rubella* Beadle – FNA; > *C. apposita* Sargent – F; < *C. flabellata* – RAB]

Crataegus intricata* Lange var. *straminea (Beadle) E.J. Palmer. Wooded hills, thickets, disturbed forests. Late Apr-May; Sep-Oct. PA s. to n. GA, w. to c. KY, ne. AL. Related to *C. rubella* Beadle, but fruit normally yellowish, inflorescences and young leaves frequently slightly pilose. [= X; >> *C. rubella* Beadle – FNA; > *C. straminea* Beadle – FNA; > *C. communis* Beadle – FNA; ? *C. communis* Beadle]

***Crataegus iracunda* Beadle**, Forest Hawthorn. Swamps, bottomlands, moist slopes, wooded hills, sometimes locally abundant. Apr-May; Sep-Oct. PA and OH south to s. GA and ne LA. Plants of Appalachian and northern portions of range tending to be glabrate; increased pubescence in southern genotypes. Morphology similar to *C. macrosperma* W.W. Ashe and separation of juvenile plants in sympatric ranges can be problematic. [= K, X; < *C. flabellata* (Bosc) K. Koch – C, RAB; > *C. iracunda* var. *iracunda* – F, G; > *C. iracunda* var. *silvicola* (Beadle) E.J. Palmer – F, G; > *C. iracunda* – FNA, Q; > *C. silvicola* Beadle – Q; > *C. drymophila* Sargent; > *C. populnea* W.W. Ashe – F, FNA, G; > *C. riparia* W.W. Ashe; > *C. sectilis* W.W. Ashe; > *C. shalotte* W.W. Ashe; > *C. iracunda* var. *iracunda* – X; > *C. iracunda* var. *populnea* (W.W. Ashe) R.W. Lance – X]

***Crataegus lacrimata* Small**, Weeping Hawthorn. Xeric, sandy soils, in scrublands and in association with sparse stands of *Pinus clausa* or *Pinus palustris*. Endemic to the western FL Panhandle; perhaps in adjacent sandhill scrub of AL. Late Mar-Apr; Aug-Sep. The combination of slender, conspicuously weeping branches, small spatulate leaves, glabrous character, and treelike habit in *C. lacrimata* is unique among a large group of related hawthorns which occupy sandy habitats in the Coastal Plain. [= FNA, Q, V, X]

***Crataegus lancei* J.B. Phipps**, Lance's Hawthorn. Upland hills, hardwood-pine forests, scrubland, pastures. Apr-May; Aug-Sept. S. NC to e. GA, with outlier populations reported from sw. GA, n. peninsular FL and se. AL. Appears to have a core range in w. SC and ne. GA, sporadic elsewhere in a fragmented range that involves broad areas devoid of specimens. [= FNA, V, X; < *C. flava* Aiton – K, RAB, S, W; ? *C. pentasperma* W.W. Ashe, nomen dubium]

Crataegus lassa* Beadle var. *colonica (Beadle) R.W. Lance, Bluffton Hawthorn. Oak-pine scrub and sandy uplands. Late Mar-Apr; Aug-Sep. Se. NC to n. FL, west to n. SC, e. GA. Morphology suggests the possibility of this entity being an intermediate form between *C. lassa* var. *lassa* and *C. pexa*. [= X; = *C. colonica* Beadle – FNA, Q]

Crataegus lassa* Beadle var. *integra (Beadle) R.W. Lance, Lake Ella Hawthorn. Oak-pine scrub and sandy uplands. Late Mar-Apr; Aug-Sep. Central SC south to peninsular FL, west to s. and c. AL. Core range is peninsular FL and n. FL, where this entity is most common. Sometimes poorly differentiated from typical *C. lassa* where sympatric in range, likely due to intergradation among mixed populations. [= X; = *C. integra* Beadle – FNA; >> *C. flava* – K; > *C. integra* Beadle – Q; > *C. dolosa* Beadle – Q; > *C. constans* Beadle – Q; > *C. sodalis* Beadle – Q; < *C. flava* Aiton – RAB]

Crataegus lassa* Beadle var. *lanata (Beadle) R.W. Lance, Lanate Hawthorn. Oak-pine scrub and sandy uplands. Late Mar-Apr; Aug-Sep. Se. NC to c. peninsular FL, west to n. GA, c. AL. The densely white-pubescent leaves are morphologically the most significant trait, but some intergradation with other forms of *C. lassa* may occur in mixed populations. Often of arborescent habit, with drooping branches and floppy leaves. [= X; = *C. lanata* Beadle – FNA, Q]

Crataegus lassa* Beadle var. *lassa, Sandhill Hawthorn. Pine forests, oak-pine scrub, upland scrublands, xeric woodlands, especially in deep sand and soils of rapid drainage. Late Mar-Apr; Aug-Sep. Central NC south to n. FL, west to s. AL. *C. lassa* broadly defined includes a range of minor species, most described by Beadle. All have been synonymized under the *C. flava* Aiton name in many previous floral treatments. [= X; = *C. lassa* – FNA; < *C. flava* Aiton – RAB; >> *C. flava* – K; > *C. lassa* – Q; > *C. amica* Beadle – Q; > *C. arguta* Beadle – Q; > *C. illudens* Beadle – Q; > *C. inops* Beadle – Q; > *C. meridiana* Beadle – Q; > *C. pearsonii* W.W. Ashe? – K, Q; > *C. michauxii* Persoon ? – Q, S]

Crataegus lassa Beadle var. *recurva* (Beadle) R.W. Lance, Ocala Hawthorn. Oak-pine scrub and sandy uplands. Late Mar-Apr; Aug-Sep. Ec. NC to peninsular FL, west to s. AL. Core range is peninsular FL and n. FL, where this entity is most common. Sometimes poorly differentiated from var. *integra* in mixed populations, likely due to some intergradation. [= X; = *C. crocea* Beadle – FNA; > *C. crocea* Beadle – Q; > *C. curva* Beadle – Q; > *C. frugalis* Beadle – Q; > *C. incana* Beadle – Q > *C. recurva* Beadle – Q; > *C. villaris* Beadle – Q]

Crataegus lepida Beadle, Pygmy Hawthorn. Xeric, sandy soils of open pinelands, wiregrass-dominated roadsides and forest edges, oak-pine scrub. Apr; Aug-Sep. S. GA south to c. peninsular FL. *C. lepida* is distinctive in bearing a preponderance of oval to orbicular, 1-2 cm leaves, short thorns and a dwarfish habit. [= FNA, X; > *C. lepida* – Q; > *C. condigna* Beadle – K, Q]

Crataegus levis Sargent. Open woodlands. Apr-May; Sep-Oct. Reported from w. NC (FNA); similar to *C. macrosperma* and possibly of hybrid origin of the latter with *C. pruinosa*. It is primarily distinguished by a combination of 10 stamens, reddish anthers and hard fruits. [= F, G, FNA]

Crataegus macracantha Loddiges ex Loudon, Large-spine Hawthorn. Rocky or mesic hardwood forests, high pastures, clearings, shaly soils. May; Oct. From the northeastern states west across upper midwestern U.S. and s. Canada to the Rocky Mountains, with range extensions s. to sw. VA and s. MO. The larger anthers and fewer stamens in its flowers are the chief diagnostic traits separating this species from *C. succulenta* Schrader ex Link. In the Midwest a pubescent form is known, var. *pertomentosa*, not here formally recognized. [= FNA, G; > *C. succulenta* var. *macracantha* – F, G; > *C. succulenta* var. *pertomentosa* (W.W. Ashe) Kruschke – F]

Crataegus macrosperma W.W. Ashe, Eastern Hawthorn. Mesic to subxeric hardwood forests, wooded slopes, rock outcrops, pastures, thickets, mountain balds and rocky summits. Apr-early May; Sep-Oct. PA w. to IL, s. to n. SC, n. MS. *C. macrosperma* is consistent in its adaxially scabrous young leaves, 5-10 stamens, and soft-textured mature fruit. The pyrenes are not unusually large (5-8 mm), despite the name. [= FNA, K, Pa, W, X; < *C. flabellata* (Bosc) K. Koch – RAB; > *C. flabellata* – C; > *C. macrosperma* var. *macrosperma* – F, G; > *C. macrosperma* var. *roanensis* (W.W. W.W. Ashe) E.J. Palmer – F, G; > *C. macrosperma* – Q; > *C. brainerdii* – C, Pa, misapplied to material in our area; > *C. roanensis* W.W. Ashe – Q; < *C. macrosperma* – S]

Crataegus margarettae W.W. Ashe var. *angustifolia* E.J. Palmer, Narrowleaf Margaret's Hawthorn. Mesic to dry hardwood forests, streamsides, pastures. Apr-May; Sep-Oct. Distributed generally with the range of the typical species. Distinguished primarily by its tendency for elliptic leaves; perhaps deserving only a forma designation. [= FNA; < *C. margarettae* – Q; < *C. chrysocarpa* W.W. Ashe – C, Pa; > *C. chrysocarpa* – K; ? *C. margarettae* – K, orthographic variant]

Crataegus margarettae W.W. Ashe var. *brownii* (Britton) Sargent, Brown's Hawthorn. Mesic hardwood forests, streamside thickets, pastures. Apr-May; Sep-Oct. A marginally distinct variant known from VA, WV, OH. [= FNA; > *C. margarettae* var. *margarettae* – F, G; > *C. margarettae* var. *brownii* (Britton) Sargent – F; > *C. margarettae* var. *brownei* – G (orthographic variant); < *C. chrysocarpa* W.W. Ashe – C, Pa; > *C. chrysocarpa* – K; ? *C. margarettae* – K, orthographic variant]

Crataegus margarettae W.W. Ashe var. *margarettae*, Margaret's Hawthorn. Mesic hardwood forests, streamside thickets, pastures. Apr-May; Sep-Oct. PA west to IO, south to w. VA, MO {TN, w. VA}. *C. margarettae* is distinctive in its widely obovate to nearly orbicular leaves with obtuse lobes, petioles often as long as the blade. [= FNA; = *C. margarettae* – Q, S, X; > *C. margarettae* var. *margarettae* – F, G; > *C. margarettae* var. *brownii* (Britton) Sargent – F; > *C. margarettae* var. *brownei* – G (orthographic variant); < *C. chrysocarpa* W.W. Ashe – C, Pa; > *C. chrysocarpa* – K; ? *C. margarettae* – K, orthographic variant]

Crataegus marshallii Eggleston, Parsley Hawthorn, Parsley Haw. Swamp forests, alluvial forests, dry and mesic upland slopes (especially over mafic or calcareous rocks). Apr-early May; Sep-Oct. Se. VA south to c. peninsular FL, west to e. TX, and north in the interior to n. AL, sc. and w. TN, n. MS, s. IL, se. MO, se. OK. *C. marshallii* is distinctive and immediately recognizable by its deeply incised leaves and small fruits (4-6 mm long by about 3 mm wide, with only 1-3 pyrenes). [= C, F, FNA, G, K, RAB, S, W, X, Y; = *C. apiifolia* (Marshall) Michaux – Q]

Crataegus mendosa Beadle, Albertville Hawthorn. Mesic hardwood forests, mixed pine-hardwood forests, upland wooded hills over calcareous substrates and well-drained clays. Apr; Sep. Lower Piedmont and upper Coastal Plain of sc. SC, wc. GA, ne. and c. AL, and c. and s. MS. Allied to *C. pulcherrima* W.W. Ashe, and perhaps only a variant of it, *C. mendosa* is distributed northward and eastward beyond the bulk of the range of *C. pulcherrima*, and the only member of the *Pulcherrimae* series known to occur in SC. Leaf shape is the chief diagnostic feature of this taxon. [= FNA, K, N, Q, S, X]

Crataegus mohrii Beadle, Mohr's Hawthorn. Hardwood and pine-hardwood forest understories. May; Sept.-Oct. Rare and sporadic from MS to GA, n. to TN. Possibly an intermediate of *C. crus-galli* L. and *C. reverchonii* Sargent. [= F, K, S; = *C. reverchonii* var. *mohrii* (Beadle) J.B. Phipps – FNA, X]

Crataegus mollis Scheele var. *meridionalis* (Sargent) J.B. Phipps, Southern Downy Hawthorn. Prairies, streamsides, scrubland. Rare and sporadic in central and s. AL and MS, primarily distributed in Black Belt and Jackson Prairie ecoregions. This southern form of *C. mollis* is distinguished by its elliptic, unlobed floreal shoot leaves; the range is east-peripheral to the general western range of typical *C. mollis*. [= FNA, K]

Crataegus mollis Scheele var. *mollis*, Downy Hawthorn. Mesic forests, alluvial forests, wooded uplands over basic or calcareous soils. Late Mar-Apr; Sep-Oct. The unusual occurrence of this species in the Mountains of VA is atypical of the majority of the range, which is mostly north and west of VA and GA; PA to ND, south to s.TX, e. to nw. GA. *C. mollis* shows wide variability in size and shape of leaves and fruit, but the tomentose young petioles and pubescent leaf undersides are consistent. The fruits of some local genotypes can reach 24 mm diameter, among the largest of the genus in the U.S. *C. mollis* often reaches treelike dimensions, to 10 m tall and trunk diameters to 30 cm. [= C, Pa, S, X; > *C. mollis* var. *mollis* – F, G; > *C. mollis* – K, Q; > *C. cibaria* Beadle – Q; > *C. gravaida* Beadle – Q; > *C. cibalis* W.W. Ashe; > *C. meridionalis* Sargent – K; ?> *C. albicans* W.W. Ashe – S]

* *Crataegus monogyna* Jacquin, English Hawthorn, One-seeded Hawthorn. Mesic soil; native of Europe. Only one definitive record of naturalization of this exotic species is evident for our region, near the Potomac River in Fairfax County, VA. [= C, F, G, K, Pa, X; > *C. monogyna* var. *monogyna* – FNA]

Crataegus munda Beadle. Xeric or subxeric forests, scrublands, disturbed woodlands. Late Mar-Apr; Sep-Oct. *C.* NC south to n. FL, west to s. and c. AL. *C. munda* as here considered includes in synonymy several shrubby taxa (< 2 m tall) with small (1-3 cm long), predominately spatulate leaves, slender geniculate twigs with thorns < 3 cm long, and inflorescences of 1-3 (-5) flowers. [= FNA, V, X; < *C. flava* Aiton – RAB, W; > *C. munda* – K, Q; > *C. geniculata* W.W. Ashe – Q; > *C. yadkinensis* W.W. Ashe – Q; > *C. pexa* Beadle – Q; > *C. invicta* Beadle – K, Q]

Crataegus opaca Hooker & Arnott, Western Mayhaw. In swamp forests, often where flooded for periods of the year; uncommon but may be locally abundant; and is often cultivated as single trees or in plantations for the fruit. Feb-Mar; Apr-May. E. TX to Escambia and Santa Rosa counties, FL (Kunzer et al. 2009). [= FNA, K, X, Z]

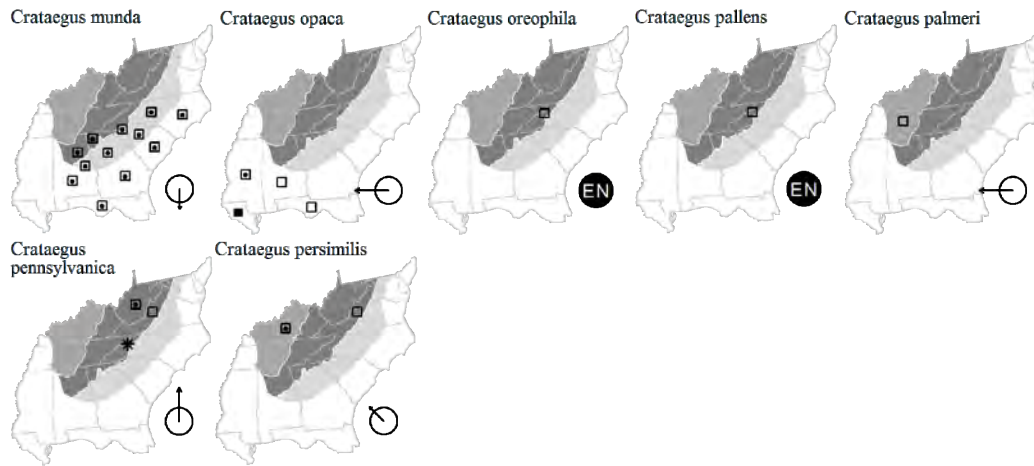

Crataegus oreophila R.W. Lance, Balsam Mountain Hawthorn. High elevation forests, balds. May; Sep. Endemic to central and western Great Balsam Mountains (Jackson, Haywood Cos.). Similar in flower and fruit morphology to *C. macrosperma* Ashe, but foliage shape usually rhombic-elliptic in *C. oreophila* and habit more arborescent (3-8 m). Thorns sparse or absent on main trunk, those of of branches 2-4 cm. A tetraploid apomict (agamospecies), presumably of hybrid origin between *C. macrosperma* and either *C. succulenta* or *C. punctata*, the latter two species no longer known from the Great Balsam Mountains. Usually sympatric with *C. macrosperma* in headwater ridges and peaks of Caney Fork watershed. See Lance (2013, 2014) for detailed information. [= Lance (2013); < *C. macrosperma* Ashe – RAB; = *C. ×oreophila* R.W. Lance – X]

Crataegus pallens Beadle. Slopes and rock outcrops, especially over mafic substrates;. Late Apr-May; Sep-Oct. Endemic to southern Appalachians: w. NC (Buncombe, Madison Cos), and perhaps in ne. AL, n. GA. *C. pallens* is closely related to *C. venusta* Beadle and has been interpreted as a variety in Lance (2014); it is the most northerly-distributed member of the *Pulcherrimae* series. The oblong-ovate leaves with 2 to 3 pairs of straight-sided lobes, 15-20 stamens, yellowish oval fruit, and furrowed trunk bark are diagnostic. [= Q; < *C. venusta* Beadle – FNA; < *C. intricata* Lange – K, S; > *C. prismatica* W.W. Ashe – Q; < *C. flabellata* – RAB; = *C. venusta* var. *pallens* (Beadle) R.W. Lance – X]

Crataegus palmeri Sargent, Palmer's Hawthorn. Rare and sporadic from KS, TX e. to MO, TN. Possibly an intermediate of *C. crus-galli* L. and *C. reverchonii* Sargent. Hardwood and pine-hardwood forest understories. May; Sept.-Oct. [= F, K, S; = *C. reverchonii* var. *palmeri* (Sargent) J.B. Phipps – FNA; > *Crataegus ×palmeri* Sargent – X]

Crataegus pennsylvanica W.W. Ashe, Pennsylvania Hawthorn. Mesic, open forests, alluvial forests. May; Sept. PA and OH, s. to c. WV; somewhat disjunct in sw. VA where it is apparently native; naturalizing near a cultivated specimen in Buncombe Co, NC. Morphology is intermediate between *C. mollis* and *C. coccinea*, suggesting hybrid origin. [= F, FNA, G, X; < *C. coccinea* L. – C; > *C. pedicellata* var. *ellwangeriana* (Sargent) Eggleston – F]

Crataegus persimilis Sargent, Plumleaf Hawthorn. Mesic, open forests, pastures. May; Sept-Oct. Fragmental range, known from s. PA, c. and s.OH, n. and w. KY, and sw VA. Morphology suggests hybrid origin between *C. succulenta* and a form of *C. crus-galli*. Intermediate between *C. mollis* and *C. coccinea*, suggesting hybrid origin. [= F, FNA, K; = *C. ×persimilis* – X]

Crataegus pexa Beadle, Woolly Dwarf Hawthorn. Xeric or subxeric forests, pine and oak scrublands, disturbed woodlands, sandhills. Late Mar-Apr; Sep-Oct. Central NC south to n. FL, west to s. and c. AL; one population in Southampton County, VA (Lance 2014). Closely related to *C. munda* and alternatively may be considered a variety of it, *C. pexa* is chiefly distinguished by longer thorns (3-5 cm) and a taller habit (1-3 m). This taxon is locally common in Cumberland County, NC. [= FNA, Q, V; < *C. flava* Aiton – RAB, W; > *C. munda* – K, Q; > *C. geniculata* W.W. Ashe – Q; > *C. yadkinensis* W.W. Ashe – Q; > *C. invicta* Beadle – K, Q; = *C. munda* var. *pexa* (Beadle) R.W. Lance – X]

Crataegus phaenopyrum (Linnaeus f.) Medikus, Washington Hawthorn. Upland forests, floodplain forests, pastures, thickets, disturbed areas, sometimes locally abundant. May-early Jun; Sep-Oct. Native range presumed to be PA south to SC, west to sw. MO; also c. and s. AL south to n. FL; naturalized populations likely originating from widespread cultivation may be involved in parts of this range, with additional expansions evident. [= C, FNA, G, K, Pa, Q, RAB, W, X; > *C. youngii* Sargent – F; > *C. phaenopyrum* – F, S; > *C. populifolia* – S]

Crataegus pruinosa (H.L. Wendland) K. Koch var. *dissona* (Sargent) Eggleston, Northern Frosted Hawthorn. Upland hardwood forests, pastures, rock outcrops. Apr-May; Sep-Oct. PA to NC, w. to MO, se. OK. The large size of the leaf blades (3-8 cm long) is only a minor deviation from the typical species, but the presence of 10 stamens is a peculiarity among the throng of 20-stamened Pruinosaes. [= F, FNA, Va; < *C. flabellata* – RAB; > *C. pruinosa* var. *pruinosa* – F, G; > *C. brachypoda* Sargent – F, G; > *C. disjuncta* Sargent – K, Q; > *C. rigida* Sargent – K, Q < *C. pruinosa* – K]

Crataegus pruinosa (H.L. Wendland) K. Koch var. *parvula* (Sargent) J.B. Phipps, Small-leaf Frosted Hawthorn. Upland hardwood forests, pastures, rock outcrops. Apr-May; Sep-Oct. PA to w. VA, w. to MI, IL, MO. Sporadic in the northern portion of range of the typical species. [= F, FNA, Va; > *C. pruinosa* var. *pruinosa* – F, G; < *C. pruinosa* – K]

Crataegus pruinosa (H.L. Wendland) K. Koch var. *pruinosa*, Frosted Hawthorn. Upland hardwood forests, pastures, rock outcrops, mountain summits and balds, sometimes locally abundant. Apr-May; Sep-Oct. PA to n. GA, w. to e. IA, e. OK. The related and more southerly-ranging taxon *C. gattingeri* W.W. Ashe extends from a nearly sympatric range into the coastal plain of AL, MS, LA, AR. Broadly defined, *C. pruinosa* is a variable species with several minor variations included in synonymy. This species may occur as a lone specimen or form colonies. The presence of a waxy bloom on the mature fruit (pruinose) is not a dependable trait, and fruits can vary from green to bright red, glaucous or not. Foliage and floral parts are usually entirely glabrous on plants in our area. [= C, FNA, Pa, S, W; < *C. flabellata* – RAB; > *C. pruinosa* var. *pruinosa* – F, G; > *C. pruinosa* var. *delawarensis* (Sargent) E.J. Palmer – F, G; > *C. rugosa* – F, G; > *C. pruinosa* – K; > *C. arcana* Beadle – K, Q; > *C. rustica* Beadle – Q; > *C. vicinalis* Beadle – Q; > *C. gattingeri* W.W. Ashe – F; > *C. gattingeri* var. *gattingeri* – G; > *C. gattingeri* var. *rigida* E.J. Palmer – G; > *C. georgiana* Sargent – Q; > *C. pruinosa* var. *pruinosa* – X; > *C. pruinosa* var. *gattingeri* (W.W. Ashe) R.W. Lance – X]

Crataegus pruinosa (H.L. Wendland) K. Koch var. *rugosa* (W.W. Ashe) Kruschke, Wide-leaved Frosted Hawthorn. Upland hardwood forests, rock outcrops, mountain pastures. Apr-May; Sep-Oct. PA to n. GA, w. to MO, n. AR. The preponderance of truncate or subcordate leaf bases in this entity is the chief distinguishing trait from the typical variety. [= C, FNA, Pa, S, W, X; < *C. flabellata* – RAB; > *C. pruinosa* var. *pruinosa* – F, G; < *C. rugosa* – F, G; > *C. mackenzii* Sargent – K, Q; < *C. pruinosa* – K]

Crataegus pulcherrima Ashe var. *opima* (Beadle) R.W. Lance, Broadleaved Beautiful Hawthorn. Hardwood and hardwood-pine forests, ravines, mesic slopes; uncommon. Apr; Sep-Oct. Sw. GA, s. & c. AL, MS, e. TX. This variety displays proportionally broader foliage than the typical variety, and the shallow lobes are obtuse or rounded. [= X; = *C. opima* Beadle – FNA; < *C. pulcherrima* – K, N, Q; > *C. abstrusa* Beadle – Q; > *C. opima* Beadle – N, Q; > *C. inanis* Beadle – K, Q; > *C. illustris* Beadle – Q]

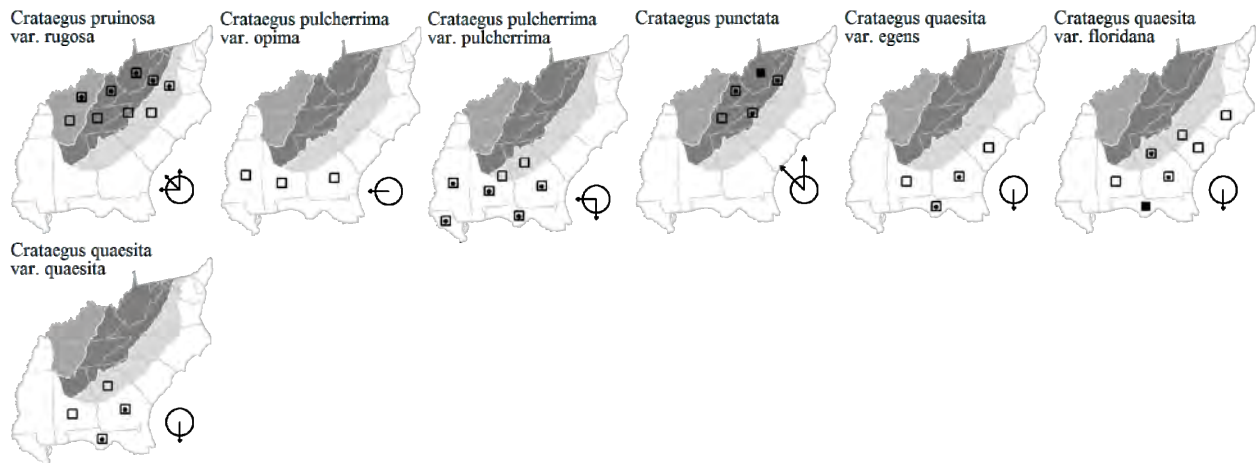

Crataegus pulcherrima W.W. Ashe var. *pulcherrima*, Beautiful Hawthorn. Hardwood and hardwood-pine forests, ravines, mesic slopes, sometimes locally abundant. Apr; Aug-Sept. W. GA and panhandle FL, w. to LA and extreme e. TX; disjunct populations have been reported from Richmond and Burke Cos, GA and McCormick Co, SC. Apr; Sep-Oct. Defined broadly, *C. pulcherrima* includes many closely related species described by Beadle, most not clearly distinct and here considered synonymous. Some may deserve varietal status following further study. Foliage of *C. pulcherrima* displays reasonable consistency in evenly incised margins and straight, parallel primary veins and obscure secondary venation. The inflorescences are compound, with 20 stamens per flower; fruits are usually small (5-10 mm diameter); bark of main trunk brown, furrowed. [= FNA, X; = *C. pulcherrima* var. *pulcherrima* - X; > *C. pulcherrima* - K, N, Q; > *C. macilenta* Beadle - Q; > *C. lenis* Beadle - Q; > *C. abstrusa* Beadle - Q; > *C. ancisa* Beadle - Q; > *C. austrina* Beadle - Q, X; > *C. contrita* Beadle - Q; > *C. concinna* Beadle - Q; > *C. lenis* Beadle - Q; > *C. macilenta* Beadle - Q; > *C. pinetorum* Beadle - K, Q; > *C. illustris* Beadle - Q; > *C. robur* Beadle - Q; > *C. tecta* Beadle - Q; > *C. incilis* Beadle - N, Q; < *C. intricata* Lange - S]

Crataegus punctata Jacquin, Dotted Hawthorn. High elevation forests, grassy balds, rock outcrops. May; Sep-Oct. The majority of range is north of our area, NY and PA w. to IO, s. in Allegheny Plateau and Blue Ridge to KY, VA and NC. Allied is the more southerly-distributed *C. collina*, which is rarely sympatric in range or habitat. *C. punctata*, often in company with *C. macrosperma*, comprises the majority of hawthorn forests, "orchards," and thickets seen in the high elevations of the North Carolina Blue Ridge, in openings and disturbed *Picea rubens* and *Abies fraseri* forests. [= FNA, K, Pa, Q, W, X; < *C. punctata* - C, RAB; > *C. punctata* var. *punctata* - F, G; > *C. punctata* var. *aurea* Aiton - F, G; > *C. punctata* var. *canescens* Britton - F, G; > *C. punctata* var. *pauisiaca* (W.W. Ashe) E.J. Palmer - F, G; ? *C. punctata* - S]

Crataegus quaesita Beadle var. *egens* (Beadle) R.W. Lance, Sand Barren Hawthorn. Sandy scrublands. Late Mar-Apr; Aug-Sep. S. SC to s. AL and peninsular FL. Small leaf size is the most pertinent morphological trait; intermediates with *quaesita* var. *floridana* is suggested among some mixed populations. One possibly intermediate taxon is *C. cirrata* Beadle. [= X; = *C. egens* Beadle - FNA; < *C. egens* Beadle - Q, X]

Crataegus quaesita Beadle var. *floridana* (Sargent) R.W. Lance, Jacksonville Hawthorn. Oak-pine forests, sandy scrublands. Late Mar-Apr; Aug-Sep. Se. NC to c. GA, s. AL, s. to Panhandle and peninsular FL. The propensity of this entity to have distinctly trilobate, toothed leaves with cuneate bases is an important identifying trait, coupled with the small (6-8mm) fruits. [= X; = *C. floridana* Sargent - FNA; < *C. floridana* Sargent - Q; < > *C. anisophylla* Beadle; > *C. cirrata* Beadle - Q; > *C. viaria* Beadle - Q; *C. versuta* Beadle - Q]

Crataegus quaesita Beadle var. *quaesita*, Florida Hawthorn. Oak-pine forests, xeric woodlands, especially in sandy soils. Late Mar-Apr; Aug-Sep. C. and s. GA, south to n. and peninsular FL. Purported in the protologue by Beadle to have purple anthers, a trait not confirmed among available herbarium specimens used for range determination; if true and consistent, purple anther color would be unique for this entity among the *Lacrimatae* group to which it is allied. [= X; = *C. quaesita* Beadle - FNA; < *C. quaesita* Beadle - Q; > *C. resima* Beadle - Q]

Crataegus ravenelii Sargent, Ravenel's Hawthorn. Sandhills, upland pine and pine-oak forests, rocky woodlands, xeric or subxeric habitats with sandy or well-drained clay soils. Apr; Aug-Sep. Se. NC s. to n. FL, w. to central AL. Often reaching treelike proportions (4-8 m tall, trunk 10-30 cm diameter); leaves serrate-dentate, densely pubescent when young, becoming glabrate; inflorescences tomentose. Similar to *C. alabamensis* Beadle, which is of a more restricted range. *C. condigna* Beadle is similar but bears smaller leaves and suggests introgression with another member of the *Lacrimatae*. [= X; = *C. condigna* Beadle - FNA; > *C. condigna* Beadle - FNA, Q, V; < *C. flava* Aiton - K, RAB, S; > *C. adunca* Beadle - Q; > *C. clara* Beadle - Q; > *C. compitalis* Beadle - Q; > *C. pulla* Beadle - Q; > *C. ravenelii* - Q]

Crataegus rufula Sargent, Florida Mayhaw, Rufous Mayhaw. Flatwoods ponds, river swamps. Feb-Mar; Apr-May. Sw. GA and adjacent Panhandle FL. Intermediate in morphology between *C. aestivalis* and *C. rufula* and an assumed intraserial hybrid; the range is at interface of two parent mayhaw species. This taxon has been shown a triploid, while *C. aestivalis* and *C. rufula* are known diploids. Reddish pubescence is typical on abaxial surface of leaves, particularly on veins and in vein axils. [= K, Z; = *C. rufula* - FNA, X; > *C. maloides* Sargent - S]

Crataegus sargentii Beadle, Sargent's Hawthorn. Mesic upland forests over calcareous or circumneutral substrates. W. GA, n. and c. AL, sporadically to c. MS and c. panhandle FL. Apr; Sep. Allied to *C. pulcherrima*, and having a core range mostly in the northern limits of the former. The entity *C. gilva* Beadle, morphologically similar and here included in synonymy,

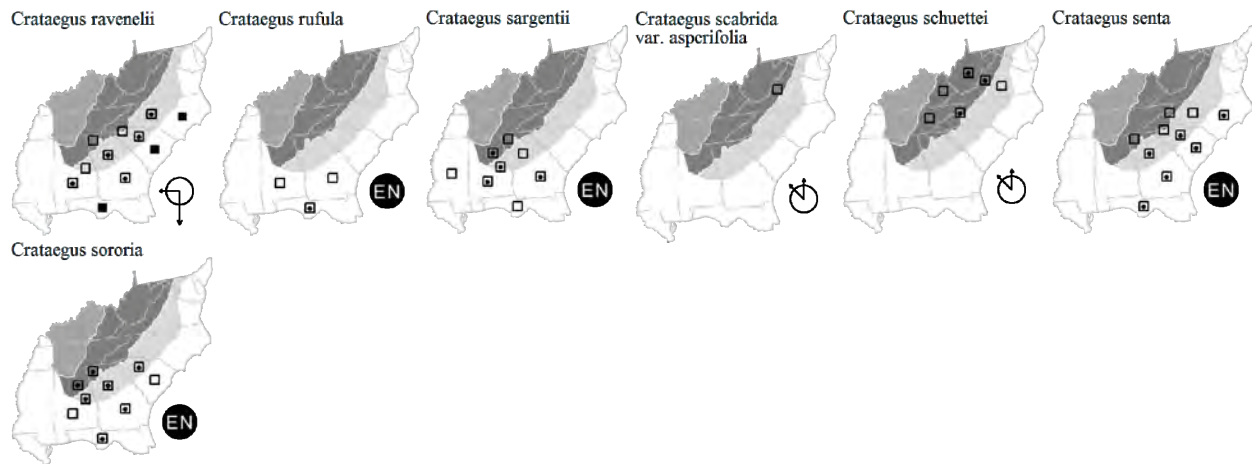

has leaves less inclined toward lobing and may at least warrant varietal status. [= K, X; > *C. sargentii* – FNA, N, Q; > *C. assimilis* Beadle – N, Q > *C. eximia* Beadle – FNA, N, Q; > *C. gilva* Beadle – FNA, N, Q; < *C. intricata* Lange – S]

***Crataegus scabrida* Sargent var. *asperifolia* (Sargent) Kruschke**, Rough Hawthorn. Mesic hardwood forests, streamside thickets. May; Sep-Oct. A northern species predominately of eastern Canada and the Great Lakes Region east to ME; the var. *asperifolia* (Sargent) Kruschke reported as disjunct for VA by Phipps, in FNA. The taxonomic disposition and status of this species in its southern range limits is poorly known. [= K, FNA; > *C. brainerdii* Sargent var. *scabrida* (Sargent) Eggleston – F, G] {not yet keyed}

***Crataegus schuettei* W.W. Ashe**, Schuette's Hawthorn. Mesic hardwood forests, sometimes locally abundant. Apr-May; Sep-Oct. *C. schuettei* occupies a range predominately north of our area, in NH, NY, PA w. to WI and n. IL, extending s. in Appalachian Plateau to n. WV and w. NC (perhaps also to e. TN). Closely related to *C. macrosperma* W.W. Ashe. Foliage of juvenile shoots of *C. schuettei* in w. NC often are deeply lacinate, with acute sinuses nearly reaching the midrib. [= FNA, K, Pa, Va, X; < *C. flabellata* (Bosc) K. Koch – C, RAB; > *C. basilica* Beadle – F, G, Q, W]

***Crataegus senta* Beadle**, Rough Hawthorn. Upland hills, hardwood-pine forests, scrubland, pastures. Apr-May; Aug-Sep. S. NC to s. GA, with outlier populations reported from n. FL; this species appears rare in its original type locality of w. NC and uncommon in the Mountains SC and GA. It is morphologically similar to *C. alabamensis* var. *ravenelii* and marginally so to *C. lancei*. [= FNA, Q, X; < *C. flava* Aiton – K, RAB, S, W]

***Crataegus sororia* Beadle**, Sister Hawthorn. Upland disturbed forests, scrublands, roadsides. Apr; Aug-Sep. Ec. NC to n. FL, west to n. AL and sw. GA. Allied to *C. aprica* Beadle, but terminal shoot leaves are regularly suborbicular, flowers bear 20 stamens and habit is more arborescent. [= FNA; = *C. sororia* Beadle var. *sororia* – X, Phipps 2007; < *C. flava* Aiton – RAB; > *C. consanguinea* Beadle – Q; > *C. orbiculata* Eggleston – X; > *C. leonensis* E.J. Palmer]

***Crataegus spatulata* Michaux**, Littlehip Hawthorn. Bottomland forests, extending upslope to drier or rocky sites especially on mafic or calcareous substrates. Apr-May; Sep-Oct. C. NC south to Panhandle FL, west to e. TX, north in the interior to e. TN, sw. MO, e. OK; sporadic in e. TN, sw. NC. This species is distinctive for its small spatulate leaves (tending to be trilobed) and thin, flaking bark (multicolored green, brown, and brownish gray). [= C, F, FNA, G, K, Q, RAB, S, W, X, Y]

***Crataegus succulenta* Schrader ex Link var. *neofluvialis* (W.W. Ashe) E.J. Palmer**, New River Hawthorn. Rocky summits, mesic forests, streamsides. Apr-May; Sep-Oct. The core range appears to be the Blue Ridge of nw. NC and adjacent VA, but entire range is unclear due to a marginal morphological distinction from the typical species. [= F, FNA, G, Va, X; > *C. neofluvialis* W.W. Ashe – Q]

Crataegus succulenta* Schrader ex Link var. *succulenta, Fleshy Hawthorn. Rocky summits, mesic forests, high pastures, especially over basic soil or mafic substrates. Apr-Jun; Sep-Oct. Widespread from the northeastern to north-central U.S. states, extending s. along the Appalachian Plateau to w. NC, sw. VA, n. KY, and s. in the interior to MO. The obovate to sub-orbicular leaves with reticulate venation, numerous long thorns (5-9 cm long), and pitted pyrenes is a highly definitive combination of traits for distinguishing this species in our area. [= C, FNA, K, Pa, RAB, S, W, X; > *C. succulenta* var. *succulenta* – F, G; > *C. vernans* W.W. Ashe]

***Crataegus teres* Beadle**, Smooth Alabama Hawthorn. Pine woodlands and sandy areas. S. AL, possibly e. to GA; a sporadic and rare glabrous Lacrimatae series entity with leaves superficially resembling those of *C. crus-galli*, but petioles and lower marginal teeth are glandular and leading shoots geniculate and usually drooping; styles and pyrenes 2-3. Apr; Aug-Sep. Appears to be related to *C. florens*; possibly of intermediate origin. [= FNA, Q, V; < *C. flava* Aiton – K1, S; = *C. alabamensis* var. *teres* (Beadle) Lance – X] {not yet keyed}

***Crataegus triflora* Chapman**, Threeflower Hawthorn. Wooded ravines and slopes under mesic forests, limestone outcrops, flatwoods, prairies. Apr-May; Sep-Oct. Nw. GA to n. MS, s. to s. MS, AL; outlier populations in prairie sites of Houston Co, GA and LA, AR (possibly in se TN?). Usually a multi-stemmed shrub 1-3 m tall, rarely to 6 m. *C. triflora* produces some of the largest flowers in the genus (to 3 cm diameter), though frequently only 3 flowers borne per inflorescence; occasional vigorous plants may bear 4-6 flowers per inflorescence. [= K, W, X; > *C. triflora* – FNA, Q, U; > *C. austromontana* Beadle – FNA, Q, U]

***Crataegus uniflora* Muenchhausen**, Oneflower Hawthorn. Upland forests, disturbed lands, roadsides, rock outcrops, often in xeric or sub-xeric conditions. Apr-May; Sep-Oct. PA and NJ south to c. peninsular FL, w. to e. TX, OK, and MO. Normally

a shrubby species, 0.5-2 m in height, though local forms may reach 4 m, particularly in n. FL. Minor variation occurs in foliage, but fairly consistent are the slender thorns (2-7 cm long) and foliaceous calyx lobes persistent on the fruit. [= C, F, FNA, G, K, Pa, RAB, S, W, X; > *C. uniflora* - Q; > *C. gregalis* Beadle - Q; > *C. arenicola* W.W. Ashe; > *C. raleighensis* W.W. Ashe - Q; > *C. pentaneura* W.W. Ashe - Q]

Crataegus ×vailiae Britton [*calpodendron* × *uniflora*], Vail’s Hawthorn. Pastures, woodlands. Apparently an interserial hybrid, but reproducing by (perhaps apomictically derived?) fruit (Lance 2014). [= FNA, X] {add synonymy}

Crataegus venusta Beadle, Red Mountain Hawthorn. C. AL. Fruits typically red or ruddy. Leaf morphology suggests a close affinity to *C. pallens*. [= FNA, N, Q, X; < *C. sargentii* Beadle - K]

Crataegus viridis Linnaeus, Green Hawthorn. Swamps, bottomland forests, alluvial woodlands, streamsides, wet flatwoods, and uplands where soils are often basic to calcareous. Late Mar-late Apr; Sep-Nov. MD to n. FL, w. MO, c. TX; absent or rare on Appalachian Plateau. One of our largest hawthorn species, frequently reaching treelike proportions (5-10 m tall, trunk 10-40 cm diameter). The orange-red fruits often persist on the bare branches into winter, sometimes until the following spring. Bark of the trunk is usually mottled with patterns of gray, reddish-brown, and greenish-gray coloration, due to the dehiscing layers of scales and plates. [= C, RAB, S, W; > *C. viridis* var. *lanceolata* (Sargent) E.J. Palmer - F, FNA, G, X; > *C. viridis* var. *ovata* (Sargent) E.J. Palmer - F, FNA, G, X; > *C. viridis* var. *velutina* (Sargent) J.B. Phipps - FNA, X; > *C. viridis* var. *viridis* - F, FNA, G, K, X; > *C. viridis* - Q; > *C. interior* Beadle - Q; > *C. vulsa* Beadle - K, Q; > *C. penita* Beadle - K, Q]

Crataegus visenda Beadle, Bristol Hawthorn. Upland pine and pine-oak forests, disturbed lands, wooded hills with clay or sandy soils, often in xeric or sub-xeric conditions. Apr; late Aug-Sep. Central & upper Coastal Plain of NC south to n. FL, west to s. AL, nw. GA. *C. visenda* is allied to *C. sororia* Beadle, but the foliage tends to have a higher percentage of obovate leaves and branches are usually drooping. This hawthorn often attains the dimensions of a small tree (4-8 m tall and with a trunk 7-20 cm diameter). [= FNA; = *C. sororia* Beadle var. *visenda* (Beadle) R.W. Lance - X; < *C. flava* Aiton - RAB, S; >> *C. flava* - K; > *C. visenda* - Q; > *C. tristis* Beadle - K, Q; > *C. segnis* Beadle - Q; > *C. abdita* Beadle - Q; > *C. annosa* Beadle - Q; > *C. arrogans* Beadle - K, Q; > *C. calva* Beadle - Q; > *C. galbana* Beadle - Q > *C. sodalis* Beadle - Q]

29. *Pyracantha* M.J. Roemer 1847 (Firethorn, Pyracantha)

A genus of about 10 species, shrubs, of s. Europe east to e. Asia. References: Lance & Zika in FNA (2014); Nesom (2010)=Y; Robertson (1974)=Z; Kalkman in Kubitzki (2004). Key based on FNA.

- 1 Leaf margins crenulate to serrulate for at least ½ the length of the blade.
 - 2 Leaf blades oblanceolate or obovate, the apices obtuse, emarginate, or short-apiculate; hypanthium and pedicels glabrate *P. fortuneana*
 - 2 Leaf blades lanceolate, oblong, oblanceolate, ovate-lanceolate, elliptic, or ovate, the apices usually acute or short-apiculate; hypanthium and pedicels finely hairy *P. coccinea*
- 1 Leaf margins usually entire, rarely remotely serrulate and only towards the leaf apex.
 - 3 Calyces and leaf undersurfaces persistently gray-tomentose [*P. angustifolia*]
 - 3 Calyces and leaf undersurfaces brown- or yellowish-puberulent when young, becoming glabrescent.
 - 4 Leaf blades widest near the middle (elliptic, oblong, or oblong-obovate); leaf apices obtuse, apiculate, or aristate; leaf undersurface glaucescent [*P. atalantioides*]
 - 4 Leaf blades widest towards the tip (oblanceolate to oblong-obovate); leaf apices notched or truncate; leaf undersurface pale green but not glaucescent *P. koidzumii*

* *Pyracantha angustifolia* (Franchet) C.K. Schneider, Narrowleaf Firethorn. Planted, rarely escaped or persistent, native of China. [= FNA]
 * *Pyracantha atalantioides* (Hance) Stapf. Planted, rarely escaped or persistent, native of China. [= FNA, Y]

* ***Pyracantha coccinea*** M.J. Roemer, Scarlet Firethorn. Planted, persistent around old homesites, and rarely escaped to woodlands; native of se. Europe and Asia Minor. Reported for AL, LA, OK, SC, TN, and TX (Nesom 2010a). [= FNA, K, Y, Z; = *Cotoneaster pyracantha* (Linnaeus) Spach – F, S; = *Crataegus pyracantha* Linnaeus]

* ***Pyracantha fortuneana*** (Maximowicz) H.L. Li, Chinese Firethorn. Planted, rarely escaped or persistent; native of China. May-Jul; Oct-Dec. Reported for AL, SC, and TX (Nesom 2010a). [= FNA, K, WH3, Y; > *P. crenatiserrata* (Hance) Rehder]

* ***Pyracantha koidzumii*** (Hayata) Rehder, Formosan Firethorn. Planted, rarely escaped to woodlands; native of Taiwan. Reported for AL, AR, FL, GA, LA, MS, OK, SC, TX (Nesom 2010a). [= FNA, K, WH3, Y, Z]

30. *Sorbus* Linnaeus 1753 (Mountain-ash, Rowan)

A genus of about 130 species, trees and shrubs, of mainly temperate Northern Hemisphere. References: Zika & Bailleul in FNA (2014); McAllister (2005)=Y; Jones (1939)=Z; Aldasoro et al. (2004); Kalkman in Kubitzki (2004). [also see *Aronia*]

- 1 Branches and lower leaf surfaces glabrous (or inconspicuously and sparsely pubescent); winter buds glutinous; [native tree]; [section *Commixtae*]..... ***S. americana***
- 1 Branches and lower leaf surfaces densely white-villous; winter buds white-villous; [introduced tree]; [section *Sorbus*] ***S. aucuparia* ssp. *aucuparia***

Sorbus americana Marshall, Mountain-ash, American Rowan. High elevation forests, balds, and high elevation rock outcrops, often with *Picea*, *Abies*, and/or *Betula alleghaniensis*. Jun-Jul; Sep-Oct (persisting well into winter). NL (Newfoundland) west to MN, south to PA, w. NC, e. TN, ne. GA, and n. IL. This small-to-medium tree is showy in most seasons; in the summer its creamy-white corymbs are attractive, the leaves turn a bright orange-red in fall, and the red berries persist well into winter. [= C, FNA, G, K, Pa, RAB, S, W, Y, Z; = *Pyrus americana* (Marshall) A.P. de Candolle – F, WV]

* ***Sorbus aucuparia* Linnaeus ssp. *aucuparia***, Rowan, European Mountain-ash. Disturbed areas, rarely cultivated; native of n. Europe. May; Sep. A planted tree and escape (sometimes appearing naturalized), south to s. PA (Rhoads & Klein 1993), MD, DE, WV (Kartesz 1999), and DC (Jones 1939). Also reported for SC by Kartesz (1999), supposedly based on Jones (1939), but Jones (1939) does not mention SC in his account of *S. aucuparia*. [= Y; < *S. aucuparia* – C, FNA, G, K, Pa, Z; < *Pyrus aucuparia* (Linnaeus) Gaertner – F, WV]

31. *Pyrus* Linnaeus 1753 (Pear)

A genus of 10-20 species, trees and shrubs, of Eurasia and n. Africa. References: Catling & Mitrow in FNA (2014); Zheng et al. (2014); Robertson (1974)=Z; Kalkman in Kubitzki (2004). [also see *Aronia*, *Malus*, and *Sorbus*]

- 1 Fruit pyriform (pear-shaped!); flowers 2.5-3 cm across; leaves crenate; styles 5..... ***P. communis***
- 1 Fruit subglobose; flowers either 2-2.5 cm or 3-3.5 cm across; leaves serrate; styles 2 or 5 (rarely 3 or 4).
 - 2 Fruit ca. 1 cm in diameter; styles 2 (-3)..... ***P. calleryana***
 - 2 Fruit 3-10 cm in diameter; styles (4-) 5..... ***P. pyrifolia***

* ***Pyrus calleryana*** Decaisne, Bradford Pear, Callery Pear. Commonly planted and persistent, now an aggressive naturalizer in fields, roadsides, and disturbed areas across most of our region; native of China. Late Feb-Apr; Aug-Oct. This species has become an aggressive naturalizer in much of our area (Nesom 2000c; Vincent 2005; Culley & Hardiman 2007). Some of the stock naturalizing may be of hybrids and horticultural selections involving additional species, including *P. betulifolia* Bunge and *P. bretschneideri* Rehder. [= FNA, K, Pa, Va, WH3]

* ***Pyrus communis*** Linnaeus, Common Pear. Planted, persistent around old houses and in orchards; native of Europe. Apr; Aug-Oct. [= C, F, FNA, G, K, Pa, RAB, S, WH3, WV, Z]

* ***Pyrus pyrifolia*** (Burm f.) Nakai, Oriental Pear, Japanese Pear, Chinese Pear. Planted, persistent around old houses and in orchards, showing a tendency to spread from plantings; native of Asia. Apr; Aug-Oct. [= F, FNA, K, Z]

32. *Raphiolepis* Lindley 1820 (Asian-hawthorn)

A genus of about 5-15 species, shrubs, of e. Asia. References: Kalkman in Kubitzki (2004).

* *Raphiolepis umbellata* (Thunberg) Makino, Japanese-hawthorn, Yedda-hawthorn. Disturbed areas, also epiphytic on trunks of cultivated palms (as on Dauphin Island; H. Horne, pers. comm., 2013), and widely planted, likely to naturalize more extensively in the future.

33 *Eriobotrya* Lindley 1821 (Loquat)

A genus of about 15-30 species, trees and shrubs, native to e. Asia. References: Phipps in FNA (2014); Kalkman in Kubitzki (2004).

* *Eriobotrya japonica* (Thunberg) Lindley, Loquat, Japanese-medlar. Suburban woodlands, uncommonly cultivated, rarely naturalized; native of ec. China. Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). Also reported for LA. [= FNA, K, WH3]

34. *Pseudocydonia* C.K. Schneider 1906 (Chinese Quince)

A monotypic genus, a shrub or small tree, of e. Asia. *Pseudocydonia* appears to be of hybrid origin involving *Chaenomeles* and *Cydonia* (Lo & Donoghue 2012). References: Catling & Mitrow in FNA (2014); Kalkman in Kubitzki (2004).

* *Pseudocydonia sinensis* (Thouin) C.K. Schneider, Chinese-quince. Suburban woodlands; native of China. Mar-Apr; Aug-Oct. Reported for suburban woodlands near Tallahassee (Leon Co., FL) by Clewell & Tobe (2011). [= FNA, K2]

35. *Chaenomeles* Lindley 1821 (Flowering Quince)

A genus of 3-4 species, shrubs, of montane, temperate e. Asia. References: Catling & Mitrow in FNA (2014); Kalkman in Kubitzki (2004).

- 1 Branches scabrous, becoming warty in age; leaf margins crenate; fruit 2.3-4 cm in diameter.....[*C. japonica*]
- 1 Branches smooth, not becoming warty in age; leaf margins serrate; fruit 4-6 cm in diameter.....*C. speciosa*

* *Chaenomeles japonica* (Thunberg) Lindley ex Spach, Japanese Flowering Quince. Rarely persisting or spreading from horticultural plantings; native of Japan. Apr-May; Aug-Oct. [= FNA, K2]

* *Chaenomeles speciosa* (Sweet) Nakai, Common Flowering Quince. Frequently persisting and rarely spreading from horticultural plantings to suburban woodlands; native of China. Jan-Apr. [= C, FNA, K1, K2, Pa]

36. *Photinia* Lindley 1821 (Photinia, Redtip)

A genus of about 40 species, trees and shrubs, of Asia and Central America. References: Nesom in FNA (2014); Guo et al. (2011); Kalkman in Kubitzki (2004). [also see *Aronia* and *Pourthiaea*]

- 1 Leaves evergreen, coriaceous, (6-) 9-20 cm; inflorescences 4-18 cm wide; pedicels without lenticels *P. serratifolia*
- 1 Leaves deciduous, herbaceous, 4-9 cm long; inflorescences 3-6 cm wide, pedicels with warty lenticels.....[see *Pourthiaea*]

* *Photinia serratifolia* (Desfontaines) Kalkman, Taiwanese Redtip. Suburban woodlands; uncommonly cultivated and rarely naturalizing; native of e. Asia. Mar-Apr. [= FNA, K]

37. *Pourthiaea* Decaisne 1874 (Photinia)

A genus of about 25 species, shrubs, of e. Asia. Guo et al. (2011) and Lo & Dochue (2012) indicate that *Pourthiaea* should be separated at generic rank from both *Photinia* and *Aronia*. References: Nesom in FNA (2014); Guo et al. (2011); Kalkman in Kubitzki (2004).

* *Pourthiaea villosa* (Thunberg) Decaisne, Oriental Photinia. Uncommonly cultivated, sometimes escaping to suburban woodlands; native of e. Asia. Apr-Jun. [= Z; = *Photinia villosa* (Thunberg) A.P. de Candolle – FNA, K, Pa]

38. *Aronia* Medikus 1789 (Chokeberry)

A genus of 3 species, of e. North America (south into Central America). In North American floristic literature, *Aronia* has sometimes been treated as a component of *Pyrus*, *Sorbus*, or *Photinia* (see synonymy below). Robertson et al. (1991) have included *Aronia* in *Photinia*. Kalkman in Kubitzki (2004) agrees that *Aronia* and *Photinia* should be combined, but points out that *Aronia* is the older name and therefore must be used for the combined genus. Guo et al. (2011) and Lo & Donoghue (2012) separate *Photinia*, *Aronia*, and *Pourthiaea* at generic rank, a decision followed here; while *Aronia* and *Pourthiaea* are closely related (sister), *Photinia* is not closely related to either and is sister to *Pyracantha* (Lo & Donoghue 2012). References: Guo et al. (2011)=V; Pankhurst in FNA (2014); Hardin (1973)=Y; Robertson (1974)=Z; Lo & Donoghue (2012); Robertson et al. 1991=X; Kalkman in Kubitzki (2004).

Identification notes: All our species of *Aronia* can be distinguished from other shrubs in our flora by the presence of several dark (usually purplish-black) glandular trichomes on the upper surface of the midrib, mostly toward the base of the leaf.

- 1 Lower surfaces of leaves, twigs, and inflorescence rachis glabrous; fruit black *A. melanocarpa*
- 1 Lower surfaces of leaves, twigs, and inflorescence rachis pubescent; fruit bright red or dark purple.
 - 2 Fruit bright red; leaves densely pubescent beneath *A. arbutifolia*
 - 2 Fruit dark purple; leaves sparsely pubescent beneath *A. prunifolia*

Aronia arbutifolia (Linnaeus) Persoon, Red Chokeberry. Bogs, pocosins, wet savannas, swamps, other wet habitats. Mar-May; Sep-Nov. NL (Newfoundland) south to c. peninsular FL and west to TX, mainly in the Coastal Plain, but extending inland in the south to WV and KY. [= C, FNA, G, GW, S, V, Va, W; = *Pyrus arbutifolia* (Linnaeus) Linnaeus f. – F, Z; = *Photinia pyrifolia* (Lamarck) K. Robertson & J.B. Phipps – K, Pa, WH3, WV, X; = *Sorbus arbutifolia* (Linnaeus) Heynhold var. *arbutifolia* – RAB]

Aronia melanocarpa (Michaux) Elliott, Black Chokeberry. Balds, forests, and openings and exposed rock outcrops at high elevations, bogs in the Mountains. May-Jun; Aug-Sep. NL west to ON and MN, extending south to n. GA, n. AL, MS, and MO. [= C, FNA, G, GW, S, V, Va; = *Sorbus melanocarpa* (Michaux) Heynhold – RAB; = *Pyrus melanocarpa* (Michaux) Willdenow – F, WV, Z; < *A. melanocarpa* – W (also see *A. prunifolia*); = *Photinia melanocarpa* (Michaux) J.B. Phipps – K, Pa, X]

Aronia prunifolia (Marshall) Rehder, Purple Chokeberry. Balds, bogs, seepages, swamp forests. Apr-May; Sep-Oct. NL and ON south to NC, KY, IN, and IL. While apparently originating as a hybrid between our other two species, *A. prunifolia* exists in populations independent of the two parent species, apparently reproducing successfully. It seems best to treat a now independent lineage such as this as a separate taxon. [= C, G, GW, V, Va; = *Pyrus floribunda* Lindley – F, WV, Z; = *Aronia × floribunda* (Marshall) Rehder – FNA; = *Photinia floribunda* (Lindley) J.B. Phipps – K, X; = *Sorbus arbutifolia* var. *atropurpurea* (Britton) Schneider – RAB; = *Aronia atropurpurea* Britton – S; < *Aronia melanocarpa* – W]

39. *Cydonia* P. Miller 1754 (Quince)

A monotypic genus, a shrub, probably native of the Caucasus. References: Catling & Mitrow in FNA (2014); Kalkman in Kubitzki (2004)=Z.

* *Cydonia oblonga* P. Miller, Edible Quince, Common Quince, “Fruiting” Quince. Suburban woodlands; native of Europe. May-Jun. Reported for MD (FNA, Kartesz 1999). Widely cultivated in Europe and formerly in e. North America; in our area it has fallen out of favor, and is now rarely cultivated. [= FNA, K, Pa, Z; = *Pyrus cydonia* Linnaeus]

40. *Malus* P. Miller 1754 (Apple, Crabapple)

A genus of 25-55 species, trees and shrubs, north temperate. References: Dickson in FNA (2014); Robertson (1974)=Z; Kalkman in Kubitzki (2004).

- 1 Twigs thorny; leaves folded (conduplicate) in bud; leaves often lobed; [native, sometimes weedy]; [subgenus *Chloromeles*].
 - 2 Leaves permanently pubescent beneath; pedicels and hypanthium pubescent; [western, disjunct east to KY and MS]..... *M. ioensis*
 - 2 Leaves glabrous or nearly so; pedicels and hypanthium glabrous or with scattered long hairs; [widespread in our area].
 - 3 Leaves elliptic to elliptic-lanceolate, 2.5-8 cm long, 1-4 cm wide, mostly > 2× as long as wide, subacute to obtuse at the tip *M. angustifolia*
 - 3 Leaves ovate to ovate lanceolate, 4-10 cm long, 2-7 cm wide, mostly < 2× as long as wide, acute to acuminate at the tip..... *M. coronaria*
- 1 Twigs not thorny; leaves involute or convolute in bud; leaves unlobed; [cultivated and persistent or escaping]; [subgenus *Malus*].
 - 4 Leaves densely pubescent in bud, permanently pubescent beneath; fruits large, > 5 cm in diameter ("apples")..... *M. pumila*
 - 4 Leaves glabrous or nearly so; fruits small, < 3 cm in diameter ("crabapples").
 - 5 Twigs glabrous; calyx deciduous; fruit ca. 1 cm in diameter..... [*M. baccata*]
 - 5 Twigs pubescent; calyx persistent; fruit ca. 2 cm in diameter..... *M. prunifolia*

Malus angustifolia (Aiton) Michaux, Wild Crabapple. Forests, woodlands, fence-rows, dry hammocks, occasionally in bottomlands. Apr-May; Aug-Sep. NJ, PA, OH, s. IL, and se. MO, south to n. peninsular FL, Panhandle FL and e. TX. [= FNA, RAB, S, Va, W, WH3; = *Pyrus angustifolia* Aiton – C, G, WV, Z; > *Pyrus angustifolia* var. *angustifolia* – F; > *Pyrus angustifolia* var. *spinosa* (Rehder) L.H. Bailey – F; > *M. angustifolia* var. *angustifolia* – K]

* *Malus baccata* (Linnaeus) Borkhausen, Siberian Crabapple. Suburban woodlands, hedgerows, and thickets; native of e. Asia. Apr-Jun; Sep-Oct. [= FNA, Pa, Va; = *Pyrus baccata* Linnaeus – C]

Malus coronaria (Linnaeus) P. Miller, Wild Crabapple. Forests, woodlands, fencerows, occasionally in bottomlands. May; Sep-Oct. NY, ON and WI south to GA, AL, and AR. [= FNA, Pa, RAB, Va, W; = *Pyrus coronaria* Linnaeus – C, Z; > *Pyrus coronaria* Linnaeus var. *coronaria* – F, WV; > *Pyrus coronaria* Linnaeus var. *elongata* Rehder – F; > *Pyrus coronaria* Linnaeus var. *dasycalyx* (Rehder) Fernald – F; > *Pyrus coronaria* Linnaeus var. *lancifolia* (Rehder) Fernald – F, WV; = *Pyrus lancifolia* L.H. Bailey – G; > *M. angustifolia* var. *puberula* Rehder – K; > *M. coronaria* – K; > *Malus bracteata* L.H. Bailey – S; > *Malus coronaria* (Linnaeus) P. Miller – S; > *Malus lancifolia* Rehder – S; > *Malus coronaria* (Linnaeus) P. Miller var. *dasycalyx* Rehder]

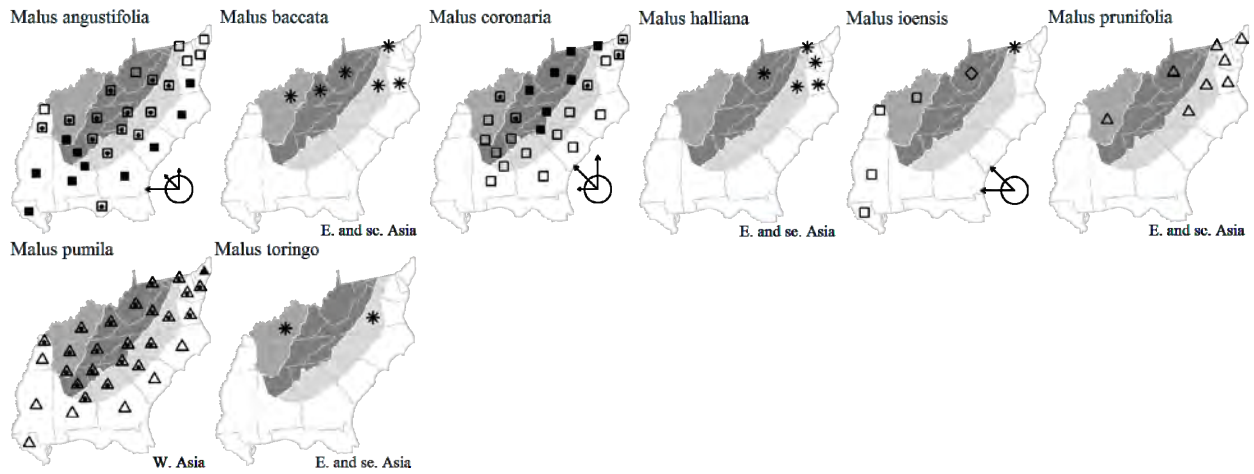

* *Malus halliana* Koehne, Hall Crabapple. Disturbed areas, suburban woodlands; rare, native of Japan. Mar-May; sep-Oct. [= FNA; ? *M. floribunda* Siebold ex Van Houtte – K, Pa] {not yet keyed}

Malus ioensis (Wood) Britton, Prairie Crabapple, Western Crabapple. Forests, woodlands, fence-rows. MI, MN, e. SD, and w. NE, south to w. WV, KY, s. MS, se. LA, and c. TX. [= FNA, WV; > *M. ioensis* var. *ioensis* – K; = *Pyrus ioensis* (Wood) L.H. Bailey – C, F, G]

* *Malus prunifolia* (Willdenow) Burkhardt, Chinese Crabapple. Disturbed areas, suburban woodlands; native of e. Asia. [= FNA, K, Pa; = *Pyrus prunifolia* Willdenow – C]

* *Malus pumila* P. Miller, Common Apple. Commonly cultivated throughout, especially in the Mountains and Piedmont, and long persistent; native of Asia. Apr-May; Jul-Oct. The rejection of the nomenclatural conservation of the name *M. domestica* Burkhardt cements that *M. pumila* P. Miller is the correct name for the domesticated apple (Applequist 2014). [= FNA, K, Pa, RAB, Va, W; = *Pyrus malus* Linnaeus – C, F, G, WV, Z; = *Malus malus* (Linnaeus) Britton – S; = *Malus domestica* Burkhardt]

* *Malus toringo* (Siebold) Siebold ex de Vriese, Toringo Crabapple. Reported, as *M. sieboldii*, for Fairfax County, VA (Steury 2011). [= FNA; ? *M. sieboldii* (Regel) Rehder – K2, illegitimate] {not yet keyed}

150. ELAEAGNACEAE A.L. de Jussieu 1789 (Oleaster Family) [in ROSALES]

A family of 3 genera and 30-50 species, shrubs, small trees, and lianas, of temperate Eurasia and North America, and tropical Asia and Australia. References: Bartish & Swenson in Kubitzki (2004).

Elaeagnus Linnaeus 1753 (Silverberry, Oleaster, Russian-olive)

A genus of 20-45 species, shrubs and small trees, of Asia (mostly) and North America. References: Bartish & Swenson in Kubitzki (2004).

- 1 Flowering in the fall (Oct-Nov) and fruiting in the spring (Mar-Apr); leaves evergreen; branches usually thorny *E. pungens*
- 1 Flowering in the spring and fruiting in late summer or fall; leaves deciduous (somewhat coriaceous in texture and semi-persistent); branches thorny or not.
- 2 Leaves 3-8× as long as wide; leaves with only silver scales beneath; twigs with silver scales only; fruit orangish-yellow at maturity, lepidote with silver scales..... *E. angustifolia*
- 2 Leaves 1.5-3× as long as wide; leaves with a mixture of silver and bronze scales beneath (the bronze scales may be few); twigs with a mixture of silver and bronze scales (the bronze scales turning dingy or blackish with age); fruit reddish-brown, pinkish, or silver at maturity, lepidote with silver and brown scales.
- 3 Leaves remaining silvery on the upper surface; fruit silver at maturity [*E. commutata*]
- 3 Leaves becoming glabrescent and green above at maturity; fruit red at maturity
- 4 Fruit 10-15 mm long, bright red; fruiting pedicel 15-25 mm long; hypanthium tube about as long as the separate calyx lobes [*E. multiflora*]
- 4 Fruit 6-8 mm long, silvery red; fruiting pedicel 8-12 mm long; hypanthium tube about 2× as long as the separate calyx lobes..... *E. umbellata*

- * *Elaeagnus angustifolia* Linnaeus, Russian Olive, Oleaster. Disturbed areas; native of Eurasia. May-Jul; Sep. [= C, F, G, K, Pa, Va]
- * *Elaeagnus commutata* Bernhardt ex Rydberg, American Silverberry. Disturbed areas; native of w. North America. [= C, F, G, K2]
- * *Elaeagnus multiflora* Thunberg, Cherry Elaeagnus, Cherry Silverberry. Disturbed areas; native of Japan and China. Apr. First reported for NC by Leonard (1971b). [= C, F, G, K; = *E. multiflorus* – S, orthographic variant]
- * *Elaeagnus pungens* Thunberg, Thorny-olive, Autumn Silverberry. Forests and woodlands in suburban areas, spread by birds; native of Japan. Oct-Nov; Mar-Apr. [= K, RAB, Va, WH3]
- * *Elaeagnus umbellata* Thunberg, Oriental Silverleaf, Autumn-olive, Spring Silverberry. Forests and woodlands, spread by birds; native of Japan and China. Apr-May; Aug-Sep. This species has become a noxious weed shrub, still unfortunately sometimes promoted for "wildlife plantings." The rapidity of its increase may be judged by its treatment in Strausbaugh & Core (1978) as not definitely naturalized in WV; Harmon, Ford-Wertz, & Grafton (2006) map it for every county of WV. [=C, F, G, Pa, RAB, Va, W, WH3, WV; > *Elaeagnus umbellata* Thunberg var. *parvifolia* (Royle) Schneider – K; = *E. umbellatus* – S, orthographic variant]

151. RHAMNACEAE A.L. de Jussieu 1789 (Buckthorn Family) [in ROSALES]

A family of about 50-52 genera and 900-925 species, mostly trees, shrubs, and lianas, cosmopolitan in distribution. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Richardson et al. (2000a, 2000b); Medan & Schirarend in Kubitzki (2004).

- 1 Plant a woody vine.
 - 2 Leaf margins entire; tendrils absent; [widespread in our area]; [tribe *Rhamneae*]..... *Berchemia*
 - 2 Leaf margins serrate to crenate; tendrils present; [of ne. FL southward]; [tribe *Gouanieae*]..... *Gouania*
- 1 Plant a shrub or small tree.
 - 3 Leaves with 3 prominent veins from near the base.
 - 4 Plants not spiny; fruit dry, capsular; [native]; [tribal placement uncertain]..... *Ceanothus*
 - 4 Plants armed with stipular spines; fruit pulpy; [alien, cultivated and escaped]; [tribe *Paliureae*]..... *Ziziphus*
 - 3 Leaves with prominently pinnate venation, the lowermost lateral veins no more prominent than others.
 - 5 Leaves opposite, 2-4 cm long; [of shell middens and shell hammocks in the outer Coastal Plain of NC and SC]; [tribe *Rhamneae*]..... *Sageretia*
 - 5 Leaves alternate (or opposite in some *Frangula* and *Rhamnus*), 3-15 cm long; [of various habitats in the Piedmont and Mountains (rarely Coastal Plain) of VA, NC, and SC].
 - 6 Inflorescence repeatedly branched dichotomously; peduncles fleshy and reddish in fruit; nectariferous disc pubescent; [tribe *Paliureae*]..... *Hovenia*
 - 6 Inflorescence not repeatedly branched dichotomously; peduncles not fleshy; nectariferous disc glabrous; [tribe *Rhamneae*].
 - 7 Winter buds naked, pubescent; flowers perfect, sepals, stamens, and petals 5; style undivided; leaves with 8-10 lateral veins on either side of the midvein..... *Frangula*
 - 7 Winter buds with bud scales; flowers functionally unisexual, sepals and stamens 4 or 5 (the stamens rudimentary in the pistillate flowers), petals 0 or 4 (never 5); style divided 1/3 to 2/3 its length into 2, 4 or 5 segments; leaves with (2-) 3-9 lateral veins on either side of the midvein..... *Rhamnus*

Berchemia Necker 1825 (Supplejack)

A genus of about 12 species, vines, of tropical to warm temperate Asia, Africa and se. North America. *B. scandens* is the only New World species. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

Identification notes: The young stems are shining and reddish; older stems can reach at least 18 cm in diameter, with bark medium gray and smooth (though often marred by sap wells drilled by Yellow-bellied Sapsuckers). The smooth bark and neatly pinnately-veined leaves are distinctive.

Berchemia scandens (Hill) K. Koch, Supplejack, American Rattan, Alabama Supplejack, Carolina Supplejack. Swamp forests, bottomlands, streambanks, also upland in mesic to even xeric uplands over calcareous rock or sediment. Apr-May; Aug-Oct. Se. VA south to s. FL, west to TX, north in the interior to nc. TN, w. TN, s. IL, and s. MO. *Berchemia* climbs high into the crowns of swamp trees. [= C, F, FNA, G, GW, K, Mo, RAB, S, Va, WH3, Z]

Ceanothus Linnaeus 1753 (Redroot, New Jersey Tea)

A genus of ca. 55 species, shrubs, mostly in California. References: Nesom in FNA (in prep.); Fross & Wilken (2006)=X; Coile (1988)=Y; Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

- 1 Leaves 0.2-1.0 cm long, obovate..... *C. microphyllus*
- 1 Leaves 2-10 cm long, elliptic to ovate.
 - 2 Inflorescences terminating leafy terminal shoots; leaves mostly obtuse to acute..... *C. herbaceus*
 - 2 Inflorescences terminating leafless axillary shoots (these sometimes with leafy bracts distinctly smaller than normal leaves); leaves mostly acute to acuminate.
 - 3 Leaves (3-) 4-10 cm long, mostly 2.5-6 cm wide; [of various habitats of the Piedmont, Mountains, and rarely Coastal Plain]..... *C. americanus* var. *americanus*
 - 3 Leaves 2-4 (-6) cm long, mostly 1-2 cm wide; [primarily of sandy habitats of the Coastal Plain and rarely Piedmont]..... *C. americanus* var. *intermedius*

Ceanothus americanus Linnaeus var. **americanus**, Common New Jersey Tea. Woodland borders, dry woodlands, glady openings, dry ridge forests and woodlands (pine or oak) in the Mountains. May-Jun; Jun-Jul. ME west to s. MB, south to FL Panhandle and TX. [= C, F, G, X, Y, Z; < *C. americanus* – FNA, K, Mo, Pa, RAB, Va, W, WH3; = *C. americanus* – S]

Ceanothus americanus Linnaeus var. **intermedius** (Pursh) Torrey & A. Gray, Southern New Jersey Tea. Sandhills, dry sandy woodlands and forests, rocky openings around granitic or quartzitic rocks in the Piedmont. May-Jun; Jun-Jul. NJ (or possibly MA) south to c. peninsular FL, west to LA, mostly on the Coastal Plain, but disjunct inland to sandy soils around outcrops of siliceous rocks. The recognition of infraspecific taxa in the variable *C. americanus* is uncertain; var. *intermedius* may either represent ecological forms, or the variation may be too clinal to make taxonomic recognition rewarding. However, material from our area (and beyond) sorts relatively easily, with some intermediates from the Piedmont; varietal status seems provisionally appropriate. [= C, F, G, X, Y, Z; < *C. americanus* – FNA, K, Mo, RAB, Va, W, WH3; = *C. intermedius* Pursh – S]

Ceanothus herbaceus Rafinesque, Prairie Redroot. Flood-scoured rocky riverbanks. Apr-May. Primarily midwestern: MI west to MT, south to nw. IN, AR, TX, and Mexico; disjunct eastward in QC, NH, VT, NY, DC, and n. VA (? - Arlington County). Rafinesque described *C. herbaceus* from "near the falls of the Potowmack, between the rocks." The holotype not extant, Coile (1988) chose a neotype, collected by Sheldon in 1881 from "Arlington County, Virginia, Chain Bridge, rocky river bottoms, Potomac River." However, Bartgis, Fleming, & Wiegand (1997) indicate that *C. herbaceus* in the Washington, D.C. area can only be ascribed with certainty to DC. [= FNA, K, Mo, X, Y, Z; > *C. ovatus* Desfontaines – F, S, misapplied; > *C. pubescens* (Torrey & A. Gray ex S. Watson) Rydberg ex Small – S]

Ceanothus microphyllus Michaux. Sandhills. E. GA south to c. peninsular FL, west to s. AL, approaching to within a few kilometers of SC (in Screven and Chatham counties, GA), and should be sought in se. SC (except that its outlandish appearance makes it difficult to overlook!). Mat-Apr. *C. xserpyllifolius* Nuttall (pro sp.) is apparently a hybrid of *C. americanus* var. *intermedius* and *C. microphyllus* (Coile 1988); it is known from scattered sites in FL and GA. [= FNA, K, S, WH3, X, Y, Z]

Frangula P. Miller 1754 (Buckthorn)

A genus of ca. 50 species, shrubs and small trees, of the northern hemisphere. The distinctions between *Frangula* and *Rhamnus* are many and meaningful; their separation at the generic level seems warranted based on morphological and molecular analyses (Richardson et al. 2000a; Bolmgren & Oxelman 2004). References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

- 1 Leaves entire; leaves ca. 2× as long as wide..... **F. alnus**
- 1 Leaves serrulate; leaves ca. 3× as long as wide..... **F. caroliniana**

* **Frangula alnus** P. Miller, European Alder-Buckthorn, Glossy Buckthorn. Forested areas, other disturbed areas; native of Europe. May-Jun; Jul-Sep. This species is a seriously invasive weed in ne. United States, south to (at least) NJ, s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), KY, and se. TN (Marion County) (Chester, Wofford, & Kral 1997, Kral 1981), and w. NC (where recently found in a forested area along the Blue Ridge Parkway). [= FNA, K, Va; = *Rhamnus frangula* Linnaeus – C, F, G, Mo, Pa]

Frangula caroliniana (Walter) A. Gray, Carolina Buckthorn. Dry to moist barrens, woodlands, and forests, Coastal Plain limestone bluffs and shell middens, especially over mafic or calcareous rocks. May-Jun. Sw. VA west to s. OH and s. MO, south to c. peninsular FL and TX. [= FNA, K, Va; = *Rhamnus caroliniana* Walter – Mo, RAB, S, W, WH3; > *Rhamnus caroliniana* Walter var. *caroliniana* – C, F, G, Z; > *R. caroliniana* var. *mollis* Fernald – C, F, G, Z]

Gouania Jacquin 1763 (Chewstick)

A genus of ca. 50 species, shrubs, of tropical America. References: Pool (2014)=Y; Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

Gouania lupuloides (Linnaeus) Urban, Chewstick, Whiteroot. Hammocks. Aug-Mar. C. and s. FL peninsula, disjunct northwards in Clay County, ne. FL; West Indies; Mexico through Central America. [= FNA, S, WH3, Y, Z]

Hovenia Thunberg 1781 (Raisin-tree)

A genus of 7 species, trees, of e. Asia. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

* *Hovenia dulcis* Thunberg, Japanese Raisin-tree. Suburban woodlands, escaped form cultivation; native of China. Goldman (1998) presents a discussion of this species' introduction into North America, with a color photograph. Also reported as naturalizing in the Coastal Plain portion of Fairfax County, VA (Steury 2011). [= FNA, K, RAB, Z]

Rhamnus Linnaeus 1753 (Buckthorn)

A genus of ca. 150 species, trees and shrubs, of the northern hemisphere. The recognition of *Frangula* as separate from *Rhamnus* is supported by molecular phylogeny (Bolmgren & Oxelman 2004). References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Johnston (1975)=Y; Bolmgren & Oxelman (2004); Medan & Schirarend in Kubitzki (2004). [also see *Frangula*]

- 1 Leaves mostly opposite or subopposite (or some alternate), mostly with (2-) 3-6 lateral veins on either side of the midrib; plant a large shrub or small tree, to 10 m tall; fruit with 4 stones; [aliens, mostly of moist (but not boggy) soils].
 - 2 Leaves mostly 1-2× as long as wide, with (2-) 3 (-4) lateral veins on either side of the midrib; style divided ½ its length into 4 segments..... *R. cathartica*
 - 2 Leaves mostly 2-3× as long as wide, with 4-6 lateral veins on either side of the midrib; style divided ⅔ its length into 2 segments *R. davurica*
- 1 Leaves alternate, mostly with (4-) 6-9 lateral veins on either side of the midrib; plant a shrub to 2 m tall; fruit with 2-3 stones; [natives of various, calcareous habitats].
 - 3 Sepals and stamens 5; petals 0; fruit with 3 stones; [of mafic or calcareous peaty wetlands and seeps]..... *R. alnifolia*
 - 3 Sepals and stamens 4; petals 4; fruit with 2 stones; [of dry to moist calcareous woodlands and thickets].
 - 4 Young leaves and young branches glabrous or with scattered hairs; mature leaves glabrous below..... *R. lanceolata* var. *glabrata*
 - 4 Young leaves and young branches pubescent; mature leaves soft pubescent below *R. lanceolata* var. *lanceolata*

Rhamnus alnifolia L'Héritier, Alder-leaved Buckthorn, American Alder-Buckthorn. Mafic or calcareous (dolomitic) seeps, usually with *Parnassia grandifolia*, northern forests. May-Jul. NL (Newfoundland) west to BC, south to NJ, PA, w. MD (Knapp et al. 2011), sw. VA, ne. TN (Chester, Wofford, & Kral 1997), OH, n. IN, n. IL, IA, and CA. [= C, F, FNA, G, K, Pa, Va, W, WV, Z]

* *Rhamnus cathartica* Linnaeus, Common Buckthorn, European Buckthorn. Disturbed areas; native of Eurasia. Apr-Jun. Reported for VA by Harvill et al. (1991), but the report is actually based on specimens of *R. davurica* (Virginia Botanical Associates 2005); now bonafide specimens have been found in Giles and Wythe counties (T.F. Wieboldt, pers. comm. 2009). Reported as “now escaping and widespread near Roaches Run”, Arlington County, VA (Steury 2011). [= C, F, FNA, G, K, Mo, Pa, Va, Z]

* *Rhamnus davurica* Pallas, Davurian Buckthorn. Suburban woodlands, rarely naturalized; native of e. Asia (n. China). Apr-Jun. Also reported from suburban areas near Louisville, KY, and Knoxville, TN (D. Estes, pers. comm.). [= Mo, Pa, Va; > *Rhamnus davurica* ssp. *davurica* – FNA, K; = *R. citrifolia* (Weston) W.J Hess & Stearn – C, illegitimate name]

Rhamnus lanceolata Pursh var. *glabrata* Gleason, Western Lance-leaved Buckthorn. Dry habitats over calcareous rocks. Apr-May. Var. *glabrata* Gleason ranges from OH west to SD, south to w. VA (Ludwig 1999), KY, c. TN, AR, and KS. [= C, F, G, Va, Z; = *R. lanceolata* ssp. *glabrata* (Gleason) Kartesz & Gandhi – FNA, K; < *R. lanceolata* – S, W, Y]

Rhamnus lanceolata Pursh var. *lanceolata*, Eastern Lance-leaved Buckthorn. Dry to moist thickets over calcareous rocks. Apr-May. Var. *lanceolata* ranges from PA south to AL, mostly in the Appalachians. [= C, F, G, Mo, Va, Z; = *R. lanceolata* ssp. *lanceolata* – FNA, K; < *R. lanceolata* – Pa, S, W, WV, Y]

Sageretia Brongniart 1827 (Small-flowered Buckthorn)

A genus of about 35 species, shrubs and trees, of tropical to warm temperate areas of Africa, Asia, and America. References: Nesom in FNA (in prep.); Nesom (1993c)=Y; Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

Identification notes: *S. minutiflora* can appear superficially a bit like *Ilex vomitoria*, with which it typically grows; it can be distinguished from *Ilex vomitoria* by its opposite leaves.

Sageretia minutiflora (Michaux) C. Mohr, Small-flowered Buckthorn. Shell middens and shell hammocks, dry calcareous hammocks and maritime forests. Aug-Sep; Oct-Nov. Se. NC south to s. FL, west to s. MS. *S. minutiflora* is apparently most closely related to *S. elegans* (Kunth) Brongniart, which ranges from s. Mexico south to s. South America. [= FNA, K, RAB, S, WH3, Y, Z]

Ziziphus P. Miller 1754 (Jujube)

A genus of 85-100 species, shrubs and trees, of tropical and warm temperate areas. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

* *Ziziphus zizyphus* (Linnaeus) Karsten, Chinese Jujube, Common Jujube, Chinese Date. Disturbed areas; native of Eurasia. Reported from ec. GA (Jones & Coile 1988). Cultivated at least as far north as NC. As of 2010, *Z. jujuba* is proposed for conservation over the nearly tautonymic *Z. zizyphus*. [= K1, K2; = *Ziziphus zizyphus* (Linnaeus) Karsten – S, orthographic variant; = *Z. jujuba* P. Miller – FNA, WH3, Z]

152. ULMACEAE de Mirbel 1815 (Elm Family) [in ROSALES]

As here circumscribed (excluding *Celtis* and relatives), a family of 6-7 genera and about 35 species, of temperate, subtropical, and boreal Northern Hemisphere, rarely extending into the Southern Hemisphere). Zavada & Kim (1996) discuss compelling reasons to remove *Celtis* from the Ulmaceae. References: Sherman-Broyles, Barker, & Schulz in FNA (1997); Zavada & Kim (1996); Todzia in Kubitzki, Rohwer, & Bittrich (1993). [also see *CANNABACEAE*]

- 1 Leaves strongly 3-veined from the base, the venation otherwise pinnate; fruit a drupe with thin flesh.....[*Celtis* – see *CANNABACEAE*]
- 1 Leaf venation pinnate throughout, the venation strictly pinnate; fruit dry, a samara (flat and winged) or nutlike (with or without fleshy protuberances).
 - 2 Fruit a samara (flat and winged); primary lateral veins mostly parallel and unforked to the leaf margin *Ulmus*
 - 2 Fruit nutlike (globular, with or without fleshy protuberances); primary lateral veins **either** mostly parallel and unforked to the leaf margin, **or** mostly forking before reaching the margin.
 - 3 Fruit with numerous fleshy protuberances; primary lateral veins mostly forking before reaching the margin; [small trees of swamp forests of the Coastal Plain from se. NC and SC southward].....*Planera*
 - 3 Fruit lacking fleshy protuberances (though irregular in shape); primary lateral veins mostly parallel and unforked to the leaf margin; [planted horticulturally, rarely persisting or spreading weakly].....[*Zelkova*]

Planera J.F. Gmelin 1791 (Planer-tree, Water-elm)

A monotypic genus, a tree, of temperate se. North America. References: Barker in FNA (1997); Todzia in Kubitzki, Rohwer, & Bittrich (1993).

Planera aquatica (Walter) J.F. Gmelin, Planer-tree, Water-elm. River swamps where flooded (often to depths of 1-2 m) in the winter. Apr. Se. NC (limited to the Waccamaw and Lumber rivers) south to n. FL, west to e. TX, and north in the Mississippi Embayment to w. TN, w. KY, s. IL, and se. MO. [= C, F, FNA, G, GW, K, Mo, RAB, S, WH3]

Ulmus Linnaeus 1753 (Elm)

A genus of about 25-30 species, trees (rarely shrubs), of temperate and boreal regions of the Northern Hemisphere (most diverse in c. and n. Asia). References: Sherman-Broyles in FNA (1997); Wiegrefe, Sytsma, & Guries (1994); Kurz & Godfrey (1962)=Z; Todzia in Kubitzki, Rohwer, & Bittrich (1993). Key adapted in part from FNA.

- 1 Leaf blades mostly < 7 cm long, the base symmetrical to somewhat oblique.
 - 2 Samaras ciliate-margined; twigs often cork-winged; upper surfaces of leaves glabrous to scabrous; [native trees, sometimes weedy].
 - 3 Leaf apex acute; flowers appearing in the late winter to late spring; calyx lobes 5, broadly rounded; upper surfaces of leaves glabrous to somewhat scabrous; [widespread in our area; [subgenus *Oreoptelea*, section *Chaetoptelea*] *U. alata*
 - 3 Leaf apex obtuse; flowers appearing in the late summer to fall; calyx lobes 6-9, linear; upper surfaces of leaves harshly scabrous; [of w. TN, w. MS westward; also disjunct in FL]; [subgenus *Oreoptelea*, section *Trichoptelea*]..... *U. crassifolia*
 - 2 Samaras with glabrous margins; twigs never cork-winged; upper surfaces of leaves glabrous; [introduced trees, planted and sometimes naturalized or persistent]; [subgenus *Ulmus*, section *Microptelea*].
 - 4 Flowers appearing in the late summer to fall; leaf base generally oblique; leaves 1.5-2.5 cm wide, 5 or more of the lateral veins forked per side..... *U. parvifolia*
 - 4 Flowers appearing in the late winter to late spring; leaf base generally symmetrical; leaves 2-3.5 cm wide, 3 or fewer of the lateral veins forked per side..... *U. pumila*
- 1 Leaf blades mostly > 7 cm long, the base moderately to strongly oblique (rarely nearly symmetrical).

- 5 Leaf uppersurface slightly to very strongly scabrous; leaf undersurface tomentose or villous, with tufts of hairs in the vein axils; flowers and fruits sessile or subsessile (on pedicels 0-2 mm long), in dense non-pendulous fascicles; [subgenus *Ulmus*, section *Ulmus*].
- 6 Leaves with ciliate margins; samara pubescent on the body with reddish hairs; bud scales red, the margins red-tomentose; [native tree].. *U. rubra*
- 6 Leaves without ciliate margins; samara glabrous except along the margin of the notched apex **or** on the central vein of the wing; bud scales brown, margins pale-ciliate; [introduced tree, planted and sometimes naturalized or persistent]
 - 7 Leaf base strongly oblique, the lower side overlapping the petiole; branchlets not corky; samara glabrous except on the central vein of the wing [*U. glabra*]
 - 7 Leaf base oblique but not overlapping the petiole; branchlets with corky wings; samara glabrous except along the margin of the notched apex [*U. minor*]
- 5 Leaf uppersurface glabrous (or slightly to moderately scabrous on stump sprouts or seedlings); leaf undersurface glabrous to tomentose, with or without tufts of hairs in the vein axils; flowers and fruits pedicellate (on pedicels 5-20 mm long), pendulous, in fascicles or racemes.
 - 8 Leaf undersurfaces glabrous or slightly pubescent, but always with tufts of hairs in the vein axils; branches never with corky wings; inflorescence a fascicle; [trees widespread in our area]; [subgenus *Oreoptelea*, section *Blepharocarpus*].
 - 9 Leaf bases strongly oblique; larger leaves 10-15 cm long; primary leaf teeth acuminate, often curved inward; [tree widespread in our area]..... *U. americana* var. *americana*
 - 9 Leaf bases moderately oblique (rarely nearly symmetrical); larger leaves 7-10 cm long; primary leaf teeth acute, not curved; [tree restricted to moist calcareous sites in the Coastal Plain of se. NC southward] *U. americana* var. *floridana*
 - 8 Leaf undersurfaces moderately white or yellowish soft-pubescent, lacking prominent tufts of hairs in the vein axils (differing from the general pubescence of the surface); branches often developing corky wings; inflorescence a raceme or racemose cyme; [trees of calcareous areas in the western portion of our area]; [subgenus *Oreoptelea*, section *Trichoptelea*].
 - 10 Leaves 7-8 (-14) cm long, lanceolate to ovate, the undersurface with yellowish-gold pubescence; buds and young twigs glabrous; calyx lobes 5-6; seeds thickened *U. serotina*
 - 10 Leaves 9-11 (-16) cm long, obovate, the undersurface with whitish pubescence; buds and young twigs pubescent; calyx lobes 7-8; seeds inflated *U. thomasi*

Ulmus alata Michaux, Winged Elm. Rock outcrops, dry and mesic forests and woodlands, bottomlands, old fields, disturbed areas. Feb-Mar; Mar-Apr. N. VA west to MO, south to c. peninsular FL and c. TX. [= C, F, FNA, G, GW, K, RAB, S, Va, W, WH3, Z]

Ulmus americana Linnaeus var. *americana*, American Elm, White Elm. Swamps, bottomland forests, moist slopes, especially on relatively or strongly nutrient-rich substrates. Feb-Mar; Mar-Apr. NS, NB, and QC west to se. SK, south to n. FL and c. TX. It now appears that *U. americana* (in the broad sense) is a polyploid complex, with tetraploids throughout its distribution and diploids south of the glacial maximum (Whittemore & Olson 2011). Ascomycetous fungi, *Ophiostoma ulmi* and *O. novo-ulmi*, are the cause of the Dutch Elm disease. In our area, the effects of the disease appear to have been variable, with less impact southwards and in natural populations (as compared to suburban or urban plantings). [= Z; < *U. americana* – C, F, FNA, G, GW, K, Mo, Pa, RAB, Va, W, WH3, WV; = *U. americana* – S]

Ulmus americana Linnaeus var. *floridana* (Chapman) Little, Florida Elm. Shell middens, other calcareous forests. Jan-Mar; Feb-Apr. Se. NC (north at least to Carteret County) south to c. peninsular FL, west to Panhandle FL and s. AL (H. Horne, pers. comm., 2013). [= Z; < *U. americana* – C, F, FNA, G, GW, K, RAB, W, WH3; = *U. floridana* Chapman – S]

Ulmus crassifolia Nuttall, Cedar Elm. Bottomlands, mesic forests. Sep. W. TN, s. MO, and OK south to MS, LA, and TX; disjunct in e. Panhandle FL. [= FNA, K, Mo, S, WH3, Z]

* *Ulmus glabra* Hudson, Wych Elm, Scotch Elm. Suburban woodlands; native of Europe. Naturalized in ne. United States; reported from VA and DC (Sherman-Broyles in FNA 1997), but may only be cultivated. [= FNA, C, F, K]

* *Ulmus ×intermedia* Elowsky [*U. pumila* × *rubra*], Hybrid Elm. Recognizable from its intermediacy between its parents and occurrence in proximity to both. This hybrid apparently occurs in many midwestern States (cited for IA, IL, KS, MN, NE, SD, TX) (Elowsky, Jordon-Thaden, & Kaul 2013); the increasingly common naturalization of *U. pumila* in our area, and its proximity to populations of *U. rubra* would seem to make it inevitable that this hybrid occurs in our area. See Elowsky, Jordon-Thaden, & Kaul (2013) for detailed information. {not keyed or mapped}

* *Ulmus minor* P. Miller, English Elm, English Cork Elm. Planted horticulturally, rarely spreading; native of Europe. Apr. [= Mo; > *U. procera* Salisbury – C, FNA, K, Pa]

* *Ulmus parvifolia* Jacquin, Chinese Elm, Lacebark Elm. Disturbed secondary forests, roadsides, fencerows, old fields, other disturbed areas; native of China and Japan. Aug-Oct; Sep-Nov. The bark on mature trees exfoliates creating a patchwork of gray, brown, green, and orange blotches. [= FNA, K, Pa, Va, WH3]

* *Ulmus pumila* Linnaeus, Siberian Elm, Dwarf Elm. Roadsides, disturbed areas; native of Asia. Mar. [= C, F, FNA, K, Mo, Pa, Va]

Ulmus rubra Muhlenberg, Slippery Elm, Red Elm. Moist to fairly dry calcareous forests, rich bottomlands, rich cove forests in the low Mountains. Feb-Apr; Mar-May. ME, QC, and ON west to MN and ND, south to Panhandle FL and c. TX. *U.*

rubra is susceptible to Dutch Elm Disease (see *U. americana*). [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WH3, WV, Z; = *U. fulva* Michaux – S]

Ulmus serotina Sargent, September Elm. Mesic limestone forests. KY, s. IL, and e. OK south to e. TN, nw. GA, AL, and MS. It was collected on the French Broad River by Rugel in 1842, the location attributed to NC by Mohr (1901). [= C, FNA, F, G, K, S]

Ulmus thomasi Sargent, Cork Elm, Rock Elm. Rocky or rich slopes, especially over limestone. Apr. QC to MN and NE, south to NJ, MD, PA, WV, KY, TN, AR, and KS. [= C, FNA, K, Mo; = *U. thomasi* – F, G, WV, orthographic variant]

***Zelkova* Spach 1841 (Zelkova)**

A genus of 5 species, trees, of e. Asia, sw. Asia, and se. Europe. References: Todzia in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: *Zelkova serrata* and *Ulmus parvifolia* are sometimes confused, because of similar habit and exfoliating bark. The leaves of *Zelkova* are strongly acuminate (vs. acute in *U. parvifolia*), larger, and with more regularly pinnate lateral veins.

* ***Zelkova serrata*** (Thunberg) Makino, Zelkova. Planted frequently for ornament, persisting of spreading weakly; native of China, Japan, and Korea. [= K2]

153. CANNABACEAE Endlicher 1827 (Hops Family) [in ROSALES]

As circumscribed to include the Celtidaceae, a family of 14 genera and about 120 species, trees, shrubs, woody vines, herbs, and herbaceous vines, of cosmopolitan distribution. Zavada & Kim (1996) discuss compelling reasons to recognize the Celtidaceae as a family distinct from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable; and Yang et al. (2013), Sytsma et al. (2002), and many others conclude that Celtidaceae should be considered a part of Cannabaceae. References: Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Sherman-Broyles, Barker, & Schulz in FNA (1997); Zavada & Kim (1996); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Sytsma et al. (2002).

- 1 Tree or shrub; leaves simple and unlobed..... *Celtis*
- 1 Herb or vine; leaves either compound or lobed.
 - 2 Erect herb; leaves with 3-7 leaflets..... *Cannabis*
 - 2 Climbing or sprawling vine; leaves simple, with 1-9 lobes..... *Humulus*

***Cannabis* Linnaeus 1753 (Hemp, Marijuana)**

A genus of 1-3 species, herbs, originally native to c. Asia. *Cannabis* was formerly widely cultivated nearly worldwide for the fiber hemp; it is now better known as the source of the drug marijuana. References: Small in FNA (1997); Hillig & Mahlberg (2004); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

* ***Cannabis sativa*** Linnaeus, Hemp, Marijuana. Disturbed areas and clandestinely cultivated plots; native of Asia. Jun-Oct. Though perhaps not truly naturalized or persistent, *Cannabis* is treated here since clandestine cultivated plots are encountered by the field biologist, especially in fairly remote areas in the mountainous parts of our area. [= F, FNA, G, Pa, WH3, WV; > *C. sativa* Linnaeus ssp. *sativa* var. *sativa* – C, K]

Celtis Linnaeus 1753 (Hackberry)

A genus of about 100 species, trees, shrubs, and woody vines, widespread in tropical, subtropical, and temperate regions worldwide. References: Whittemore in Yatskiyevych (2013)=Mo; Todzia in Kubitzki, Rohwer, & Bittrich (1993). Key based on Mo.

- 1 Branches armed with short spines..... *C. iguanaea*
- 1 Branches unarmed.
 - 2 Leaves thick, very glossy above; bark remaining smoothish, lacking protuberances; [rare alien] [*C. sinensis*]
 - 2 Leaves thin, dull or glossy above (glossy normally only in sun leaves, especially of *C. laevigata*); bark developing wartlike corky protuberances on larger individuals; [collectively common natives].
 - 3 Leaf blades (fully-formed leaves subtending fruits) 7-12 cm long, the longer side with 23-40 teeth, the shorter with 12-27 teeth; secondary veins 5-8 on each side of the midvein, the basalmost reaching the leaf margin at a point 1/3 to 1/2 the length of the leaf above the base; fruits 8-10 mm long..... *C. occidentalis*
 - 3 Leaf blades (fully-formed leaves subtending fruits) 3.5-8.5 cm long, each side with 0-15 teeth; secondary veins 3-5 on each side of the midvein, the basalmost reaching the leaf margin at a point 1/3 to 2/3 the length of the leaf above the base; fruits 5-8 mm long.
 - 4 Plants shrubs or small trees, to 7 m tall, with ascending trunks and horizontal or arching leaders; bark often nearly smooth (sometimes with corky warts near the base or around wounds); leaf undersurface glaucous or pale green, usually distinctly lighter than the upper surface; flower stalks usually hairy; twigs usually moderately to densely hairy (sometimes glabrous); anthers small and indehiscent, pollen malformed and generally sterile (< 10% of the grains stainable with acetocarmine)..... *C. tenuifolia*
 - 4 Plants usually trees, to 30 m tall, typically single-trunked, with erect leaders; bark with corky warts on trunks and major branches; leaf undersurface usually bright green, little if at all paler than the upper surface; flower stalks glabrous (rarely with a few hairs); twigs glabrous or sparsely hairy; anthers well-developed, dehiscent, pollen copious, regular, and fertile (> 95% of the grains stainable with acetocarmine).
 - 5 Leaves subtending fruits with margins entire or with 1-2 teeth 0.5-1 mm long on one side only (leaves of juvenile plants or of vigorous leader shoots may be more strongly toothed)..... *C. laevigata*
 - 5 Leaves subtending fruits with margins with 2-15 teeth 1-2 mm long on each side..... *C. smallii*

Celtis iguanaea (Jacquin) Sargent, Iguana Hackberry. Shell-middens and calcareous coastal sites. S. AL, sw. peninsular FL; West Indies; American tropics. [= K, WH3; = *Momisia iguanaea* (Jacquin) Rose & Standley - S]

Celtis laevigata Willdenow, Southern Hackberry, Sugarberry. Bottomland forests, especially on natural levees, upland calcareous forests and woodlands, shell middens. Apr-May; Aug-Oct. MD, WV, IN, IL, MO and KS south to s. FL and TX. [*C. laevigata* - C, FNA, G, GW, K2, RAB, Va, W, WH3; = *C. laevigata* var. *laevigata* - F, Mo; = *C. mississippiensis* Bosc - S]

Celtis occidentalis Linnaeus, Northern Hackberry. Xeric to mesic glades, outcrops, barrens, woodlands, and bottomland forests, usually over calcareous substrates. Mar-May; Aug-Oct. NH, QC, MB, and MT south to Panhandle FL, TX, and NM. [= C, FNA, G, K, Mo, Pa, S, Va, W, WV; = *C. occidentalis* var. *occidentalis* - RAB; > *C. occidentalis* var. *canina* (Rafinesque) Sargent - F; > *C. occidentalis* var. *occidentalis* - F; > *C. occidentalis* var. *pumila* (Pursh) A. Gray - F, misapplied; < *C. occidentalis* - WH3]

* *Celtis sinensis* Willdenow, Chinese Hackberry. Suburban woodlands; native of China, Korea, and Japan. Found naturalizing in Guilford County, NC (W. Cook, pers. comm., 2010).

Celtis smallii Beadle, Small's Hackberry. Glades, woodlands, forests. Apr-May; Aug-Oct. VA and KY south to GA and AL, mainly inland. [= S; < *C. laevigata* - C, FNA, G, GW, K2, RAB, Va, W, WH3; = *C. laevigata* var. *smallii* (Beadle) Sargent - F, Mo]

Celtis tenuifolia Nuttall, Dwarf Hackberry, Georgia Hackberry. Xeric to mesic glades, outcrops, barrens, woodlands, often over calcareous substrate. Apr-May; Aug-Oct. NJ, PA, IN, IL, and KS south to Panhandle FL and TX. It is unclear whether *C. pumila* applies to this taxon; if it does, it has priority. [= *C. tenuifolia* Nuttall - C, FNA, G, K, Pa, Va, W, WV; = *C. occidentalis* var. *georgiana* (Small) H.E. Ahles - RAB; > *C. tenuifolia* var. *georgiana* (Small) Fernald & Schubert - F; > *C. tenuifolia* var. *tenuifolia* - F; = *C. pumila* Pursh - Mo, perhaps misapplied; = *C. georgiana* Small - S; < *C. occidentalis* - WH3]

Humulus Linnaeus 1753 (Hops)

A genus of 2 species, herbaceous vines, of temperate regions of the Northern Hemisphere. References: Small (1978)=Z; Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Z.

- 1 Veins on lower surface of leaves armed with rigid, spinulose hairs; bracts of pistillate flowers spinulose-ciliate; most leaves 5-9 lobed..... *H. japonicus*
- 1 Veins on lower surface of leaves more or less pubescent with lax, weak hairs, but lacking rigid, spinulose hairs; bracts of pistillate flowers smooth-margined; most leaves 1-3 lobed.

- 2 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) usually with < 20 hairs per cm of length of midrib; glands (measured on leaves as above) < 25 per 10 square mm of intervein lower leaf surface; [introduced variety, sometimes showing introgression with native varieties]..... ***H. lupulus* var. *lupulus***
- 2 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) usually with > 20 hairs per cm of length of midrib; glands (measured on leaves as above) > 25 per 10 square mm of intervein lower leaf surface; [native varieties, though often weedy and sometimes showing introgression with var. *lupulus*].
- 3 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) conspicuously pubescent between the veins and on the veins, with > 100 hairs per cm of length of midrib; smaller leaves unlobed (less commonly 3-lobed) ***H. lupulus* var. *pubescens***
- 3 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) not conspicuously pubescent, the pubescence usually limited to the veins, usually with < 100 hairs per cm of length of midrib; smaller leaves generally 3-lobed ***H. lupulus* var. *lupuloides***

* ***Humulus japonicus*** Siebold & Zuccarini, Japanese Hops. Disturbed areas, particularly in rich, alluvial soils, where it has become a serious weed along major VA rivers; native of Japan, Taiwan, and China. Jun-Oct; Jul-Oct. [= C, F, FNA, G, K, Pa, RAB, Va, W, WV, Z]

Humulus lupulus Linnaeus var. ***lupuloides*** E. Small, Northeastern Hops. Disturbed areas, particularly in rich, alluvial soils. Jul-Aug; Sep-Oct. NS and NL (Newfoundland) south to VA and NC, west to NE, MT, and AB. It is not clear whether its occurrence in NC is native or native of farther north. The 3 varieties (two native and one introduced) in our area are subtly different, the differences apparently sometimes further obscured by introgressive hybridization. [= C, FNA, K, Pa, Z; < *H. lupulus* – F, G, RAB, S, Va, W, WV]

* ***Humulus lupulus*** Linnaeus var. ***lupulus***, Brewer's Hops, European Hops. Disturbed areas; native of Europe. Jul-Aug; Sep-Oct. The European var. *lupulus* is (of course) one of the key ingredients of beer. [= C, FNA, K, Pa, Z; < *H. lupulus* – F, G, RAB, S, Va, W, WV]

Humulus lupulus Linnaeus var. ***pubescens*** E. Small, Midwestern Hops. Disturbed areas, particularly in rich, alluvial soils; rare. Jul-Aug; Sep-Oct. NY and PA south to NC and ne. GA and west to MN, NE, KA, and AR. It is not clear whether the few occurrences east of the Blue Ridge (including those in NC and VA) are native or adventive from farther west. [= C, FNA, K, Pa, Z; < *H. lupulus* – F, G, RAB, S, Va, W]

154. MORACEAE Lindley 1847 (Mulberry Family) [in ROSALES]

A family of about 38 genera and 1100 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (few) warm temperate areas. References: Wunderlin in FNA (1997); Rohwer & Berg in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Herb, 0.3-1.0 m tall; stem without latex; [tribe *Moreae*]..... ***Fatoua***
- 1 Shrub or tree, at maturity over 1 m tall, or woody vine growing appressed to masonry; stem bearing translucent to milky-white latex.
- 2 Stipules connate, the stipule scar encircling the twig; inflorescence a syconium (the flowers borne on the inner walls of the fleshy receptacle); [tribe *Ficeae*]..... ***Ficus***
- 2 Stipules free, the stipule scar not encircling the twig; inflorescence a spike, head, or catkin (the flowers borne exposed on a contracted or elongated axis or receptacle).
- 3 Leaves entire, unlobed or shallowly 3 (-5)-lobed; stems usually thorny; [tribe *Maclureae*]..... ***Maclura***
- 3 Leaves serrate, often also 3-15-lobed (the lobes sometimes deep); stems not thorny; [tribe *Moreae*].
- 4 Stems and leaves hirsute; leaves alternate, opposite, and whorled..... ***Broussonetia***
- 4 Stems and leaves glabrous to pubescent; leaves alternate..... ***Morus***

Broussonetia L'Héritier ex Ventenat 1799 (Paper Mulberry)

A genus of about 8 species, trees, shrubs, and vines, of tropical and subtropical Asia and Madagascar. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

* ***Broussonetia papyrifera*** (Linnaeus) L'Héritier ex Ventenat, Paper Mulberry. Urban lots, disturbed areas, roadsides; native of e. Asia. Apr-May. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WH3; = *Papyrius papyriferus* (Linnaeus) Kuntze – S]

Fatoua Gaudichaud-Beaupré 1830 (Crabweed)

A genus of 2-3 species, herbs or weak shrubs, of Asia, Madagascar, and Australia. References: Vincent (2004)=Y; Massey (1975)=Z; Miller & Wood (2003); Kral (1981b); Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

* *Fatoua villosa* (Thunberg) Nakai, Crabweed, Mulberry-weed, Foolish-weed. Disturbed areas, vegetable and flower gardens, landscaped areas around institutional buildings; native of Asia (apparently se. Asian islands). Jul-Nov. As reported by Massey (1975) and Vincent (2004), *Fatoua* was first reported in the United States (Louisiana) in the early 1960's. As of 2004, its distribution in North America had spread to include 28 states and the District of Columbia, including most states except the Great Plains and Rocky Mountains had spread (Vincent 2004, Sundell et al. 1999, Miller & Wood 2003). Since all early collections seem to be in and around greenhouses and nurseries, it is likely that it has been introduced in horticultural material, perhaps repeatedly (Kral 1981b). *Fatoua* appears to have become a fairly aggressive weed in eastern North America. It can be expected to continue to spread, and has the potential to become noxious. It has alternate, ovate leaves with cordate bases, borne on long petioles (about as long as the leaf blade), the inflorescences are dense cymes borne on peduncles in the axils of leaves. Pubescence of the stem and foliage is uncinulate, giving the plant a "tacky" feel. An excellent illustration appears in Correll & Correll (1982). [= FNA, K, Mo, Va, WH3, Y, Z]

Ficus Linnaeus 1753 (Fig)

A genus of about 750 species, trees, shrubs, and vines, of tropical, subtropical, and warm temperate areas. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves lobed, 7-30 cm long; [shrub to small tree]..... *F. carica*
- 1 Leaves unlobed, 1-10 cm long; [vine, climbing appressed to walls]..... *F. pumila*

* *Ficus carica* Linnaeus, Edible Fig, Garden Fig. Grown for its fruits, persistent from plantings, persisting and naturalizing particularly on barrier islands, where it sometimes forms thickets on dunes, or otherwise in the outer Coastal Plain, where proximity to the ocean ameliorates cold winter temperatures; native of w. Asia. May-Aug; Jul-Oct. This is the common cultivated fig, grown for its fruit in the Mid-east for millenia. [= F, FNA, K, RAB, S, WH3]

* *Ficus pumila* Linnaeus, Climbing Fig. Walls, disturbed urban areas; native of s. Asia. Locally common in Charleston, Savannah, Pensacola, Mobile, New Orleans, and other old seaports, where grown on walls as an ornamental, more recently planted more extensively in the South, especially but not strictly in the Coastal Plain, commonly persisting and also spreading vegetatively into disturbed urban areas (cf. Diamond 2013). [= FNA, K, WH3]

Maclura Nuttall 1818 (Osage-orange)

A genus of 3-11 species, trees, of sc. North America and e. Asia. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Fruit 10-15 cm in diameter; petioles 30-50 mm long; leaves 6-20 cm long *M. pomifera*
- 1 Fruit 2-3 cm in diameter; petioles 5-20 mm long; leaves 3-7 (-10) cm long [*M. tricuspidata*]

* *Maclura pomifera* (Rafinesque) C.K. Schneider, Osage-orange, Bow-wood, Bois-d'arc, Hedge-apple. Fields, hedgerows, forests, naturalized from extensive planting in the eighteenth and nineteenth centuries, native of TX, OK, AR, and LA. Apr-Jun; Oct. The large fruits are unmistakable: yellowish-green, grapefruit-sized, and wrinkled, reminiscent of a giant, spherical mulberry fruit. The wood is extremely heavy, fine-grained, a bright yellow-orange when fresh, but darkening with age, famous for making bows and also used in cabinetetry. [= C, F, FNA, G, K1, K2, Pa, RAB, Va, W, WH3, WV; = *Toxylon pomiferum* Rafinesque ex Sargent - S]

* *Maclura tricuspidata* Carrière, Cudrania, Strawberry-bush. Forest edges, suburban woodlands, escaped and naturalized from plantings; native of China and Korea, where cultivated as a food for silkworms. Jul. Naturalized in Orange County, NC, in McIntosh County, GA (Jones & Coile 1988), in Clay County, TN (D. Estes, pers. comm., 2015), and at other widely scattered locations in the South, where recommended as a hedge plant since at least 1940 (Rehder 1940). [= *Cudrania tricuspidata* (Carrière) Bureau ex Lavallée - FNA, K1, K2]

Morus Linnaeus 1753 (Mulberry)

A genus of about 10-15 species, trees, of warm temperate, subtropical, and tropical areas. References: Saar et al. (2012)=Y; Galla et al. (2009)=Z; Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Upper leaf surface glossy, glabrous or slightly scabrous; lower leaf surface glabrous, or slightly pubescent on the veins and in the vein axils only; ripe fruits black, purple, red, pink, or white *M. alba*
 1 Upper leaf surface dull, scabrous; lower leaf surface pubescent on the veins, veinlets, and the surface between the veins; ripe fruits black or purple *M. rubra*

* *Morus alba* Linnaeus, White Mulberry, Silkworm Mulberry, Russian Mulberry. Disturbed areas, vacant lots, roadsides, moist forests; native of e. Asia. Mar-May; May-Jun. [= C, F, FNA, G, GW, K1, K2, Mo, Pa, RAB, S, Va, W, WH3, WV, Y, Z; > *M. alba* - S; > *M. nigra* Linnaeus - S, misapplied as to our material; > *M. alba* var. *tatarica* (Linnaeus) Seringe]

* *Morus nigra* Linnaeus, Black Mulberry. Reported for scattered localities in North America, perhaps only because of confusion with dark-fruited plants of *M. alba*. [= FNA, K2] {add to synonymy; add to key}

Morus rubra Linnaeus, Red Mulberry. Bottomland forests, mesic slopes, disturbed areas, suburban woodlands. Apr-May; May-Jun. MA, VT, NY, MI, WI, and se. SD south to s. FL and w. TX, and into Mexico. The fruits are very variable in quality from tree to tree. *M. rubra* is the only member of the Moraceae native to our area. *M. murrayana* D.E. Saar & S.J. Galla (or alternatively treated as a variety of *M. rubra*) has recently been described as distinct from *M. rubra* and occurring widely in eastern North America (KY, TN, MO, IL, IN, MS, LA, VA, NC, and AL) (Galla et al. 2009; Saar et al. 2012). It is alleged to differ from *M. rubra* by its leaves to 38 cm long (vs. to 15 cm long), the outer three leaves on branchlets almost always > 15 cm long (vs. < 15 cm long), leaves with caudate apex (vs. acute to acuminate apex); mature fruit to 4 cm long and 1.5 cm wide but often thinner, with much size variation on a single individual (vs. mature fruit to 3 cm long). All the alleged characters appear to be highly variable and correlated with vigor. [= C, F, G, GW, K2, Mo, Pa, RAB, S, Va, W, WH3, WV; > *M. rubra* var. *rubra* - K1, Y; > *M. rubra* var. *murrayana* (D.E. Saar & S.J. Galla) D.E. Saar - Y; > *M. rubra* - Z; > *M. murrayana* D.E. Saar & S.J. Galla - Z]

155. URTICACEAE A.L. de Jussieu 1789 (Nettle Family) [in ROSALES]

A family of about 45 genera and 1000 species, herbs, shrubs, vines, and trees, of cosmopolitan distribution in tropical, subtropical, and temperate regions. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Miller (1971a).

- 1 Leaves opposite.
 2 Plant with stinging trichomes, these having a distinct bulbous or cylindrical base, and a stiff, translucent apex; [tribe *Urticeae*] *Urtica*
 2 Plant without stinging trichomes (or these minute and not apparent), the non-stinging hairs (if present) soft and flexible, lacking a bulbous or cylindrical base.
 3 Flowers in axillary spikes; foliage dull, yellow-green; leaves 3-veined from the base, the 2 main side veins reaching the margin about 2/3s of the way from blade base to blade tip, the midvein with 1-2 or more prominent secondary veins borne near or past the midpoint and at a sharply acute angle to the midvein, these arching to the leaf margin; [tribe *Boehmerieae*] *Boehmeria*
 3 Flowers in axillary panicles or fascicles; foliage shiny, bright green; leaves 3-veined from the base, the 2 main side veins extending to the apex of the blade, the midvein with many secondary veins borne along its length at a nearly right angle, and connecting to the 2 main side veins rather than reaching the leaf margin; [tribe *Lecantheae*] *Pilea*
 1 Leaves alternate (at least above, if not throughout).
 4 Leaves toothed; plant either with or without stinging trichomes.
 5 Flowers in axillary spikes; woody herb to 4 m tall, without stinging trichomes; leaf undersurfaces white-pubescent; [tribe *Boehmerieae*] *Boehmeria*
 5 Flowers in terminal or axillary panicles; herb to 1.5 m tall, with stinging trichomes; leaf undersurfaces green; [tribe *Urticeae*] *Laportea*
 4 Leaves entire; plants without stinging trichomes.
 6 Stipules absent; [tribe *Parietarieae*] *Parietaria*
 6 Stipules present; [tribe *Boehmerieae*] *Pouzolzia*

Boehmeria Jacquin 1760 (False-nettle)

A genus of about 50-80 species, trees, shrubs, and perennial herbs, of warm temperate, subtropical, and tropical regions of the Old World and New World. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves opposite (upper leaves sometimes alternate); monoecious herb to 1.5 m tall; [subgenus *Duretia*] *B. cylindrica*
 1 Leaves alternate; dioecious herb to 4 m tall; [subgenus *Tilocnide*] *B. nivea*

Boehmeria cylindrica (Linnaeus) Swartz, False-nettle. Swamp forests, bottomlands, bogs, tidal marshes, other marshes, other wetlands. Jul-Aug; Sep-Oct. QC and MN south to FL and NM. [= C, FNA, G, GW, K, Mo, Pa, RAB, Va, W, WH3; > *B. cylindrica* var. *cylindrica* - F; > *B. cylindrica* var. *drummondiana* (Weddell) Weddell - F; > *B. cylindrica* - S; > *B. drummondiana* Weddell - S]

* *Boehmeria nivea* (Linnaeus) Gaudichaud-Beaupré, Ramie. Disturbed suburban areas, waste ground; native of Asia. This plant has been cultivated for the fiber of its stems, which is extracted and used for fabric in a manner reminiscent of linen (which is made from *Linum usitatissimum*). Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). [= FNA, K, RAB, WH3; = *Ramium niveum* (Linnaeus) Small - S]

Laportea Gaudichaud-Beaupré 1830 (Wood-nettle)

A genus of about 21 species, shrubs, perennial herbs, and annual herbs, of tropical and warm temperate e. Asia and temperate e. North America. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Plants with stipitate-glandular trichomes as well as stinging trichomes; fruiting pedicels lacking lateral wings [*L. aestuans*]
- 1 Plants with stinging trichomes only; fruiting pedicels laterally-winged *L. canadensis*

* *Laportea aestuans* (Linnaeus) Chew, West Indian Wood-nettle. Reported for scattered sites in the se. US (Kartesz 2010). [= K2, WH3]

Laportea canadensis (Linnaeus) Weddell, Wood-nettle. Moist, nutrient-rich forests, seepage swamps, especially abundant in cove forests in the Mountains and bottomlands in the Piedmont. May-Aug; late Jul-Oct. NS and se. MB south to Panhandle FL and OK. By mid-summer, *Laportea* often becomes the aspect dominant in rich, moist cove forests of the mountains (especially those with extensive seepage), visually replacing the diverse spring flora. The stinging hairs can penetrate pants made of light-weight or loosely woven fabrics. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, Va, W, WH3, WV; ? *Urticastrum divaricatum* (Linnaeus) Kuntze – S]

Parietaria Linnaeus 1753 (Pellitory)

A genus of about 20 species, annual and perennial herbs, of nearly cosmopolitan distribution. References: Boufford in FNA (1997); Hinton (1968)=Z; Friis in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Perennial; achenes dark brown, with an acute apex and lacking a mucro; leaves softly pubescent; [alien weed]; [subgenus *Parietaria*] [*P. judaica*]
- 1 Annual; achenes light brown, the apex rounded but with an apical or subapical mucro; leaves glabrescent; [native, sometimes weedy in calcareous or coastal areas]; [subgenus *Freirea*].
 - 2 Main lateral veins diverging from the midvein above the usually narrowly cuneate leaf base; larger leaves 2-5× as long as wide; achene 0.9-1.2 mm long *P. pensylvanica* var. *pensylvanica*
 - 2 Main lateral veins diverging from the midvein at the usually truncate, rounded, or broadly cuneate leaf base; larger leaves 1-2× as long as wide; achene either 0.6-0.9 or 1.0-1.4 mm long.
 - 3 Achene 0.6-0.9 mm long, with a flanged stipe, the mucro located symmetrically at the pole of the achene; leaf blades 0.7-2.7 cm long.... *P. floridana*
 - 3 Achene 1.0-1.4 mm long, without a flanged stipe, the mucro located asymmetrically; leaf blades 1-6.5 cm long *P. praetermissa*

Parietaria floridana Nuttall, Florida Pellitory. Coastal shores, sometimes weedy in calcareous situations. Mar-frost; Apr-frost. DE south to FL and west to TX, on the outer Coastal Plain. This species has smaller leaves than *P. praetermissa*. [= FNA, GW, K, WH3, Z; = *P. nummularia* Small – C, F, S]

* *Parietaria judaica* Linnaeus, Pellitory-of-the-wall. Disturbed urban areas; native of Europe. Reports of *P. officinalis* in our area are based on *P. judaica*. [= FNA, WH3; > *P. judaica* – K1, K2; > *P. officinalis* Linnaeus – K1, K2; > *P. diffusa* Mertens & Koch]

Parietaria pensylvanica Muhlenberg ex Willdenow, Pennsylvania Pellitory, Rock Pellitory. In circumneutral soils, such as in thin soils at the bases of calcareous or subcalcareous cliffs or on calcareous shale barrens, rich floodplain soils. Apr-Oct; May-Oct. ME west to BC, south to e. NC, w. NC, SC (Gaddy 2014), AL, Panhandle FL, TX, NV, and Mexico. Two varieties are sometimes delimited, var. *pensylvanica* eastern and northern and var. *obtusata* (Rydberg ex Small) Shinnery southwestern. [= C, FNA, G, GW, K, K2, Mo, Pa, RAB, S, Va, W, WH3; > *P. pensylvanica* – F, WV (sensu stricto)]

Parietaria praetermissa Hinton, Coastal Pellitory. Shell middens, coastal hammocks. Mar-frost; Apr-frost. E. NC south to s. FL and west to w. LA. [= FNA, GW, K, WH3, Z; = *P. floridana* Nuttall – C, F, RAB, S, misapplied]

Pilea Lindley 1821 (Clearweed)

A genus of about 250 species, annual and perennial herbs, nearly cosmopolitan in tropical and warm temperate regions of the Old World and the New World. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaf margins dentate; leaves 2-13 cm long, the 2 leaves of a pair equal in size.
 - 2 Achene 1-1.5× as long as broad, pebbled, dark brown, dark purple, or black, the margins slightly paler *P. fontana*
 - 2 Achene 1.5-2× as long as broad, smooth, green or light brown, with slightly raised dark to black lines and mottlings..... *P. pumila*
- 1 Leaf margins entire; leaves 0.1-1.0 (-1.8) cm long, the 2 leaves of a pair slightly to strongly unequal in size.
 - 3 Plant prostrate; achene pebbled, ca. 0.4 mm long [*P. herniarioides*]
 - 3 Plant erect; achene smooth, 0.5-1.1 mm long *P. microphylla*

Pilea fontana (Lunell) Rydberg, Blackfruit Clearweed, Lesser Clearweed. Swamp forests, freshwater marshes, tidal marshes, calcareous wetlands, sand bars. Aug-Sep; Sep-Nov. E. Canada west to MN and ND, south to FL, IN, and NE; disjunct in n. AL. Only reliably distinguishable from *P. pumila* using fruits, *P. fontana* is, however, somewhat less shiny and transparent-translucent. [= C, F, FNA, G, GW, K1, K2, Pa, RAB, Va, W, WH3; < *Adicea pumila* (Linnaeus) Rafinesque – S]

* **Pilea herniarioides** (Swartz) Lindley, Caribbean Clearweed. Disturbed areas; native of the Neotropics. Reported for Mobile County, AL and scattered sites in the FL peninsula (Kartesz 2010). [= FNA, K2, WH3] {not keyed; add to synonymy}

* **Pilea microphylla** (Linnaeus) Liebmann, Rockweed, Artillery Weed. Old rock and brick walls, urban areas, hammocks. Jan-Dec. Although listed by RAB for the Carolinas as "a weed in and around greenhouses, not established as part of our flora," this species is well-established and weedy in Charleston, SC and Savannah, GA. Probably native at least in FL, and perhaps further north, the original distribution unclear. [= FNA, K1, K2, RAB, S, WH3]

Pilea pumila (Linnaeus) A. Gray, Greenfruit Clearweed, Coolwort, Richweed. Swamp forests, bottomlands, freshwater marshes, tidal marshes, disturbed wet ground. Aug-Sep; Sep-Nov. QC west to MN, south to FL, LA, and OK. [= C, FNA, G, GW, K2, Mo, Pa, RAB, Va, W, WH3, WV; > *P. pumila* var. *pumila* – F, K1; > *P. pumila* var. *deamii* (Lunell) Fernald – F, K1; < *Adicea pumila* (Linnaeus) Rafinesque – S]

Pouzolzia Gaudichaud-Beaupré 1830

A genus of ca. 70 species, herbs and shrubs, of the Old World and New World tropics. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993).

* **Pouzolzia zeylanica** (Linnaeus) Bennett & R. Brown, Ceylon Pouzolzia; Mist Vine, Reekudzu. Disturbed areas; native of tropical se. and temperate e. Asia. [= FNA, K2, WH3; > *P. zeylanica* var. *zeylanica*; = *Parietaria officinalis* – S, misapplied]

Urtica Linnaeus 1753 (Stinging Nettle)

A genus of about 80 species, annual and perennial herbs, nearly cosmopolitan, but primarily in temperate regions of the Northern Hemisphere. References: Henning et al. (2014)=Y; Boufford in FNA (1997); Woodland (1982)=Z; Woodland, Bassett, Crompton, & Forget (1982); Friis in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Tap-rooted annual; stipules 1-3 mm long, spreading or deflexed; inflorescences usually shorter than the subtending leaf petiole, each panicle consisting of a mixture of pistillate and staminate flowers.
 - 2 Flower clusters subglobose; mature achenes ovate, 1-1.5 mm long, < 1 mm wide; leaf teeth generally blunt, the sides of the tooth convex... *U. chamaedryoides*
 - 2 Flower clusters elongate; mature achenes triangular, 1.5-2.5 mm long, 1-1.5 mm wide; leaf teeth generally sharp, the sides of the tooth straight..... [*U. urens*]

- 1 Rhizomatous perennial; stipules 5-15 mm long, erect; inflorescences usually surpassing the subtending leaf petiole, each panicle of either pistillate or staminate flowers.
- 3 Plants dioecious (male and female flowers always on separate plants); stems usually weak, sprawling, branching; stems strongly hispid with stinging hairs; leaf blades strongly hispid with stinging hairs on both surfaces; leaf teeth commonly 5-6 mm long *U. dioica* ssp. *dioica*
- 3 Plants mostly monoecious (with male and female flowers in separate inflorescences on the same plant), rarely an entire plant male or female; stems upright, erect, less branched; stems glabrous to puberulent or strigose, lacking (or nearly so) stinging hairs; leaf blades glabrous or glabrescent above (lacking stinging hairs), glabrous to puberulent below (with some stinging hairs); leaf teeth commonly 2-3.5 mm long *U. gracilis* ssp. *gracilis*

Urtica chamaedryoides Pursh, Dwarf Stinging Nettle. Rich moist soil, usually on floodplains. Sep-May; Nov-Jul. WV, KY, se. MO and OK south to FL, TX, and Mexico; very rare east of the Blue Ridge. Notable disjunct eastern locations include Stevens Creek (McCormick County, SC), Congaree Swamp (Richland County, SC), and various sites on very rich levees of the Roanoke River (NC). Gaddy & Rayner (1980) report the common winter flowering of this species in our area. [= C, F, FNA, G, K, Mo, RAB, S, WH3, Z]

* *Urtica dioica* Linnaeus ssp. *dioica*, European Stinging Nettle, Great Nettle. Bottomlands, roadsides, other disturbed areas, primarily in calcareous soils; native of Europe. May-Jul; Jul-Sep. See *U. gracilis* for discussion of the two taxa. [= FNA, K, Mo, Pa, Y, Z; = *U. dioica* – F, S, Va, WV; < *U. dioica* – RAB, W, WH3 (also see *U. gracilis*); = *U. dioica* var. *dioica* – C, G]

Urtica gracilis Aiton ssp. *gracilis*, American Stinging Nettle. Bottomland forests and edges, particularly over limestone. May-Jul; Jul-Sep. NL (Labrador) and NS west to AK, south to sw. VA, w. NC (?), s. OH, s. IL, s. MO, n. TX, s. NM, and se. AZ. The native stinging nettle of e. and c. North America is best treated as specifically distinct from *U. dioica* of Europe. Woodland (1982) and Woodland, Bassett, Crompton, & Forget (1982) showed that *U. gracilis* differs from *U. dioica* in a variety of morphologic characters (see key), chromosome number ($2n = 26$ for *U. gracilis*, $2n = 52$ for *U. dioica*), breeding system (monoecy vs. dioecy), and distribution (North American vs. Eurasian); furthermore, the two taxa could not be crossed. Woodland (1982) chose subspecific status, apparently to emphasize the close relationship of the two (and a third taxa in w. North America). The combination of morphological distinctiveness, allopatry, major differences in species biology, and incompatibility seem adequate to warrant separation as species, however. F (as *U. procera*), G (as *U. dioica* var. *procera*) and S include NC in the range; Woodland (1982), however, showed the range as extending only south to VA. Henning et al. (2014) further validate the idea that American “*U. dioica*” is specifically distinct from European *U. dioica*. [= Y; = *U. gracilis* – S, Va, WV; < *U. dioica* – RAB, W; = *U. dioica* Linnaeus var. *procera* (Muhlenberg ex Willdenow) Weddell – C, G; > *U. gracilis* Aiton – F; > *U. procera* Muhlenberg – F; = *U. dioica* Linnaeus ssp. *gracilis* (Aiton) Selander – FNA, K, Mo, Pa, Z]

* *Urtica urens* Linnaeus, Burning Nettle, Dog-nettle, Small Nettle. Disturbed areas; native of Eurasia. Apr-May; May-Jul. [= C, F, FNA, G, K, Mo, Pa, RAB, S, WH3, WV, Z]

157. FAGACEAE Dumortier 1829 (Beech Family) [in FAGALES]

A family of about 8 genera and 620-1050 species, trees and shrubs, mostly of the Northern Hemisphere, but extending into se. Asia and Australia. References: Nixon in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Elias (1971a).

- 1 Fruits partially enclosed in a scaly cup; leaves lobed, toothed, crenate, or entire *Quercus*
- 1 Fruits enclosed in a spiny or prickly bur; leaves toothed.
- 2 Nuts rounded or flattened on one or two sides; bur with long, straight spines; winter buds < 1 cm long; leaves elliptic or oblanceolate, some of them usually > 12 cm long *Castanea*
- 2 Nuts sharply triangular; bur with short, recurved prickles; winter buds 1.5-2.5 cm long; leaves ovate, 6-12 cm long *Fagus*

Castanea P. Miller 1754 (Chestnut, Chinquapin)

A genus of 8-10 species, trees and shrubs, of temperate regions of the Northern Hemisphere. References: Johnson (1988)=Z; Nixon in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Stanford (1998). Key adapted from Z, in part.

- 1 Leaves elliptic, oblanceolate or lanceolate, 8-30 cm long, the apices acuminate, sometimes only shortly so; spine-covered husk of fruit splitting into 4 sections, enclosing (2-) 3 (-5) nuts; nut flattened on at least one side, 18-25 mm in diameter; pistillate dichasia of 3 flowers; leaves usually without stellate trichomes; twigs puberulent or glabrous.
- 2 Undersurface of leaves densely covered with bulbous-based trichomes when young, essentially glabrous in age; leaves mostly > 15 cm long, generally long-acuminate; twigs glabrous; trees single-trunked; spines of fruit husk weak, easily bent *C. dentata*

- 2 Undersurface of leaves persistently and densely tomentose beneath; leaves mostly < 15 cm long, generally short-acuminate; twigs puberulent; trees multi-trunked from base; spines of fruit husk stiff; nut *C. mollissima*
- 1 Leaves elliptic to oblanceolate, mostly < 15 cm long, the apices acute to obtuse; twigs puberulent; spine-covered husk of fruit splitting into 2 sections, enclosing 1 nut; nut circular in cross-section, 7-19 mm in diameter; pistillate dichasia of 1 flower; leaves with stellate trichomes, with few bulbous-based trichomes when young, puberulent, pilose, tomentulose, or tomentose in age (usually rather densely so).
- 3 Longest spines of the fruit husk usually >10 mm long; young twigs glabrous; petiole 8-10 (-15) mm long; [plants of n. AL and westward].. *C. ozarkensis*
- 3 Longest spines of the fruit husk usually <10 mm long; young twigs puberulent; petiole 3-7 (-10) mm long; [plants widespread in our area]. *C. pumila*

Castanea dentata (Marshall) Borkhausen, American Chestnut. Mesic and xeric forests. Jun-Jul; Sep-Oct. S. ME, s. ON, MI, c. IN, s. IL, south to c. NC, c. GA, Panhandle FL, and sc. MS. Formerly one of the most important, largest, and most abundant forest trees in the Mountains of our area, *C. dentata* was severely affected by chestnut blight, *Cryphonectria parasitica* (Murrill) Barr, introduced at New York City in 1904 on nursery stock of *C. mollissima*. Blight spread steadily southward, reaching our area in the 1920's and 1930's. *C. dentata* remains rather abundant, but now occurs only as stump sprouts and small trees, usually reinfected by blight persisting on oaks and killed at about the size of first fruit production. The accidental introduction of chestnut blight and the subsequent profound alteration of the role of chestnut is one of the most tragic ecological disasters to have affected our area. *Castanea* × *neglecta* Dode (pro sp.) [*C. dentata* × *pumila*], occurs in our area; "the leaves of the hybrid resemble those of *C. dentata* in size and shape but have the vestiture and stellate trichomes of *C. pumila*" (Johnson 1988). [= C, F, FNA, G, K1, K2, Mo, Pa, RAB, S, Va, W, WH3, Z]

* ***Castanea mollissima*** Blume, Chinese Chestnut. Forests; native of China. Jun; Sep. This species is relatively resistant to chestnut blight and has been planted widely as an ornamental and nut tree; it sometimes naturalizes and appears nearly native. Reported for NC (Macon County) by Pittillo & Brown (1988). [= C, FNA, K1, K2, Mo, Pa, WH3]

Castanea ozarkensis W.W. Ashe, Ozark Chinquapin. Dry forests. May-Jul; Sep-Oct. S. MO, e. OK, and w. AR; disjunct in c. AL, where now apparently extirpated by blight. *C. ozarkensis* is related to *C. pumila*, though showing some relation as well to *C. dentata*. *C. ozarkensis* is more susceptible to blight than *C. pumila*. [= FNA, S; = *C. pumila* P. Miller var. *ozarkensis* (W.W. Ashe) G.E. Tucker – K1, K2, Mo, Z]

Castanea pumila (Linnaeus) P. Miller, Common Chinquapin. Xeric forests and woodlands, generally in fire-maintained habitats. May-Jul; Sep-Oct. NJ, s. PA, s. OH, n. KY, and s. MO, south to c. peninsular FL and se. TX. It is relatively resistant to chestnut blight. [= FNA, Pa, Va, WH3; = *C. pumila* var. *pumila* – C, K1, K2, Mo, Z; > *C. pumila* var. *pumila* – F, RAB; > *C. pumila* var. *ashei* Sudworth – F, RAB; > *C. alnifolia* Nuttall var. *alnifolia* – RAB; > *C. alnifolia* var. *floridana* Sargent – RAB; > *C. pumila* – G, S, W; > *C. ashei* (Sudworth) Sudworth – S; > *C. floridana* (Sargent) W.W. Ashe – S; > *C. alnifolia* – S]

* ***Castanea sativa*** P. Miller, Spanish Chestnut. Reported as naturalized in KY, AL, PA, and elsewhere in e. North America (Clark et al. 2005). [= K1, K2] {not yet keyed; synonymy incomplete}

***Fagus* Linnaeus 1753 (Beech)**

A genus of about 10 species, trees, of temperate regions of the Northern Hemisphere. Our native trees belong to subgenus *Fagus*, section *Grandifolia* (Shen 1992). References: Cooper & Mercer (1977)=Z; Nixon in FNA (1997); Shen (1992)=X; Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Elias (1971a)=Y; Stanford (1998); Govaerts & Frodin (1998)=V.

- 1 Lateral veins of the leaves 5-10 (-12) on each side of the midvein [*F. sylvatica*]
- 1 Lateral veins of the leaves (12-) 15-18 (-20) on each side of the midvein.
- 2 Leaves denticulate; cupule prickles 1-2.5 (-4) mm long, slightly to strongly recurved; cupule valves generally ovate, the apex obtuse, reddish in color; leaves with fairly dense white acicular trichomes on the lower leaf surface at maturity; leaf base sometimes clearly cordate; [plants of the Coastal Plain, Piedmont, and low to moderate elevations (mostly below 1050 m or 3500 feet) in the Mountains] *F. grandifolia* var. *caroliniana*
- 2 Leaves sharply serrate; cupule prickles (3-) 4-10 mm long, projecting forward; cupule valves generally narrowly triangular, the apex acute, grayish-yellow in color; leaves usually lacking white acicular trichomes on the lower surface at maturity, instead with yellowish glandular hairs (acicular trichomes often present on the veins); leaf base not clearly cordate; [plants of moderate to high elevations (mostly above 1050 m or 3500 feet) in the Mountains] *F. grandifolia* var. *grandifolia*

Fagus grandifolia* Ehrhart var. *caroliniana (Loudon) Fernald & Rehder, White Beech, American Beech. Moist forests, from near sea level to low elevations in the Mountains, mostly below 1050 meters (3500 feet). Mar-May; Sep-Oct. Se. MA, OH, IN, s. IL, s. MI (?), and MO south to Panhandle FL and e. TX. Several subspecies, varieties, or phases of *Fagus grandifolia* have been described, and their taxonomic recognition is controversial. The most recent monographer, Shen (1992), recognizes three

subspecies, one of which is limited to Mexico, the other two as treated here but at the subspecific level. I have here chosen to recognize 2 intergradient varieties in our area. A third variety, var. *mexicana* (Martínez) Little, of the mountains of México, is apparently most closely related to var. *grandifolia*. Cooper & Mercer (1977) studied variation in NC, concluding that two genetic races or varieties were present, the montane var. *grandifolia* and the Piedmont and Coastal Plain var. *caroliniana*, but that patterns of variation were complicated. Hardin & Johnson (1985) and Hardin (1992, 1985) note that variation is "more-or-less" clinal, variation within populations is great, and they do not favor recognition of infraspecific taxa. Depending on one's tolerance or intolerance for intergradational varieties, one may choose to recognize one or two taxa in our area. [= C, F, G, Y; < *F. grandifolia* – FNA, K1, K2, Mo, Pa, RAB, S, Va, W, WH3, WV, Z; < *F. grandifolia* ssp. *grandifolia* – V; = *F. grandifolia* ssp. *caroliniana* (Loudon) Camp ex Shen – X, nomen nudum; = *F. ferruginea* Aiton]

Fagus grandifolia* Ehrhart var. *grandifolia, Gray Beech, Red Beech, American Beech. Moderate to high elevation forests, especially on high elevation ridges, gaps, and open slopes, often forming clonal dwarfed thickets in the most exposed situations. Apr-May; Sep-Oct. NS, NB, and s. QC west to s. ON and n. MI, south to VA, w. NC, n. GA, e. TN, and n. OH. "Red beech" is alleged to differ from "gray beech" in having the involucre segments not covering the nutlets at maturity. Hardin & Johnson (1985), Hardin (1985), and Shen (1992) point out that var. *mexicana* (Martínez) Little, of the mountains of México, is more closely related to our montane variety or phase than to the lower elevation variety or phase. [= C, F, G, Y; < *F. grandifolia* – FNA, K1, K2, Mo, Pa, RAB, S, Va, W, WV, Z; < *F. grandifolia* ssp. *grandifolia* – V; = *F. grandifolia* ssp. *grandifolia* – X]

* ***Fagus sylvatica* Linnaeus**, European Beech, Copper Beech. Rarely cultivated and sometimes long-persistent, but is not known to escape in our area. [= K2, V; ? *F. sylvatica* ssp. *sylvatica* – X]

Quercus Linnaeus 1753 (Oak)

A genus of about 350-530 species, trees and shrubs, of temperate, subtropical, and rarely tropical regions of the Northern Hemisphere. Oaks are the predominant tree of our area, with a variety of species dominating much of the landscape in nearly every ecological situation. Only in a few specialized (and usually in some sense edaphically extreme) communities are oaks generally entirely absent: deepest Coastal Plain swamps, some Coastal Plain depression ponds, wettest pine savannas, pocosins, spruce-fir forests, highest elevation northern hardwood forests, and mountain bogs.

Our native oaks are divided into two well-marked sections; other sections occur outside our area. Red oaks (section *Lobatae*, sometimes treated as subgenus *Erythrobalanus*) are characterized by acorns maturing in two years (in one year in *Q. elliotii*), styles elongate, abortive ovules are at the top of the seed, leaves and leaf lobes bristle-tipped, inner surface of the acorn shell velvety-pubescent, and acorns rooting in the spring. White oaks (section *Quercus*, sometimes treated as subgenus *Quercus*) are characterized by acorns maturing in a single year, styles short or absent, abortive ovules at the base of the seed, leaves and leaf lobes not bristle-tipped, inner surface of the acorn shell smooth, and acorns rooting in the autumn. Twenty of our *Quercus* species are in this group: *Q. alba*, *Q. austrina*, *Q. bicolor*, *Q. boyntonii*, *Q. chapmanii*, *Q. geminata*, *Q. lyrata*, *Q. macrocarpa*, *Q. margarettae*, *Q. michauxii*, *Q. minima*, *Q. montana*, *Q. muehlenbergii*, *Q. oglethorpensis*, *Q. prinoides*, *Q. robur*, *Q. similis*, *Q. sinuata* var. *sinuata*, *Q. stellata*, and *Q. virginiana*. Hybrids within each section are frequent and diverse; hybrids do not naturally occur between the two sections. The live oaks of the southeastern Coastal Plain and Central America are subsection *Virentes*; other white oaks are subsection *Quercus*. References: Nixon in FNA (1997) (overall treatment); Jensen in FNA (1997) (red oaks); Nixon & Muller in FNA (1997) (white oaks); Godfrey (1988); Stein, Binion, & Acciavatti (2003); Cronquist (1991); Duncan & Duncan (1988); Hunt (1990)=Z; Hunt (1994); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: Many oak species are well-adapted to ecological situations in which fires frequently burn the ground layer. Fire-maintained communities of the Piedmont and Mountains typically have oaks such as *Q. stellata*, *Q. marilandica* var. *marilandica*, *Q. ilicifolia*, and *Q. prinoides*. The two latter species are normally shrubby, and have become rarer because of fire suppression (they require fire to prevent larger trees from outcompeting them). In contrast, *Q. stellata* and *Q. marilandica* var. *marilandica* become larger and more frequent in fire-suppressed conditions.

Fifteen oak species in our area are typical of upland Coastal Plain communities with at least occasional fire: *Q. arkansana*, *Q. chapmanii*, *Q. geminata*, *Q. hemisphaerica*, *Q. incana*, *Q. laevis*, *Q. margarettae*, *Q. marilandica* var. *marilandica*, *Q. minima*, *Q. myrtifolia*, *Q. stellata*, and less typically *Q. falcata*, *Q. nigra*, *Q. velutina*, and *Q. virginiana*. Fire suppression of Coastal Plain communities, especially of sandhills, leads to an unnatural increase in the stature and abundance of oaks present. In frequent fire conditions, most oaks will persist as short, shrubby fire sprouts. Additional suggestions of how to recognize fire sprouts of these species are given below. In general, leaves of fire sprouts are larger and more deeply lobed than normal leaves. In species of the red oak group, the bristle tips are larger and more pronounced. Increased size in leaves is particularly noticeable when an area previously long fire-suppressed is burned (the large underground root system and nutritional resources of a small tree destroyed by fire being devoted to a few very vigorous sprouts). Fire sprouts are often in sunny conditions, which tend to make oak leaves more deeply lobed and more coriaceous than shaded leaves.

White oaks with lobed leaves:

Q. margarettae – Often forms dense clonal, stoloniferous patches in frequent fire conditions. Tends to retain standard leaf characteristics.

Q. stellata – Less prone to formal clonal patches. Sprout leaves often very large, with exaggerated lobing.

Red oaks normally with deeply lobed leaves:

Q. laevis – Not clonal. Vigorous sprouter, leaves more deeply lobed than any other fire red oak. Small sprouts often have vertical leaf orientation characteristic of adults, though vigorous fire sprouts sometimes have more normally disposed leaves. Sprout leaves sometimes very large, with very long, curving lobes.

Q. falcata – Not clonal. Sprout leaves generally less lobed than typical adult leaves, more like forma *triloba*, but larger and coarser in texture, difficult to distinguish in shape from *Q. marilandica* var. *marilandica* and *Q. velutina*. See pubescence differences in main key.

Q. velutina – Not clonal. Leaves variable, sometimes minimally lobed and closely resembling *Q. marilandica* var. *marilandica* and *Q. falcata*. See pubescence differences in main key.

Red oaks normally with unlobed leaves:

Q. marilandica var. *marilandica* – Sprout leaves sometimes coarsely (though never deeply) lobed. Texture often very coriaceous, shiny, and very stiff. See pubescence characters in main key.

Q. nigra – Not very typically in fire-prone situations, but sometimes so. Young saplings, as well as fire sprouts, often with wildly different leaves than the typical adult form, frequently deeply lobed (for excellent illustrations showing variability in leaf shapes, see p. 329 of Godfrey, 1988 and pp. 51-52 of Godfrey & Wooten, 1981). Leaves always smaller and more glabrous than those of other fire oaks (except *Q. hemisphaerica*).

Q. incana – Generally not strongly clonal and stoloniferous even in frequently burned situations. Fire sprouts and vigorous shoots more prone to lobing than adult trees. Even fire shoots, though, usually with only one to several lobes, and the characteristic bluish-green characteristic holds. See comments above on *Q. elliotii*.

Q. elliotii – Strongly clonal via a stoloniferous "runner", never tree-like. Leaves never lobed, even on fire sprouts, though fire sprout leaves can be larger (to 15 cm long and 5 cm wide). Very difficult to tell from fire sprouts or seedlings of *Q. incana*, best separated by leaf pubescence (white in *Q. elliotii*, gray in *Q. incana*), margin (slightly revolute in *Q. elliotii*, flat in *Q. incana*), leaf vernation (planate in *Q. incana*, rolled in *Q. elliotii*), and acorn maturation (1 year in *Q. elliotii*, with acorns often on small plants, 2 years in *Q. incana*, with small plants rarely producing acorns).

Q. hemisphaerica – Not clonal. Leaves of vigorous shoots and fire sprouts often shallowly lobed, the lobing usually fairly neat and regular, triangular-ascending, and with bristle tips.

Live oaks:

Q. geminata – Sometimes clonal. Leaves, even of sprouts, not normally with lobes or teeth.

Q. virginiana – Sometimes clonal. Leaves of vigorous summer shoots (but apparently not spring shoots) often coarsely toothed, very similar to similar leaves of *Q. hemisphaerica*, but lacking bristle tips (instead the translucent margin with a darker, thickened callus at the tip of the tooth).

Q. minima – Always clonal. Leaves often with teeth or lobes.

Some oaks with ambiguous leaves are keyed in both Key A and Key D or in both Key B and Key C. The leaves of juvenile (seedling or sapling) branches, fire-sprout shoots, or other vigorous shoots (resulting from similar stimuli such as insect damage) are often much different than typical leaves and are not accounted for in these keys (see discussion at end of generic treatment). Hybrids are frequently encountered; they, too, are not keyed here, but can usually be identified (with difficulty) by their intermediate morphology and by parental context. Trichome types are useful in making and confirming identifications of oaks, since certain types are restricted to various groups of species. Hand lenses of 10× or 20× can be useful, but a dissecting scope with 20× to 40× dissecting microscope is far preferable. See Hardin (1992, 1976, 1979), and Thomson & Mohlenbrock (1979).

- 1 Most of the leaves on a relatively mature tree entire and unlobed (some species frequently with some leaves on a tree, especially those on young or vigorous growth, that are toothed or shallowly lobed, the teeth or lobes generally few and irregular in size or location); [primarily either "laurel oaks" of section *Lobatae* or "live oaks" of section *Quercus*] **Key A**
- 1 Most of the leaves on a relatively mature tree lobed or toothed.
 - 2 Venation of the leaves neatly and evenly pinnate, the 3-17 (or more) main lateral veins on each side distinctly parallel to each other, each ending in a tooth or shallow, crenate lobe extending < ¼ of the way to the midrib; ["chestnut oaks" of sections *Quercus* and *Cerris*] **Key B**
 - 2 Venation of the leaves pinnate, but more branched and irregular, the 1-7 main lateral veins on each side rebranching into prominent side veins, the leaf usually distinctly lobed, at least some of the lobes of some of the leaves of a tree extending > ¼ of the way to the midrib.
 - 3 Apices of the lobes or teeth obtuse (rarely acute), lacking bristle tips; ["white oaks" of section *Quercus*] **Key C**
 - 3 Apices of the lobes or teeth acuminate (rarely acute), and with bristle tips; ["red oaks" of section *Lobatae*] **Key D**

Key A – Leaves (most of them) entire and unlobed (Laurel Oaks and Live Oaks)

- 1 Leaves broadly obovate or spatulate, 1-2.5 (-3)× as long as wide.
 - 2 Leaves 10-30 cm long, with rounded, subcordate, truncate, or oblique bases; lower leaf surfaces thinly to densely pubescent with tawny to orange glandlike hairs; [section *Lobatae*] *Q. marilandica* var. *marilandica*
 - 2 Leaves 2-10 (-15) cm long, mostly with cuneate or rounded bases (in some species sometimes subcordate, truncate, or oblique); lower leaf surfaces glabrous, glabrescent, or pubescent, but the pubescence not orange and glandlike.
 - 3 Twigs of the current year densely and finely hairy, obscuring the surface; [scrubby trees of sandhills from se. SC southward]; [section *Quercus*] *Q. chapmanii*
 - 3 Twigs of the year glabrous or sparsely pubescent; [shrubs, scrubby small trees, or large trees of various habitats].
 - 4 Leaves grayish beneath; [section *Quercus*] *Q. sinuata* var. *sinuata*
 - 4 Leaves bright green or orange-scurfy beneath; [section *Lobatae*].
 - 5 Leaf blade strongly convex; lower leaf surface orange-scurfy; [of sandhills and scrub from n. FL southward] *Q. inopina*
 - 5 Leaf blade planar (the margins sometimes revolute); lower leaf surface glabrous or pubescent and also with tufts of hairs in the vein axils; [collectively more widespread in habitat and distribution].
 - 6 Leaves evergreen, (including the petiole) usually < 4 cm long (sometimes to 9 cm long) and < 2 cm wide (to 6 cm wide); lower leaf surface usually entirely glabrous at maturity (rarely with pubescence in the vein axils); leaf blades rarely lobed; [shrub to scrubby tree of sandhills in se. SC and southward] *Q. myrtifolia*
 - 6 Leaves deciduous, (including the petiole) usually > 5.5 cm long (rarely smaller) and usually 3-5 cm wide; lower leaf surface usually with tufts of hairs in the main vein axils beneath; leaf blades often lobed.
 - 7 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward] *Q. arkansana*

- 7 Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils; [widespread in our area]..... *Q. nigra*
- 1 Leaves linear, elliptic, or narrowly obovate, 2-10× as long as wide.
- 8 Leaves (at maturity) glabrous or at most sparsely pubescent on the surface below, though often with tufts of hairs in the main vein axils.
- 9 Twigs of the year densely and finely hairy, obscuring the surface; leaves (at maturity) sparsely pubescent beneath; [scrubby trees of sandhills from se. SC south]; [section *Quercus*]..... *Q. chapmanii*
- 9 Twigs of the year glabrous or sparsely pubescent; leaves (at maturity) bright green and glabrous beneath, though often with tufts of hairs in the main vein axils; [medium to large trees, more widespread, mostly of moist habitats, except *Q. hemisphaerica*]; [section *Lobatae*].
- 10 Leaves predominantly lanceolate, mostly 6-12 cm long and 0.7-2 cm wide, most of them 5-8× as long as wide, the apex acute; mature leaves with tufts of hairs in the vein axils below, and sometimes also some pubescence on the blade surface near the midrib; blades never with lobes or teeth; leaves deciduous in autumn; young leaves bronze red, emerging tightly rolled lengthwise and appearing linear; [trees of bottomlands and upland depression swamps, mesic uplands, and also weedy and frequent in disturbed successional habitats]..... *Q. phellos*
- 10 Leaves predominantly oblanceolate, obovate, or rhombic, mostly 2.5-10 cm long and 1.5-4 cm wide, most of them 2-5× as long as wide, the apex acute, obtuse, or rounded; mature leaves with or without tufts of hairs in the vein axils below, lacking pubescence on the blade surface; blades sometimes with 1-5 lateral lobes or teeth; leaves persisting until spring, or tardily and irregularly deciduous in winter; young leaves red, yellow, or green, not emerging tightly rolled lengthwise; [trees primarily either of swamp forests, maritime forests, or sandhills, not typically weedy].
- 11 Mature leaves entirely glabrous below; leaves mostly with acute apices and bristle tips (rarely a few rounded), mostly 2.5-8 cm long and 1-2 (-3) cm wide, the upper surface shiny, the vein network not readily visible when backlit; leaves evergreen (persisting until spring); petiole 0.5-2 mm long; leaves of vigorous growth often with dentate lobes; [trees of dry sandy habitats, such as sandhills, maritime forests, and dry hammocks]..... *Q. hemisphaerica*
- 11 Mature leaves with tufts of stellate trichomes in the vein axils; leaves mostly with rounded apices (rarely a few acute and then bristle-tipped), mostly 5-10 cm long and (1.8-) 2-4 cm wide, the upper surface dull, the vein network readily visible when backlit; leaves tardily deciduous (at least northwards in the Southeast); petiole 2-6 mm long; leaves of vigorous growth rarely lobed, and then not dentate; [trees of moist habitats, such as floodplain forests, mesic slopes, and moist hammocks]..... *Q. laurifolia*
- 8 Leaves (at maturity) persistently and densely pubescent on the surface below, the pubescence in some species so dense and tight as to be difficult to perceive without at least 10× magnification.
- 12 Leaves bristle-tipped (sometimes the bristle fallen or broken off, but leaving a truncate scar), deciduous in autumn; multi-armed trichomes of the rosulate or multiradiate types, many of the arms ascending or erect (never with the stellate or fused-stellate trichomes characteristic of the live oaks); acorns maturing in 2 years (immature acorns present through the winter on fruiting trees); [section *Lobatae*].
- 13 Leaves (including petiole) mostly 10-17 cm long, 3.5-7 cm wide; lower leaf surface (at maturity) sparsely to moderately densely pubescent with soft hairs; leaves lustrous dark-green above; [trees of the Mountains, Piedmont, and rarely Coastal Plain]..... *Q. imbricaria*
- 13 Leaves (including petiole) mostly 4-11 cm long, 0.5-3.0 cm wide; lower leaf surface densely covered with soft hairs; leaves lustrous dark-green or bluish-green above; [stoloniferous shrubs and small to medium trees of the Coastal Plain].
- 14 Leaves 0.5-1.5 cm wide, mostly 4-8× as long as wide, lustrous dark-green above; acorns 8-12 mm long; petioles 1-3 mm long; [plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands)]..... *Q. elliotii*
- 14 Leaves 1.5-3.0 cm wide, mostly 2-4× as long as wide, dull bluish-green above; acorns 10-15 mm long; petioles 4-15 mm long; [plant a small to medium tree]..... *Q. incana*
- 12 Leaves not bristle-tipped, evergreen (overwintering, falling with the expansion of new leaves in the spring) or deciduous (in *Q. oglethorpensis*); multi-armed trichomes of the fused-stellate and stellate types, the arms parallel to the leaf surface, radiating from a well developed disc that appears as a white eye or dot at 20-40× magnification (or rosulate or multiradiate in *Q. oglethorpensis*); acorns maturing in 1 year (immature acorns not present through the winter, unless aborted); [section *Quercus*].
- 15 Leaves deciduous in autumn; bark gray, resembling *Q. alba*; [trees of bottomlands and upland clay flats of GA and SC]..... *Q. oglethorpensis*
- 15 Leaves evergreen (overwintering, falling with the expansion of new leaves in the spring); bark (on the tree species) brownish, deeply furrowed; [trees and stoloniferous shrubs of sandy habitats of the Coastal Plain of GA, NC, SC, and VA].
- 16 Plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands) and producing acorns at that size..... *Q. minima*
- 16 Plant a small to large tree, not producing acorns until >2m tall.
- 17 Leaf blades with the margins strongly revolute, and also the sides of the blades generally rolled downward and obscuring part of the lower surface, the leaf appearing boatlike (the depth of the "boat" often approaching the width of the leaf); midvein and major lateral veins impressed on the upper surface and raised on the lower surface (the lower surface therefore appearing rugose); buds dark brown; cup scales gray-tipped; pubescence of the lower surface stellate, both appressed and erect, the individual stellae readily visible at 20× magnification (sometimes at 10× magnification); acorns (1-) 2 (-6) per stalk; [typically a small tree of dry sands]..... *Q. geminata*
- 17 Leaf blades flat, or the margins slightly to strongly revolute, the sides of the blade sometimes rolled downward, usually not obscuring part of the lower surface, the leaf not boatlike (the leaf much wider than deep); midvein and major lateral veins not impressed (or very slightly so) on the upper surface and only very slightly, if at all, raised on the lower surface (the lower surface therefore not appearing notably rugose); buds red-brown; cup scales red-tipped; pubescence of the lower surface stellate, all of it tightly appressed, the individual stellae readily visible only at 30× magnification (sometimes barely distinguishable at 20× magnification); acorns 1-2 per stalk; [typically a large upland or bottomland tree, or northwards a salt-pruned shrub to large tree of dunes and estuarine shorelines]..... *Q. virginiana*

Key B – Leaves with even crenations or teeth (Chestnut Oaks)

- 1 Scales of the acorn cup prolonged and long tapered; lateral veins terminating in a well-developed bristle; [species planted, rarely escaped]; [section *Cerris*]..... *Q. acutissima*

- 1 Scales of the acorn cup acute to obtuse; lateral veins terminating in a minute mucro or hardened projection; [species native]; [section *Quercus*].
- 2 Acorns on peduncles (2-) 4-7 cm long; acorns 1.5-2.5 cm long; veins ending in crenations usually 6-10 on each side of leaf *Q. bicolor*
- 2 Acorns sessile or on peduncles 0-1 cm long; acorns 1-2 cm or 2.5-3.5 cm long; veins ending in crenations usually 8-15 or 3-7 (if 3-7, then a stoloniferous shrub).
- 3 Leaves mostly obovate, with rounded teeth (crenations), the teeth sometimes with a minute mucro; hairs of the leaf undersurface clustered in sessile, stellate-appearing clusters of 2-8 hairs; acorns 2.5-3.5 cm long; large trees.
 - 4 Hairs of the leaf undersurface in clusters with a diameter of 0.15-0.5 mm, dense to sparse; bark of mature trees light gray, loose, breaking into plates or scales *Q. michauxii*
 - 4 Hairs of the leaf undersurface asymmetric, appressed-stellate, with a diameter of 0.1-0.25 mm, sparse; bark of mature trees dark gray, tight, deeply furrowed *Q. montana*
- 3 Leaves mostly narrowly elliptic, narrowly ovate, or narrowly obovate (but sometimes broadly obovate), with sharp ascending, often incurved teeth, the teeth ending in a hardened projection; hairs of the leaf undersurface tiny and stellate, with 6-10 rays parallel to the leaf surface; acorns 1-2 cm long; medium to large trees or stoloniferous shrubs.
 - 5 Medium to large tree; veins ending in teeth usually 7-13 on each side of the leaf; leaves 8-20 cm long and 4-10 cm wide; [of dry to moist calcareous woodlands and forests] *Q. muehlenbergii*
 - 5 Stoloniferous shrub to 5 m tall; veins ending in teeth usually 3-8 (-9) on each side of the leaf; leaves 4-10 (-14) cm long and 2-6 (-8) cm wide; [of dry, often sandy and acid woodlands] *Q. prinoides*

Key C – Leaves with lobes not bristle-tipped (White Oaks)

- 1 Lower surfaces of mature leaves glabrous.
 - 2 Leaf lobes with acute apices; sinuses often both broad and "flat-bottomed" (with portions parallel to the midrib); acorn cup covering 2/3 to 3/4 of acorn *Q. lyrata*
 - 2 Leaf lobes with obtuse apices; sinuses narrow (often notch-like), narrowly to broadly rounded or triangular (lacking portions parallel to the midrib); acorn cup covering 1/4 to 1/2 of acorn.
 - 3 Leaves mostly 4-10 (-17) cm long, 2-5 (-9) cm wide, with 1-5 shallow lobes or undulations, extending 1/8 to 1/2 of the way to the midrib; acorn cup flat at the base, covering < 1/4 of the acorn *Q. sinuata* var. *sinuata*
 - 3 Leaves mostly 7-20 cm long, 3-10 cm wide, with 3-11 lobes, extending 1/4 to 5/6 of the way to the midrib (if the lobing < 1/2 of the way to the midrib, then the acorn cup rounded at the base and covering 1/4 to 1/2 of the acorn).
 - 4 Leaf base deeply cordate; [alien, sometimes planted and persistent] [*Q. robur*]
 - 4 Leaf base cuneate; [native]
 - 5 Leaves with 7-11 lobes (the sinuses usually deep, those of the larger leaves usually about 2/3 to 5/6 of the way to the midrib), 10-20 cm long, 5-10 cm wide; terminal bud rounded or globose; basal scales of acorn cup thickened, the thickening giving the cup a knobby texture *Q. alba*
 - 5 Leaves with 3-7 lobes (the sinuses usually shallow, those of the larger leaves usually ranging from 1/4 to 1/2 of the way to the midrib), 7-15 cm long, 3-8 cm wide; basal scales of the acorn cup thin, appressed, the cup having a rough but not knobby texture *Q. austrina*
 - 1 Lower surfaces of mature leaves pubescent, the pubescence varying from dense to sparse (sometimes minute and requiring 10× magnification to be readily visible).
 - 6 Lower surfaces of mature leaves whitish to pale green, with a mixture of minute, sessile, stellate hairs with horizontal tips and longer stellate hairs with erect ascending tips; leaves shallowly lobed (if so, the lobes 9-19) to deeply lobed (if so, the lobes with acute apices), the sinuses extending 1/4 to 4/5 of the way to the midrib.
 - 7 Leaves mostly shallowly lobed at the base, the sinuses extending 1/4 to 1/2 of the way to midrib, grading into mere crenations toward the tip of the leaf, the total number of lobes/crenations usually 9-19; acorns borne on peduncles 2-10 cm long; acorn cup covering 1/3 to 1/2 of acorn, the upper scales with long-acuminate apices *Q. bicolor*
 - 7 Leaves mostly relatively deeply lobed throughout the length of the leaf, the sinuses extending 1/2 to 4/5 of the way to the midrib, the total number of lobes 3-13; acorns sessile or borne on peduncles up to 1 cm long; acorn cup covering 1/3 to 3/4 of acorn, the upper scales with acute, long-acuminate, to long-awned apices.
 - 8 Upper scales of the acorn cups thin and acute; acorn cup covering 1/2 to 3/4 of the acorn; [swamps in the Coastal Plain and lower Piedmont of GA, NC, SC, and VA] *Q. lyrata*
 - 8 Upper scales of the acorn cups long-attenuate into nearly terete awns; acorn cup covering 1/3 to 1/2 of the acorn; [Mountains of VA] *Q. macrocarpa* var. *macrocarpa*
 - 6 Lower surfaces of mature leaves gray, green, pale green, or yellowish, glabrescent or densely pubescent, the hairs few-branched and erect; leaves mostly relatively deeply and obtusely lobed, rarely shallowly lobed (if so, the lobes 3-7), the sinuses extending 1/2 to 4/5 of the way to the midrib, the total number of lobes 3-7; acorns sessile or nearly so.
 - 9 Leaf lobes with acute apices; acorn cup covering 2/3 to 3/4 of acorn *Q. lyrata*
 - 9 Leaf lobes with obtuse to rounded apices; acorn cup covering 1/3 to 1/2 of acorn.
 - 10 Woody twigs of the season glabrous or with scattered, deciduous 2-forked hairs; petioles of mature leaves 3-10 (-15) mm long; leaf blades (2.5-) 4-8 (-13.5) cm long, irregularly and often rather shallowly 3-5 (-7) lobed, the overall form of the leaf only rarely cruciform; largest lateral lobes usually at the midpoint of the blade (or even below it), the lobes usually not sublobed, tapering from base to tip; [xeric sandy sites in the Coastal Plain from se. VA southward] *Q. margarettae*
 - 10 Woody twigs of the season densely and persistently stellate-pubescent, especially toward the tip of the twig; petioles of mature leaves 15-20 mm long (*Q. stellata*) or 3-10 (-15) mm long (*Q. boyntonii* and *Q. similis*); leaf blades (5-) 7.5-15 (-20) cm long, usually 5-lobed, the overall form of the leaf typically cruciform (*Q. stellata*) or not (*Q. boyntonii* and *Q. similis*); largest lateral lobes of the leaves usually above the midpoint of the blade, these lobes **either** often sublobed or squarish in shape, usually wider near their tips than at their bases (*Q. stellata*) or not sublobed, tapering from base to tip (*Q. boyntonii* and *Q. similis*); [collectively widespread in our area].
 - 11 Leaves usually cruciform, the largest lateral lobes often sublobed or squarish in shape, usually wider near their tips than at their bases, and borne at right angles to the midrib; [usually of dry to dry-mesic upland situations, widespread in our area]

- *Q. stellata*
- 11 Leaves not cruciform, the largest lateral lobes usually not sublobed, the lobes tapering from base to tip, and borne at ascending angles relative to the midrib; [of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward in our area (*Q. similis*) or localized on sandstone in nc. AL (*Q. boyntonii*)].
- 12 Rhizomatous shrubs to small trees, generally < 2 m tall; [of sandstone outcrops in nc. AL]..... *Q. boyntonii*
- 12 Single-trunked large trees; [usually of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward in our area]..... *Q. similis*

Key D – Leaves with lobes or teeth bristle-tipped (Red Oaks)

- 1 Leaves shallowly 3-lobed near the broad apex (some leaves of sprout or juvenile shoots may be more lobed).
- 2 Leaf blades 5-15 cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils (or pubescent across the surface in *Q. arkansana*).
- 3 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward] *Q. arkansana*
- 3 Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils; [widespread in our area]..... *Q. nigra*
- 2 Leaf blades 10-30 cm long; lower leaf surfaces pubescent across the surface (and often also with denser tufts of hairs in the vein axils).
- 4 Petioles short and stout, 5-15 mm long; lower leaf surfaces thinly to densely pubescent with a mixture of tawny or orange glandlike hairs and stellate hairs whose structure is easily visible at 10× magnification *Q. marilandica* var. *marilandica*
- 4 Petioles long and slender, (14-) 20-50 mm long; lower leaf surfaces densely puberulent with tawny stellate hairs whose structure is barely visible at 10× magnification..... *Q. falcata*
- 1 Leaves shallowly to deeply 5-12-lobed (some of the leaves of *Q. georgiana* only 3-lobed), the lobes primarily lateral.
- 5 Mature leaves pubescent beneath on the surface with stellate hairs.
- 6 Leaves 5-10 (-12) cm long, 5-lobed; shrub or small tree; [w. NC northward] *Q. ilicifolia*
- 6 Leaves (8-) 10-20 cm long, 5-12-lobed; small to large trees [collectively widespread in our area].
- 7 Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; leaves all deeply lobed, some of the sinuses extending > 4/5 of the way to the midrib; pubescence of the lower leaf surface greenish yellow, matted, and glandlike, usually sloughing off by late in the year *Q. laevis*
- 7 Petioles 2-5 cm long, not twisted so that the blade is oriented in a vertical plane; leaves shallowly to deeply lobed, some of the leaves on a tree generally shallowly lobed, none of the sinuses extending > 2/3 of the way to the midrib; pubescence of the lower leaf surface tawny or gray, stellate, not glandlike, persistent or sloughing off by late in the year.
- 8 Acorns 12-20 mm long, in a cup 15-25 mm across and 10-12 mm deep; mature leaves loosely and rather coarsely pubescent (the stellate hairs conspicuous and readily distinguishable at 10× magnification), often becoming nearly or entirely glabrous by late in the year (except for tufts of hairs in the vein axils); terminal bud 4-angled, 7-10 mm long, densely gray-tomentose *Q. velutina*
- 8 Acorns 10-15 mm long, in a cup 12-14 mm across and 4-5 mm deep; mature leaves densely and finely pubescent (the stellate hairs minute and scarcely distinguishable at 10× magnification), the pubescence permanent; terminal bud only obscurely angled (if at all), 5-8 mm long, brown-puberulent.
- 9 Base of blades of sun-leaves typically rounded, thus forming a U-shape (some leaves cuneate, angled, or oblique); terminal lobe of leaves generally long-attenuated, narrow (its sides nearly parallel for much of its length), and curved to one side (falcate) (note that trees with the trilobed leaf form will key out above); leaves with 3-7 well-developed lobes, these often very irregular in size, shape, spacing, and orientation; pubescence of lower leaf surface normally tawny (when fresh) *Q. falcata*
- 9 Base of blades of sun-leaves typically cuneate or angled, thus forming a V-shape (some leaves somewhat U-shaped or oblique); terminal lobe of leaves generally short, broadly triangular (its sides normally tapering toward the tip for most of their length), not strongly curved to one side; leaves with 5-9 well-developed lobes, these generally rather uniform in size, shape, spacing, and orientation; pubescence of leaf surface gray *Q. pagoda*
- 5 Mature leaves glabrous beneath on the surface, with tufts of hairs in the main vein axils beneath.
- 10 Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup inflexed, thus the cup appearing to have a broadly rounded rim..... *Q. laevis*
- 10 Petioles 2.0-7 cm long, not twisted so that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup not inflexed, thus the cup appearing to have a sharp rim appressed against the acorn.
- 11 Terminal buds 4-angled, 7-10 mm long, the bud scales densely gray-tomentose *Q. velutina*
- 11 Terminal buds not 4-angled, 3-5 (-7) mm long, the bud scales glabrous or with ciliate margins.
- 12 Leaves relatively shallowly lobed, the sinuses extending up to 2/3 of the way to the midrib; upper leaf surface dull, not lustrous.
- 13 Acorn cup covering about 1/4 of acorn; leaf sinuses extending about 1/4 of the way to the midrib; bark of mature trees dark gray to black; [widespread in our area, at low to medium elevations] *Q. rubra* var. *rubra*
- 13 Acorn cup covering about 1/3 of acorn; leaf sinuses extending about 1/3 of the way to the midrib; bark of mature trees medium gray; [of the Mountains, mostly at 1000 m and above] *Q. rubra* var. *ambigua*
- 12 Leaves relatively deeply lobed, the sinuses extending 2/3 to 9/10 of the way to the midrib; upper leaf surface lustrous.
- 14 Larger lateral lobes of most leaves with 1 bristle per lobe (-2 on some lobes); total bristle tips < 10/leaf *Q. georgiana*
- 14 Larger lateral lobes of most leaves with 2 or more bristles; total bristle tips 9-50/leaf.
- 15 Mature leaves mostly 7-12 cm long, 5-11 cm wide (averaging about 9 cm long and 8 cm wide), with 5-7 lobes; acorns (8-) 10-13 (-15) mm long; acorn cup nearly flat at base, covering about 1/4 of the acorn *Q. palustris*
- 15 Mature leaves mostly 10-20 cm long, 8-15 cm wide (averaging about 12-15 cm long and 10-12 cm wide), with (5-) 7-11 lobes; acorns (12-) 15-25 (-37) mm long; acorn cup nearly flat, turbinate, or rounded, covering 1/4-1/2 of the acorn.
- 16 Acorn cup nearly flat at base, covering about 1/4-1/3 of the acorn; acorn 15-37 mm long, lacking concentric grooves near the tip; upper surface of leaves dark green..... *Q. shumardii*
- 16 Acorn cup turbinate, covering about 1/2 of the acorn; acorn (12-) 15-26 mm long, with or without 1-3 concentric grooves near the tip; upper surface of leaves bright green.

- 17 Acorn (12-) 15-20 mm long, with 1-3 concentric grooves near the tip; bud silvery or tawny pubescent toward the tip; upper surface of leaves bright green; lobes 5-9 per leaf; total bristle tips 18-50/leaf; [usually of dry uplands, widespread in our area] *Q. coccinea*
- 17 Acorn 15-26 mm long, without concentric grooves near the tip; bud glabrous, or with the scales merely ciliate-margined; lobes 7-11 per leaf; total bristle tips 9-24/leaf; [bottomlands, from c. TN and AL westward] *Q. texana*

* *Quercus acuta* Thunberg, Japanese Evergreen Oak. Suburban woodlands; native of Japan. Reported as aggressively establishing near plantings at Kalmia Gardens, Coker College, Darlington County, SC. [= *Cyclobalanopsis acuta* (Thunberg) Oersted] {not yet keyed}

* *Quercus acutissima* Carruthers, Sawtooth Oak. Commonly cultivated as a suburban street tree and also widely planted in "wildlife food plots", rarely naturalizing; native of Japan. This species has been a popular recommendation for "wildlife plantings" in the recent past, and entire stands can be encountered in relatively remote areas, planted by federal and state land management agencies; why "wildlife" species in our area need more oak trees is somewhat mystifying! See Whittemore (2004) for additional information. Spreading from plantings in Knoxville, TN (D. Estes, pers. comm., 2007). [= K, Mo, Pa, Va; ? *Q. acutissima* ssp. *acutissima*]

Quercus alba Linnaeus, White Oak. Mesic to xeric forests. Apr; Sep-Nov (of the same year). ME west to MN, south to Panhandle FL and e. TX. Historically, one of the most valuable timber trees of eastern North America. *Q. alba* is probably the most abundant native plant in our area, and in eastern North America, based on biomass, leaf area, and ubiquity. Hardin (1975) discusses introgression between *Q. alba* and many other species of *Quercus* subgenus *Quercus*. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WH3, WV; < *Q. alba* - S (also see *Q. austrina*)]

Quercus arkansana Sargent, Arkansas Oak. Dry bluffs. Sw. and wc. GA and Panhandle FL west in a fragmented distribution to sw. AR and e. TX. [= FNA, K, S, WH3; > *Q. caput-rivuli* W.W. Ashe]

Quercus austrina Small, Bluff Oak. River bluffs, mesic hammocks, dry hammocks, natural levees of brownwater rivers, over mafic rocks, on shell or calcareous sediments. Apr; Oct (of the same year). Essentially a Southeastern Coastal Plain endemic, ranging from sc. NC south to n. FL and west to MS, and apparently disjunct in sw. AR; nowhere common. [= FNA, K, RAB, WH3; < *Q. alba* - S (apparently)]

Quercus bicolor Willdenow, Swamp White Oak. Upland depression swamp forests over mafic rocks such as gabbro or diabase, bottomland swamps with calcareous sediments. Apr; Sep (of the same year). Widespread in ne. North America, south to NC, SC (Nelson 1993), TN, n. AL, and MO. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W]

Quercus boyntonii Beadle, Boynton Oak. Dry forests. Ne. AL and (possibly) TX. [= FNA, K, S; = *Q. stellata* Wangenheim var. *boyntonii* (Beadle) Sargent]

Quercus chapmanii Sargent, Chapman Oak. Dry pinelands, sandhills, scrub. Feb-Mar; Sep-Nov (of the same year). A Southeastern Coastal Plain endemic: se. SC south to s. FL, west to sw. AL. [= FNA, K, RAB, S, WH3]

Quercus coccinea Muenchhausen, Scarlet Oak. Xeric upland forests. Apr; Sep-Nov (of the second year). Centered in the Appalachians, from s. ME south to c. AL, but ranging west to MS, ne. AR, s. IL, and s. MI. [= C, F, FNA, G, Mo, Pa, RAB, S, Va, W, WV; > *Q. coccinea* var. *coccinea* - K; > *Q. coccinea* var. *tuberculata* Sargent - K]

Quercus elliotii Wilbur, Running Oak. Pine flatwoods, especially on loamy soils in the Middle Coastal Plain. Mar-Apr; Sep (of the first year). A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to s. MS. Wilbur (2002b) and Wilbur & Ho (2008) discuss the reasons for rejecting the traditional use of *Q. pumila* for this species; Walter's diagnosis states that *Q. pumila* has leaves that are glabrous and glaucous below, ruling out application to this species. [= *Q. pumila* Walter - FNA, K, RAB, S, WH3, Z, apparently misapplied]

Quercus falcata Michaux, Spanish Oak, Southern Red Oak. Upland forests, usually xeric or submesic, but occasionally in mesic situations. Apr; Sep-Nov (of the second year). Widespread in se. North America, north to e. OK, s. MO, s. IL, s. IN, s. OH, WV, se. PA, NJ, and reported (apparently without specimen documentation) from Long Island, NY. "*Q. triloba* Michaux", the form with the leaves only shallowly trilobed at the apex, can cause confusion. Though even medium-sized trees sometimes have leaves only of this form (rather than the typical form, deeply 5-7-lobed, the terminal lobe long-attenuate and falcate), it has

no taxonomic merit. [= C, FNA, K, Mo, Pa, Va, W, WH3, WV; = *Q. falcata* var. *falcata* – G, GW, RAB; > *Q. falcata* var. *falcata* – F; > *Q. falcata* var. *triloba* (Michaux) Nuttall – F; = *Q. rubra* – S, misapplied; ? *Q. digitata* Sudworth; > *Q. triloba* Michaux]

Quercus geminata Small, Sand Live Oak. Xeric sandhills (northward restricted to areas very near the coast). Apr; Sep-Nov (of the same year). A Southeastern Coastal Plain endemic: se. NC south to s. FL, and west to s. MS. The alleged occurrence of *Q. geminata* as far north as se. VA is apparently based on ambiguous specimens that probably are only *Q. virginiana* (the so-called var. *maritima*). A careful study of the genetics, morphology, and ecology of *Q. geminata* and *Q. virginiana* supports their recognition as separate species (Cavender-Bares & Pahlisch 2009). *Q. geminata* flowers about 2-3 weeks later than *Q. virginiana* when growing in close proximity. [= C, FNA, GW, K, S, WH3; < *Q. virginiana* – RAB]

Quercus georgiana M.A. Curtis, Georgia Oak. Dry slopes, ridges, and bluffs, mainly over granite and quartzite. Apr; Sep-Oct (of the second year). Sc. NC south and west through GA to c. AL; the NC population discovered by David Campbell in 2010 (pers. comm., specimens at NCU and UNCC). This small tree conspicuously retains tawny dry leaves through the winter, reminiscent of *Acer leucoderme*, *Acer floridanum*, and young *Fagus grandifolia*. [= FNA, K, RAB, S]

Quercus hemisphaerica Bartram ex Willdenow, Sand Laurel Oak, Darlington Oak. Sandhills, dry hammocks, and other dry, sandy soils, a component of maritime forests with *Q. virginiana*, and widely planted as a street tree in most parts of our region. Mar-Apr; Sep-Nov (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to c. FL and west to s. TX, north uncommonly in the interior to nc. AL, n. MS, and s. AR. Often confused with *Q. laurifolia* (see the key for distinctions). *Q. hemisphaerica* is the semi-evergreen laurel oak planted widely as a street tree in southern cities, often intermixed with the strictly deciduous *Q. phellos*. [= C, F, FNA, Va, Z; < *Q. laurifolia* – RAB, WH3; = *Q. laurifolia* – S, misapplied; > *Q. hemisphaerica* var. *hemisphaerica* – K; > *Q. hemisphaerica* var. *maritima* (Michaux) Muller – K]

Quercus ilicifolia Wangenheim, Bear Oak, Scrub Oak. Xeric soils in ridges in the Mountains and monadnocks in the upper Piedmont, pine-oak / heath woodlands, shale barrens, other dry and acidic sites. Late Apr-Jun; Aug (of the second year). Primarily Appalachian: s. ME south to w. VA, w. NC, and e. KY. In NC this scrubby oak is rare and probably declining because of fire suppression (Barden 1985), though recent ice storms have opened the tree canopy at several of its NC sites. The occurrence of *Q. ilicifolia* in KY was confirmed at the Devil's Teatable, Floyd County (Clark et al. 1997). [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WV]

Quercus imbricaria Michaux, Shingle Oak. Rich soils of upper floodplains of rivers and creeks, often at the base of the slope into the upland, also on lower slopes, upland depression swamps, and in drier forests over diabase, limestone, or other calcareous or mafic claypan soils, rarely extending to 5100 feet elevation. May; Oct (of the second year). Primarily midwestern, ranging from NJ, PA, n. OH, s. MI, n. IL, and c. IA, south to e. VA, nc. and w. NC, sc. TN, n. AL, and n. AR. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV, Z]

Quercus incana Bartram, Bluejack Oak. Sandhills, primarily in somewhat loamier textured, submesic soils, inland from the Coastal Plain on coarse sandy alluvium or upland ridges over quartzite or other acidic rocks. Apr; Sep-Nov (of the second year). Primarily a species of the Southeastern Coastal Plain, but rarely extending inland into the Piedmont (especially on coarse sandy alluvium): se. VA south to c. peninsular FL and west to e. TX, sw. AR, and se. OK. This oak is recognizable even at a distance by its bluish color. [= F, FNA, K, RAB, Va, WH3, Z; = *Q. cinerea* Michaux – C, G, S; ? *Q. humilis* Walter]

Quercus inopina W.W. Ashe, Florida Scrub Oak. Florida scrub, sandhills. FL peninsula, north to St. Johns County. [= FNA, K, WH3] {add to synonymy}

Quercus laevis Walter, Turkey Oak. Sandhills, primarily in very xeric soils of deep sandy deposits (Carolina bay rims, old beach dunes, early Cenozoic deposits of the Sandhills Province), or inland from the Coastal Plain on dry ridges and slopes over quartzite or other acidic rock types. Apr; Sep-Oct (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. LA. The leaves turn an intense orange-red in the autumn (Nov). [= C, F, FNA, G, K, RAB, S, Va, WH3, Z; = *Q. catesbaei* Michaux]

Quercus laurifolia Michaux, Laurel Oak. Mesic to seasonally flooded soils of floodplains, also (rarely) mesic slopes and swamps in maritime forests. Mar-Apr; Sep-Nov (of the second year). A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX and s. AR. Sometimes confused with *Q. hemisphaerica*, but (in addition to the key characters above) *Q. laurifolia* has blunter leaf tips, flowers about 2 weeks earlier, and generally occupies much moister habitats. [= C, F, FNA, G, GW, K, Va, Z; < *Q. laurifolia* – RAB, WH3 (also see *Q. hemisphaerica*); = *Q. obtusa* (Willdenow) W.W. Ashe – S]

Quercus lyrata Walter, Overcup Oak. Seasonally rather deeply and frequently flooded soils of floodplains of the Coastal Plain, less commonly in seasonally flooded swamps in Triassic basins in the lower Piedmont, and rarely in upland depression swamps of the Piedmont (developed over clays weathered from mafic rocks) and Coastal Plain. Mar-Apr; Sep-Oct (of the same year). Primarily a species of the Southeastern Coastal Plain: DE south to Panhandle FL, west to e. TX and se. OK, north in the inland to w. TN, s. IN, s. IL, and se. MO. Of our oaks, *Q. lyrata* tolerates the wettest habitats, both in terms of depth and duration of flooding. [= C, F, FNA, G, GW, K, Mo, RAB, S, Va, WH3]

Quercus macrocarpa Michaux var. *macrocarpa*, Bur Oak, Mossycup Oak. Rich bottomland forests, sometimes in drier forests and then usually over limestone or other calcareous rocks. NB and QC west to s. MB, south to nw. VA, KY, TN, LA, and TX. Variation in this species needs additional study; *Q. macrocarpa* in our area is the typical variety or subspecies if other taxa are recognized. [= K1, K2; < *Q. macrocarpa* – C, F, FNA, G, GW, Mo, Pa, S, Va, W, WV]

Quercus margarettae W.W. Ashe ex Small, Sand Post Oak. Sandhills, typically in slightly loamy or clayey soils, not usual in the deepest and most xeric sands. Apr; Sep-Nov (of the same year). Primarily a species of the Southeastern Coastal Plain: se. VA south to FL and west to TX and se. OK. As stated by Fernald (1950), this oak was "chivalrously named [by W.W. Ashe] in 1903 for Margaret Henry Wilcox, who two years later became Mrs. Ashe." There has been controversy, however, over the spelling of the specific epithet; apparently it should be corrected to the genitive "ae" (K. Gandhi, pers. comm. 2007). [= Va; = *Q. margareta* – C, FNA, G, RAB, S, WH3, orthographic variant; = *Q. margarettiae* W.W. Ashe ex Small – K1, K2, orthographic variant; = *Q. stellata* var. *margareta* (W.W. Ashe ex Small) Sargent – F, orthographic variant]

Quercus marilandica Muenchhausen var. *marilandica*, Blackjack Oak. Upland forests and woodlands, usually on periodically droughty soils, as over shrink-swell clays, sandstones, deep sands, sands with clay lenses, and shallow soils over acidic bedrock. Apr; Sep-Nov (of the second year). NY (Long Island), NJ, se. PA, w. VA, s. OH, s. IN, c. IL, s. IA, and se. NE south to s. GA, Panhandle FL, and sc. TX (west to the Prairie border). There are historical accounts of the existence of prairies or barrens in the vicinity of Charlotte in the late eighteenth century, known as the "the blackjack lands." These areas were described as open and prairie-like, until the early nineteenth century, when they became dominated by dense forests of blackjack oak. The previously open condition was almost certainly maintained by fire, perhaps set by the Waxhaw Indians. Blackjack oak has long been considered an indicator of poor soil, as in Guthrie (1820), who states in his discussion of NC, "the Black Jack land is generally poor, ... and is avoided by farmers, as unproductive." Var. *marilandica* is the widespread taxon; var. *ashei* Sudworth [= *Q. neoashei* Bush] is worthy of recognition at the varietal level at least, and occurs from s. MO and s. KS south to c. AR, e. TX, and sc. TX, especially on the Edwards Plateau (Hunt 1990). [= FNA, K1, Mo, Va, Z; < *Q. marilandica* – C, F, G, K2, Pa, RAB, S, W, WH3, WV]

Quercus michauxii Nuttall, Basket Oak, Swamp Chestnut Oak. Bottomland forests, especially in fertile soils of upper terraces where flooded only infrequently and for short periods, upland depression ponds, sometimes on moist lower slopes. Apr; Sep-Oct (of the same year). NJ south to n. peninsular FL and west to e. TX and se. OK, north in the interior to s. IL and s. IN. See discussion under *Q. montana* about the application of the name *Q. prinus* Linnaeus. [= C, F, FNA, G, GW, K, Mo, RAB, Va, W, WH3; = *Q. prinus* Linnaeus – S, name rejected (possibly misapplied, and a source of confusion)]

Quercus minima (Sargent) Small, Dwarf Live Oak. Pine flatwoods, coastal fringe sandhills. Apr; Sep-Nov (of the same year). A Southeastern Coastal Plain endemic: se. NC (New Hanover County) south to s. FL, west to s. MS. [= FNA, K, S, WH3]

Quercus montana Willdenow, Rock Chestnut Oak. Xeric forests of ridges and slopes, shale barrens, occasionally in mesic situations especially where rocky. Apr; Sep-Nov (of the same year). Primarily Appalachian but broadly distributed in e. North America: s. ME, NY, MI, s. UN, s. IL, and se. MO (Smith & Parker 2005) south to c. GA, c. AL, ne. MS (and LA?). The proper application of the Linnaean "*Q. prinus*" has been controversial and unclear, having been debated and variously applied for well over a century. The name "*Q. prinus*" has nomenclatural priority over either "*Q. montana*" or "*Q. michauxii*", but it is not clear which species was intended; after centuries of uncertainty, Whittemore & Nixon (2005) proposed its formal rejection and the proposal was formally and unanimously accepted (Brummitt 2007). [= FNA, K2, Pa, S, Va, W; = *Q. prinus* Linnaeus – C, F, G, K1, RAB, WV, name rejected (probably misapplied, and a source of confusion)]

Quercus muehlenbergii Engelmann, Yellow Oak, Chinquapin Oak. Slopes and bluffs, on soils derived from calcareous or mafic rocks. Apr; Oct-Nov (of the same year). S. New England and ON west to WI, se. MN, and IA, south to nw. FL, TX, and

n. Mexico. The similar *Q. montana* sometimes has a few leaves with somewhat sharply lobed leaves, but these are minutely mucronate and lack the well-developed callus of *Q. muehlenbergii*. Additionally, *Q. muehlenbergii* has a flaky, light gray bark, very different from the dark gray, deeply furrowed bark of *Q. montana*. [= C, F, K, Mo, RAB, Va, WH3, WV; = *Q. muehlenbergii* – FNA, Pa, S, W, orthographic variant; = *Q. prinoides* Willdenow var. *acuminata* (Michaux) Gleason – G]

Quercus myrtifolia Willdenow, Myrtle Oak. Dry pinelands. Feb-Mar; Sep (of the second year). A Southeastern Coastal Plain endemic: se. SC south to s. FL, west to se. MS. [= FNA, K, RAB, S, WH3, Z]

Quercus nigra Linnaeus, Water Oak, Paddle Oak. Bottomland forests, especially on levees or second terraces where flooded infrequently and for short periods, less commonly on mesic slopes. Apr; Sep-Nov (of the second year). Primarily a species of the Southeastern Coastal Plain: s. NJ south to s. FL and west to e. TX and se. OK, north in the interior to se. TN, c. TN, w. and sc. KY (Clark et al. 2005), se. MO, and e. OK. Seedlings and fire sprouts of this species are highly variable; see discussion at end of generic treatment. [= C, FNA, G, GW, K, Mo, RAB, S, Va, W, WH3, Z; > *Q. nigra* var. *nigra* – F; > *Q. nigra* var. *heterophylla* (Aiton) W.W. Ashe – F; = *Q. aquatica* Walter]

Quercus oglethorpensis Duncan, Oglethorpe Oak. Bottomland forests, upland oak flats over clays (Iredell and Enon soils). Apr; Sep-Oct (of the same year). Widely scattered from w. SC, to adjacent e. GA, nw. AL (Sorrie pers. comm. 2002), MS, and LA. [= FNA, GW, K, RAB]

Quercus pagoda Rafinesque, Cherrybark Oak, Swamp Spanish Oak. Bottomland forests, especially on second terraces, also mesic to dry-mesic upland sites, especially where somewhat base-rich. Apr; Sep-Nov (of the second year). A Southeastern Coastal Plain endemic: e. and c. VA south to nw. FL and west to se. TX and north in the interior to e. TN, s. IL, and s. IN. [= C, FNA, K, Mo, S, Va, WH3; = *Q. falcata* var. *pagodifolia* Elliott – F, G, GW, RAB]

Quercus palustris Muenchhausen, Pin Oak. Swamps and bottomlands, especially the broader swamps developed in the sedimentary rocks of Triassic basins of the lower Piedmont, isolated upland sag ponds, also widely planted as a street tree in towns and cities. Mar-Apr; Oct-Nov (of the second year). MA and NY west to se. IA and e. KS, south to c. NC, nw. GA, sc. TN, n. AR, and e. OK. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WV]

Quercus phellos Linnaeus, Willow Oak. Bottomland forests, especially on natural levees and second terraces, also in upland depression swamps developed on clay soils, weedy and successional on slopes and upland sites following disturbance, and widely planted as a street tree in towns and cities. Mar-Apr; Sep-Nov (of the second year). Primarily a species of the Southeastern Coastal Plain: NY (Long Island), s. NJ, and se. PA south to s. GA and Panhandle FL, west to e. TX and se. OK, north in the interior to e. TN, s. KY, w. KY, s. IL, and se. MO, and e. OK. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WH3, Z]

Quercus prinoides Willdenow, Dwarf Chinquapin Oak. Xeric uplands, on clay soils derived from mafic rocks or sandy acidic soils, probably in sites which naturally burned rather frequently. Apr; Aug-Sep (of the same year). MA and s. MI south to NC, OK, and TX. Fire suppression in the sites where this rare oak occurs has nearly or entirely extirpated it from much of our area. [= C, FNA, K, Mo, Pa, RAB, S, Va, W; > *Q. prinoides* var. *prinoides* – F; > *Q. prinoides* var. *rufescens* Rehder – F; = *Q. prinoides* var. *prinoides* – G]

* ***Quercus robur*** Linnaeus, English Oak. Rarely cultivated in our area; sometimes persisting or escaping in ne. United States, south at least to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007). [= FNA, K, Pa] {rejected; not mapped}

Quercus rubra Linnaeus var. *ambigua* (A. Gray) Fernald, Gray Oak. Forests on ridges, slopes, and coves, mostly at over 1000 meters elevation. May; Sep-Oct (of the second year). Fairly widespread in ne. North America south to PA, and in the Appalachians to w. NC, nw. SC, and n. GA. This and var. *rubra* tend to intergrade and their distinction as even varieties may not be warranted. For discussion of the two varieties, see McDougal & Parks (1984) and Jensen (1977). [= K1; = *Q. rubra* var. *borealis* (Michaux f.) Farwell – F, FNA, RAB, WV; < *Q. rubra* – C, K2, Mo, Pa, Va, W; = *Q. borealis* Michaux f. var. *borealis* – G; = *Q. borealis* – S]

Quercus rubra Linnaeus var. *rubra*, Red Oak. Moist to fairly dry forests of slopes, coves, and ravines, below 1000 meters elevation. Apr; Aug-Sep (of the second year). Widespread in e. North America, south to e. VA, GA, AL, MS, AR, and OK. [= F, FNA, K1, RAB, WV; < *Q. rubra* – C, K2, Mo, Pa, Va, W; = *Q. borealis* Michaux f. var. *maxima* (Marshall) W.W. Ashe – G; = *Q. maxima* (Marshall) W.W. Ashe – S]

Quercus shumardii Buckley, Shumard Oak. Moist and fertile soils of bottomlands and lower slopes, also in xeric sites over calcareous rocks (such as limestone). Apr; Sep-Oct (of the second year). Sc. PA, OH, s. MI, IN, s. IL, MO, and e. KS south to n. peninsular FL and TX. A number of varieties have been recognized in *Q. shumardii*, and the morphological and habitat variation needs additional study. Var. *schneckii* (Britton) Sargent is apparently distributed in calcareous uplands west of the Blue Ridge, especially on dry limestone slopes. It is allegedly distinguished by the acorn cups rounded to turbinate below (vs. flattened and saucer-shaped in var. *shumardii*). Hess & Stoyonoff (1998) tentatively concluded that no varieties should be recognized within *Q. shumardii*. *Q. acerifolia* (E.J. Palmer) Stoyonoff & W.J. Hess (*Q. shumardii* var. *acerifolia* E.J. Palmer) is an endemic of Magazine Mountain in n. AR and scattered sites in OK; it is best treated as a distinct species, though there has been much debate about its taxonomic status, with opinions ranging from full species to mere form (Smith 1988, Stoyonoff & Hess 1990, Johnson 1992, Johnson 1994, Hess & Stoyonoff 1998). [= C, FNA, K2, Mo, Pa, RAB, S, Va, W, WH3; > *Q. shumardii* var. *shumardii* – F, G, K1, WV; > *Q. shumardii* var. *schneckii* (Britton) Sargent – F, G, K1, WV]

Quercus similis W.W. Ashe, Swamp Post Oak, Delta Oak. Calcareous stream flats. SC south to GA, west to e. TX; disjunct in c. TN. *Q. similis* resembles *Q. stellata*, differing in its less definitely cross-shaped leaves and its distinctly wetland habitat. [= FNA, K1, K2; < *Q. stellata* – Mo; = *Q. stellata* Wangenheim var. *paludosa* Sargent; = *Q. ashei* Sterret]

Quercus sinuata Walter var. *sinuata*, Bastard Oak. Alluvial and slope forests. Apr-May; Sep-Nov (of the same year). Se. SC south to FL Panhandle, west to TX. Var. *breviloba* (Torrey) C.H. Muller is in TX and OK. [= FNA, K1, K2; > *Q. durandii* Buckley – RAB, S]

Quercus stellata Wangenheim, Post Oak. Upland forests and woodlands, especially in clay or rocky soils and in communities at least formerly exposed to fire. Apr; Sep-Nov (of the same year). Se. MA, s. NY, s. PA, s. OH, s. IN, s. IA, and e. KS south to n. peninsular FL and TX. In KS, OK, and TX, post oak is one of the trees that forms the Prairie boundary. There is no question of the distinctness of *Q. margarettae* from *Q. stellata*. See *Q. similis*. [= C, FNA, G, K1, K2, Pa, RAB, S, Va, W, WH3, WV; = *Q. stellata* var. *stellata* – F; < *Q. stellata* – Mo; = *Q. villosa* Walter]

Quercus texana Buckley, Nuttall Oak, Texas Red Oak. Floodplain swamps and bottomlands. Apr-May. AL, TN, w. KY (Clark et al. 2005), west to e. TX. [= FNA, K1, K2, Mo; = *Q. nuttallii* E.J. Palmer – F, GW; = *Q. shumardii* Buckley var. *texana* (Buckley) W.W. Ashe]

Quercus velutina Lamarck, Black Oak. Upland forests and woodlands, especially in fairly xeric and sandy soils. Apr; Sep-Oct (of the second year). ME west to MN and NE, south to Panhandle FL and TX. [= C, F, FNA, G, K1, K2, Mo, Pa, RAB, S, Va, W, WH3, WV]

Quercus virginiana P. Miller, Live Oak. Locally common to abundant in maritime forests and maritime scrub on barrier islands, more rarely inland (though regularly on the mainland from se. NC south, and extending substantially inland from s. SC south), sometimes in dry, fire-maintained habitats more usually occupied by *Q. geminata*, also planted (especially in the outer Coastal Plain). Apr; Sep-Nov (of the same year). A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to TX. *Q. fusiformis* Small of TX has sometimes been treated as a variety of *Q. virginiana*, but is best separated as a species. Flowering before *Q. geminata* when growing together. [= C, FNA, GW, K1, K2, S, Va, WH3; < *Q. virginiana* – G, RAB (also see *Q. geminata*); > *Q. virginiana* var. *virginiana* – F; > *Q. virginiana* var. *maritima* (Michaux) Sargent – F, misapplied; = *Q. sempervirens* Walter]

158. MYRICACEAE Blume 1829 (Bayberry Family) [in FAGALES]

A family of about 3-5 genera and 55 species, trees and shrubs, nearly cosmopolitan. See *Morella* for discussion of our 3 genera. References: Bornstein in FNA (1997); Wilbur (1994)=Z; Elias (1971b)=Y; Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves oblong or linear-lanceolate, pinnatifid, stipulate; fruit in a bristly involucre formed by 8 bractlets.....**Comptonia**
- 1 Leaves mostly obovate or oblanceolate, entire or toothed (especially apically), estipulate; fruit either exposed and densely waxy (*Morella*), or partially enclosed in 2 wing-like bractlets (*Myrica*).
- 2 Fruit spherical, densely waxy, exposed (the 4-6 bractlets small and inconspicuous); terminal buds present; aments inserted on old wood mainly below the leaves; [in our area, common and in the Coastal Plain, Mountains, and Piedmont].....**Morella**
- 2 Fruit flattened, not waxy, partially enclosed in 2 wing-like bractlets; terminal buds lacking; aments inserted at the summit of the branchlets of the preceding year; [in our area, very rare and restricted to bogs in the Mountains].....**Myrica**

Comptonia L'Heritier ex Aiton 1789 (Sweet-fern)

A monotypic genus, a shrub, of e. North America, known as fossils from a much broader area. References: Bornstein in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Comptonia peregrina (Linnaeus) J.M. Coulter, Sweet-fern. Dry open woods and barrens, in the mountains on xeric ridges at low to medium elevations, usually in fire-maintained habitats, also in xeric and fire-maintained habitats on monadnocks in the upper Piedmont and in dry, sandy sites in the lower Piedmont and fall-line sandhills. Apr-May; Aug-Sep. NB, ON and MN,

south to sc. and w. NC, w. SC, ne. GA, nc. TN, and IL. [= C, FNA, K1, K2, Pa, RAB, S, Va, W, WV; > *Comptonia peregrina* var. *asplenifolia* (Linnaeus) Fernald – F, Y; > *Comptonia peregrina* var. *peregrina* – F, Y; > *Myrica asplenifolia* Linnaeus var. *asplenifolia* – G; > *Myrica asplenifolia* var. *tomentosa* (Chevallier) Gleason – G]

Morella Loureiro 1790 (Bayberry, Wax-myrtle, Candleberry)

Wilbur (1994) makes a compelling case for the recognition of three genera among eastern North American Myricaceae, and for application of the name *Myrica* to *Myrica gale*. The typification of the genus *Myrica* with *Myrica gale* Linnaeus has been confirmed (Brummitt 1999); thus, the familiar southeastern species placed by many authors in *Myrica* must take another name. Wilbur (1994) prefers to treat our species as subgenus *Cerothamnus* (Tidestrom) Wilbur of genus *Morella* Loureiro; subgenus *Morella* is restricted to e. Asia, the Philippines, and Malaysia, and differs in a number of ways from subgenus *Cerothamnus*, including its fleshy and succulent, rather than waxy and hard, berries. Small maintained *Cerothamnus* at the generic level. Wilbur's inclusion of *Cerothamnus* in *Morella* may well be warranted (and is followed here), but I disagree with his provisional decision to include the taxon treated below as *Morella pumila* in *Morella cerifera*, and the taxon treated below as *Morella pensylvanica* in *Morella caroliniensis*, though their appropriate rank may be questioned. References: Bornstein in FNA (1997); Wilbur (1994)=Z; Wilbur (2002a); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Fresh leaves odorless when crushed; staminate flowers with 6-10 stamens (or as few as 3 in distal flowers); leaves usually entire; [of s. GA south and west]; [subgenus *Cerothamnus*, series *Faya*].....***M. inodora***
- 1 Fresh leaves aromatic when crushed; staminate flowers with 3-5 (-7) stamens; leaves usually serrate, at least near the tip; [collectively widespread in our area]; [subgenus *Cerothamnus*, series *Cerothamnus*].
 - 2 Leaves oblanceolate (generally narrowly so), most of them 0.5-1.5 cm wide, 4-6× as long as wide, evergreen; mature fruits 2.0-3.5 mm in diameter.
 - 3 Medium shrub to small tree (usually 2-10 m tall), not stoloniferous; leaves of fertile branches 4-9 cm long, 8-20 mm wide; [of a wide range of wetland habitats, including wet Coastal Plain pinelands; also planted and naturalized in upland sites]***M. cerifera***
 - 3 Small shrub (usually < 1 m tall), strongly stoloniferous; leaves of fertile branches 1.5-4 cm long, 3-8 mm wide; [restricted to Coastal Plain pinelands (or areas formerly so)]***M. pumila***
 - 2 Leaves elliptic to broadly oblanceolate, most of them 1.5-4 cm wide, 2-4× as long as wide, evergreen to deciduous; mature fruits 3.0-7.0 mm in diameter.
 - 4 Leaves subcoriaceous and more or less evergreen, not revolute (or slightly so if sun-grown), the larger ones usually about 9 cm long and 3.5 cm wide, with punctate glands dense on the lower surface and nearly or entirely absent on the upper surface; fruits 3-4.5 mm in diameter, the fruit wall glabrous or sparsely glandular, the warty protuberances glandular; twigs densely hairy to rarely glabrous; older branches blackish; [of various boggy habitats, widespread in our area] ***M. caroliniensis***
 - 4 Leaves coriaceous, tardily deciduous, often revolute, the larger ones about 6 cm long and 2 cm wide, with punctate glands fairly dense on both surfaces; fruits 4-6 (-7) mm in diameter, the fruit wall and warty protuberances densely hirsute when young; twigs glabrous to sparsely hairy; older branches whitish gray; [usually of dunes, from Dare County, NC northward].....***M. pensylvanica***

Morella caroliniensis (P. Miller) Small, Pocosin Bayberry, Evergreen Bayberry. Pocosins, wet savannas and pine flatwoods, sandhill seepage bogs, and other peaty or sandy-peaty wetlands. Apr; Aug-Oct. Primarily limited to the Southeastern Coastal Plain, from NJ south to FL and west to TX and AR. [= K1, K2, Va; = *Myrica heterophylla* Rafinesque – C, FNA, RAB, W, Y; > *Myrica heterophylla* var. *heterophylla* – F; > *Myrica heterophylla* var. *curtissii* (Chevallier) Fernald – F; < *Myrica pensylvanica* – G; < *Cerothamnus carolinensis* – S (also see *Morella pensylvanica*); = *Myrica caroliniensis* P. Miller – WH3; < *Morella caroliniensis* (P. Miller) Small – Z (also see *Morella pensylvanica*)]

Morella cerifera (Linnaeus) Small, Common Wax-myrtle, Southern Bayberry. Interdune swales (where often dominant), pocosins, brackish marshes, other wet to moist habitats, now also widely planted (including in the Piedmont) as an ornamental or landscaping shrub and persistent or naturalizing in suburban woodlands. Apr; Aug-Oct. Widespread in the Coastal Plain of Southeastern United States: NJ south to FL and west to TX. Our most common *Morella*, and also the largest, sometimes becoming a small tree, to at least 10 m tall and 20 cm DBH. See *Morella pumila* for a discussion of the controversial taxonomy of *Morella cerifera* and *Morella pumila*. [= Va; = *Myrica cerifera* Linnaeus var. *cerifera* – RAB, Y; < *Myrica cerifera* – C, FNA, GW, WH3 (also see *Morella pumila*); = *Myrica cerifera* – F, G; < *Morella cerifera* (Linnaeus) Small – K1, K2, Z (also see *Morella pumila*); = *Cerothamnus ceriferus* (Linnaeus) Small – S]

Morella inodora (Bartram) Small, Odorless Bayberry. Acid wetlands, especially in wooded, acid, streamhead "bogs" and bayheads, often associated with *Magnolia virginiana*, *Persea palustris*, *Cyrilla racemiflora*, *Cliftonia monophylla*, and *Woodwardia areolata*. A Southeastern Coastal Plain endemic: se. GA west to s. MS. [= K1, K2, Z; = *Myrica inodora* Bartram – FNA, GW, WH3, Y; = *Cerothamnus inodorus* (Bartram) Small – S]

Morella pensylvanica (Mirbel) Kartesz, Northern Bayberry. Dunes, sometimes even on the foredune and stoloniferously colonizing the upper beach, more typically behind the foredune on secondary dunes and sandy flats, often growing intermixed with *Morella cerifera*, but able to occupy drier sites higher on the dunes, from VA north, also ranging inland in sandy situations. Apr; Aug-Oct. This species reaches its southern limit at Avon (Kinnakeet), Dare County, NC. On interdune flats, it often grows intermixed with *Morella cerifera*, but is readily distinguished (even at a distance) by its stoloniferous growth (appearing as dome-shaped clones 3-20 m in diameter), stouter twigs, and tardily deciduous leaves. The twigs of this species are noticeably stouter than those of *Morella cerifera*; measured at 10 cm from the twig tips, they are (2-) 3-5 mm in diameter, those of *Morella cerifera* ca. 1.5-2.5 mm. [= K, Va; = *Myrica pensylvanica* Loiseleur – C, F, FNA, GW, Pa, RAB, Y; < *Myrica pensylvanica* – G (also see *Morella heterophylla*); < *Cerothamnus carolinensis* – S (also see *Morella pensylvanica*); < *Morella caroliniensis* (P. Miller) Small – Z; = *Cerothamnus pensylvanicus* (Mirbel) Moldenke]

Morella pumila (Michaux) Small, Dwarf Bayberry, Dwarf Wax-myrtle. Savannas, pine flatwoods, relatively moist to extremely dry sites in sandhills (under *Quercus laevis* and *Q. geminata*). Apr; Aug-Oct. A Southeastern Coastal Plain endemic: se. VA south to FL and west to e. LA (or TX?). Some authors dismiss the distinction between this taxon and *Morella cerifera* as merely environmental, while others treat the two as distinct at the varietal or specific level. In our area at least, they appear to be genetically distinct. They often occur in close proximity (though their typical habitats differ, they can be seen side by side in wet spodosolic pine savannas, sometimes also intermixed with *Morella caroliniensis*), and maintain their distinctiveness. There are some observations that there is a phenologic difference, with *Morella pumila* peak flowering 3 weeks later than *Morella cerifera* (J. Townsend, pers. comm. 2002). Though the issue remains unresolved, the stoloniferous growth of *Morella pumila* is not merely a fire response; I here maintain the two as distinct, pending further research. [= Va; < *Myrica cerifera* – C, FNA, GW, WH3; = *Myrica pusilla* Rafinesque – F, G; < *Morella cerifera* (Linnaeus) Small – K1, K2, Z; = *Myrica cerifera* Linnaeus var. *pumila* Michaux – RAB, Y; = *Cerothamnus pumilus* (Michaux) Small –S]

Myrica Linnaeus 1753 (Sweet Gale)

A genus of two species, shrubs, of temperate and subarctic regions of North America and Eurasia. References: Bornstein in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Myrica gale Linnaeus, Sweet Gale. Peaty bogs. Apr; Aug-Sep. A circumboreal species, south in North America to NJ, PA, MI, MN, and OR, disjunct from PA and s. NJ to Henderson County, NC, where considered extirpated at one time, as a result of the destruction of the famous East Flat Rock Bog. This shrub has been relocated at a single site, where it is abundant in a small area (less than 0.25 hectare). [= C, FNA, G, GW, K, Pa, S, W, Y; > *Myrica gale* var. *gale* – F; = *Gale palustris* Chevallier – RAB]

159. JUGLANDACEAE A. Richard ex Kunth 1824 (Walnut Family) [in FAGALES]

A family of about 8 genera and 60 species, trees and shrubs, mostly temperate. References: Stone in FNA (1997); Manos & Stone (2001); Elias (1972); Stone in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Nutlets 6-7 mm long, with 2 wings; leaf rachis usually winged **Pterocarya**
- 1 Nuts > 15 mm long, unwinged; leaf rachis unwinged.
 - 2 Fruit with husk dehiscent into 4 valves; pith of twigs continuous; leaves with (3-) 5-17 (-19) leaflets, the largest usually the terminal or final 2 lateral; nut with shell smooth, ridged, or irregularly wrinkled (but not deeply furrowed); terminal buds with imbricate (overlapping) or valvate scales; [tribe *Juglandae*, subtribe *Caryinae*] **Carya**
 - 2 Fruit with husk indehiscent; pith of twigs chambered (not always developing until autumn of the first year's growth); leaves with (7-) 11-19 (-23) leaflets, the largest usually about halfway up the leaf; nut with shell deeply furrowed in a complex corrugated pattern; terminal buds with valvate; [tribe *Juglandae*, subtribe *Juglandinae*] **Juglans**

Carya Nuttall (Hickory)

[contributed by Alan S. Weakley & Robert K. Peet]

A genus of about 18 species, trees, of e. North America (south into s. Mexico), and e. Asia. *Carya* in our area is separated into two sections, section *Apocarya* (*C. aquatica*, *C. cordiformis*, *C. illinoensis*) and section *Carya* (*C. carolinae-septentrionalis*, *C. floridana*, *C. glabra*, *C. laciniosa*, *C. myristiciformis*, *C. ovalis*, *C. ovata*, *C. pallida*, *C. texana*, *C. tomentosa*). The southeastern United States is the center of diversity of *Carya*. Our area includes all 13 North American species, and 13 of 18 species worldwide. Section *Rhamphocarya* includes a single Asian species. The remaining 4 species in the genus are all in section *Apocarya*: *C. palmeri* Manning of Mexico and 3 Asian species. *C. cordiformis*, *C. aquatica*, *C. illinoensis*, *C. myristiciformis*, *C. laciniosa*, *C. ovata*, and *C. carolinae-septentrionalis* are diploids, with n = 16. *C. pallida*, *C. floridana*, *C. texana*, *C. glabra*, *C. ovalis*, and *C. tomentosa* are tetraploids with n = 32 (Stone 1961). As suggested by Stone, Adrouny, & Flake (1969), it seems possible that reticulate evolution involving extant or extinct diploid species is responsible for some of the difficulties in the *C. glabra-ovalis* complex. Many hybrids have been described, but some are questionable. Additionally, Hardin & Stone (1984) state that "most of these hybrids are localized and have not led to introgressive populations, or at least none that have been recognized". Ecologically, *Carya* is one of the more diverse and ubiquitous genera of trees in our area, surpassed in number of species, abundance, and ecological amplitude only by *Quercus* and *Pinus*. This has led to a long tradition of describing large parts of our area (in particular the Piedmont) as being characterized by "oak-hickory" or "oak-pine-hickory" forests (e.g. Küchler 1964; Greller 1988; Schafale & Weakley 1990; Skeen, Doerr, & Van Lear 1993). Ware (1992) and others have recently

questioned this tradition, pointing out that *Carya* only rarely dominates or codominates, primarily in specialized circumstances (such as in soils with greater cation concentrations, derived from mafic rocks). The association of many (but certainly not all) species of hickories with soils with high base status was noted in print as early as 1820 in an account of the landscape of North Carolina. "The sandy pine barrens, and all the lands on which pine is the exclusive growth, are unfriendly to agriculture; but where the pine is intermixed with oak and hickory, the soil is good. Some of our strongest lands have tall pine, mixed not only with hickory and oak, but also with walnut and cherry, and such trees that indicate the best soil. Where hickory prevails, the land is strong" (Guthrie 1820). Key based in part on an unpublished manuscript prepared by Stone & Hardin for the Flora of the Southeastern United States.

Identification notes: Surface vestiture of leaves and bud scales is useful in distinguishing species of *Carya*. Some use of these characters can be made with a 10× or 20× hand lens; better still is a dissecting microscope. It is important to understand the different trichome types mentioned in the key (terminology follows Hardin 1990 and Hardin & Stone 1984). **Short acicular trichomes** are simple, unicellular trichomes tapered to a pointed tip, 0.10-0.35 mm long and with rough walls. **Long acicular trichomes** ("solitary" of Hardin & Stone 1984) are similar to short acicular, but are much larger, 0.45-1.6 mm long, and have smooth walls. **Fasciculate trichomes** are multicellular and have 2-8 straight or curled rays radiating from a clustered base. **Multiradiate trichomes** are similar to fasciculate, but have 8-17 rays, the inner (and usually more upright) rays attached basally above the outer (and usually more spreading) rays. **Capitate glandular trichomes** are unicellular or multicellular, and are distinguished by their bulbous or expanded tip; they are usually 0.02-0.1 mm long. **Peltate scales** are flat or dome-shaped shields or disks, slightly to strongly glandular, (sometimes regularly or irregularly lobed) and can be either sessile or stalked (they are often referred to as scales, resin dots, peltate glands, or lepidote scales). On the lower surfaces of leaflets, peltate scales are of two types: **large peltate scales** are 0.08-0.3 mm in diameter and are round, with smooth or slightly irregular margins, while **small peltate scales** are 0.025-0.12 mm in diameter and are either round, irregularly lobed or regularly 2- or 4-lobed.

- 1 Terminal buds elongate, flattened in cross-section, with 4-6 valvate scales; leaves with 7-13 (-19) leaflets, these symmetrical to strongly falcate; fruit sutures narrowly winged.
- 2 Leaves with 7-9 (-11) leaflets, these symmetrical to slightly falcate; fasciculate trichomes with 2-4 rays; terminal bud, 9-19 mm long, bright orangey yellow to dull orange-tan; [common and widely distributed tree in our area, typically in floodplain and slope forests].....
..... *C. cordiformis*
- 2 Leaves with (7-) 9-19 leaflets, these slightly to strongly falcate; fasciculate trichomes with 2-8 rays; terminal bud {} mm long, brown to rusty-brown.
- 3 Leaves with (7-) 9-11 (-13) leaflets, the lower surfaces pubescent at least along the midrib and in the main vein axils; bark shaggy; lateral petiolules 0-2 mm long; nut flattened and angled in cross-section; kernel bitter; [native, of swamp forests, primarily in the Coastal Plain]
..... *C. aquatica*
- 3 Leaves with (7-) 11-19 leaflets, the lower surfaces nearly glabrous; bark scaly, with small exfoliating plates; lateral petiolules 0-7 mm long; nut round in cross-section; kernel sweet; [introduced, frequently cultivated, long persistent, and occasionally naturalized]
..... *C. illinoensis*
- 1 Terminal buds ovoid, terete in cross-section, with 6-15 imbricate scales; leaves with (3-) 5-9 (-11) leaflets, these symmetrical to slightly falcate; fruit sutures not winged (except *C. myristiciformis*).
- 4 Bark shaggy (on large trees separating in segments to a meter in length); leaves with (3-) 5 (-7) leaflets; serrations of the leaflets densely (or only moderately) ciliate when young, most densely so just below the tooth apex, the hairs sloughing with age but leaving a subapical tuft of white trichomes on at least some teeth; fallen foliage turning black.
- 5 Twigs slender, hardened first-year growth or second-year growth 1-3 mm in diameter; terminal bud 6-15 mm long, glabrous to sparsely puberulent (except for ciliate fringe on the scales), reddish-brown (usually turning black on drying); lower surface of leaflets nearly glabrous, except for tufts of trichomes in the main vein axils, and only slightly lepidote with a few, scattered scales, the large peltate scales yellow and round, the small peltate scales brown, 2- and 4-lobed; terminal leaflet 2-5 (-6) cm wide
..... *C. carolinae-septentrionalis*
- 5 Twigs stout, hardened first-year growth or second-year growth (2.5-) 3-6 mm in diameter; terminal bud 9-18 mm long, tomentose, tan to brown (rarely turning black on drying); lower surface of leaflets moderately to densely hirsute with acicular and fasciculate hairs (sometimes the hairs more or less limited to the main veins), and also moderately lepidote, the large peltate scales yellow and round, the small peltate scales dark brown and mostly round; terminal leaflet (4-) 6-15 cm wide
..... *C. ovata*
- 4 Bark tight (the ridges typically forming an interlocking diamond pattern), scaly, or shaggy (when shaggy, the separated segments normally much < 1 meter long); leaves with (3-) 5-9 (-11) leaflets; serrations of the leaflets glabrous or ciliate, but lacking subapical tufts of trichomes; fallen foliage not notably blackening.
- 6 Twigs stout; terminal buds 8-20 mm long; leaves with (5-) 7-9 (-11) leaflets; lower surface of leaflets moderately to densely hirsute with a mixture of acicular (single), fascicled (2-8 rays), and multiradiate (8-many rays) hairs; small peltate scales of the lower surface of leaflets all round; fruit husk 4-13 mm thick; nuts slightly to strongly 4-angled toward the apex.
- 7 Bark shaggy; petiole hirtellous; leaflet apex acuminate; lower surface of leaflets hirsute with acicular (single), 2-6-rayed fascicled, and occasional multiradiate hairs; fruit husk pubescent, lacking pustulate bumps; fruit 4-7 cm long; nut 3-6 cm long; [rare in our area].....
..... *C. laciniosa*
- 7 Bark tight; petiole hirsute; leaflet apex acute; lower surface of leaflets densely hirsute with acicular (single) and abundant 2-8-rayed fascicled and multiradiate hairs; fruit husk glabrous, with pustulate bumps; fruit 3.5-5 cm long; nut 2.5-3.5 cm long; [common in our area].....
..... *C. tomentosa*
- 6 Twigs slender; terminal buds 3-15 mm long; leaves with 3-7 (-9) leaflets; lower surface of leaflets mostly glabrous, except for along the midrib and primary veins, and sometimes hirsute on the surface with acicular (single) and infrequent fascicled (2-8 rays) hairs (lacking multiradiate trichomes); small peltate scales of the lower surface of leaflets of various types, 4-lobed and/or irregular scales often more frequent than round scales; fruit husk 2-5 mm thick; nuts not 4-angled toward the apex.
- 8 Terminal bud 3-15 mm long, **either** predominantly pubescent (also sparsely lepidote) **or** densely lepidote (*C. floridana*); leaves with 3-7 (-9) leaflets; lower surface of spring leaflets slightly to densely lepidote with irregular and round peltate scales (4-lobed peltate scales uncommon or absent).

- 9 Terminal buds 3-9 mm long, densely lepidote and golden-brown to rusty; leaflets 3-7; lower leaf surfaces lacking small, round, dark brown, peltate scales; n. peninsular FL southward] *C. floridana*
- 9 Terminal buds 5-15 mm long, sparsely lepidote and reddish-brown to tan; leaflets (3-) 5-7; lower leaf surfaces with small, round, dark brown, peltate scales; [widespread in our area].
- 10 Fruit husk indehiscent at maturity or tardily splitting to base along 1 suture; leaves with (3-) 5 (-7) leaflets, glabrous to pubescent beneath; petiole usually green; fruits ellipsoidal, pyriform, or subglobose; bark tight..... *C. glabra*
- 10 Fruit husk splitting to base at maturity along 2-4 sutures; leaves with (5-) 7 leaflets, pubescent beneath; petiole reddish; fruits typically ellipsoidal; bark tight or often scaly or somewhat shaggy..... *C. ovalis*
- 8 Terminal bud 4-10 mm long, predominantly lepidote (also pubescent); leaves with (5-) 7 (-9) leaflets; lower surface of spring leaflets densely lepidote with 4-lobed, irregular, and round peltate scales, giving the undersurface a reflective, silvery-tan, rusty-brown, or bronze sheen.
- 11 Lepidote scales initially silver, soon turning bronze, and giving the buds, young twigs, and undersurface of the leaves a metallic bronze sheen; fruit 2-3 cm long; [of calcareous swamps, bottomlands and slopes of the Coastal Plain of se. NC southward]..... *C. myristiciformis*
- 11 Lepidote scales silvery-tan or rusty-brown, giving the buds, young twigs, and undersurface of the leaves a dull or slightly shiny tan or rusty-brown color; fruit 3-5 cm long; [usually of upland and acidic forests and woodlands, collectively widespread in our area].
- 12 Undersurface of the leaflets with dense, silvery-tan large peltate scales, and fewer and less conspicuous fewer small peltate scales (thus the leaves appearing overall silvery-tan); petiole and rachis hirsute with fasciculate trichomes, and also with concentrations of hairs near the leaflet insertions; [widespread in our area, of upland and acidic forests and woodlands]..... *C. pallida*
- 12 Undersurface of the leaflets with dense, rusty-brown small peltate scales, and fewer and less conspicuous silvery-tan large peltate scales (thus the leaves appearing overall rusty-brown); petiole and rachis with few fasciculate hairs (but densely scaly), and lacking concentrations of hairs near the leaflet insertions; [of the sc. United States, east to MS, w. KY, w. TN, and perhaps AL and GA, of upland or lowland, acidic or calcareous forests and woodlands]..... *C. texana*

Carya aquatica (Michaux f.) Elliott, Water Hickory, Bitter Pecan. Swamp forests, where flooded during the winter months. Apr-May; Oct. Se. VA south to s. peninsular FL, west to e. TX, north inland to se. MO, s. IL, and se. OK. [= C, F, FNA, G, GW, K, Mo, RAB, Va, WH3; = *Hicoria aquatica* (Michaux f.) Britton - S]

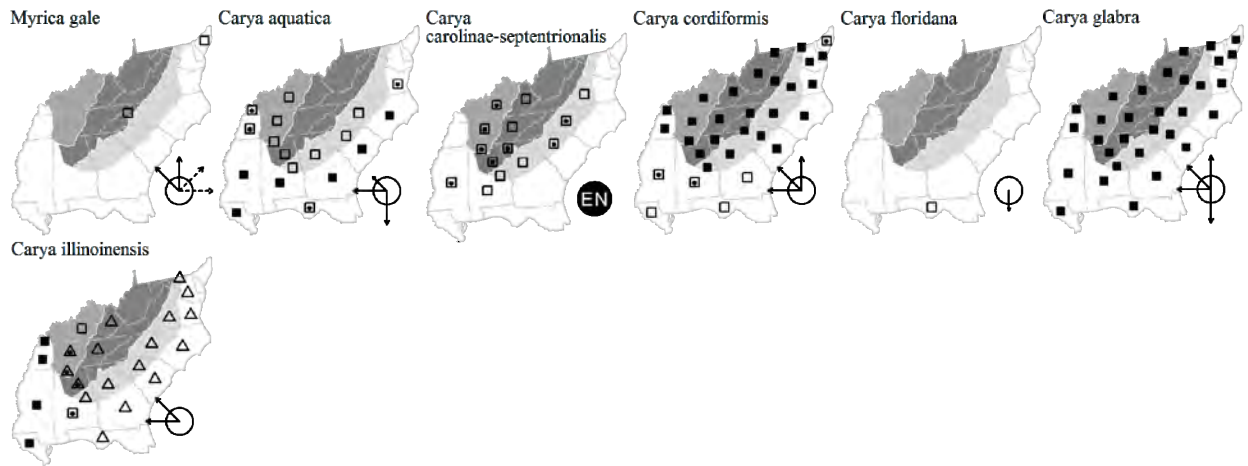

Carya caroliniae-septentrionalis (W.W. Ashe) Engler & Graebner, Carolina Shagbark Hickory, Carolina Hickory. Upland flats, especially those weathered from mafic rocks and with shrink-swell soils dominated by montmorillonitic clays, less typically on slopes and bottomlands. Apr-May; Oct. Sc. VA (Halifax County) south to GA, AL, and MS, and inland northward to c. TN and sc. KY. First reported for VA by Wieboldt et al. (1998). The taxonomic status of *C. caroliniae-septentrionalis* has been controversial, with some workers reducing it to variety of *C. ovata* or not recognizing it at all; it seems to us morphologically and ecologically distinctive and to represent an independent evolutionary lineage. Hardin & Stone (1984) found differences in trichomes, and in a study of nut oils, Stone, Adrouny, & Flake (1969) found *C. ovata* "surprisingly distant" from *C. caroliniae-septentrionalis*. There are reports that the two taxa are also phenologically separated, *C. caroliniae-septentrionalis* leafing out about two weeks earlier than *C. ovata*, when growing together in the c. Piedmont of NC. Though usually ecologically and/or geographically segregated, the two species sometimes occur together or in close proximity to one another; they maintain their distinctness in such situations. [= C, G, K, RAB, Va; = *C. ovata* (P. Miller) K. Koch var. *australis* (W.W. Ashe) Little - FNA; = *Hicoria caroliniae-septentrionalis* W.W. Ashe - S; = *C. ovata* var. *caroliniae-septentrionalis* (W.W. Ashe) Reveal; = *C. australis* W.W. Ashe]

Carya cordiformis (Wangenheim) K. Koch, Bitternut Hickory. Forests and woodlands, especially in rich, moist alluvial or slope forests. Apr-May; Oct. ME and s. QC west to MN and NE, south to Panhandle FL and e. TX. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, Va, W, WH3; = *Hicoria cordiformis* (Wangenheim) Britton - S]

Carya floridana Sargent, Scrub Hickory. Florida scrub, sandhills. N. peninsular FL (Marion County) southward to s. FL. [= FNA, WH3; = *Hicoria floridana* (Sargent) Sudworth - S]

Carya glabra (P. Miller) Sweet, Pignut Hickory. In a wide variety of forests and woodlands. Apr-May; Oct. S. NH west to s. MI, se. IA, and se. KS, south to c. peninsular FL and e. TX. The *C. glabra*-*C. ovalis* portion of this treatment is tentative; in our area, this group has been variously treated as consisting of between 1 and 10 (or more) taxa. Here we recognize two species (*C. glabra* and *C. ovalis*) and no varieties, but further study of variation in this group is needed. Var. *megacarpa* in particular seems to show correlation of morphological traits and geographic distribution, with larger fruits (2.5-5 cm long vs. 1.5-3.5 cm long), thicker husks (ca. 3.5 mm thick vs. ca. 2 mm thick), large terminal leaflets (often to 20-25 cm long, vs. 10-17 cm long), and a primarily southern Coastal Plain distribution. [= C, GW, K, RAB, Va, WH3; > *C. glabra* var. *glabra* - F, G; > *C. glabra* var. *megacarpa* (Sargent) Sargent - F, G; > *C. ovalis* (Wangenheim) Sargent var. *hirsuta* (W.W. Ashe) Sargent - F; < *C. glabra* - FNA, Pa; > *Hicoria glabra* (P. Miller) Britton var. *glabra* - S; > *Hicoria glabra* (P. Miller) Britton var. *hirsuta* W.W. Ashe - S; > *Hicoria austrina* Small - S; = *C. glabra* var. *glabra* - W]

* *Carya illinoensis* (Wangenheim) K. Koch, Pecan. Bottomlands, eastward persistent around dwellings and in pecan orchards, escaped to suburban woodlands, rural forest edges and floodplains, commonly cultivated. Apr-May; Oct. Native to the sc. United States, now more widespread in the se. United States as a result of cultivation. The spelling of the specific epithet has been a source of controversy. [= C, FNA, K, MO, Va, WH3; = *C. illinoensis* - F, G, GW, RAB, orthographic variant; > *Hicoria pecan* (Marshall) Britton - S; > *Hicoria texana* LeConte - S]

Carya laciniosa (Michaux f.) W.P.C. Barton, Kingnut Hickory, Big Shellbark Hickory. Moist, circumneutral, alluvial levee forests along brownwater rivers of the Coastal Plain (NC), streams of the Piedmont (NC) and Mountains (GA). Apr-May; Oct. NY and s. ON west to IA, south to NC, nw. GA, MS, and OK. This species is sometimes planted, but occurs native in nw. GA, along the Roanoke River (Halifax and Northampton counties, NC) and New Hope Creek (Durham County, NC). [= *C. F.*, FNA, G, GW, K, Mo, Pa, RAB, W; = *Hicoria laciniosa* (Michaux f.) Sargent – S]

Carya myristiciformis (Michaux f.) Elliott, Nutmeg Hickory. Nonriverine swamps over calcareous substrates, including calcareous clays and coquina limestone ("marl"), oak flatwoods. Apr; Oct. Se. NC south to GA, and from wc. AL west to e. TX and se. OK; disjunct in Mexico (Nuevo León and Tamaulipas). The bronze sheen of the leaflets of this species is diagnostic. First reported for NC by Leonard (1971b). [= FNA, K; = *C. myristicaeformis* – GW, RAB, orthographic variant; = *Hicoria myristicaeformis* (Michaux f.) Britton – S]

Carya ovalis (Wangenheim) Sargent, Red Hickory. Forests and woodlands. Apr-May; Oct. MA west to WI, south to GA, MS, and MO. [= C, K, RAB, Va; > *C. ovalis* var. *obcordata* (Muhlenberg & Willdenow) Sargent – F, G; > *C. ovalis* var. *obovalis* Sargent – F, G; > *C. ovalis* var. *odorata* (Marshall) Sargent – F, G; < *C. glabra* – FNA, Mo, Pa; = *Hicoria microcarpa* (Nuttall) Britton – S; = *C. glabra* (P. Miller) Sweet var. *odorata* (Marshall) Little – W]

Carya ovata (P. Miller) K. Koch, Common Shagbark Hickory. Rich moist bottomlands, slopes, occasionally on dry upland flats. May; Oct. S. ME and s. QC west to MN and NE, south to GA and TX; also disjunct in Mexico. [= C, F, G, GW, K, RAB, Va, W; > *C. ovata* var. *ovata* – F; > *C. ovata* var. *pubescens* Sargent – F; = *C. ovata* var. *ovata* – FNA, MO, Pa; = *Hicoria ovata* (P. Miller) Britton – S]

Carya pallida (W.W. Ashe) Engler & Graebner, Sand Hickory, Pale Hickory. Dry sandy or rocky forests and woodlands. Apr-May; Oct. S. NJ south to Panhandle FL, west to TX, inland in the interior to w. NC, KY, s. IL, and AR. [= C, F, FNA, G, K, Mo, RAB, Va, W, WH3; = *Hicoria pallida* W.W. Ashe – S]

Carya texana Buckley, Black Hickory. Dry slopes and ridges, especially calcareous. Apr-May; Oct. Reported to occur as far east as KY, TN, and MS (FNA). Jones (2005) states that w. KY material of *C. pallida* is transitional to *C. texana*. [= FNA, K, Mo; > *C. texana* var. *arkansana* (Sargent) Little – C; > *C. texana* var. *texana* – F; > *C. buckleyi* Durand var. *arkansana* (Sargent) Sargent – G; = *Hicoria texana* LeConte, misapplied – S]

Carya tomentosa (Lamarck) Nuttall, Mockernut Hickory, White Hickory. Forests and woodlands. Apr-May; Oct. MA west to IN and IA, south to n. peninsular FL and TX. One of the most common forest trees of much of our area. There has been confusion and controversy for several centuries over the specific epithet. The oldest basionym available is *Juglans alba* Linnaeus, which apparently included disparate elements, including this taxon and *C. ovata*. Following a more circumscribed typification by Crantz in 1766, the epithet 'alba' should have been applied to this taxon, but continued to be applied in various ways. Rehder (1945) proposed that *C. alba* should be considered a *nomen ambiguum*, but agreed that it applied correctly to what has often been called *C. tomentosa*. He argued that the use of *C. alba* should be rejected "in order to avoid confusion and ambiguity". In 2008, Ward & Wiersma (2008) formally proposed rejection of *Juglans alba* (the basionym of *Carya alba*), and the Committee has recommended its rejection unanimously (Brummitt 2010). For further discussion see Rehder (1945), Howard & Staples (1983), Wunderlin, Hansen, & Hall (1985), and Brummitt (2010). [= C, F, FNA, G, MO, Pa, RAB, Va, W, WH3; = *C. alba* (Linnaeus) Nuttall ex Elliott – K; = *Hicoria alba* (Linnaeus) Britton – S]

Juglans Linnaeus (Walnut)

A genus of about 21 species, trees and shrubs, of Mediterranean Europe to e. Asia, and North America to Andean South America. Stanford, Harden, & Parks (2000) present a molecular phylogeny and a discussion of biogeography; our two species are distantly related within the genus, with *J. nigra* most closely related to sw. North American *J. microcarpa* and *J. major*, and *J. cinerea* most closely related to several e. Asian species. References: Whittemore & Stone in FNA (1997); Stanford, Harden, & Parks (2000); Stone in Kubitzki, Rohwer, & Bittrich (1993); Stanford (1998).

- 1 Lower surface of the leaflets densely hirsute with 4-8-rayed fascicled hairs; fruit ellipsoid, densely pubescent with reddish-brown glandular hairs; leaf scars with a velvety ridge along the upper margin; leaves with (7-) 11-17 leaflets; pith dark brown; terminal buds 12-18 mm long; bark of mature trees pale; [section *Trachycaryon*] ***J. cinerea***
- 1 Lower surface of the leaflets hirsute with single and 2-rayed fascicled hairs; fruit spherical or nearly so, lepidote with peltate scales and occasional glandular hairs; leaf scars without a velvety ridge along the upper margin; leaves with (9-) 15-19 (-23) leaflets; pith light brown; terminal buds 8-10 mm long; bark of mature trees dark; [section *Rhysocaryon*] ***J. nigra***

Juglans cinerea Linnaeus, Butternut, White Walnut. Moist, nutrient-rich forests. Apr-May; Oct. NB west to MN, south to n. GA and AR. This tree, formerly common, is afflicted with butternut canker disease, which now threatens its continued existence. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WV; = *Wallia cinerea* (Linnaeus) Alefeld – S]

Juglans nigra Linnaeus, Black Walnut. Moist, nutrient-rich forests of floodplains and slopes, calcareous hammocks. Apr; Oct. MA west to MN, south to Panhandle FL and TX. The dark brown wood is famous for cabinetry and other uses; it is one of the most prized of North American hardwoods. The nuts, though difficult to crack, are prized for their intense flavor. The husk is used as a dye. Country people dehusk the nuts by putting them in dirt or gravel driveways where the passage of car tires removes the husk but does not crack the nut. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WH3, WV; = *Wallia nigra* (Linnaeus) Alefeld – S]

Pterocarya Kunth (Wingnut)

A genus of 6 species, trees, of e. and sw. Asia. References: Stone in Kubitzki, Rohwer, & Bittrich (1993)

* ***Pterocarya stenoptera*** A.C.P. de Candolle, Japanese Wingnut. Uncommonly cultivated, rarely naturalized or persistent; native of e. Asia (China, Japan, and Korea). Apr-May; Aug-Sep. Naturalized in e. LA. [= K]

160. CASUARINACEAE R. Brown 1814 (Casuarina Family) [in FAGALES]

A family of 4 genera and about 100 species, trees and shrubs, of Malesia, Australia, and Melanesia. References: Johnson & Wilson in Kubitzki, Rohwer, & Bittrich (1993); Rogers (1982c).

Casuarina Linnaeus 1759 (Casuarina, Beefwood, She-oak)

A genus of about 17 species, trees, tropical to warm temperate in s. Asia, Australia, and Polynesia. References: Johnson & Wilson in Kubitzki, Rohwer, & Bittrich (1993); Rogers (1982c)=Z.

- 1 Leaves (teeth in whorls at each node) 6-8 per node; longitudinal ridges of branchlets sharply angular; plant monoecious; branchlet segments 5-8 (-13) mm long, 0.5-0.7 (-1) mm in diameter ***C. equisetifolia* ssp. *equisetifolia***
- 1 Leaves 10-14 (-17) per node; longitudinal ridges of branchlets flattened or rounded; plant dioecious; branchlet segments 8-20 mm long, 0.9-1.2 mm in diameter..... ***C. glauca***

* ***Casuarina equisetifolia*** Linnaeus ssp. ***equisetifolia***, Casuarina, Australian-pine, Horsetail Casuarina, Beach She-oak, Coastal She-oak. Beaches, dunes, suburban areas, disturbed areas; native of Malaysia, s. Asia, and Oceania. *C. equisetifolia* was reported as planted and persistent on the Outer Banks of NC by Brown (1959), but it is not currently established so far north. Reported for AL by Barger et al. (2012), “definitely naturalized and suckering”. Ssp. *incana* (Bentham) L.A.S. Johnson is not known to be introduced in se. North America. [= FNA; < *C. equisetifolia* – K, S, WH3, Z]

* ***Casuarina glauca*** Sieber ex Sprengel, Gray She-oak, Suckering Australian-pine, Scaly-bark Beefwood. Disturbed beaches and yards; native of Australia. Reported for Panhandle FL by Kunzer et al. (2009). [= FNA, K, WH3]

162. BETULACEAE S.F. Gray 1821 (Birch Family) [in FAGALES]

A family of 6 genera and about 150 species, primarily of subarctic to cold temperate regions of the Northern Hemisphere, but extending through Central America to n. South America. The two subfamilies recognized here are sometimes elevated to family status, as by Govaerts & Frodin (1998). References: Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Scales of the pistillate catkins persistent; leafy involucre absent; fruit a small winged nut; [subfamily *Betuloideae*].
 - 2 Pistillate scales woody, forming a persistent conelike catkin; plant a shrub, < 4 m tall (except *A. glutinosa*)..... *Alnus*
 - 2 Pistillate scales deciduous with or soon after the fruits; plant a tree, > 10 m tall at maturity *Betula*
- 1 Scales of the pistillate catkins caducous; leafy involucre present, conspicuous; fruit an unwinged nut; [subfamily *Coryloideae*].
 - 3 Nut spherical, 1-1.5 cm in diameter, closely enveloped by the involucre *Corylus*
 - 3 Nut ovoid, 0.4-0.6 cm long, loosely or not at all enveloped by the involucre.
 - 4 Infructescence bracts flat, 1-3 lobed, not enclosing the nut; bark gray, smooth; trunk moderately to strongly fluted; buds 4-angled *Carpinus*
 - 4 Infructescence bracts inflated, loosely enclosing the nut; bark brown, shreddy; trunk not fluted; buds not 4-angled..... *Ostrya*

Alnus P. Miller 1754 (Alder)

A genus of about 25-35 species, shrubs and trees, of subarctic to warm temperate regions of the Northern Hemisphere, and in montane situations south to n. South America. References: Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Schrader & Graves (2002)=X; Chen & Li (2004); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993). Key based in part on Schrader & Graves (2002).

- 1 Fruit broadly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula*].....*A. viridis* ssp. *crispa*
- 1 Fruit narrowly winged; winter buds stalked, covered by 2-3 equal scales.
 - 2 Pistillate catkins mostly 1-1.5 (-2) cm long, subsessile and often clustered together closely; typical leaves with 8-14 principal veins on each side of the midrib; [subgenus *Alnus*].
 - 3 Fruiting catkins drooping; leaves broadest at or below the middle, pale green to glaucous beneath, doubly serrate, the teeth of various sizes, usually some of them coarse; bark dark reddish-brown, shiny, with prominent light-colored lenticels *A. incana* ssp. *rugosa*
 - 3 Fruiting catkins erect; leaves broadest at or above the middle, green beneath, finely serrate, the teeth approximately equal in size; bark light gray or brown, with inconspicuous lenticels *A. serrulata*
 - 2 Pistillate catkins mostly 1.5-3 cm long, evidently pedunculate and therefore spaced; typical leaves with 5-8 principal veins on each side of the midrib.
 - 4 Flowering spring; plant a tree; leaves broadly rounded to slightly notched at the tip; [alien, rarely planted and possibly persistent in our area]; [subgenus *Alnus*]*A. glutinosa*
 - 4 Flowering late summer or autumn; plant a shrub or tree to 9.5 m tall; leaves obtuse to short-acuminate at the tip; [native of e. MD, DE, and GA]; [subgenus *Clethropsis*].
 - 5 Strobili (14-) 14.5-19 (-24) mm long, <1.3× as long as wide; large shrub or tree 5.5-9.5 m tall, with a narrow crown; [of nw. GA]..... *A. maritima* ssp. *georgiensis*
 - 5 Strobili (15.2-) 18.5-22 (-25) mm long, >1.3× as long as wide; medium to large shrub 3.5-6 (-7.5) m tall, with a narrow to broad crown; [of s. DE and e. MD] *A. maritima* ssp. *maritima*

* *Alnus glutinosa* (Linnaeus) Gaertner, Black Alder, European Alder. Disturbed areas, suburban woodlands; native of Europe. Mar-May. Sometimes cultivated, especially northward, and naturalized at least as far south as s. PA (Rhoads & Klein 1993; Rhoads & Block 2007); it has also been reported for Morgan County, TN (Chester, Wofford, & Kral 1997). [= FNA, C, F, G, H, K1, K2, Pa; = *Alnus alnus* (Linnaeus) Britton]

Alnus incana (Linnaeus) Moench ssp. *rugosa* (Du Roi) Clausen, Speckled Alder. Braided streamhead seepage swamps. May-Jun; Jul-Aug. *A. incana* is here treated as a circumpolar complex consisting of several subspecies, though the wisdom of this approach remains unclear. Ssp. *incana* occurs in ne. and ne. Eurasia. Ssp. *rugosa* occurs from nw. Canada east to the Maritime Provinces, south to MD, VA, and WV, and IL. Ssp. *tenuifolia* (Nuttall) Breitung occurs in w. North America, from AK south to CA and NM. [= FNA, K1, K2, Pa, Va, Z; > *A. incana* var. *americana* Regel - C; > *A. rugosa* (Du Roi) Sprengel var. *americana* (Regel) Fernald - F; = *A. rugosa* (Du Roi) Sprengel - G, W, Y; > *A. incana* - H; > *A. rugosa* - I]

Alnus maritima (Marshall) Muhlenberg ex Nuttall ssp. *georgiensis* Schrader & Graves, Georgia Alder. Standing water of Ridge-and-Valley spring run. Endemic to a single site in Bartow County, GA. It is one of three subspecies of *A. maritima*, each endemic to a small area - ssp. *maritima* of the Delmarva Peninsula of MD and DE, ssp. *georgiensis* Schrader & Graves of nw. GA, and ssp. *oklahomensis* Schrader & Graves of sc. OK. The closest relatives of *A. maritima* are in Asia. [= K2, X; < *A. maritima* - FNA, K1]

Alnus maritima (Marshall) Muhlenberg ex Nuttall *ssp. maritima*, Seaside Alder, Delmarva Alder. Ecotones between fresh tidal marshes and tidal swamps, open-canopy Atlantic white cedar swamps, streambanks, ponds, shores. Endemic to six counties in the Delmarva Peninsula of MD and DE. See above for additional discussion of *A. maritima* in general. [= K2, X; < *A. maritima* – FNA, C, F, G, K1]

Alnus serrulata (Aiton) Willdenow, Tag Alder, Smooth Alder, Hazel Alder. Streambanks, bogs, wet thickets. Feb-Mar; Aug-Oct. NS west to s. QC, MO, and OK, south to ne. FL, Panhandle FL, and TX. [= C, FNA, G, GW, II, K1, K2, Pa, RAB, Va, W, WH3, Y, Z; > *A. serrulata* var. *serrulata* – F; > *A. serrulata* var. *subelliptica* Fernald – F; = *A. rugosa* – S, misapplied]

Alnus viridis (Villars) Lamarck & A.P. de Candolle *ssp. crispa* (Aiton) Turrill, Green Alder, Mountain Alder. Grassy balds, shrub balds, spruce-fir forests, and rock outcrops at high elevations (1600-1900m) in the Roan Mountain Massif, Mitchell and Avery counties, NC and Carter County, locally common. May-Jun; Jul. *Ssp. crispa* has variously been considered as varietally, subspecifically, and specifically distinct from typic *A. viridis*. Following most recent authors, *A. viridis* is here treated as a circumpolar complex of four subspecies, but with no great confidence that this is the best treatment. *Ssp. viridis* occurs in montane portions of Europe. *Ssp. sinuata* (Regel) Á. Löve & D. Löve occurs in w. Canada and south in the montane west to nw. United States. *Ssp. fruticosa* (Ruprecht) Nyman ranges from n. CA north to coastal AK, and in ne. Asia. *Ssp. crispa* is generally far northern, ranging across n. Canada, south to MA and c. NY, and disjunct at a few localities in PA and at Roan Mountain on the NC-TN border, where it forms an extensive population. [= FNA, K1, K2, Pa, Z; = *A. viridis* var. *crispa* (Aiton) House) – C, Z; = *A. crispa* (Aiton) Pursh – G, RAB, W, Y; > *A. crispa* var. *crispa* – F; < *A. alnobetula* (Ehrhart) K. Koch – S; > *Alnus mitchelliana* M.A. Curtis ex Gray]

Betula Linnaeus 1753 (Birch)

A genus of 35-100 species, trees, shrubs, and subshrubs, of subarctic and temperate regions of the Northern Hemisphere. The subgeneric classification shown follows Schenk et al. (2008). References: Schenk et al. (2008); Grant & Thompson (1975); Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Järvinen et al. (2004); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Bark yellowish-gray, yellowish, pink, reddish-brown, or dark brown; samara rounded or slightly retuse at its apex, the wings making up 1/2 or less of the width; fruiting peduncles sessile (peduncled in *B. nigra*).
 - 2 Leaves broadly cuneate at the base; inner bark of the twigs bitter, not aromatic; [subgenus *Betulaster*].....***B. nigra***
 - 2 Leaves rounded to subcordate at the base; inner bark of the twigs with odor and flavor of wintergreen; [subgenus *Betulenta*].
 - 3 Bark of stems 5-30 cm in diameter (on larger trees look up for branches) yellow or yellowish-gray, exfoliating in papery shreds (bark of larger trunks becoming platey, the plates not prominently marked horizontally by old lenticels); scales of fruiting catkins 6-13 mm long, pubescent and marginally ciliate; twigs and buds slightly hairy.....***B. alleghaniensis***
 - 3 Bark of stems 5-30 cm in diameter (on larger trees look up for branches) reddish-brown or dark brown, tight (bark of larger trunks becoming platey, the plates prominently marked horizontally by old lenticels); scales of fruiting catkins 5-7 mm long, glabrous; twigs and buds glabrous.
 - 4 Leaf blades suborbicular, the apex rounded; [of Smyth County in sw. VA].....***B. lenta* var. *uber***
 - 4 Leaf blades ovate or triangular, the apex acute to acuminate; [widespread in the Mountains, and northward, also the Piedmont and Coastal Plain of our area].....***B. lenta* var. *lenta***
- 1 Bark white to pale gray; samara strongly retuse at its apex, the wings making up over 1/2 of the width; fruiting catkins peduncled; [subgenus *Betula*].
 - 5 Leaves glabrous beneath or somewhat pubescent on the veins; bark of young stems remaining tight; leaf apex long-acuminate to attenuate; central lobe of infructescence scales shorter than the basal and lateral lobes.
 - 6 Leaf apex long-acuminate, but not attenuate; infructescence scales sparsely pubescent on the outer surface; bark of mature trees creamy to bright white.....***B. pendula***
 - 6 Leaf apex attenuate-acuminate; infructescence scales densely pubescent on the outer surface; bark of mature trees grayish white.....***B. populifolia***
 - 5 Leaves pubescent beneath, at least on the veins; bark of young stems exfoliating; leaf apex acute to short-acuminate; central lobe of infructescence scales equal to or longer than than the basal and lateral lobes.
 - 7 Leaf blades 3-4 (-6) cm long, with 3-6 lateral veins on each side of the midvein.....***B. pubescens* ssp. *pubescens***
 - 7 Leaf blades 5-10 (-14) cm long, with 6-12 lateral veins on each side of the midvein.
 - 8 Twigs glabrous or slightly pubescent (and then glabrate in age); leaves cordate (rarely rounded) at the base; leaves with 9-12 lateral veins on each side of the midvein; bark pinkish-white.....***B. cordifolia***
 - 8 Twigs densely pubescent; leaves cuneate to rounded (rarely truncate) basally; leaves with 6-9 lateral veins on each side of the midvein; bark chalky-white.....***B. papyrifera***

Betula alleghaniensis Britton, Yellow Birch. Forests at medium to high elevations, rarely at low elevations. Apr-May; Jun-Aug. NL (Newfoundland) west to se. MB, south to DE, PA, OH, n. IN, WI, MN, and IA, and in the mountains south to w. NC, n. GA, and e. TN. [= C, FNA, IL, K2, Pa, S, Va, W, WV, Y, Z; > *B. lutea* var. *lutea* – F, G; > *B. lutea* var. *macrolepis* Fernald – F, G; > *B. alleghaniensis* var. *alleghaniensis* – K1; > *B. alleghaniensis* var. *macrolepis* (Fernald) Brayshaw – K1; = *B. lutea* Michaux f. – RAB]

Betula cordifolia Regel, Mountain Paper Birch. High elevation forests, primarily on talus of avalanche chutes, in the Black Mountains, Yancey County, NC, and on talus slopes and adjacent forests at high elevations, especially on quartzite on the western flank of the Blue Ridge, and on sandstone talus in the Ridge and Valley in VA. May-Aug; Jul-Sep. NL (Newfoundland) and e. QC south to the mountains of NY; disjunct in n. MN, w. VA, w. NC, and e. TN (Chester, Wofford, & Kral 1997). The question of the appropriate treatment of *B. cordifolia* and *B. papyrifera* is difficult (and still controversial). [= FNA, G, S, Va, Y, Z; = *B. papyrifera* Marshall var. *cordifolia* (Regel) Fernald – C, F, K1, K2, RAB, W]

Betula lenta Linnaeus var. *lenta*, Sweet Birch, Cherry Birch, Black Birch, "Mahogany." Forests at low to high elevations; common (uncommon in Piedmont). Mar-Apr; Jun-Jul. S. ME west to OH, south to GA and n. AL. This species is generally restricted elevationally in North Carolina to medium elevations and lower, but in VA it reaches higher elevations, where it can be as common as *B. alleghaniensis*. Once the primary source of methyl salicylate (wintergreen flavoring), used in medicines and confections; it is now produced synthetically. [= Va; < *B. lenta* – C, Y (also including *B. uber*); = *B. lenta* – F, FNA, G, K1, K2, Pa, RAB, S, W, WV, Z]

Betula lenta Linnaeus var. *uber* W.W. Ashe, Virginia Roundleaf Birch. Mountain forests (endemic to Smyth County, VA). May-Jun; Jul-Aug. *B. lenta* var. *uber* is related very closely to *B. lenta* var. *lenta*, and is apparently endemic to Smyth County, VA. In addition to the characters in the key, it differs from *B. lenta* var. *lenta* in having the leaves 2-6 cm long (vs. 7-15 cm long), with 4-6 pairs of lateral veins (vs. 8-12 pairs). See Mazzeo (1974), Ogle & Mazzeo (1976), Hayden & Hayden (1984), and McAllister & Ashburner (2004) for additional information on this birch and its history. It does not breed "true" and should perhaps be considered a form of *B. lenta*. [= Va; < *B. lenta* Linnaeus – C, Y; = *Betula uber* (W.W. Ashe) Fernald – F, FNA, K1, K2, W, Z; = *B. lenta* ssp. *uber* (W.W. Ashe) E. Murray; = *B. lenta* forma *uber* (W.W. Ashe) McAllister & Ashburner]

Betula nigra Linnaeus, River Birch, Red Birch. Riverbanks, streambanks, floodplains, sandbars, disturbed uplands. Mar-Apr; May-Jun. NH west to se. MN and e. KS, south to ne. FL, FL Panhandle, and TX. [= C, F, FNA, G, GW, IL, K1, K2, Pa, RAB, S, Va, W, WH3, WV, Y, Z]

Betula papyrifera Marshall, Paper Birch, Canoe Birch. Dry soils. NL (Newfoundland), NL (Labrador) and AK, south to NJ, WV, OH, IN, IL, IA, NE, CO, and BC; it has sometimes been attributed to the Mountains of VA, but apparently these reports are based on *B. cordifolia*. [= FNA, G, IL, Pa, WV, Y, Z; = *B. papyrifera* var. *papyrifera* – C, F, K1, K2, W]

* **Betula pendula** Roth, European Weeping Birch, European White Birch. Persistent and escaping from plantings; native of Europe. Apr-May. Reported for Watauga County, NC by Poindexter (pers. comm.). [= C, F, FNA, IL, K1, K2, Pa]

Betula populifolia Marshall, Gray Birch, White Birch. Woods, thickets, in VA native in old fields and young forests in the Big Meadows area on greenstone (Madison & Page counties, VA), disturbed areas. May-Jun; Jun-Jul. NS to s. QC, south to s. NJ and MD, more or less disjunct in n. VA, s. ON, n. OH, and n. IN. [= C, F, FNA, G, IL, K1, K2, Pa, RAB, Va, W, Y, Z]

* **Betula pubescens** Ehrhart ssp. *pubescens*, European White Birch, Downy Birch. Disturbed areas; native of Europe. Also reported as an introduction in e. GA (Jones & Coile 1988) and at scattered sites throughout PA (Rhoads & Block 2007). [= FNA, K1, K2; = *B. alba* Linnaeus – C, F, G, an ambiguous name; < *B. pubescens* – Pa]

Carpinus Linnaeus 1753 (Hornbeam, Ironwood, Muscle-tree, Water-beech, Blue-beech)

A genus of about 26 species, trees, in temperate regions of the Northern Hemisphere, extending southward to se. Asia and Central America. The smooth gray bark gives *Carpinus* the names "Water-beech" and "Blue-beech", the fluted, sinewy appearance of the trunk the name "Muscle-tree", and the very hard, heavy wood the name "Ironwood." References: Furlow (1990)=Z; Hardin (1971)=Y; Furlow (1987a); Furlow (1987b)=X; Furlow in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves narrowly ovate to oblong-ovate, 3-8.5 cm long, 1-4.5 cm wide, the apex acute, secondary teeth small and blunt, the lower leaf surface lacking conspicuous dark glands; bracts of the infructescence with rounded to subacute tips and few, blunt teeth; [primarily of the Coastal Plain and lower Piedmont] *C. caroliniana* var. *caroliniana*
- 1 Leaves ovate to elliptic, 5.8-12.5 cm long, 2.5-6.0 cm wide, usually abruptly narrowed to the tip (sometimes gradually tapered to a long, acuminate apex), the secondary teeth often almost as long as the primary teeth, sharp-tipped, the lower leaf surface with conspicuous dark-brown glands; bracts of the infructescence mostly sharp-tipped and bearing several sharp teeth; [primarily of the Mountains and Piedmont] *C. caroliniana* var. *virginiana*

Carpinus caroliniana Walter var. *caroliniana*, Coastal American Hornbeam. Streambanks, riverbanks, bottomland forests, lower slopes, maritime forests. Mar-Apr; Sep-Oct. S. NJ, e. MD, and e. VA south to c. peninsular FL, west to e. TX, and north in the inland to s. MO and s. IL. The validity of 2 taxa was established by Furlow (1987a, 1987b) largely through statistical methods. The two taxa have some morphologic and phylogeographic coherence, but intergradation appears to be extensive, and individual specimens (in the herbarium) or trees (in the field) may not be readily identifiable to variety. [= C, F; = *C. caroliniana* ssp. *caroliniana* – FNA, K1, K2, X, Z; < *C. caroliniana* – G, GW, RAB, S, Va, WH3, Y]

Carpinus caroliniana Walter var. *virginiana* (Marshall) Fernald, Inland American Hornbeam. Rich cove forests, streambanks, riverbanks, bottomland forests, lower slopes. Mar-Apr; Sep-Oct. ME, QC and s. ON west to MN, south to e. VA, c. NC, n. GA, n. AL, n. MS, AR, and se. OK. See above for discussion of the two varieties. [= C, F; = *C. caroliniana* ssp. *virginiana* (Marshall) Furlow – FNA, K1, K2, W, X, Z; < *C. caroliniana* – G, GW, Pa, RAB, S, Va, Y]

Corylus Linnaeus 1753 (Hazelnut, Filbert)

A genus of about 15-18 species, shrubs and trees, of temperate regions of the Northern Hemisphere. Eurasian species of this genus, *C. avellana* Linnaeus and *C. maxima* P. Miller, are the sources of commercial filberts or hazelnuts. They are sometimes cultivated in North America, especially in the Pacific Northwest. Our wild species are also excellent eating, but wild animals, especially squirrels, usually harvest them before they are ripe. References: Furlow in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Whitcher & Wen (2001); Forest & Bruneau (2000); Govaerts & Frodin (1998).

- 1 Mature involucre 1.5-3 cm long, the lobes flattened and lacinate; young twigs and petioles stipitate-glandular; [section *Corylus*, subsection *Corylus*].....***C. americana***
- 1 Mature involucre 4-7 cm long, extended into a tubular beak; young twigs and petioles villous, glandless; [section *Corylus*, subsection *Siphonochlamys*].....***C. cornuta* var. *cornuta***

Corylus americana Walter, American Hazelnut, American Filbert. Rocky woodlands, mesic to rich forests and thickets. Feb-Mar; Sep-Oct. ME west to SK, south to GA, LA, and OK. [= C, FNA, K1, K2, Pa, RAB, S, Va, W, WV, Y, Z; > *C. americana* var. *americana* – F, G; > *C. americana* var. *indehiscens* E.J. Palmer & Steyermark – F, G]

Corylus cornuta Marshall var. *cornuta*, Beaked Hazelnut. Dry rocky woodlands, thickets, high elevation forests and openings, seepage swamps. Feb-Apr; Aug-Oct. The species ranges from NL (Newfoundland) west to BC, south to NJ, n. GA, e. TN (Chester, Wofford, & Kral 1997), OH, MO, CO, and CA. Var. *cornuta* occupies most of that range; var. *californica* (A.L.P.P. de Candolle) Sharp [ssp. *californica* (A.L.P.P. de Candolle) E. Murray], a small tree, is far western and grades into var. *cornuta*. [= K1, K2, Va, Z; < *C. cornuta* – C, F, G, Pa, RAB, S, W, WV, Y; = *C. cornuta* ssp. *cornuta* – FNA]

Ostrya Scopoli 1760 (Hop-hornbeam, Ironwood)

A genus of 5-9 species, trees, of temperate regions of the Northern Hemisphere. References: Furlow in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Ostrya virginiana (P. Miller) K. Koch, American Hop-hornbeam, Ironwood. Mesic to dry forests, often rocky, especially over basic rocks, reaching high elevations. Apr-May; Aug-Oct. NS west to MB, south to c. peninsular FL, Panhandle FL, and TX. One of our heaviest and hardest woods. [= C, FNA, G, K2, Pa, RAB, S, Va, W, WH3, WV, Y, Z; > *O. virginiana* var. *lasia* Fernald – F; > *O. virginiana* var. *virginiana* – F; = *O. virginiana* var. *virginiana* – K1]

167. CUCURBITACEAE Durande 1782 (Gourd Family) [in CUCURBITALES]

A family of about 97-120 genera and 800-1000 species, of tropical and subtropical areas, with a few extending to temperate areas. References: Schaefer & Renner in Kubitzki (2011); Nesom (2011b); Nesom in FNA (in prep.).

- 1 Ovaries and fruits muricate, tuberculate, or echinate; fruits 1-25 cm long at maturity.
 - 2 Plants prostrate; tendrils absent; leaves with whitish-cripsed margins; [section *Bryoniae*].....**[2. *Ecballium*]**
 - 2 Plants climbing; tendrils present; leaves with green margins
 - 3 Corolla 5-lobed, yellow, the petals 7-25 mm long; fruit muricate or tuberculate, 10-25-seeded, dehiscent by 3 valves or somewhat irregularly; tendrils with 1-2 branches; [tribe *Joliffieae*].....***I. Momordica***

- 3 Corolla 5-6-lobed, white, the petals 0.5-6 mm long; fruit echinate, 1- or 4-seeded, indehiscent or dehiscent by 2 pores; tendrils with 3 branches; [tribe *Sicyeae*].
- 4 Corolla 6-lobed; fruit 4-seeded, dehiscent by 2 pores; stems and leaves glabrous or glabrescent..... **4. *Echinocystis***
- 4 Corolla 5-lobed; fruit 1-seeded, indehiscent; stem and leaves conspicuously viscid-pubescent **5. *Sicyos***
- 1 Ovaries and fruits smooth or pubescent, but not prickly; fruits 1-70 cm long at maturity.
- 5 Leaves pinnately lobed, the divisions rounded; fruit surface green and white, the flesh red or pink; [tribe *Benincaseae*].....**[8. *Citrullus*]**
- 5 Leaves palmately lobed, the divisions angular and toothed; fruit surface red, green, white, black, orange, yellow, or blue, the flesh white, orange, yellow, tan, or green.
- 6 Fruit < 3 cm long; tendrils present, simple; [native, mostly in moist forests or thickets].
- 7 Fruit surface red at maturity; pedicel of pistillate flowers and fruits 1-3 mm long; [tribe *Cucurbitaeae*]..... **11. *Cayaponia***
- 7 Fruit surface black or dark green at maturity; pedicel of pistillate flowers and fruits > 20 mm long; [tribe *Benincaseae*].....
.....**7. *Melothria***
- 6 Fruit > 5 cm long; tendrils absent or present (if present, forked); [introduced, mostly in gardens, fields, or disturbed places].
- 8 Corolla white; [bottle gourd, ivy gourd]; [tribe *Benincaseae*].
- 9 Corolla campanulate; fruit scarlet at maturity; [ivy gourd].....**[9. *Coccinia*]**
- 9 Corolla salverform; fruit not scarlet at maturity; [bottle gourd].....**[10. *Lagenaria*]**
- 8 Corolla yellow; [cantaloupe, cucumber, luffa, squash, gourd, pumpkin].
- 10 Corolla < 3 cm long; [cantaloupe, cucumber]; [tribe *Benincaseae*]..... **6. *Cucumis***
- 10 Corolla > 5 cm long; [luffa, squash, gourd, pumpkin].
- 11 Corolla campanulate; fruit indehiscent, the interior fleshy; [squash, gourd, pumpkin]; [tribe *Cucurbitaeae*]..... **12. *Cucurbita***
- 11 Corolla salverform; fruit dehiscent, the interior very fibrous; [luffa]; [tribe *Luffeae*] **[3. *Luffa*]**

1. *Momordica* Linnaeus 1753 (Balsam-apple, Bitter Melon)

A genus of ca. 45-60 species, vines, of the Old World tropics. References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

- 1 Bract of the male flowers toothed; bract of male flowers attached at the apex of the peduncle; fruit 2.5-4 (-7) cm long **[*M. balsamina*]**
- 1 Bract of the male flowers entire; bract of male flowers attached near or below the midpoint of the peduncle; fruit 7-25 cm long
..... ***M. charantia* ssp. *charantia***

- * ***Momordica balsamina*** Linnaeus, Balsam-apple, Bitter Melon. Disturbed areas; native of Africa. May-Sep. [= FNA, K2, WH3]
- * ***Momordica charantia*** Linnaeus ssp. *charantia*, Balsam-pear, Balsam-apple, Bitter Melon. Disturbed areas, roadsides, fence-rows; native of Africa. Reported for Panhandle FL by Anderson (2007) and Kunzer et al. (2009). An additional subspecies, ssp. *macroloba* Achigan-Dako & Blattner, is known from wc. Africa. [= FNA; < *M. charantia* – K, S, WH3]

2. *Ecballium* A. Richard 1824 (Squirting Cucumber)

A monotypic genus, a vine, of Mediterranean Europe, n. Africa, and w. Asia. References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

- * ***Ecballium elaterium*** (Linnaeus) A. Richard, Squirting Cucumber. Disturbed areas; native of Mediterranean Europe, n. Africa, and w. Asia. [= FNA, K2]

3. *Luffa* P. Miller 1754 (Luffa)

A genus of 5-7 species, vines, of the tropics. References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

- 1 Fruits clavate, strongly 10-angled; petals pale yellow; leaves shallowly lobed **[*L. acutangula* var. *acutangula*]**
- 1 Fruits cylindrical, not angled; petals deep yellow; leaves deeply lobed **[*L. aegyptiaca*]**

- * ***Luffa acutangula*** (Linnaeus) Roxburgh var. *acutangula*, Angled Luffa, Ridged Gourd, Sponge Gourd. Gardens, fields, trash heaps; cultivated in home gardens, sometimes volunteering from seed the following year; native of s. Asia. Var. *amara* (Roxburgh) Clarke is also native of s. Asia. [= FNA; < *L. acutangula* – K]

* *Luffa aegyptiaca* P. Miller, Smooth Luffa, Sponge Gourd, Vegetable Sponge. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of s. Asia. [= FNA, K, WH3; ? *L. cylindrica* (Linnaeus) M. Roemer – S]

4. *Echinocystis* Torrey & A. Gray 1840 (Wild-cucumber)

A monotypic genus, an annual vine, of e. North America. References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

Echinocystis lobata (Michaux) Torrey & A. Gray, Wild Balsam-apple, Wild-cucumber. Bottomland forests and thickets. Jul-Oct. NB west to SK, south to GA (?) and TX. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WV; = *Micrampelis lobata* (Michaux) Greene – S]

5. *Sicyos* Linnaeus 1753 (Bur-cucumber)

A genus of about 75 species, annual or perennial vines, of Australia, Pacific Islands, tropical America. References: Nesom (2011a)=Z; Schaefer & Renner in Kubitzki (2011).

Sicyos angulatus Linnaeus, Bur-cucumber, Nimble-Kate, Star-cucumber. Moist forests and thickets. Aug-Nov. S. ME west to MN and se. ND, south to Panhandle FL and c. TX. [= C, F, G, GW, K, Pa, S, RAB, Va, W, WH3, WV, Z]

6. *Cucumis* Linnaeus 1753 (Canteloupe, Muskmelon, Cucumber)

A genus of 50-60 species, herbaceous vines, native of the Old World (but see discussion under *C. melo* var. *texanus*). Infrageneric classification follows Schaefer (2007). References: Munger & Robinson (1991)=X; Schaefer (2007)=V; Kirkbride(1993)=Z; Decker-Walters et al. (2002)=Y; Silberstein et al. (1999); Stepansky, Kovalski, & Perl-Treves (1999)=U; Schaefer & Renner in Kubitzki (2011).

- 1 Fruits with spine-bearing tubercles (aculeae); [West Indian gherkin]; [subgenus *Cucumis*; section *Aculeatosi*].
- 2 Plants monoecious; pedicels of pistillate flowers cylindrical (isodiametric through their length); staminate inflorescences of (1-) 2-5 flowers in a sessile fascicle.....[*C. metulifer*]
- 2 Plants dioecious; pedicels of pistillate flowers and fruits flaring upwards; staminate inflorescences 3-10 in a pedunculate or sessile raceme.
- 3 Spine-bearing tubercles 1-2 mm long; leaves deeply 3-5-palmately lobed[*C. anguria* var. *anguria*]
- 3 Spine-bearing tubercles 4-10 (-15) mm long; leaves slightly to deeply 3-5-palmately lobed.....[*C. anguria* var. *longaculeatus*]
- 1 Fruits smooth, reticulate, or hairy, lacking aculeae; [subgenus *Cucumis*; section *Cucumis*].
- 4 Leaf blade broadly triangular; corolla tube of female flower 3.5-6.5 mm long; corolla tube of male flower 3.4-4.9 mm long; [cucumber].....[*C. sativus*]
- 4 Leaf blade central lobe elliptic, oblong or ovate; corolla tube of female 0.8-2.8 mm long; corolla tube of male flower 0.8-2.0 mm long.
- 5 Fused portion of hypanthium or youngest fruits with appressed hairs; stem abundantly beset with retrorse prickles; fruit diameter 2.5-5 cm*C. melo* var. *texanus*
- 5 Fused portion of hypanthium or youngest fruits with spreading hairs; stems smooth or nearly so; fruit diameter > 10 cm.
- 6 Fruits with smooth or wrinkled rind; ripe fruits with white or green flesh, lacking musky odor[*C. melo* var. *inodorus*]
- 6 Fruits with netted, warty, or scaly rind; ripe fruits with orange (rarely green) flesh, with aromatic flavor and musky odor.....[*C. melo* var. *melo*]

* *Cucumis anguria* Linnaeus var. *anguria*, Bur Gherkin. Disturbed areas; native of Africa. [= FNA, K2; < *C. anguria* – S, V]

* *Cucumis anguria* Linnaeus var. *longaculeatus* J.H. Kirkbride, West Indian Gherkin. Disturbed areas; native of the Africa. Reported for GA (Jones & Coile 1988), FL (Wunderlin & Hansen 2003, as *C. anguria*), and AL (Diamond & Woods 2009, as *C. anguria*). [= FNA, K, Z; < *C. anguria* – S, V, WH3]

* *Cucumis melo* Linnaeus var. *inodorus* Jacquin, Honeydew, Winter Melon. Sometimes cultivated in our area. [= U, X; < *Cucumis melo* Linnaeus – F, G, K, RAB, S, V, WH3; = *C. melo* ssp. *melo* var. *inodorus* – FNA; < *C. melo* ssp. *melo* – Z]

* *Cucumis melo* Linnaeus var. *melo*, Canteloupe, Muskmelon. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of w. Africa. [= *C. melo* ssp. *melo* var. *melo* – FNA; < *Cucumis melo* Linnaeus – F, G, K, RAB, S, V, WH3, WV; = *C. melo* var. *cantalupensis* Naudin – U, X; < *C. melo* ssp. *melo* – Z]

Cucumis melo Linnaeus var. *texanus* Naudin, Gulf Coast Melon. Fields, roadsides, other disturbed areas; apparently evolved into a distinct variety in the southeastern United States from Asian stock introduced at an unknown time and by unknown means. Panhandle FL south to peninsular FL, west through s. MS, s. TX, and Mexico. Decker-Walters et al. (2002) show that

var. *texanus* is morphologically and molecularly distinct from the most closely related varieties, the Asian var. *chito* (C. Morren) Naudin and var. *dudaim* (Linnaeus) Naudin; they postulate that var. *texanus* was likely introduced from Asia in pre-Columbian times. [= FNA, Y; < *Cucumis melo* Linnaeus – F, G, K, RAB, S, V, WH3; = *C. melo* ssp. *agrestis* (Naudin) Pangalo var. *texanus* – FNA; < *C. melo* var. *chito* – U, X; < *C. melo* ssp. *agrestis* (Naudin) Pangalo – Z]

* *Cucumis metulifer* E. Meyer ex Naudin, African Horned Cucumber. Disturbed areas; native of Africa. [= FNA; = *C. metuliferus* – WH3, orthographic variant]

* *Cucumis sativus* Linnaeus, Cucumber. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of s. Asia. [= F, FNA, G, K, V, WH3, Z]

7. *Melothria* Linnaeus 1753 (Melonette)

A genus of about 12 species, vines, of the New World. References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

Melothria pendula Linnaeus, Melonette, Creeping Cucumber, Mouse Melon. Bottomland forests, moist roadsides and disturbed areas, marshes. Jun-Nov. DC, MD, and VA west to IN, south to FL and TX, and widespread in the West Indies, Mexico, Central America, and South America. [= C, F, FNA, G, GW, RAB, Va, W, WH3; > *M. pendula* – S; > *M. pendula* var. *pendula* – K; > *M. pendula* var. *aspera* Cogniaux – K, S; > *M. pendula* var. *crassifolia* (Small) Cogniaux – K; > *M. microcarpa* Shuttleworth – S; > *M. nashii* Small – S]

8. *Citrullus* Schrader 1836 (Watermelon)

A genus of 4 species, annual or perennial herbaceous vines, of Africa, Mediterranean Europe, and w. Asia. References: Dane & Lang (2004); Nesom in FNA (in prep.); Nesom (2011b)=Z; Schaefer & Renner in Kubitzki (2011). Key based on Nesom (2011b).

- 1 Perennials; stems pustulate-scabrous to pustulate-hispid; tendrils unbranched or rarely 2-fid; fruits 4-7 (-10) cm in diameter; flesh of fruit dry-spongy, yellowish orange to pale yellow, intensely bitter.....[*C. colocynthis*]
- 1 Annuals; stems villous; tendrils 2--3-fid; fruits 12-35+ cm in diameter; flesh of fruit juicy, red, yellow, or greenish, sweet[*C. lanatus* ssp. *lanatus*]

* *Citrullus colocynthis* (Linnaeus) Schrader, Colocynth. On ballast, presumably only a waif; native of w. Asia and Mediterranean Africa and Europe. [= FNA, K2, Z]

* *Citrullus lanatus* (Thunberg) Matsumura & Nakai ssp. *lanatus*, Watermelon. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical Africa. [< *Citrullus lanatus* (Thunberg) Matsumura & Nakai var. *lanatus* – K; < *C. vulgaris* Schrader – F, G, RAB, WV; = *C. lanatus* ssp. *lanatus* – FNA, Z; < *C. citrullus* (Linnaeus) Karsten – S; < *C. lanatus* – WH3]

9. *Coccinia* Wight & Arnott 1834 (Ivy Gourd)

A genus of ca. 30 species, herbaceous or woody vines, of sub-Saharan Africa (and possibly also Asia). References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

* *Coccinia grandis* (Linnaeus) Voigt, Ivy Gourd. Disturbed areas, escaped from cultivation; native of sub-Saharan Africa. May-Nov. [= K, WH3]

10. *Lagenaria* Seringe 1825 (Bottle Gourd)

A genus of 6 species, herbaceous vines, of sub-Saharan Africa and Madagascar. References: Nesom in FNA (in prep.); Schaefer & Renner in Kubitzki (2011).

* *Lagenaria siceraria* (Molina) Standley ssp. *siceraria*, Bottle Gourd, Calabash Gourd. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, rare as a volunteer from seed the following year; native of Africa. One of the oldest cultivated plants. [= FNA; < *L. siceraria* – K, WH3; < *L. vulgaris* Seringe – RAB, F; < *L. leucantha* Rusby – G; < *Cucurbita lagenaria* Linnaeus – S]

11. *Cayaponia* Silva Manso 1836

A genus of about 45 species, herbaceous vines, of tropical, subtropical and warm-temperate America (a few in the Old World tropics). References: Schaefer & Renner in Kubitzki (2011).

Cayaponia quinqueloba (Rafinesque) Shinners. Swamp forests, river banks, hammocks. Jun-Nov. E. SC south to GA and FL Panhandle, west to e. TX, north in the interior to w. TN. [= FNA, K, WH3; = *C. boykinii* (Torrey & A. Gray) Cogniaux – RAB, S; > *C. quinqueloba* GW; > *C. grandifolia* (Torrey & A. Gray) Small – GW]

12. *Cucurbita* Linnaeus 1753 (Squash, Zucchini, Pumpkin, Gourd, Vegetable Marrow)

A genus of 14-22 species, annual or perennial herbaceous vines, of the New World tropics and subtropics. References: Nesom in FNA (in prep.); Nesom (2011b)=Z; Schaefer & Renner in Kubitzki (2011).

- 1 Leaf blades distinctly longer than broad, triangular, usually unlobed; [coyote melon].....[*C. foetidissima*]
- 1 Leaf blades as wide or wider than long, deeply to shallowly lobed.
 - 2 Corolla cream.....[*C. okeechobeensis*]
 - 2 Corolla bright yellow, golden yellow, or orange.
 - 3 Stems and leaves variously pubescent, the hairs generally not pustulate-based.
 - 4 Fruiting peduncles relatively soft and corky-thickened, terete and not strongly ribbed, expanding gradually along their length.....[*C. maxima*]
 - 4 Fruiting peduncles hardened and woody, 5-ribbed, abruptly and widely expanded at point of fruit attachment.....[*C. moschata*]
 - 3 Stems and leaves hispid with pustulate-based hairs.
 - 5 Wild plants; fruit almost always bitter, solid ivory or green-and-white striped, usually not yellow or orange; rind smooth.
 - 6 Fruit usually solid ivory, sometimes green-and-white striped; germination within 1-4 days.....*C. melopepo* var. *ozarkana*
 - 6 Fruit usually green-and-white striped, sometimes maturing yellow; germination within 3-7 days.....[*C. melopepo* var. *texana*]
 - 5 Cultivated plants (or occurring as waifs and short-term naturalized population, usually in proximity to cultivation); fruit non-bitter (except for some ornamental gourds), variously colored, often at least partially yellow or orange; rind smooth, ribbed, or with warts.
 - 7 [scallop, pattypan, acorn, crookneck, and straightneck squashes, most ornamental gourds].....[*C. melopepo* var. *melopepo*]
 - 7 [cocozelle, jack-o'-lantern pumpkins, vegetable marrows, zucchini, some ornamental gourds].....[*C. pepo*]

* *Cucurbita foetidissima* Kunth, Coyote Gourd, Buffalo Gourd, Foetid Gourd, Chili Coyote. Disturbed areas; native of sc. and sw. North America (including Mexico). May-Aug. [= FNA, K2, WH3]

* *Cucurbita maxima* Duchesne, Hubbard Squash, Pumpkin. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical America. [= F, FNA, K1, K2]

* *Cucurbita melopepo* Linnaeus var. *melopepo*, Crookneck Squash, Straightneck Squash, Scallop Squash, Pattypan Squash, Acorn Squash, Ornamental Gourd. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year; native of tropical America. May-Oct. [= FNA; = *C. pepo* Linnaeus var. *ovifera* (Linnaeus) Harz – K2; = *C. melopepo* ssp. *texana* (Scheele) G.L. Nesom var. *melopepo* – Z]

Cucurbita melopepo Linnaeus var. *ozarkana* (D. Decker) G.L. Nesom, Ozark Squash. Bottomlands, fields. IL and MO south to AL, MS, and LA. [= FNA; = *C. pepo* Linnaeus var. *ozarkana* D. Decker – K2; = *C. melopepo* ssp. *texana* (Scheele) G.L. Nesom var. *ozarkana* (D. Decker) G.L. Nesom – Z]

Cucurbita melopepo Linnaeus var. *texana*, Texas Squash. Bottomlands. {distribution} [= FNA; = *C. pepo* Linnaeus var. *texana* (Scheele) D. Decker – K2; = *C. melopepo* ssp. *texana* (Scheele) G.L. Nesom var. *texana* (Scheele) G.L. Nesom – Z]

* *Cucurbita moschata* Duchesne, Butternut Squash. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year; native of tropical America. May-Oct. [= F, FNA, K1, K2, WH3; = *Pepo moschata* (Duchesne) Britton – S]

Cucurbita okeechobeensis (Small) L.H. Bailey, Okeechobee Gourd. Floodplain forests. Endemic to FL, closely approaching our area in Volusia and Lake counties, FL. The closely related *C. martinii* L.H. Bailey, sometimes treated as a subspecies of *C. okeechobeensis*, is common in e. Mexico. [= FNA, K2; = *Pepo okeechobeensis* Small – S; = *C. okeechobeensis* ssp. *okeechobeensis* – WH3]

* *Cucurbita pepo* Linnaeus, Pumpkin, Zucchini, Ornamental Gourd, Vegetable Marrow. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical America. May-Oct. [= FNA, Z; < *C. pepo* – F, Pa, RAB, WV; = *C. pepo* var. *pepo* – K1, K2; < *Pepo pepo* (Linnaeus) Britton ex Small – S]

170. **BEGONIACEAE** C. Agardh 1824 (Begonia Family) [in CUCURBITALES]

A family of 2 genera and about 900-1500 species, herbs and shrubs, of tropical and subtropical (rarely warm temperate) regions. References: de Wilde in Kubitzki (2011).

Begonia Linnaeus (Begonia)

A genus of about 900-1500 (or more) species, herbs and shrubs, of tropical and subtropical (rarely warm temperate) regions. References: de Wilde in Kubitzki (2011).

* **Begonia cucullata** Willdenow, Wax Begonia, Club Begonia. Disturbed places; native of South America. Escaped or persistent in e. GA (Jones and Coile 1988) and AL (Woods & Diamond 2006), south to Panhandle FL and ne. FL (Wunderlin & Hansen 2004). [= K, WH3]

172a. **PARNASSIACEAE** Gray 1821 (Grass-of-Parnassus Family) [in CELASTRALES]

A family of 2 genera and about 16 species, herbs, of largely north temperate and arctic areas. Numerous anomalous features separate *Parnassia* from the Saxifragaceae; affinities with the Droseraceae, Clusiaceae, Celastraceae, and other families have been historically suggested. It is now clear that its affinities lie with Celastraceae, but APG III's (2009) inclusion of it in Celastraceae seems premature; it is here retained as separate. Considering the uncertainties of its relationships, *Parnassia* is best treated as a family, the Parnassiaceae, as suggested by numerous workers as early as 1821, and increasingly accepted in recent decades. The very distant relationship of *Parnassia* to the Saxifragaceae (sensu stricto) has been strongly reaffirmed by molecular analyses (Morgan & Soltis 1993, Soltis et al. 2000, Savolainen et al. 2000). References: Simmons in Kubitzki (2004). [including **LEPUROPETALACEAE**]

- 1 Plants diminutive, rosettes < 3 cm across; winter annual **Lepuropetalon**
- 1 Plants larger, rosettes over 8 cm across; perennial from rhizomes **Parnassia**

Lepuropetalon Elliott 1817 (Lepuropetalon)

A monotypic genus, of se. North America, Mexico, c. Chile, and Uruguay. Sometimes treated as part of a broad and polymorphic Saxifragaceae, *Lepuropetalon* has often been associated with *Parnassia* in the Parnassiaceae. Morgan & Soltis (1993) suggest a close relationship of *Lepuropetalon* and *Parnassia*, as well as the "distant relationship between both genera and the Saxifragoideae." The affinities of *Lepuropetalon* with *Parnassia* remain uncertain, however, as emphasized by Gastony & Soltis (1977) in their analysis of chromosomes and partially reiterated by Morgan & Soltis (1993). *Lepuropetalon* is here treated in the Parnassiaceae, as supported by molecular analyses (Soltis et al. 2000, Savolainen et al. 2000); treatment in a monotypic Lepuropetalaceae is perhaps equally warranted. References: Ward & Gholson (1987); Spongberg (1972); Gastony & Soltis (1977); Wilbur (1988b); Simmons in Kubitzki (2004).

Lepuropetalon spathulatum Elliott, Lepuropetalon. In moist open areas, such as seepage on granitic flatrocks, ditches, seasonally wet depressions. Feb-Apr. Se. NC and SC south to GA and FL Panhandle (Kunzer et al. 2009), west to e. TX and Mexico; also in Chile and Uruguay. As indicated by Ward & Gholson (1987), *Lepuropetalon* is more common than collections would indicate; the rosettes are 0.5-2 (-3) cm across, the greenish flowers are 2-3 mm across. It has been considered "the smallest terrestrial angiosperm" (Morgan & Soltis 1993). Its apparently greater abundance in the western portion of its range, where largely found by a few botanists "who have made determined efforts to establish its range" (Ward & Gholson), and in habitats such as granitic flatrocks, which have overall received close scrutiny, may be more a reflection of its diminutive size and early season of occurrence than of its real distribution and abundance. The recent increase in collections, mostly in disturbed or human-maintained habitats, also suggests a possible increase in abundance (and range?) from its original state. It should be more vigorously sought in our area. The presence of lines of red glandular dots on the leaves and sepals is a helpful diagnostic character. [= GW, K, RAB, S, WH3]

Parnassia Linnaeus 1753 (Grass-of-Parnassus, Parnassia)

A genus of 15-70 species, herbs, primarily of arctic and north temperate areas. Our species (especially *P. caroliniana*) are among the most southerly of the genus in distribution. *Parnassia* (all species) are among the most beautiful of our native plants. From a distance the white flowers are attractive but not extraordinary; when observed closely, though, the delicate tracery of the green veins on the waxy white petals is astonishing. References: Gastony & Soltis (1977); Spongberg (1972); GW; Simmons in Kubitzki (2004).

Identification notes: Note that the five staminodia are (in our species) deeply three-lobed to the base, thus appearing as 15.

- 1 Leaf blades reniform, as wide or wider than long, the base strongly cordate; staminodia shorter than the stamens [note that the stamens elongate after the staminodia; thus at a certain early stage the stamens of *P. asarifolia* may be shorter than the staminodia; check several flowers].....*P. asarifolia*
- 1 Leaf blades ovate, longer than wide, the base rounded, broadly cuneate, truncate, or cordate; staminodia longer than the stamens (*P. caroliniana* and *P. grandifolia*) or shorter than the stamens (*P. glauca*).....*P. glauca*
- 2 Staminodia shorter than the stamens; [of NJ, PA, and OH northward].....*P. glauca*
- 2 Staminodia longer than the stamens; [of VA, WV, MO, OK southward].....*P. glauca*
- 3 Main parallel veins of each petal (9-) 11-17 (counted at a point halfway between the base and the apex and ignoring short laterals), usually not dilated toward the apex of the petal; outer- or basal-most main vein branching pseudo-dichotomously several times; rhizome horizontal, long-creeping, the leaves scattered or loosely clustered, tending to form clonal patches to several m in diameter; ovary white; [of Coastal Plain pinelands].....*P. caroliniana*
- 3 Main parallel veins of each petal 5-9 (counted at a point halfway between the base and the apex and ignoring short laterals), often strongly dilated toward the apex of the petal; outer- or basal-most main vein with numerous short laterals on the outer side, extending to the petal margin with few or no branchings; rhizome erect, short, the leaves strongly clustered, not forming large clonal patches; ovary green, sometimes white toward the base; [primarily of the Mountains, rarely also disjunct in the Coastal Plain].....*P. grandifolia*

Parnassia asarifolia Ventenat, Kidney-leaved Grass-of-Parnassus, Appalachian Grass-of-Parnassus, Brook Parnassia.

Bogs, sphagnum seeps, brookbanks, generally in more acidic habitats than *P. grandifolia*, up to elevations over 1800 m. (Jul-) Aug-Oct. VA, e. WV, sw. AR south to GA; disjunct in e. TX and sc. AR, primarily in the Appalachian and Ozarkian highlands. [= C, F, G, GW, K, RAB, S, Va, W, WV]

Parnassia caroliniana Michaux, Carolina Grass-of-Parnassus, Savanna Parnassia, Eyebright. Wet longleaf pine, pond pine,

or pond cypress savannas (especially but not strictly where shallowly underlain by coquina limestone), sandhill seepage bogs. Sep-Nov (-Dec). Se. and sc. NC south through SC; disjunct in the Panhandle of FL, the distribution (at least now) fragmented and disjunctive. In NC, locally common in three small areas, centered around Maple Hill (Pender and Onslow counties), Old Dock (Columbus and Brunswick counties), and the Green Swamp (Brunswick County). Following Michaux's discovery of the species it was apparently not reported again in the Carolinas until found by H.A. Rankin near Hallsboro. His comments, quoted in Alexander (1934) are interesting. "What if our savannas are sometimes steaming, it is the condition necessary for the development for many wonderful plants which find here their most congenial surroundings. But Grass-of-Parnassus does not star the meadows during the steaming season, instead, by local tradition, the 'Eyebright,' its local name, times its first flowers to come just two weeks before frost ... As a matter of fact, I saw the first flowers this year on October 12th and our first frost came the morning of the 25th. Its chosen habitat is the wet savannas and hundreds of acres may be seen liberally dotted with its white stars, but it finds its best development in the lower places, and here it often almost covers the ground. Today, Nov 1st, it is in its prime and is the most conspicuous flower on many acres and in one little depression less than two feet in diameter I counted seventy-two flowers and buds." With the extensive destruction of our wet savannas (by conversion to pine tree farms, agriculture, and developed areas) and fire suppression, very few such places now remain. [= GW, K, RAB, S, WH3]

Parnassia glauca Rafinesque, American Grass-of-Parnassus, Fen Grass-of-Parnassus. Fens. Aug-Sep. NL

(Newfoundland), QC, and SK south to NJ (Ocean County), s. PA (Rhoads & Block 2007), OH, IN, IA, and SD. [= C, F, G, K, Pa]

Parnassia grandifolia A.P. de Candolle, Bigleaf Grass-of-Parnassus, Limeseep Parnassia. Fens, gravelly seepages,

pineland seepage bogs and ecotones, primarily or solely over calcareous, mafic, or ultramafic rocks, in the outer Coastal Plain in seepage over marl on nearly vertical river bluffs on the Cape Fear River (NC) and in pineland seepage bogs. Aug-Oct. VA, WV, s. MO, and OK south to n. GA, Panhandle FL, s. MS (Sorrie & Leonard 1999), AR, and e. TX, primarily in the Appalachian and Ozarkian highlands. The discovery of populations of this species in Brunswick and Columbus counties, NC, was remarkable. In the Panhandle of FL and the West Gulf Coastal Plain of LA and TX it also occurs in wet savannas and pitcherplant bogs (MacRoberts, MacRoberts, & Jackson 2004), in FL sometimes in close proximity to *P. caroliniana*; *Parnassia* in Coastal Plain savannas should not necessarily be assumed to be *P. caroliniana*. [= C, F, G, GW, K, Mo, RAB, S, Va, W, WH3, WV]

172b. CELASTRACEAE R. Brown 1814 (Bittersweet Family) [in CELASTRALES]

A family of ca. 98 genera and ca. 1200 species, trees, shrubs, lianas, perennial and annual herbs, nearly cosmopolitan, especially in the tropics and subtropics. References: Brizicky (1964); Simmons in Kubitzki (2004).

- 1 Leaf margins spiny-toothed, coriaceous; [rare waif in our area]..... *Crossopetalum*
- 1 Leaf margins entire to serrate (but not spiny-toothed), herbaceous to coriaceous; [collectively common in our area].
 - 2 Leaves alternate.
 - 3 Leaf margins distinctly serrate; twining woody vines; [widespread in our area] *Celastrus*
 - 3 Leaf margins entire; shrub or small tree; [FL southward] *Maytenus*
 - 2 Leaves opposite.
 - 4 Leaves widely spaced, averaging < 1 pair per cm of stem; leaves 2.5-12 cm long, (0.5-) 1-6 cm wide; [shrubs to small trees, mostly > 0.4 m tall, collectively in many habitats] *Euonymus*
 - 4 Leaves closely spaced, 2-4 pairs per cm of stem; leaves 1.1-2.5 cm long, 0.2-0.6 cm wide; [shrub < 0.4 m tall, native to calcareous rock outcrops, rarely naturalized elsewhere] *Paxistima*

Celastrus Linnaeus 1753 (Bittersweet)

A genus of ca. 30 species, scandent shrubs, primarily in e. Asia, Malaysia, Oceania, Madagascar, and Central and South America. The one species native to e. North America is related to e. Asian species. The grammatical gender of the genus has been conserved as masculine (Brummitt 2005). References: Duncan (1969)=Z; Leicht-Young et al. (2007); Simmons in Kubitzki (2004).

- 1 Flowers in 2-3-flowered axillary cymes; mature leaves mostly obovate, averaging 1.2-1.4 (-1.7)× as long as wide; expanding leaves folded (conduplicate); capsule yellow (contrasting with the seeds); pollen white *C. orbiculatus*
- 1 Flowers in 6-many-flowered terminal panicles; mature leaves mostly ovate-lanceolate to elliptic, averaging (1.8-) 2.0-2.6× as long as wide; expanding leaves rolled (involute); capsule orange (similar in color to the seeds); pollen yellow *C. scandens*

* *Celastrus orbiculatus* Thunberg, Oriental Bittersweet. Thickets, roadsides, forests; native of Asia. May-Jun; Aug-Sep. *C. orbiculatus* is grown for its attractive fruits; it has become a noxious weed in much of our area. The first reports of its occurrence in our area appear to be in the 1960's; it is now much more common than its native relative, *C. scandens*. [= C, F, Pa, RAB, Va, W, Z; = *C. orbiculata* - G, K, orthographic variant]

Celastrus scandens Linnaeus, American Bittersweet. Mesic forests. May-Jun; Aug-Sep. QC west to MB and WY, south to w. SC, n. GA, AL, LA, and TX. [= C, F, G, K, Pa, RAB, S, Va, W, Z]

Crossopetalum P. Browne 1756 (Christmas-berry)

A genus of about 26 species, trees and shrubs, of the West Indies and tropical America. References: Simmons in Kubitzki (2004).

* *Crossopetalum ilicifolium* (Poiret) Kuntze, Holly-leaf Rhacoma, Christmas-berry. Disturbed, acid, peaty soil; native of subtropical FL. Presumably introduced via cattle at an agricultural experiment station near Wenona, Washington County, NC (Hayes 1946). The species has probably not persisted in our area. [= K, WH3; = *Rhacoma ilicifolia* (Poiret) Trelease - S]

Euonymus Linnaeus 1753 (Spindle-tree, Euonymus, Strawberry-bush)

A genus of ca. 129 species, of temperate and tropical areas, trees, shrubs, and lianas. The genus name was variously spelled "*Euonymus*" and "*Evonymus*" by Linnaeus. The spelling *Euonymus* has been nomenclaturally "conserved." The genus is now considered to be grammatically masculine, and adjectival specific epithets therefore end in "-us." References: Ma & Funston (2008)= Y; Voss (1985)=Z; Simmons in Kubitzki (2004).

- 1 Leaf undersurface with mostly erect hairs to ca. 0.2 mm long; petioles 8-20 mm long; flowers 4-merous; [native]; [section *Euonymus*] *E. atropurpureus* var. *atropurpureus*
- 1 Leaf undersurface glabrous (or with some hairs on the midrib); petioles 1-33 mm long; flowers 4- or 5-merous; [introduced or native].
 - 2 Leaves evergreen; flowers 4-merous; [introduced species, rarely naturalized]; [section *Ilicifolii*].
 - 3 Leaves 2-5.5 cm long, 2-3.5 cm wide; capsule 5-6 mm in diameter *E. fortunei*
 - 3 Leaves (3-) 5-10 (-12) cm long, (2-) 3-5 (-5.5) cm wide; capsule 6-9 (-12) mm in diameter *E. japonicus*
 - 2 Leaves deciduous; flowers 4- or 5-merous; [introduced or native].
 - 4 Petioles 5-33 mm long; flowers 4-merous; [introduced, rarely naturalized]; [section *Euonymus*].
 - 5 Leaf apex acute to short-acuminate; larger leaves 8-11 per cm *E. europaeus*
 - 5 Leaf apex long-acuminate; larger leaves with teeth 6-8 per cm *E. maackii*
 - 4 Petioles 1-5 mm long; flowers 4- or 5-merous; [native and introduced].
 - 6 Twigs and branches with 2-4 corky wings; flowers 4-merous; capsules smooth; [introduced, rarely naturalized]; [section *Melanocarya*] *E. alatus*
 - 6 Twigs and small branches lacking corky wings, terete (or nearly so); flowers 5-merous; capsules muricate; [native species]; [section *Echinococcus*].
 - 7 Primary stems erect, to 20 dm tall; upper leaves widest at or below the middle; petioles mostly 1-3 mm long; [widespread in our area] *E. americanus*

- 7 Primary stems trailing or decumbent, the tips and flowering branches ascending to 3 (-6) dm tall; upper leaves widest at or beyond the middle; petioles mostly 3-5 mm long; [of the Mountains].....*E. obovatus*

* *Euonymus alatus* (Thunberg) Siebold, Winged Euonymus. Suburban woodlands; native of e. Asia. Apr-Jun; Sep-Oct. Reported for NC (Jackson Co.) by Pittillo & Brown (1988). [= C, F, G, Pa, V, Va, W, Y; = *E. alata* - K1, Z; > *E. alatus* var. *alatus*; > *E. alatus* var. *apterus* Regel]

Euonymus americanus Linnaeus, Strawberry-bush, Heart's-a-bustin'-(with-love). Mesic to submesic forests. May-Jun; Sep-Oct. Se. NY west to s. OH and se. MO, south to n. peninsular FL and TX. A variety, var. *angustifolius* (Pursh) Alph. Wood, with narrowly lanceolate to linear leaves, has been named and occurs in our area; it is of uncertain status (Brizicky 1964) but is here considered a form. [= C, F, G, Pa, RAB, S, Va, W, WH3, WV; = *E. americana* - K1; > *E. americanus* var. *americanus*; > *E. americanus* var. *angustifolius* (Pursh) Alph. Wood]

Euonymus atropurpureus Jacquin var. *atropurpureus*, American Wahoo, Burning Bush. Bottomland forests, riverbanks, mostly on rich alluvial sediments, or on slopes over mafic or calcareous rocks. May-Jul; Aug-Oct. NY west to ND, south to Panhandle FL and TX. Var. *cheathamii* Lundell is endemic to TX. [= *E. atropurpurea* var. *atropurpurea* - K1; < *Euonymus atropurpureus* - RAB, C, F, G, Pa, S, Va, W, WH3, WV; < *Euonymus atropurpurea* - Z]

* *Euonymus europaeus* Linnaeus, European Spindle-tree. Suburban woodlands, uncommonly cultivated, rarely naturalized; native of Europe. May-Jun; Sep-Oct. [= C, F, G, Pa, Va; = *E. europaea* - K, Z]

* *Euonymus fortunei* (Turczaninow) Handel-Mazzetti, Wintercreeper, Chinese Spindle-tree. Bottomlands, swamps, upland suburban woodlands; native of China. May-Jun; Oct-Dec. Sometimes climbing into the canopy. [= F, G, Va, Y, Z; > *E. kiautschovica* - K; > *E. fortunei* (Turczaninow) Handel-Mazzetti var. *radicans* (Siebold ex Miquel) Rehder - K; ? *E. hederaceus* Champ. ex Benth - K2]

* *Euonymus japonicus* Thunberg, Japanese Spindle-tree. Disturbed areas, especially on barrier islands; native of Japan. Especially widely planted on barrier islands and in other maritime situations because of its resistance to salt damage (Brown 1959). [= C, Y; = *E. japonica* - K]

* *Euonymus maackii* Ruprecht, Winterberry. Cultivated, rarely naturalized; native of n. China. May-Jun; Sep-Nov. [= WH3, Y; > *E. bungeanum* Maximowicz - K; ? *E. hamiltonianus* Wallich var. *hamiltonianus* - K2; < *E. hamiltonianus* - Pa]

Euonymus obovatus Nuttall, Running Strawberry-bush. Cove forests, northern hardwood forests, other mesic forests, especially in boulderfields, where sometimes locally abundant. May-Jun; Sep-Oct. W. NY west to s. MI, south to sw. NC, ne. GA, TN, and MO. Two separate species may be confused in this concept; plants of the Southern Blue Ridge differ from plants in the more northern and western distribution, and are dijunct. [= C, F, G, Pa, RAB, S, W; = *E. obovata* - K, Z]

Maytenus Molina 1782 (Mayten)

A genus of ca. 200 species, shrubs and trees, of tropical and subtropical parts of the New World and Old World (the circumscription remaining controversial). References: McKenna et al. (2011); Simmons in Kubitzki (2004).

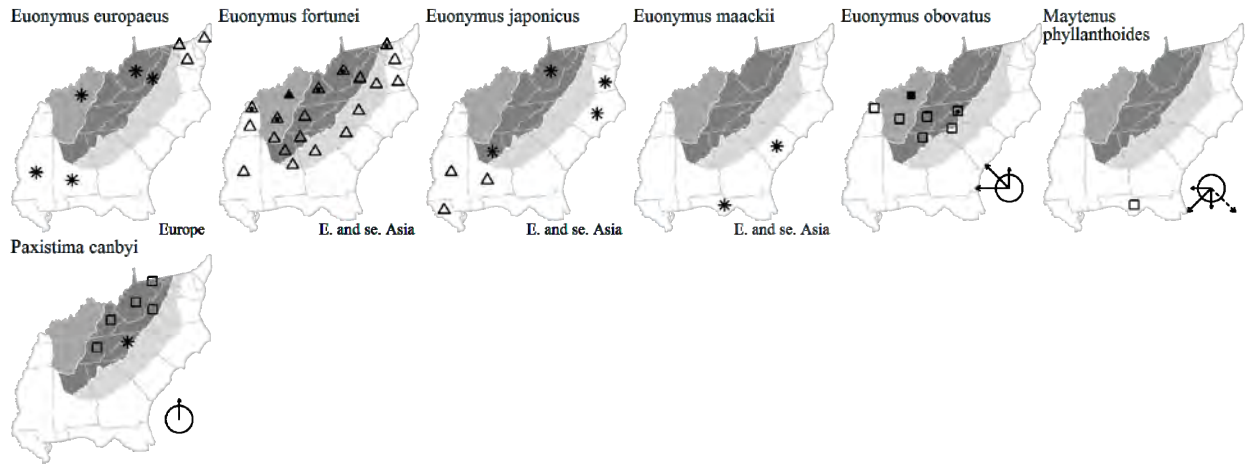

Maytenus phyllanthoides Bentham, Gutta-percha, Leatherleaf. Coastal hammocks, dunes, upper salt marsh edges. Jan-May (and irregularly later). FL peninsula (on the west coast from Levy County south to s. FL); Bahamas; Cuba; se. TX south through Mexico and Central America. [= K2, S, WH3; > *M. texana* Lundell; = *Tricerna phyllanthoides* (Bentham) Lundell]

Paxistima Rafinesque 1838 (Mountain-lover)

A genus of 2 species, rhizomatous shrubs, of temperate North America. The only other species in the genus is *P. myrsinites* (Pursh) Rafinesque of the Western Cordillera; its two subspecies are ssp. *myrsinites*, ranging from BC and AB south to AZ and NM, and ssp. *mexicana* Navaro & Blackwell of mountainous Mexico (Coahuila, Nuevo León, and Tamaulipas). For discussion of the long confusion and controversy over the appropriate spelling of the genus, see Navaro & Blackwell (1990) and Uttal (1986). The first validly published spelling of the name was "*Paxistima*," and this spelling should be retained. References: Navaro & Blackwell (1990)=Z; Simmons in Kubitzki (2004).

Paxistima canbyi A. Gray, Cliff-green, Canby's Mountain-lover, Ratstripper. On calcareous bluffs and cliffs (generally near the top of the cliffs or bluffs, rarely far below the crest), mostly on limestone and dolostone, but rarely on greenstone or shale; in NC naturalized at the site of a plant nursery and possibly also native (see discussion below). Apr-May; Aug-Sep. The species is a Central Appalachian endemic: sc. PA (Bedford County) (Rhoads & Klein 1993; Rhoads & Block 2007), e. WV, w. VA, s. OH, e. KY, ne. TN, and w. NC (where questionably native). The only collection definitely known from NC is that from an old nursery

site (Hardin 1963). Navaro & Blackwell (1990) note that "the presence of *P. canbyi* in North Carolina was, however, noticed as long ago as 1883 by Chapman, and *P. canbyi* is likely native to North Carolina." Small (1933) reports it from "n. NC." Casting doubt on its native status in NC is the species' habitat: limestone ravines and bluffs, a very rare habitat in NC. [= C, K, Pa, RAB, Va, W, Z; = *Pachistima canbyi* – F, WV (the name not validly published); = *Pachystima canbyi* – G, S (the name not validly published)]

175. OXALIDACEAE R. Brown 1818 (Wood-sorrel Family) [in OXALIDALES]

A family of 5-6 genera and 600-775 species, herbs, shrubs, vines, and small trees, nearly cosmopolitan (especially temperate).
References: Cocucci in Kubitzki (2004).

Oxalis Linnaeus 1753 (Wood-sorrel, Oxalis)

A genus of about 500-700 species, herbs, shrubs, and vines. References: Ward (2004a)=Z; Eiten (1963)=Y; Lourteig (1979)=X; Nesom (2009b)=V; Nesom (2009c)=U; Nesom, Spaulding, & Horne (2014); Robertson (1975)=Q; Horne, Barger, & Nesom (2013)=T; Lourteig (1990); Cocucci in Kubitzki (2004). Taxonomy and key based in part on Nesom (2009b) and Horne, Barger, & Nesom (2013).

- 1 Plant acaulescent; leaves basal; flowers white, pink, or purple.
 - 2 Leaflets obdeltoid (the apical lobes angular).
 - 3 Leaflets green; plants with bulbs and bulblets.....[*O. intermedia*]
 - 3 Leaflets purple; plants with scale-clad rhizomes.....[*O. triangularis*]
 - 2 Leaflets obovate (the apical lobes rounded).
 - 4 Flowers solitary (rarely in simple umbels of up to 5 flowers); plants **either** rhizomatous (*O. montana*) **or** bulbous (*O. brasiliensis* and *O. hispidula*); tips of sepals plane; leaflets lacking oxalate deposits (visible as dots)..... *O. montana*
 - 5 Flowers strictly solitary; [plants native]; [section *Oxalis*]..... *O. montana*
 - 5 Flowers solitary or in simple umbels of 2-5 flowers; [plants non-native of disturbed situations]; [section {}].
 - 6 Abaxial leaf surface sparsely but evenly strigose with fine hairs; leaflet margins glabrous to sparsely irregularly ciliate with loose, fine hairs; outer bulb scales 5-8 (-13)-nerved; sepal apices without orange tubercles; aerial propagules sometimes produced at bracteole region of scape.....[*O. brasiliensis*]
 - 6 Abaxial leaf surface strongly strigose to hirsute-strigose; leaflet margins prominently ciliate with stiff, sharp-pointed hairs; outer bulb scales 3- (-5)-nerved; sepal apices with a pair of elongate orange tubercles; aerial propagules never produced... [*O. hispidula*]
 - 4 Flowers in umbels; plants bulbous; tips of sepals with orange callosities; leaflets with oxalate deposits (visible as dots) distributed either evenly over the entire surface, around the margins of the leaflets, or at the apical notch of the leaflets; [section *Ionoxalis*].
 - 7 Sepals conspicuously appressed-pubescent; leaflets with reddish-brown callosities mostly along the margins; [naturalized]..... *O. articulata*
 - 7 Sepals glabrous or sparsely pubescent; leaflets with reddish-brown callosities **either** scattered over the surface **or** only at the apical notch; [native or naturalized]
 - 8 Leaflets 25-45 mm long; leaflets with reddish-brown callosities scattered over the surface; [naturalized].....*O. debilis*
 - 8 Leaflets 8-15 mm long; leaflets with reddish-brown callosities only at the apical notch; [native]
 - 9 Flowering Aug-Sep (-Oct); leaves present Oct-May; [in longleaf pine woodlands and Coastal Plain outcrop glades / woodlands].....*O. species 1*
 - 9 Flowering (Mid Feb-) Apr-May (-Jul); leaves present Mar-Oct; [widespread in our area].....*O. violacea*
- 1 Plant caulescent; leaves alternate; flowers yellow; [section *Corniculatae*].
 - 10 Stems evenly strigose from base to peduncles and pedicels
 - 11 Flowers 1-3 (-8) in umbelliform cymes; flowers homostylous; petals 5-12 mm long, yellow, without red lines*O. dillenii*
 - 11 Flowers (2-) 3-5 (-8) in umbelliform cyme; flowers distylous; petals (6-) 12-16 (-17) mm long, yellow with prominent red lines in the corolla throat..... *O. texana*
 - 10 Stems pilose to villous to nearly glabrous, rarely strigose and then only on peduncles or pedicels.
 - 12 Petals 10-20 mm long, red-lined in the throat (sometimes very faintly so).

- 13 Corolla throats strongly red-lined within; petals 14-20 mm long; flowers 1 or (2-) 3-8 in umbelliform cymes above the level of the leaves; stems densely and pilose with stiffly spreading non-septate hairs; stoloniform rhizomes lignescent or ligneous and numerous on an individual plant *O. macrantha*
- 13 Corolla throats yellow, very faintly to strongly red-lined within; petals 10-18 mm long; flowers 1 or 2-4 (-8) in regular or irregular cymes, above or within the level of the leaves; stems nearly glabrous to sparsely or densely pilose or villous with septate hairs or a mixture of septate and non-septate hairs; stoloniform rhizomes usually 1 or few, herbaceous or lignescent.
- 14 Plants arising from slender, lignescent, stoloniform rhizomes without tubers; leaflets with upper shoulders usually rounded, margins often with a narrow purple margin; flowers produced above the level of the leaves; petals 10-14 mm long, throat yellow to very faintly or weakly red-lined within *O. grandis*
- 14 Plants arising from slender, herbaceous, stoloniform rhizomes at intervals producing white, horizontal, fusiform tubers or tuberlike thickenings; leaflets with upper shoulders flattened, margins green; flowers produced mostly within the level of the leaves; petals 12-18 mm long, throat strongly red-lined within *O. illinoensis*
- 12 Petals 4-9 (-11) mm long, yellow, without red lines in the throat.
- 15 Stems repent, rooting at most nodes; seeds brown, transverse ridges not white; stipules oblong with distinct flanges and free auricles. *O. corniculata*
- 15 Stems erect, usually arising singly from the base, rarely decumbent, not or very rarely rooting at the nodes, from a short, thin, often herbaceous to slightly lignescent rhizome etc. ; seeds all brown or with white transverse ridges; stipules absent or so reduced to be barely evident.
- 16 Stems (5-) 8-30 (-35) cm, sparsely pilose with non-septate hairs to almost completely glabrous, arising from a taproot, often producing lignescent stolons; flowers 1 or 2 (-3, rarely 4-5) in umbelliform cymes; capsules glabrous to sparsely puberulent, not villous *O. florida*
- 16 Stems 20-60 (-90) cm long, sparsely to very sparsely pilose with nonseptate hairs or a mixture of nonseptate and septate hairs or densely villous with septate hairs, arising singly from the base from a short herbaceous to lignescent rhizome; flowers usually (3-) 5-7 (-15) in regular (rarely irregular) cymes; capsules villous to puberulent and villous to glabrate *O. stricta*

* *Oxalis articulata* Savigny in Lamarck. Roadsides, old gardens; native of South America. [= WH3, V; > *O. rubra* St. Hilaire – K, Q, RAB, Va; ? *Ionoxalis martiana* (Zuccarine) Small – S, misapplied; > *O. articulata* Savigny ssp. *rubra* (St. Hilaire) Lourteig]

* *Oxalis brasiliensis* G. Loddiges. Disturbed roadsides; native of Argentina, Uruguay, and Brazil. Mar-Jul. See Horne, Barger, & Nesom (2013) for additional and more detailed information. [= T]

Oxalis colorea. {not yet keyed}

* *Oxalis corniculata* Linnaeus, Creeping Lady's-sorrel. Gardens, fields, disturbed areas, sometimes more natural areas including pinelands, dunes; probably native of New World tropics and subtropics, possibly including the deeper South. Feb-Dec. Now nearly worldwide in distribution. [= C, F, K, Mo, Pa, Q, RAB, Va, WV, Y; = *O. repens* Thunberg – G; > *Xanthoxalis corniculata* (Linnaeus) Small – S; > *Xanthoxalis langloisii* Small – S; < *O. corniculata* – WH3; > *O. corniculata* var. *corniculata* – Z; > *O. corniculata* var. *atropurpurea* Planchon – Z]

* *Oxalis debilis* Kunth. Disturbed areas; native of South America. See Kartesz (1999). [= WH3, V; > *O. corymbosa* A.P. de Candolle – Q, Z; > *Oxalis debilis* Kunth var. *corymbosa* (A.P. de Candolle) Lourteig – K]

Oxalis dillenii Jacquin, Southern Yellow Wood-sorrel. Roadsides, pastures, lawns, a wide variety of other habitats. Feb-Nov. NS west to SK, south to FL, TX, NM; introduced elsewhere. See Nesom, Spaulding, & Horne (2014) for additional information. [= C, K, Mo, Va; > *O. dillenii* – RAB; > *O. florida* var. *florida* – RAB; > *O. florida* Salisbury var. *filipes* (Small) H.E. Ahles – RAB; = *O. stricta* Linnaeus – G, WV, misapplied; > *O. dillenii* ssp. *filipes* (Small) Eiten – Pa; > *O. dillenii* ssp. *dillenii* – Q, W, Y, Z; > *O. florida* – F; > *Xanthoxalis brittoniae* (Small) Small – S; < *O. corniculata* – WH3]

Oxalis florida Salisbury. Floodplain forests, moist fields, ditches, bluffs, and moist slopes. Mar-Sep. VT and CT south to FL, west to LA, AR, and MO. [= Mo, Va; = *Oxalis priceae* Small ssp. *colorea* (Small) Eiten – K, Q, Y; = *O. recurva* Elliott var. *recurva* – F; < *O. recurva* – G; = *O. florida* Salisbury var. *recurva* (Elliott) H.E. Ahles – RAB; = *O. macrantha* (Trelease) Small – C; > *Xanthoxalis colorea* Small – S; > *Xanthoxalis recurva* Elliott Small – S; > *O. filipes* – F; > *Xanthoxalis filipes* (Small) Small – S; > *O. dillenii* Jacquin ssp. *filipes* (Small) Eiten – Q, W, Y, Z; < *O. corniculata* – WH3]

Oxalis grandis Small, Great Yellow Wood-sorrel. Rich moist forests, rocky bluffs. May-Aug. PA, OH, and IN, south to SC, GA, AL, MS. [= C, F, G, K, Pa, Q, RAB, Va, W, Y; = *Xanthoxalis grandis* (Small) Small – S]

* *Oxalis hispidula* Zuccarini. Wet ditches, disturbed roadsides; native of Argentina, Uruguay, Paraguay, and Brazil. Oct-Nov. See Horne, Barger, & Nesom (2013) for additional and more detailed information. [= T]

Oxalis illinoensis Schwegman, Illinois Wood-sorrel. Dry to dry-mesic forests and bluffs, often but not necessarily calcareous. S. IN and s. IL south through KY to c. TN. [= K]

* *Oxalis intermedia* A. Richard, West Indian Wood-sorrel. Moist disturbed areas; native of West Indies. Apr-Sep. [= V; < *O. latifolia* Kunth – WH3]

Oxalis macrantha (Trelease) Small, Sadie Price's Yellow Wood-sorrel. Rich woodlands. KY and TN south to GA, Panhandle FL, AL, MS, and se. LA; disjunct in c. NC. *O. macrantha* predates *O. priceae* and thus is the name to use. [= WH3; =

Oxalis priceae Small ssp. *priceae* – K, Q, Y; = *O. recurva* Elliott var. *macrantha* (Trelease) Wiegand – F; < *O. recurva* – G; > *Xanthoxalis priceae* Small – S; > *Xanthoxalis hirsuticaulis* (Small) Small – S; = *Xanthoxalis macrantha* (Trelease) Small – S]

Oxalis montana Rafinesque, American Wood-sorrel, White Wood-sorrel. Spruce-fir forests, northern hardwood forests, at high elevations. May-Jul. QC and NY west to SK, south to GA, NC, and TN. Closely related to the Eurasian *O. acetosella*, and sometimes treated as a geographic subspecies or phase (see synonymy). [= F, K, S, Va, WV; < *O. acetosella* Linnaeus – C, G, Pa, RAB, W; = *O. acetosella* ssp. *montana* (Rafinesque) Hultén ex D. Löve – Q]

Oxalis species 1, Asynchronous Violet Wood-sorrel. Longleaf pine sandhills, Altamaha grit glades. Aug-Sep (-Oct). S. GA and adjacent FL. Under study by Richard Carter. [< K, Q, RAB, V, WH3, Z; < *Sassia violacea* (Linnaeus) Holub; < *Ionoxalis violacea* (Linnaeus) Small – S]

Oxalis stricta Linnaeus, Common Yellow Wood-sorrel. Disturbed areas, also in a variety of natural habitats. May-Oct. Widespread in North America, now widespread nearly worldwide. [= C, K, Mo, Pa, Q, RAB, Va, W, WV, Y, Z; > *O. europaea* Jord. var. *europaea* – F; > *O. europaea* var. *bushii* (Small) Wiegand – F; = *O. europaea* – G; > *Xanthoxalis stricta* (Linnaeus) Small – S; > *Xanthoxalis bushii* Small – S; > *Xanthoxalis rufa* Small – S; > *Xanthoxalis cymosa* (Small) Small – S; < *O. corniculata* – WH3]

* ***Oxalis texana*** (Small) Fedde. Disturbed areas; native of sc. United States (LA, AR, and TX). Mar-May (-Jun). Reported for GA (GANHP, Kartesz 1999); not in GA (Ward 2004). [= V; = *O. priceae* Small ssp. *texana* (Small) Eiten – K, Q, Y; = *O. lyonii* Pursh – X]

* ***Oxalis triangularis*** A. St.-Hilaire. Disturbed areas; native of Brazil and Argentina. Apr-May. [= WH3, V; > *Oxalis triangularis* A. St.-Hilaire ssp. *papilionacea* (Hoffmannsegg ex Zuccarini) Lourteig]

Oxalis violacea Linnaeus, Violet Wood-sorrel. Dry to moist forests. Mid Feb-May (-Jul). MA, VT, MI, SD, and CO south to FL, TX, and AZ. [< C, G, K, Mo, Pa, Q, RAB, V, Va, W, WH3, Z; > *O. violacea* var. *violacea* – F, WV; > *O. violacea* var. *trichophora* Fassett – F, WV; < *Sassia violacea* (Linnaeus) Holub; < *Ionoxalis violacea* (Linnaeus) Small – S]

181. RHIZOPHORACEAE Persoon 1806 (Red Mangrove Family) [in MALPIGHIALES]

A family of about 14 genera and 145 species, shrubs and trees, of tropical areas of the Old and New World. References: Schwarzbach in Kubitzki (2014).

Rhizophora Linnaeus 1753 (Red Mangrove)

A genus of ca. 8 species, trees and shrubs, of tropical shores. References: Takayama et al. (2013); Schwarzbach in Kubitzki (2014).

Rhizophora mangle Linnaeus, Red Mangrove. Estuarine and bay shores, beaches. Well-established from n. FL (St. Johns County on the east coast, Escambia County in the Panhandle), southward into the West Indies and beyond in tropical America (both Atlantic and Pacific coasts). The distinctive floating seedlings of *Rhizophora* occasionally wash up as jetsam on beaches of GA, NC, and SC, particularly following hurricanes. Dave Owen (pers. comm. and photograph) has provided photographic evidence from Bear Island, Onslow County, NC, 11 Jun 1996. These propagules (repeatedly introduced naturally) may sprout and grow for some time, forming a young sapling with leaves, but do not currently survive in or north of NC because of frost. Populations of *R. mangle* from the Atlantic and Caribbean (including w. Africa) are genetically differentiated from populations on the west coast of the Americas and on Pacific islands (Takayama et al. 2013). [= GW, K, S, WH3]

184. EUPHORBIACEAE A.L. de Jussieu 1789 (Spurge Family) [in MALPIGHIALES]

A family of about 313-322 genera and 8100-9000 species, trees, shrubs, vines, and herbs, nearly cosmopolitan in distribution, as defined broadly. Molecular systematics suggests that various units traditionally included in the Euphorbiaceae should be segregated (Soltis et al. 2000; Chase et al. 2002). In our flora, this includes *Phyllanthus*, *Phyllanthopsis*, and *Glochidion* (in

Phyllanthaceae). References: Webster (1967), Webster (1994); Govaerts, Frodin, & Radcliffe-Smith (2000); Webster in Kubitzki (2014). [also see *PHYLLANTHACEAE*]

- 1 Shrub or tree (woody).
 - 2 Leaves entire.
 - 3 Leaf blades 2-5× as long as wide; petioles 0.2-1.0 cm long; plant a native shrub; [subfamily *Euphorbioideae*].....*Ditrysinia*
 - 3 Leaf blades 1-1.5× as long as wide; petioles 2-6 cm long; plant an alien tree; [subfamily *Acalyphoideae*].....*Triadica*
 - 2 Leaves crenate, serrate, or palmately lobed.
 - 4 Leaves elliptic or lanceolate, with crenate or serrate margins.
 - 5 Petiole lacking glands; [subfamily *Acalyphoideae*].....*Sapium*
 - 5 Petiole with 2 glands at summit; [subfamily *Euphorbioideae*].....*Stillingia*
 - 4 Leaves ovate or orbicular in outline, palmately lobed.
 - 6 Inflorescence a panicle; petals absent; [subfamily *Acalyphoideae*].....*Ricinus*
 - 6 Inflorescence a dichasium; petals present; [subfamily *Crotonoideae*].....*Vernicia*
- 1 Herb.
 - 7 Leaves palmately deeply divided into 3-many lobes.
 - 8 Leaves peltate; calyx green or purple; plant glabrous; stamens 100-1000; [subfamily *Acalyphoideae*].....*Ricinus*
 - 8 Leaves cordate at base; calyx petaloid, white; plant glabrous or with conspicuous stinging trichomes; stamens 8-10; [subfamily *Crotonoideae*].
 - 9 Plant with stinging trichomes; stamens connate.....*Cnidoscolus*
 - 9 Plant lacking stinging trichomes; stamens separate.....*Manihot*
 - 7 Leaves generally not lobed, entire or serrate (rarely pinnately lobed in *Euphorbia*).
 - 10 Plant with copious white latex; flowers enclosed in a cyathium; [subfamily *Euphorbioideae*].....*Euphorbia*
 - 10 Plant without white latex (the sap clear, or slightly milky in *Stillingia*); flowers not enclosed in a cyathium.
 - 11 Pubescence of stellate trichomes and/or scales; [subfamily *Crotonoideae*].....*Croton*
 - 11 Pubescence of simple trichomes, or glabrous.
 - 12 Flowers in terminal spikes; stout perennial with several to many stems arising from a subterranean crown [subfamily *Euphorbioideae*].....*Stillingia*
 - 12 Flowers strictly axillary or both axillary and terminal, in small clusters, racemes, or spikes; finer perennial or annual, not typically with > 1 stem arising from a subterranean crown.
 - 13 Ovules and seeds 2 per locule (the capsule thus 6-seeded); flowers in small axillary clusters of 2-4.....
[see *Phyllanthus* – *PHYLLANTHACEAE*]
 - 13 Ovules and seeds 1 per locule (the capsule thus 3-seeded, or fewer by abortion); flowers in axillary spikes or in racemes borne in leaf axils or opposite the leaves; [subfamily *Acalyphoideae*].
 - 14 Pistillate flowers lacking a leafy bract; plant with stinging trichomes; styles undivided.....*Tragia*
 - 14 Pistillate flowers subtended by a conspicuous leafy bract; plant lacking stinging trichomes; styles lacinate
 - 15 Leaves alternate; carpels 3 (sometimes fewer by abortion).....*Acalypha*
 - 15 Leaves opposite; carpels 2.....*Mercurialis*

Acalypha Linnaeus 1753 (Copperleaf, Three-seeded Mercury)

A genus of about 430-462 species, shrubs, herbs, and trees, of primarily tropical and subtropical regions (rarely warm temperate). References: Levin in FNA (in prep.); Levin (1999b)=Z; Levin (1999a); Govaerts, Frodin, & Radcliffe-Smith (2000)=Y; Webster in Kubitzki (2014). Key based in part on Levin in FNA.

- 1 Bracts of pistillate flowers with linear tips or lobes longer than the broad basal portion; pistillate flowers all or chiefly in terminal spikes, the staminate flowers in axillary clusters (except sometimes in *A. arvensis*).
 - 2 Pistillate inflorescences with the bracts densely crowded, completely hiding the inflorescence axis; bracts of pistillate flowers with lobes consisting of deltate bases bearing long linear tips, long-hirsute with nonglandular hairs to 2 mm long.....*A. arvensis*
 - 2 Pistillate inflorescences with the bracts loosely arranged, the axis visible between the bracts; bracts of pistillate flowers with the lobes linear throughout, glabrous or pubescent with nonglandular hairs < 0.25 mm long (glandular hairs may be longer).
 - 3 Leaves cordate at base; fruit tuberculate, but not pubescent.....*A. ostryifolia*
 - 3 Leaves rounded to widely cuneate at base; fruit pubescent with pustular-based trichomes.....*A. setosa*
- 1 Bracts of the pistillate flowers with deltate or lanceolate tips or lobes; pistillate and staminate flowers all in axillary inflorescences, the staminate flowers above and pistillate flowers below in each inflorescence.
 - 4 Bracts subtending the pistillate flowers (5-) 7-9 (-11) lobed, usually stipitate-glandular; petiole 0.5-1.5× as long as the leaf blade; stems with only short, incurved trichomes.
 - 5 Fruit 2-seeded; seeds 2.4-3.2 mm long.....*A. deamii*
 - 5 Fruit 3-seeded; seeds 1.2-2.0 mm long.....*A. rhomboidea*
 - 4 Bracts subtending the pistillate flowers 9-15 (-16) lobed, stipitate-glandular or merely pubescent; petiole 0.2-0.5× as long as the leaf blade; stems with short incurved trichomes, with or without longer, straight, spreading trichomes as well.
 - 6 Bracts subtending the pistillate flowers usually stipitate-glandular, the bract lobes ovate to deltoid, the longest <2 mm long.....*A. gracilens*
 - 6 Bracts subtending the pistillate flowers usually with non-stipitate, pointed hairs, the bract lobes linear to oblong, the longest usually > 3 mm longbroadly.....*A. virginica*

* *Acalypha alopecuroidea* Jacquin. Disturbed areas; native of the Neotropics. [= FNA, K2, WH3] {not yet keyed; add to synonymy};

* *Acalypha arvensis* Poeppig & Endlicher. Disturbed ground; native of West Indies, Mexico, and Central America. [= FNA, K1, WH3; ? *A. aristata* Kunth – K2, misapplied]

Acalypha deamii (Weatherby) H.E. Ahles, Big-seeded Copperleaf, Two-seeded Copperleaf. Alluvial forests, especially on sandy levees. W. PA (Rhoads & Block 2007), s. OH, and s. IN south to w. TN (Chester, Wofford, & Kral 1997) and AR; apparently disjunct in c. VA (where now known from 23 counties, mainly in the Piedmont), but perhaps only overlooked elsewhere. This plant is up to a meter tall and occurs in moist bottomland forests. [= C, FNA, K, Pa, Va, Z; = *A. rhomboidea* var. *deamii* (Weatherby) Weatherby – F, G; = *A. virginica* Linnaeus var. *deamii* Weatherby – Y]

Acalypha gracilens A. Gray, Shortstalk Copperleaf. Woodlands, disturbed ground. Late Jun-Nov. ME west to WI, south to FL and TX. The related *A. monococca* (Engelmann ex A. Gray) Lill. W. Miller & Gandhi is of broadly Ozarkian distribution and warrants specific status (Levin 1999a, 1999b). Var. *fraseri* is generally more southern and is considered to differ in having more elongate staminate spikes, to 3-4 cm long (vs. 0.5-1.5 cm long). It may have merit, but was not recognized by Levin (1999a, 1999b). [= FNA, K, Pa, RAB, S, Va, W, WH3, Z; > *A. gracilens* var. *gracilens* – C, F, G; > *A. gracilens* var. *fraseri* (Müller of Aargau) Weatherby – C, F, G; = *A. virginica* Linnaeus var. *gracilens* (A. Gray) Müller of Aargau – Y; = *A. gracilens* ssp. *gracilens*]

Acalypha herzogiana Pax & K. Hoffmann, Strawberry Firetails. Disturbed ground, grown as an ornamental, and escaping via vegetative growth; native of South America. See Steinmann & Levin (2011) for additional information. [= *A. reptans* Swartz, misapplied; = *A. pendula*, misapplied] {not yet keyed}

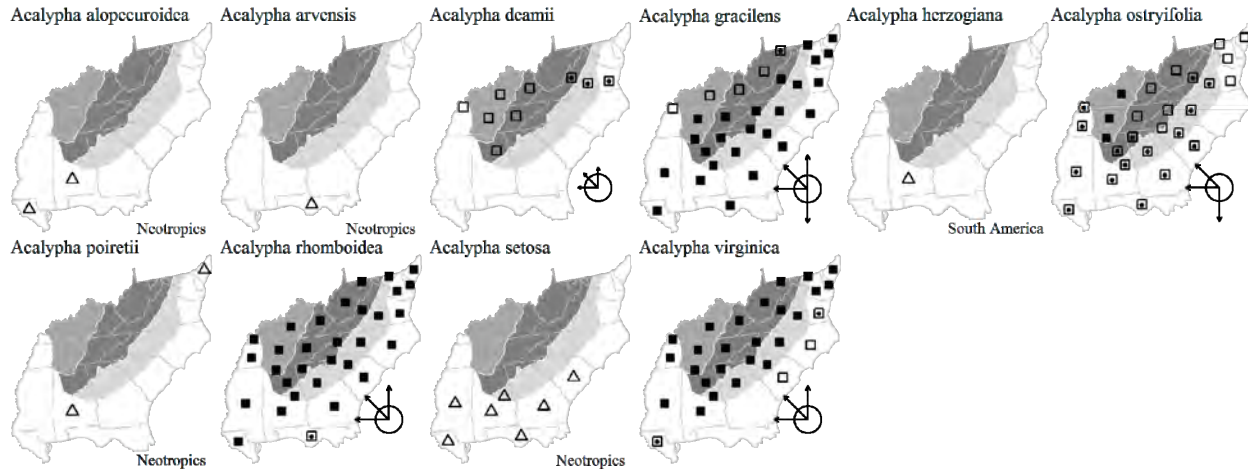

Acalypha ostryifolia Riddell ex J.M. Coulter, Rough-pod Copperleaf. Disturbed ground. Late Jun-Nov. NJ west to IN and NE, south to FL, TX, Mexico, and the West Indies. [= FNA, K, Va, W, WH3, Y; = *A. ostryaefolia* – C, F, G, RAB, S, orthographic variant]

* *Acalypha poiretii* Sprengel. On ballast, perhaps in other disturbed areas; native of the Neotropics. [= FNA, K2] {not yet keyed; add to synonymy}

Acalypha rhomboidea Rafinesque, Rhombic Copperleaf. Woodlands, disturbed ground. Late Jun-Nov. NS and ME west to ND, south to Panhandle FL and e. TX. [= C, FNA, G, GW, K, Pa, RAB, S, Va, W, WH3, Z; = *A. rhomboidea* var. *rhomboidea* – F; = *A. virginica* Linnaeus var. *rhomboidea* (Rafinesque) Cooperrider – Y]

* *Acalypha setosa* A. Richard in R. Sagra, Cuban Copperleaf. Disturbed ground; native of west Indies, Mexico, Central America, and n. South America. Jun-Nov. [= FNA, K, RAB, S, WH3, Y]

Acalypha virginica Linnaeus, Virginia Copperleaf. Woodlands and disturbed ground. Late Jun-Nov. ME west to IN, IL, MO, and KS, south to c. GA and TX. [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, Z; = *A. virginica* Linnaeus var. *virginica* – Y]

Caperonia A. St.-Hilaire 1826

A genus of about 35-40 species, annual and perennial herbs, tropical. References: Gillespie in FNA (in prep.); Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

* *Caperonia palustris* (Linnaeus) St.-Hilaire, Sacatrapo, Texas-weed. Wet disturbed areas; native of the Neotropics. [= K2, WH3] {not yet keyed; add references Z}

Cnidoscolus Pohl 1827 (Spurge-nettle)

A genus of about 75 species, perennial herbs, shrubs, and trees, of America (especially the tropics). References: McVaugh (1944)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

Cnidoscolus stimulosus (Michaux) Engelmann & A. Gray, Spurge-nettle, Tread-softly, Finger-rot, Bull-nettle. Sandhills, dry sandy woodlands, other dry sandy soils. Late Mar-Aug; May-Sep. Se. VA south to s. FL, west to e. LA, mostly on the Coastal Plain, but farther inland southward. Besfet with stinging trichomes. Allied to *C. urens* of Mexico, Central America, and n. South America, and sometimes treated as a variety of it. [= C, F, G, K1, RAB, Va, W, WH3, Y; = *C. urens* (Linnaeus) Arthur var. *stimulosus* (Michaux) Govaerts – K2, Z; = *Bivonea stimulosus* (Michaux) Rafinesque – S]

Cnidoscolus stimulosus

*Croton* Linnaeus 1753 (Croton, Doveweed, Rushfoil)

A genus of about 1250 species, herbs, shrubs, and (rarely) trees, of nearly cosmopolitan distribution (primarily tropical and warm-temperate). Webster (1992, 1993) considered the 2 taxa traditionally treated as *Crotonopsis* to be closely related to sections within *Croton*, such as section *Gynamblosis*; his reasoning has been supported by molecular phylogenetic studies and all recent floristic treatments and is followed here. References: van Ee & Berry in FNA (in prep.); van Ee, Riina, & Berry (in press); van Ee & Berry (2009)=X; Webster (1992)=Z; Webster (1993)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000); Webster in Kubitzki (2014).

- 1 Evergreen shrub, (1-) 2-3 m tall; pistillate flowers with well-developed, greenish petals; [subgenus *Quadrilobi*; section *Alabamenses*].....*C. alabamensis* var. *alabamensis*
- 1 Herbaceous or suffrutescent, 0.1-1.2 m tall; pistillate flowers lacking petals; [subgenus *Geiseleria*].
 - 2 Leaves with coarsely serrate margins; 1-2 glands present near the junction of the petiole and the leaf blade; [subgenus *Geiseleria*; section *Geiseleria*].....*C. glandulosus* var. *septentrionalis*
 - 2 Leaves with entire margins; glands absent at the junction of the petiole and the leaf blade.
 - 3 Leaves sessile or with short petioles (to 3.2 mm long), the petiole < 1/5 the length of the leaf blade; fruit 1-locular, indehiscent; seed 1 per fruit, 2-2.5 mm long; [subgenus *Geiseleria*; section *Crotonopsis*].
 - 4 Inflorescences 1-4 cm long, with 3-6 pistillate flowers arranged loosely toward the base; staminate flowers usually > 1 mm in diameter; stellate-lepidote trichomes of the fruit numerous, with radii much longer than the fused portion and often ascending (giving the fruit a fuzzy appearance when viewed under magnification); stellate trichomes of the upper leaf surface sparse, the radii not overlapping the radii of nearby stellae, the radii 5-8 per trichome; leaves 1-3 mm wide*C. michauxii*
 - 4 Inflorescences usually < 1 cm long, with 1-2 pistillate flowers crowded at the base (appearing sessile in the axil of the subtending leaf); staminate flowers usually < 1 mm in diameter; stellate-lepidote trichomes of the fruit sparse, with radii fused for all or most of their lengths, appressed; stellate trichomes of the upper leaf surface denser, the radii usually overlapping the radii of nearby stellae, the radii often only 1-3 per trichome (as viewed near the midvein); leaves 1.5-4 (-15) mm wide*C. willdenowii*
 - 3 Leaves with relatively long petioles (2-90 mm long), at least some of the petioles 1/3 or more the length of the leaf blades; fruit 3-locular (2-locular in *C. monanthogynus*), dehiscent; seeds 3 per fruit (1 per fruit in *C. monanthogynus*, the second locule aborting), 2.5-5 mm long.
 - 5 Petals of the staminate flowers lepidote; [of dry longleaf pinelands]; [subgenus *Geiseleria*; section *Argyranthemii*].....*C. argyranthemus*
 - 5 Petals of the staminate flowers glabrous or villous; [of various other habitats].
 - 6 Stem leaves mostly 2× or more as long as wide; lobes of the calyx of the pistillate flowers 5-9 (-12); [subgenus *Geiseleria*; section *Heptallon*].
 - 7 Leaves (the larger) 4-15 cm long, 1.5-6 cm wide (generally 2-3× as long as wide), lanceolate to elliptic, cordate at the base; hairs of 2 colors, the shorter gray, the longer tan; lobes of the calyx of the pistillate flowers (6-) 7-9 (-12); [alien, of disturbed habitats].....*C. capitatus*
 - 7 Leaves (the larger) 2.5-6 cm long, 0.7-1.5 cm wide (generally 3-6× as long as wide), linear to linear-lanceolate, cuneate at the base; hairs of 1 color, all gray; lobes of the calyx of the pistillate flowers 5-6; [native, of Coastal Plain pondshores]*C. elliotii*
 - 6 Stem leaves mostly < 2× as long as wide, 1-8 cm long, broadly cuneate to rounded at the base (a few rarely subcordate); lobes of the calyx of the pistillate flowers 5.
 - 8 Styles 3, each 4-lobed, the style branches thus 12; capsule erect, 5-7 mm long; seeds 4.5-5.0 mm long; lower leaf surface silvery; plant an annual or perennial; [of coastal dunes]; [subgenus *Geiseleria*; section *Drepadenium*].....*C. punctatus*
 - 8 Styles 2 or 3, each 2-lobed, the style branches thus 4 or 6; capsule pendulous, 3-6 mm long; seeds 2.5-4.0 mm long; lower leaf surface white to silvery; plant an annual; [of limestone outcrops, fields, or weedy situations]; [subgenus *Geiseleria*; section *Heptallon*].
 - 9 Fruit 2-locular; seeds 1 per fruit; styles 2, each 2-lobed; [of limestone outcrops or weedy situations]*C. monanthogynus*
 - 9 Fruit 3-locular; seeds 3 per fruit; styles 3, each 2-lobed or 4-lobed; [of fields or weedy situations]*C. lindheimerianus* var. *lindheimerianus*

Croton alabamensis E.A. Smith ex Chapman var. *alabamensis*, Alabama Croton. Dry to mesic limestone glades, woodlands, and wooded ravines. Mar-Apr. Endemic to scattered populations in c. AL; alleged populations in sc. TN (Chester, Wofford, & Kral 1997) are apparently based on mislabeled specimens (Wurdack 2006). Var. *texensis* S. Ginzburg is endemic to c. TX (Ginzburg 1992; Aplet et al. 1994), where it occurs in canyons in the Edwards Plateau. The species is most closely related to species of the West Indies, Central America, and South America; its distribution is obviously relictual. [= K; < *Croton alabamensis* - S]

Croton argyranthemus Michaux, Silver Croton, Sandhill Croton, Healing Croton. Sandhills. C. GA and s. AL south to c. peninsular FL; w. LA and sw OK south through e. and c. TX to Nuevo León and Tamaulipas. [= K1, K2, S, WH3]

* *Croton bonplandianus* Baillon. Chrome ore piles; native of South America. Reported for chrome ore piles at Newport News, VA and Canton, MD (Reed 1964). [= K] {not keyed; rejected}

* *Croton capitatus* Michaux, Woolly Croton, Hogwort, Capitata Croton. Fields, disturbed areas; native of sc. United States, the exact limits of the original native distribution unclear. Jul-Oct. [= F, S, Va; = *Croton capitatus* Michaux var. *capitatus* - C, G, K1, K2; < *Croton capitatus* - Pa, RAB, W, WH3]

Croton elliotii Chapman, Pondshore Croton, Elliott's Croton. Shores and exposed drawdown zones of clay-based Carolina bays and limesink ponds (dolines). Se. SC south to Panhandle FL, west to se. AL. [= K, S, WH3]

* *Croton glandulosus* Linnaeus var. *septentrionalis* Müller of Aargau, Doveweed, Tooth-leaved Croton, Sand Croton. Fields, roadsides, disturbed areas. May-Oct. *C. glandulosus* is widespread in tropical and subtropical America; var. *septentrionalis* is the northernmost variety, distributed from PA west to MN, south to FL, TX, and ne. Mexico (its exact pre-Columbian range is speculative because of its weedy nature). [= C, F, G, K, RAB, S, Va, W; < *Croton glandulosus* var. *glandulosus* - WH3; < *Croton glandulosus* - Pa, WV]

Croton lindheimeri (Engelmann & A. Gray) Alph. Wood. In GA and westward. [= *Croton capitatus* Michaux var. *lindheimeri* (Engelmann & A. Gray) Müller of Aargau - K1, K2; = *C. engelmannii* Ferguson - S; < *C. capitatus* - WH3] {not yet keyed;}

* *Croton lindheimerianus* Scheele var. *lindheimerianus*, Lindheimer's Croton. Fields and other disturbed soils; adventive from farther west. Jun-Oct. [= K; < *Croton lindheimerianus* - Pa, RAB]

Croton michauxii G.L. Webster, Sand Rushfoil, Michaux's Croton, Narrowleaf Rushfoil. Sandhills, disturbed sandy soils. Jun-Oct. SC south to s. FL, west to TX, north in the interior to MO, IL, and IA. Fernald (1950) alleges that this species extends as far north as VA, but the documentation is unknown to me. [= K, WH3, Z; = *Crotonopsis linearis* Michaux - C, F, G, RAB, S; = *Croton michauxii* G.L. Webster var. *michauxii* - X]

Croton monanthogynus Michaux, Prairie-tea, One-seed Croton. Limestone outcrops, blackland prairies, disturbed dry soil. Jun-Oct. Sw. VA, OH, IN, IA, NE, and CO, south to nw. GA, FL, TX, and Mexico; adventive as a weed at scattered locations east of the Blue Ridge. [= C, F, G, K, RAB, S, Va, W, WV]

Croton punctatus Jacquin, Silverleaf Croton, Beach-tea, Gulf Croton. Beach dunes, coastal grasslands, usually with *Uniola paniculata* and/or *Spartina patens*. Late May-Nov. NC (Dare County) south to s. FL, west to TX, and south into Central and South America. [= K, RAB, S, WH3]

* *Croton texensis* (Klotzsch) Müller of Aargau var. *texensis*, Texas Croton. Disturbed areas; native of c. North America. [= K; < *C. texensis* - WH3] {not yet keyed; add to synonymy}

* *Croton trinitatis* Millspaugh. Ballast piles; native of Central and South America. Collected once, in Pensacola, Escambia County, FL. [= FNA, WH3] {rejected as a component of the flora; not keyed}

Croton willdenowii G.L. Webster, Glade Rushfoil, Outcrop Rushfoil, Broadleaf Rushfoil, Willdenow's Croton. Granitic flatrocks, diabase barrens, calcareous barrens, thin soils around other rock outcrops, disturbed sandy soil. Jun-Oct. CT, se. PA (Rhoads & Block 2007), IL, and se. KS, south to ne. FL, Panhandle FL, and TX. Van Ee & Berry (2009) argue that this taxon is only varietally distinct from *Croton michauxii* (see synonymy). [= K, Va, WH3, Z; = *Crotonopsis elliptica* Willdenow - C, F, G, Pa, RAB, S, W; = *Croton michauxii* G.L. Webster var. *elliptica* (Willdenow) van Ee & P.E. Berry - X]

Ditrysinia Rafinesque 1825 (Sebastian-bush)

A monotypic genus, a shrub, of the Southeastern United States Coastal Plain. References: Wurdack in FNA (in prep.); Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

Ditrysinia fruticosa (W. Bartram) Govaerts & Frodin, Sebastian-bush. Swamp forests, other wet to moist, mostly shaded, habitats. May-Jun; Jul-Oct. Se. NC south to c. peninsular FL, west to e. TX. [= FNA, K2, Z; = *Sebastiania fruticosa* (W. Bartram) Fernald – GW, K1, WH3; = *Sebastiania ligustrina* (Michaux) Müller of Aargau – RAB; = *Sebastiania ligustrina* – S (orthographic error)]

Euphorbia Linnaeus 1753 (Spurge)

A genus of over 2000 species, herbs, shrubs, and trees, nearly cosmopolitan in distribution. Infrageneric classification follows Yang et al. (2012), Dorsey et al. (2013), Riina et al. (2013), and Horn et al. (2012). References: Mayfield (2013)=V; Huft (1979)=Z; Park (1998)=Y; Bridges & Orzell (2002)=X; Yang et al. (2012); Dorsey et al. (2013); Riina et al. (2013); Horn et al. (2012); Zimmermann, Ritz, & Hellwig (2010); Govaerts, Frodin, & Radcliffe-Smith (2000)=Q; Webster in Kubitzki (2014).

{add to key:

C: graminea

D: platyphyllos, tetrapora

?: davidii, hexagona

Subg. Esula, section Exiguae: exigua

Subg Euphorbia, Sect Nummulariopsis: floridana, inundata var. inundata, telephioides

- 1 Leaves strictly opposite, oblique or inequilateral at base; branches prostrate (less usually erect) **Key A (subgenus Chamaesyce, section Anisophyllum, subsection Hypericifoliae)**
- 1 Leaves alternate or opposite, not oblique or asymmetric at base; branches usually erect.
 - 2 Bracteal leaves lobed or toothed (rarely linear), usually marked with red or white at the base or purple-spotted; glands of the cyathia usually 1 (rarely more), bilabiate, lacking petaloid appendages **Key B (subgenus Chamaesyce, section Poinsettia)**
 - 2 Bracteal leaves entire, not marked with red (white-margined in *E. marginata*); glands of the cyathia 4-5, flattish, not bilabiate, with or without petaloid appendages.
 - 3 Glands of the cyathia 5 (or 7-10 on the central cyathium in *E. pubentissima*), with petaloid appendages 0.1-5.0 mm long (measured along a radius), these white, maroon, red, pink, or green; stipules present, glandlike, often minute **Key C (subgenus Chamaesyce, section Alectorocotnum)**
 - 3 Glands of the cyathia 4 (except 5 in *E. purpurea*), oval, reniform, or crescent-shaped, lacking petaloid appendages (the glands themselves yellowish or green); stipules absent or vestigial **Key D (subgenus Esula)**

Key A – subgenus Chamaesyce, section Anisophyllum, subsection Hypericifoliae

{add to Key A: *E. blodgettii*, *E. hypericifolia*, *E. mesembrianthemifolia*, *E. ophthalmica*, *E. serpyllifolia* var. *serpyllifolia*}

- 1 Young stems and leaves glabrous; leaves **either** entire **or** serrulate, at least at the apex (use 10× magnification).
 - 2 Leaves serrulate, at least at the apex (use 10× magnification); seeds with 2-4 transverse ridges.
 - 3 Seeds 1.0-1.3 mm long, with 3-4 transverse ridges [*E. glyptosperma*]
 - 3 Seeds 0.8-1.0 mm long, with 2-3 (-4) transverse ridges *E. hyssopifolia*
 - 2 Leaves absolutely entire; seeds smooth.
 - 4 Stipules united into a triangular scale-like structure (this often lobed or fringed), thus appearing as 2 stipules at each node *E. serpens*
 - 4 Stipules separate, lacerate, appearing as 4 stipules at each node.
 - 5 Mature seeds 1.0-1.2 (-1.4) mm long, angled; leaves **either** 1.5-2× **or** 4-5× as long as wide, not fleshy; [of inland sandhills or coastal dunes].

- 6 Leaves 1.5-2× as long as wide, green throughout; [more widespread]..... *E. cordifolia*
- 6 Leaves 4-5× as long as wide, the leaf margin red; [FL]..... *E. cumulicola*
- 5 Mature seeds (1.3-) 1.5-2.6 mm long, rounded; leaves 2-3 (-5)× as long as wide, often somewhat fleshy; [of barrier island dunes and other sandy coastal habitats].
 - 7 Mature seeds (1.3-) 1.5-1.9 mm long; cyathia terminal on the stems and also axillary *E. bombensis*
 - 7 Mature seeds (2.0-) 2.2-2.6 mm long; cyathia terminal on the stems *E. polygonifolia*
- 1 Young stems and leaves pubescent (at least in lines along the stems); leaves serrulate, at least at the apex (use 10× magnification).
 - 8 Ovary and capsule glabrous.
 - 9 Seeds 0.8-1.0 mm long, light gray, the faces with 2-3 (-4) horizontal, low, blunt ridges, sometimes connected by 1-2 cross ridges; stems glabrous when young (uncommonly puberulent along 1 side of the branchlets); capsule 1.5-2.0 mm long *E. hyssopifolia*
 - 9 Seeds 1.0-1.3 mm long, dark gray, faces without ridges, though irregularly and finely wrinkled; stems puberulent when young on 1 side only; capsule 2.0-2.5 mm long.
 - 10 Stems ascending or suberect, puberulent when young..... *E. nutans*
 - 10 Stems prostrate or widely spreading, spreading-hirsute..... *E. vermiculata*
 - 8 Ovary and capsule pubescent.
 - 11 Stems with 2 types of trichomes, the longer 3-5 mm long; cyathia in axillary and terminal cymes, at least some of the peduncles > 10 mm long..... *E. hirta*
 - 11 Stems with 1 type of trichome, these < 2 mm long; cyathia solitary or several in axils, the peduncles < 5 mm long.
 - 12 Capsules spreading-villous, especially or solely on the angles; styles 0.2-0.3 mm long, bifid nearly to the base; seeds sharply quadrangular-angled, the faces with 3-4 transverse ridges *E. prostrata*
 - 12 Capsules minutely appressed-puberulent, on the entire surface (though sometimes primarily on the lower portion); styles 0.3-0.7 mm long, bifid only in the upper half or third; seeds quadrangular but not angled, the faces with inconspicuous transverse ridges or nearly smooth.
 - 13 Involucre cleft on 1 side half its length; leaves mostly obovate, 1.5-2× as long as wide; styles 0.5-0.7 mm long, filiform; seed faces nearly smooth; adventitious roots formed at middle nodes along the stem *E. humistrata*
 - 13 Involucre cleft on 1 side a fourth to a third its length; leaves mostly oblong, 2-3× as long as wide; styles 0.3-0.4 mm long, clavate; seed faces transversely ridged; adventitious roots not formed..... *E. maculata*

Key B – subgenus *Chamaesyce*, section *Poinsettia*

- 1 Principal stem leaves opposite, dentate, neither lobed nor linear; plant pubescent *E. dentata*
- 1 Principal stem leaves alternate, either lobed or linear; plant usually glabrous
 - 2 Cyathial gland 2-lipped, the opening elongate; bracteal leaves red or green at base; seeds not angular *E. cyathophora*
 - 2 Cyathial gland with a circular opening; bracteal leaves purple-spotted or green; seeds angular *E. heterophylla*

Key C – subgenus *Chamaesyce*, section *Alectorcoctonum*

{add to Key C: *E. graminea*}

- 1 Upper stem leaves and bracteal leaves with white margins, ovate, the apex acute; [alien, cultivated and rarely persisting or a waif]..... *E. marginata*
- 1 Upper stem leaves and bracteal leaves entirely green, obovate, elliptic, narrowly elliptic, or oblanceolate, the apex rounded or obtuse; [native].
 - 2 Petaloid appendages (0.5-) 1.0-4.4 mm long (measured along a radius), about as long as wide or longer, white; stems (1.5-) 3-9 (-11) dm tall, erect; leaves not ciliate-margined.
 - 3 Nodes below the umbel (25-) 35-60 (-115); cyathia (5-) 6.5-8.0 (-11.0) mm wide (across the appendages); stems (1-) 3-10 from a crown, each (1.2-) 2.5-5 (-7) mm in diameter at the base; plants (2-) 4-9 (-1.3) dm tall; leaves ascending, leathery, sessile or subpetiolate; plants flowering Jun-Sep; [NH and MA west to s. ON, MI, WI, MN, and NE, south to se.VA, c. NC, n. GA, s. AL, and e. TX]..... *E. corollata*
 - 3 Nodes below the inflorescence (6-) 15-26 (-41); cyathia (3.5-) 4.0-5.5 (-6.5) mm wide (across the appendages); stems usually 1-2 (-3) from a crown, each (0.8-) 1.5-2.8 (-3.5) mm in diameter at the base; plants (1.5-) 3-5 (-6.5) dm tall; leaves usually reflexed (*E. pubentissima*) or usually ascending (*E. discoidalis*), thin, petiolate or subpetiolate; plants flowering Mar-Jul; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS, west to e. TX].
 - 4 Leaves 1.9-7.2 cm long, 0.1-0.5 cm wide, averaging > 10× as long as wide; primary inflorescence rays usually 3; [e. and c. GA (or e. SC?) south and west to Panhandle FL and e. TX] *E. discoidalis*
 - 4 Leaves (1.6-) avg. 3.8 (-6.1) cm long, 0.5-2.2 cm wide, averaging < 4× as long as wide; primary inflorescence rays usually 5; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS]..... *E. pubentissima*
 - 2 Petaloid appendages 0.05-0.6 mm long (measured along a radius), shorter than wide, green, red, white, or pink; stems (0.8-) 1.5-4.5 (-6) dm tall, erect, ascending or decumbent; leaves ciliate-margined (*E. mercurialina* and *E. curtisii*) or not.
 - 5 Leaf margins ciliate; cyathia 3.5-5.9 mm wide (across the appendages), green; leaves not fleshy, 1.7-2.2 (-3)× as long as wide, not especially variable; [of mesic forests with rich soils]..... *E. mercurialina*
 - 5 Leaf margins not ciliate (except some marginal hairs in *E. curtisii*); cyathia 2.0-3.4 mm wide (across the appendages), green or maroon; leaves slightly to strongly fleshy, 0.7-20× as long as wide, often very variable in shape, even on the same plant; [of more or less xeric sandhill woodlands with acidic, sandy soils].
 - 6 Stems usually 10-18 per crown, decumbent to weakly ascending; leaves opposite (scales on the lower stem sometimes alternate), fleshy, blue-green with a narrow, thickened, red-hyaline margin; branching dichotomous from the base of the plant (the branches typically equal, though sometimes unequal) *E. ipecacuanhae*
 - 6 Stems 1-4 (-9) per crown, erect to strongly ascending; leaves alternate, opposite, or in whorls of 3 (at least some alternate on a plant), less fleshy, green to blue-green, without a red margin (or with a very narrow, slightly red-hyaline, but not thickened margin in *E. exserta*); branching alternate below the inflorescence (rarely dichotomous or trichotomous), the branches typically unequal.

- 7 Cyathia and capsules green; petaloid appendages white or pink; leaves thin-textured, green, finely pubescent with appressed white hairs (0.1-0.3 mm long) on the lower surface and margins (visible at 10× or greater); branching primarily alternate; leaves primarily alternate (typically opposite or 3-whorled below the inflorescence); cyathia unisexual, plants usually unisexual (dioecious).....*E. curtisii*
- 7 Cyathia and capsules maroon; petaloid appendages maroon-red; leaves slightly fleshy, somewhat blue-green, glabrous; branching primarily opposite; leaves primarily opposite (usually some alternate on upper branches); cyathia bisexual, plants bisexual.....*E. exserta*

Key D – subgenus *Esula*

- 1 Principal stem leaves finely serrulate (especially toward the apex); [subgenus *Esula*, section *Helioscopia*].
 - 2 Ovary and capsule smooth.....*E. helioscopia*
 - 2 Ovary and capsule verrucose-roughened.
 - 3 Seeds smooth or very obscurely reticulate, 2-2.5 mm long.....*E. obtusata*
 - 3 Seeds distinctly alveolate, 1.5-1.8 mm long.....*E. spathulata*
- 1 Principal stem leaves entire.
 - 4 Stem leaves opposite, decussate (each succeeding pair turned by 90 degrees); seeds 4-6 mm long; [subgenus *Esula*, section *Lathyris*]*E. lathyris*
 - 4 Stem leaves alternate (or mostly so); seeds 1-3 mm long.
 - 5 Stem leaves linear to narrowly oblong, averaging ca. 10× as long as wide; [subgenus *Esula*, section *Esula*].
 - 6 Stem leaves 1-3 cm long, 1-3 mm wide.....*E. cyparissias*
 - 6 Stem leaves 3-8 cm long, 4-8 mm wide.....*E. virgata*
 - 5 Stem leaves oblanceolate, obovate, elliptic, or oblong, 1-10 cm long, 5-30 mm wide, averaging 1-5× as long as wide.
 - 7 Principal stem leaves elliptic to oblong, (5-) 7-10 cm long; rhizomatous perennial to 1 m tall; seeds smooth, 3-5 mm long; rays of the umbel usually 5-8; [subgenus *Esula*, section *Helioscopia*]*E. purpurea*
 - 7 Principal stem leaves oblanceolate to obovate, 1-2 cm long; annual, biennial, or perennial by basal offshoots, to 0.4 m tall; seeds pitted, 1.3-2.0 mm long; rays of the umbel 3 (-5).
 - 8 Seeds pitted only on one face, the inner face furrowed; [subgenus *Esula*, section *Tithymalus*]*E. peplus*
 - 8 Seeds pitted on both the inner and outer faces.
 - 9 Seeds coarsely pitted with transversely elongate pits in 4 vertical rows (appearing nearly transversely rugose); glands of the cyathia crescent-shaped, the horns short and blunt; [subgenus *Esula*, section *Pithyusa*]*E. falcata*
 - 9 Seeds finely pitted with numerous, evenly distributed, isodiametric pits; glands of the cyathia crescent-shaped, the horns slender, elongate, and caudate; [subgenus *Esula*, section *Tithymalus*].
 - 10 Biennial, 20-40 cm tall; seeds > 1.8 mm long; primary ray bracts about as long as wide.....*E. commutata*
 - 10 Annual, 8-32 cm tall; seeds 1.6-2.1 mm long; primary ray bracts about as long as broad or longer than broad.
 - 11 Seeds whitish-gray, 1.6-1.7 mm long; [on granite in GA].....*E. georgiana*
 - 11 Seeds lustrous brown, 1.9-2.1 mm long; [on limestone and shale from TN westwards].....*E. ouachitana*

Euphorbia blodgettii Engelmann ex A.S. Hitchcock. Dunes, hammocks, sandhills, other dry sandy habitats. From St. Johns and Levy counties, FL south to s. FL; Bermuda; West Indies; Central and South America. [= *Chamaesyce blodgettii* (Engelmann ex A.S. Hitchcock) Small – K2, WH3; > *C. blodgettii* – S; > *C. chiogenes* Small – S; > *C. nashii* Small – S] {not yet keyed}

Euphorbia bombensis Jacquin, Southern Seaside Spurge, Dixie Sandmat. Open sands of dunes, dune blowouts and overwashes, often growing with perennial grasses such as *Uniola paniculata*, but preferring open sands with little competition, sometimes mixed with the more common *E. polygonifolia*. Jun-Oct. E. VA south to s. FL along the Atlantic, from s. FL to TX and Mexico along the Gulf of Mexico, and south into n. South America. Johnson (1992) contrasts the habitat of this species with that of the closely similar *E. polygonifolia*; *E. bombensis* prefers areas behind the foredune, while *E. polygonifolia* prefers the pioneer situation on the upper beach and foredune front. [= Q, Va; = *Chamaesyce bombensis* (Jacquin) Dugand – K, WH3, Z; = *Euphorbia ammannioides* Kunth – C, F, G, RAB; > *Chamaesyce ingallsii* Small – S]

Euphorbia commutata Engelmann ex A. Gray, Woodland Spurge, Tinted Spurge. Rich forests and rock outcrops, over calcareous or mafic rocks. Mar-Jul. PA west to s. ON and MN, south to FL and TX. The southern var. *erecta* J.B.S. Norton may be worthy of recognition; we have both it and the typic var. *commutata* in our area. Var. *erecta* (ranging north to VA, KY, and MO) has all the cauline leaves oblanceolate and with petioles 5-12 mm long; var. *commutata* has leaves varying from oblanceolate to obovate or ovate, the upper leaves usually broad and sessile. [= F, K, Pa, Q, RAB, V, Va, W, WH3, WV; > *E. commutata* var. *commutata* – C, G; > *E. commutata* var. *erecta* J.B.S. Norton – C, G; = *Galarhoeus commutatus* (Engelmann) Small – S]

Euphorbia cordifolia Elliott, Heartleaf Sandmat. Open sands of very dry sandhills. Jul-Oct. Se. NC south to s. FL and west to se. OK (Singhurst, Buthod, & Holmes 2012) and s. TX. [= Q, RAB; = *Chamaesyce cordifolia* (Elliott) Small – K, S, WH3, Z]

Euphorbia corollata Linnaeus, Eastern Flowering Spurge. Woodlands and forests. Jun-Sep. NH and MA west to s. ON, MI, WI, MN, and NE, south to se. VA, c. NC, n. GA, s. AL, and e. TX. Huft (1979) considered *E. marilandica* a sporadic growth form of *E. corollata*. [= K, Pa, Va, WV, Y, Z; > *E. corollata* var. *corollata* – C, F; > *E. marilandica* Greene – C, F, G; > > *E. corollata* – G, W (also see *E. pubentissima*); = *E. corollata* var. *corollata* – RAB; = *Tithymalopsis corollata* (Linnaeus) Klotzsch – S; < *E. corollata* var. *corollata* – Q (also see *E. discoidalis*)]

Euphorbia cumulicola (Small) Oudejans. Dunes and Florida scrub. Peninsular FL; w. Panhandle FL (Escambia County). [= Q; = *Chamaesyce cumulicola* Small – K, S, WH3]

Euphorbia curtisii Engelm., White Sandhills Spurge, Curtis's Spurge. Sandhills. Late Mar-Jun. Sc. and se. NC to ne. FL and w. Panhandle FL, on the Coastal Plain. Less variable in leaf shape than *E. ipecacuanhae* or *E. exserta*. [= GW, K, Q, RAB, WH3, Y, Z; > *Tithymalopsis curtisii* (Engelmann) Small – S; > *Tithymalopsis eriogonoides* Small – S]

Euphorbia cyathophora Murray, Painted Leaf, Fire-on-the-mountain. Disturbed habitats, dune. Jun-Oct. E. VA, KS, and CA south into the New World tropics, the original range obscure. [= C, K, Q, Va; > *E. heterophylla* Linnaeus var. *heterophylla* – F, RAB, misapplied; > *E. heterophylla* var. *graminifolia* Engelm. – F, RAB; = *E. heterophylla* – G; > *Poinsettia cyathophora* (Murray) Klotzsch & Garcke – S, WH3; > *Poinsettia heterophylla* – S, misapplied]

* *Euphorbia cyparissias* Linnaeus, Cypress Spurge, Graveyard Spurge. Roadbanks, graveyards, waste places; native of Europe. Mar-May (occasionally later). [= C, F, G, K, Pa, Q, RAB, Va, W, WV; = *Galarhoeus cyparissias* (Linnaeus) Small ex Rydberg – S; = *Tithymalus cyparissias* (Linnaeus) Lamarck]

* *Euphorbia davidii* Subils, David's Spurge. Disturbed areas; native of sw. United States, Mexico. Introduced in se. TN (Chester, Wofford, & Kral 1997). [= K, Q; ? *E. dentata* var. *gracillima* Millspaugh] {not yet keyed}

* *Euphorbia dentata* Michaux, Painted Leaf, Wild Poinsettia, Toothed Spurge. Disturbed areas, hedgerows, thickets, railroad cinders; native of w. North America. Jul-Oct. [= C, F, G, Pa, Q, RAB, Va, W, WV; ? *E. dentata* var. *dentata* – K; = *Poinsettia dentata* (Michaux) Klotzsch & Garcke – S, WH3]

Euphorbia discoidalis Chapman, Summer Spurge. Sandhills. E. and c. GA (or e. SC?) south and west to Panhandle FL and e. TX. Park (1998) includes in synonymy *E. corollata* var. *angustifolia* Elliott, which has a stated type locality in e. SC. [= K, WH3, Y; < *E. corollata* var. *corollata* – Q; = *Tithymalopsis discoidalis* (Chapman) Small – S] {augment}

Euphorbia exigua Linnaeus, Dwarf Spurge. Disturbed areas; rare, native of Europe. In PA and WV (Kartesz 1999). [= K, V, WV; ? *E. exigua* ssp. *exigua* – Q] {not yet keyed}

Euphorbia exserta (Small) Coker, Maroon Sandhills Spurge, Coastal Sand Spurge. Sandhills. Mar-Jun. Sc. NC south to c. peninsular and e. Panhandle FL; disjunct in se. VA (Sussex County) (Belden et al. 2004). The leaves are extremely variable in size and shape, from linear to rotund. Park (1998) recognizes *E. exserta* and *E. gracilior* as distinct from one another, differing in the involucre (purple in *E. exserta* and green in *E. gracilior*) and the appendages (rudimentary and purple in *E. exserta* and semicircular and white in *E. gracilior*). [= K, Q, Va, WH3, Z; = *E. gracilior* Cronquist – RAB; > *Tithymalopsis exserta* Small – S; > *Tithymalopsis gracilis* (Boissier) Small – S; > *E. exserta* – Y; > *E. gracilior* – Y]

* *Euphorbia falcata* Linnaeus. Roadsides, other disturbed areas; native of Europe. [= C, F, G, K, Pa, Va, WV; > *E. falcata* ssp. *falcata* – Q]

Euphorbia floridana Chapman, Florida Spurge. Sandhills, Florida scrub. May-Sep. Panhandle FL and sw. GA west to s. MS. Reported for sw. GA by Bridges & Orzell (2002) and Jones & Coile (1988). [= K, Q, WH3, X; = *Galarhoeus floridanus* (Chapman) Small – S] {not yet keyed}

Euphorbia georgiana M.H. Mayfield, Georgia Spurge. Granite outcrops. Apr-May. See Mayfield (2013) for detailed information. [= V]

Euphorbia glyptosperma Engelm., Ridge-seed Spurge. {}. East to sc. TN (Chester, Wofford, & Kral 1997). In VA, WV, LA (Q). [= C, F, G, Q; = *Chamaesyce glyptosperma* (Engelmann) Small – K]

* *Euphorbia graminea* Jacquin. Landscaped areas, other disturbed areas. Native of tropical America. Naturalized in FL Panhandle, FL peninsula, and s. AL (Diamond 2014). [= WH3; = *Agaloma graminea* (Jacquin) D.B. Ward] {not yet keyed}

* *Euphorbia helioscopia* Linnaeus, Wartweed. Disturbed areas, roadsides, cultivated ground; native of Europe. Late Mar-Jun. [= C, F, G, K, Pa, RAB, Va; = *Galarhoeus helioscopia* (Linnaeus) Haworth - S; > *E. helioscopia* ssp. *helioscopia* - Q]

Euphorbia heterophylla Linnaeus, Fiddler's Spurge, Mexican Fireplant. Disturbed areas. All year. [= K, Q; > *Poinsettia heterophylla* (Linnaeus) Klotzsch & Garcke ex Klotzsch - S; > *Poinsettia geniculata* Ortega - S; = *Poinsettia heterophylla* (Linnaeus) Klotzsch & Garcke ex Klotzsch - WH3]

* *Euphorbia hexagona* Nuttall ex Sprengel, Six-angle Spurge. Disturbed areas; native of c. North America. [= K] {not yet keyed; add to synonymy}

Euphorbia hirta Linnaeus, Pillpod Sandmat. Fields, disturbed ground, waste areas, in and around greenhouses, perhaps only adventive in the northern part of our area. (Jan-) Jun-Oct (-Dec). E. NC, c. SC, south to s. FL, west to TX, and south into Central and South America. Reported for Goldsboro, NC and Abbeville, Abbeville County, SC (C.N. Horn, pers. comm. 2008). [= C, G, Q, RAB; = *Chamaesyce hirta* (Linnaeus) Millsbaugh - K, S, WH3, Z]

Euphorbia humistrata Engelman, Spreading Sandmat. Floodplain forests, exposed river shores, rocky riverside gravel bars, disturbed areas, some of the easternmost occurrences apparently adventive from farther west. ON and MN south to Panhandle FL and TX; scattered eastward, apparently as an adventive. [= C, F, G, Q, Va, WV; = *Chamaesyce humistrata* (Engelmann) Small - GW, K, S, WH3, Z]

Euphorbia hypericifolia Linnaeus. {}. Reported for SC (Kartesz 1999), FL, GA, LA (Q). {Investigate} FL west to TX, south into Mexico, Central America, South America; West Indies. [= Q; = *Chamaesyce hypericifolia* (Linnaeus) Millsbaugh - K, S, WH3] {not yet keyed}

Euphorbia hyssopifolia Linnaeus, Hyssopleaf Sandmat. Disturbed ground. May-Oct. SC south to s. FL, west to LA; also in w. TX, s. NM, and n. Mexico, and south to s. South America. Its status in our area has been muddled by confusion with *E. nutans*. [= Q; = *Chamaesyce hyssopifolia* (Linnaeus) Small - GW, K, WH3, Z]

Euphorbia inundata Torrey ex Chapman var. *inundata*, Flatwood Spurge. Wet pine flatwoods, savannas, seepage slopes. Ne. FL and se. GA (Bridges & Orzell 2002); Panhandle FL west to s. MS. Var. *garrettii* Bridges & Orzell is endemic to c. and s. FL peninsula. [= WH3, X; < *E. inundata* - K, Q; < *Galarhoeus inundatus* (Torrey ex Chapman) Small - S] {not yet keyed; subgenus

Euphorbia, section *Nummulariopsis*;

Euphorbia ipecacuanhae Linnaeus, Carolina Ipecac. Sandhills, other dry, barren sands. Feb-May (and later, especially in response to fire). CT (formerly), NY (Long Island), NJ, and se. PA (Rhoads & Block 2007) south to ec. GA, on the Coastal Plain. The leaves are extremely variable in size and shape, from linear to rotund. Huft (1979) considered *E. arundelana* Bartlett (reported from MD, SC, and GA) a sporadic form of *E. ipecacuanhae*. [= C, G, K, Pa, RAB, Q, Va, Z; > *E. ipecacuanhae* - F; > *E. arundelana* Bartlett - F; = *Tithymalopsis ipecacuanhae* (Linnaeus) Small - S]

* *Euphorbia lathyris* Linnaeus, Caper Spurge, Myrtle Spurge, Mole Plant. Roadsides, disturbed areas; native of Europe. May-Aug. [= F, K, Pa, Q, RAB, Va, W, WV; = *E. lathyris* - C, G, an orthographic variant; = *Galarhoeus lathyris* - S]

Euphorbia maculata Linnaeus, Milk-purslane, Spotted Spurge. Gardens, fields, disturbed places, crevices in pavement or sidewalks. Jan-Dec. QC west to ND, south to s. FL and TX; introduced in various places worldwide. [= C, G, Pa, Q, Va, W; = *Chamaesyce maculata* (Linnaeus) Small - GW, K, S, WH3, Z; > *Euphorbia supina* Rafinesque - F, RAB, WV]

* *Euphorbia marginata* Pursh, Snow-on-the-mountain. Roadsides, disturbed areas; native w. North America. Jul-Nov. [= C, F, G, K, Pa, Q, RAB, Va, WH3, WV; = *Lepadena marginata* (Pursh) Nieuwland - S; = *Agaloma marginata* (Pursh) A. & D. Löve]

Euphorbia mercurialina Michaux, Cumberland Spurge, Mercury Spurge. Rich moist forests over mafic or calcareous rocks. May-Jun. S. KY south through e. TN to nw. GA and n. AL; disjunct in sc. NC, where found in 1992. Apparently introduced in VA. [= C, F, G, K, Q, W, Y, Z; = *Tithymalopsis mercurialina* (Michaux) Small - S]

Euphorbia mesembrianthemifolia Jacquin. Dunes. FL peninsula (from Flagler County on the east coast and Dixie County on the west coast south to s. FL); Bermuda; West Indies; Central America. [= *Chamaesyce mesembrianthemifolia* (Jacquin) Dugand - K2, WH3] {not yet keyed; not mapped}

Euphorbia nutans Lagasca y Segura, Eyebane. Fields, gardens, waste places, disturbed ground. May-Oct. NH west to MI and ND, south to Panhandle FL and TX; introduced in various places worldwide. [= C, Pa, Q, Va, W = *Chamaesyce nutans* (Lagasca y Segura) Small – GW, K, WH3, Z; = *Euphorbia maculata* Linnaeus – F, RAB, WV, misapplied; = *Euphorbia preslii* Guss. – G; = *Chamaesyce hyssopifolia* (Linnaeus) Small – S, in part, misapplied]

Euphorbia obtusata Pursh, Woodland Spurge. Rich bottomland forests. Apr-Jul. Sc. PA west to IN and IA, south to SC and TX. [= C, F, G, Pa, RAB, W, WV; < *E. spathulata* Lamarck – K1, K2, Q; = *Galarhoeus obtusatus* (Pursh) Small – S]

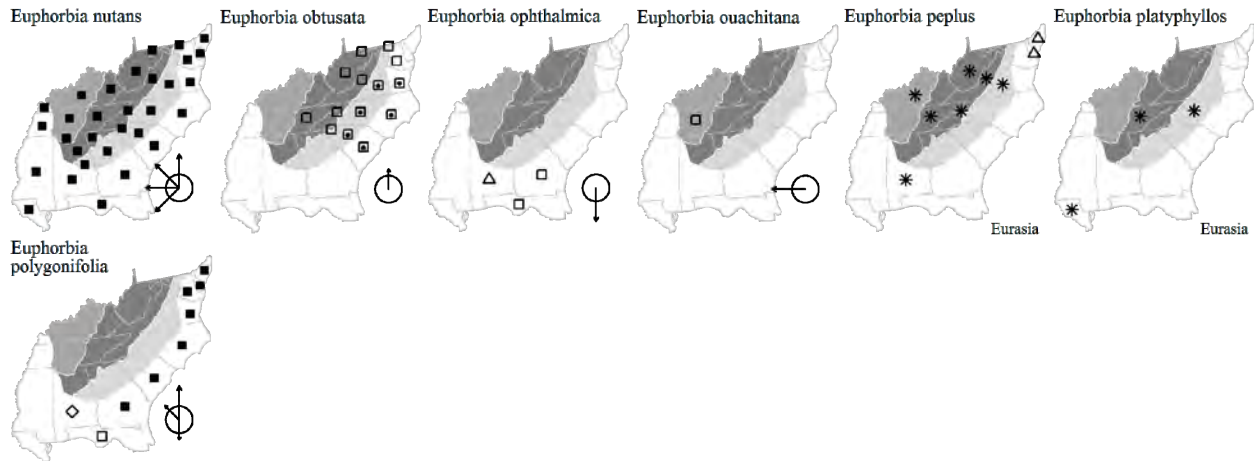

Euphorbia ophthalmica Persoon, Florida Hammock Sandmat. Roadsides, flowerbeds, other disturbed areas, hammocks. GA and PA (Kartesz 1999), widespread in FL (WH), but not in North America (Q). See Barger et al. (2012) for discussion of AL occurrences. [= Q; = *Chamaesyce ophthalmica* (Persoon) Burch – K, WH3; ? *Chamaesyce gemella* (Lagasca y Segura) Small] **{not yet keyed}**;

Euphorbia ouachitana M.H. Mayfield, Ouachita Spurge. Dry woodlands and forests over shale or limestone. Apr-May. Endemic to the Interior Highlands; disjunct to Cumberland River bluffs in Smith and Clay counties, TN (D. Estes, pers. comm. 2012). [= V]

* **Euphorbia peplus** Linnaeus, Petty Spurge. Disturbed areas; native of Eurasia. Jun-Sep. Naturalized in Watauga County, NC (Poindexter, pers. comm.). [= C, F, G, K, Pa, V; = *Galarhoeus peplus* (Linnaeus) Haworth – S; > *E. peplus* var. *minima* A.P. de Candolle – Q; > *E. peplus* var. *peplus* – Q; = *Tithymalus peplus* (Linnaeus) Hill]

* **Euphorbia platyphyllos** Linnaeus, Broadleaf Spurge. Disturbed areas. Naturalized in e. TN in Knox County (B.E. Wofford, pers. comm., 2012), and scattered other locations in e. North America. Jun-Aug. [= C; = *Euphorbia platyphylla* – F, G, orthographic variant; = *Galarhoeus platyphylla* (Linnaeus) Small – S, orthographic variant; = *Galarhoeus platyphyllos* (Linnaeus) Small; = *Tithymalus platyphyllos* (Linnaeus) Hill] **{not yet keyed}**; subgenus *Esula*, sect. *Helioscopia*]

Euphorbia polygonifolia Linnaeus, Northern Seaside Spurge, Northern Sandmat. Open sands of dunes, upper beach, dune blowouts and overwashes, sometimes growing with perennial grasses such as *Uniola paniculata*, but preferring open sands with little competition, sometimes mixed with the less common *E. bombensis*. May-Oct. NS to ne. FL along the Atlantic Ocean; disjunct to the Great Lakes. See *E. bombensis* for discussion of the habitats of these related species. [= C, F, G, Pa, Q, RAB, Va; = *Chamaesyce polygonifolia* (Linnaeus) Small – K, S, WH3, Z]

* **Euphorbia prostrata** Aiton, Prostrate Sandmat. Crevices of pavement or sidewalks, disturbed places; probably native of tropical America and only naturalized in our area. Jan-Dec. [= C, Q, Va; = *Chamaesyce prostrata* (Aiton) Small – K, S, WH3, Z; = *Euphorbia chamaesyce* Linnaeus – F, G, RAB, misapplied]

Euphorbia pubentissima Michaux, Southeastern Flowering Spurge. Dry woodlands, sandhills. Mar-Jul. C. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS. [= K, Va, WH3, Y, Z; > *E. corollata* Linnaeus var. *zinniiflora* (Small) H.E. Ahles – RAB; >> *E. corollata* Linnaeus var. *corollata* – RAB, in part; = *E. corollata* var. *paniculata* Boissier – C, F, Q; > *E. zinniiflora* Small – F, WV; > *E. apocynifolia* Small – F; > *E. corollata* var. *mollis* Millspaugh – F; < *E. corollata* – G, W; > *Tithymalopsis zinniiflora* (Small) Small – S; > *Tithymalopsis apocynifolia* (Small) Small – S; > *Tithymalopsis paniculata* (Boissier) Small – S; = *Agaloma pubentissima* (Michaux) D.B. Ward]

Euphorbia purpurea (Rafinesque) Fernald, Glade Spurge, Darlington Spurge, Purple Spurge. Rich moist forests in bottomlands or on slopes, in rich soil around rock outcrops, in swamps or seeps, especially over calcareous rocks (such as dolomite) or mafic rocks (such as amphibolite). May-Sep. NJ, PA, and OH south to w. NC and n. GA. [= C, F, G, K, Pa, Q, RAB, Va, W, WV; = *Galarhoeus darlingtonii* (A. Gray) Small – S]

Euphorbia serpens (Kunth) Small. Dry sandy hammocks. Jul-Oct. Allegedly in se. PA (Rhoads & Klein 1993). [= C, F, G, Pa, Q; = *Chamaesyce serpens* (Kunth) Small – K, S, WH3]

Euphorbia serpyllifolia Persoon var. *serpyllifolia*. Disturbed areas; native of the Great Plains. Jul-Oct. Also in GA, PA, and DE (Kartesz 1999). In NC, GA, SC (Q) {investigate} [= Q: = *Chamaesyce serpyllifolia* (Persoon) Small ssp. *serpyllifolia* – K; < *Chamaesyce serpyllifolia* – Pa; < *C. serpyllifolium* – WH3, orthographic variant] **{not yet keyed}**

Euphorbia spathulata Lamarck, Prairie Spurge, Warty Spurge. Rocky woodlands, disturbed areas. May-Jun. MN and WA south to w. VA, AL, LA, TX, and Mexico. [= C, Va, W, WH3; > *E. dictyosperma* Fischer & Meyer – F, G; < *E. spathulata* – K1, K2, Q (also see *E. obtusata*); > *Galarhoeus arkansanus* (Engelmann & A. Gray) Small ex Rydberg – S]

Euphorbia telephioides Chapman. Pine flatwoods. Endemic to FL Panhandle (Bay, Franklin, and Gulf counties). [= K, WH3; = *Galarhoeus telephioides* (Chapman) Small – S] **{not yet keyed; add to synonymy; subgenus *Euphorbia*, section *Nummulariopsis*}**

Euphorbia tetrapora Engelmann. AR and OK south to w. LA and TX; allegedly also in AL and GA (Kartesz 2010), the basis for the records in our area unknown. [= K, Q, V] **{not yet keyed; add to synonymy; subgenus *Esula*, section *Tithymalus*}**

Euphorbia vermiculata (Rafinesque) House, Hairy Spurge. Mt (VA, WV): disturbed areas; rare. Widespread and common in PA (Rhoads & Klein 1993; Rhoads & Block 2007). [= C, F, G, Pa, Q, Va, WV; = *Chamaesyce vermiculata* (Rafinesque) House – K]

* *Euphorbia virgata* Waldstein & Kitaibel, Wolf's-milk, Leafy Spurge. Disturbed areas; native of Eurasia. May-Sep. [< *E. esula* Linnaeus – C, F, G, Pa, WV, misapplied; = *E. esula* Linnaeus var. *uralensis* (Fischer ex Link) Dorn – K1, K2; ? *E. esula* ssp. *esula* – Q; < *Tithymalus esula* (Linnaeus) Scopoli, misapplied]

Manihot P. Miller 1754 (Cassava)

A genus of about 100 species, trees, shrubs, and herbs, of tropical and subtropical America. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

- 1 Leaf lobes 3-7, each broadest toward the tip, narrowing evenly toward the acuminate apex; calyx of male flowers < 10 mm long; fruit wing-angled.....*M. esculenta*
- 1 Leaf lobes 9-13, each constricted near the tip and then broadening again; calyx of male flowers 12-15 mm long; fruit not winged.....*M. grahamii*

* *Manihot esculenta* Crantz, Manioc, Tapioca. Disturbed areas; native of tropical America. Naturalized on the Gulf Coast, as in AL and s. FL. [= K2, WH3, Z; = *Jatropha manihot* Linnaeus – S]

* *Manihot grahamii* Hooker, Hardy Tapioca, Graham's Cassava. Suburban forests, vacant lots, other disturbed areas, uncommonly grown as an ornamental, rarely naturalizing; native of tropical America. Introduced in sw. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009), FL Panhandle, peninsular FL, west to LA and TX (Aplaca 2012). [= K2, WH3, Z]

Mercurialis Linnaeus 1753 (Mercury)

A genus of about 8 species, herbs, of the Old World. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

* *Mercurialis annua* Linnaeus, Annual Mercury, Boys-and-girls. Disturbed areas, waif on ballast; native of Mediterranean Europe. This species has been reported as a rare "ballast weed" from Charleston, SC and Mobile, AL (Wiggins 1932); some of the occurrences presumably represent non-persistent waifs. [= C, F, G, K, S, Z] {not yet keyed}

Ricinus Linnaeus 1753 (Castor-bean)

A monotypic genus, a shrub or tree, native to w. Africa, now pantropical. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

* *Ricinus communis* Linnaeus, Castor-bean, Castor-oil Plant, Palma Christi. Waste places, gardens; native of the tropics, probably Africa. Jul-Oct. The seeds are dangerously poisonous, formerly the source of an oil used as a purgative and machine lubricant. In FL and farther south in the tropics, *R. communis* is a small to medium tree. [= C, F, G, K, Pa, RAB, WH3, Z]

Sapium Jacquin 1760 (Milktree)

A genus of about 25 species, trees and shrubs, of the Neotropics. The most recent monographers of *Sapium* and related genera (Kruijt 1996; Esser 2002) separate *Triadica* from *Sapium* sensu stricto. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Kruijt (1996)=Z; Govaerts, Frodin, & Radcliffe-Smith (2000)=Y; Webster in Kubitzki (2014). [also see *Triadica*]

* *Sapium haemospermum* Müller of Aargau, Milk-tree. Disturbed areas; native of n. South America. Known in our area only from Escambia County, FL, where not recently seen. [= Y, Z; ? *S. caribaeum* Urban – K; ? *S. glandulosum* (Linnaeus) Morong – S, WH3]

Stillingia Garden ex Linnaeus 1767 (Queen's-delight)

A genus of about 30 species, herbs, shrubs, and small trees, of tropical to subtropical regions of America, Madagascar, and se. Asia. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

- 1 Stems woody, single; leaves < 1 cm wide; [of pineland ponds and other aquatic habitats] *S. aquatica*
- 1 Stems herbaceous, several from a crown; leaves > 1 cm wide; [of dry habitats]..... *S. sylvatica*

Stillingia aquatica Chapman, Corkwood, Water Toothleaf. Ponds in pine flatwoods. May-Sep. Se. SC south to s. FL, west to sw. AL. [= K, RAB, S, WH3, Z]

Stillingia sylvatica Garden ex Linnaeus, Queen's-delight. Sandhills, dryish coastal plain woodlands. May-Jul; Jun-Sep. Se. VA south to s. FL, west to TX and NM, north in the interior to KS. Ssp. *tenuis* (Small) D.J. Rogers of s. FL is sometimes recognized. [= C, G, RAB, WH3; > *S. sylvatica* var. *sylvatica* – F; > *S. sylvatica* ssp. *sylvatica* – K, Va, Z; > *S. sylvatica* – S; > *S. spathulata* (Müller of Aargau) Small – S]

Tragia Linnaeus 1753 (Noseburn)

A genus of about 170 species, herbs and shrubs, of tropical to warm temperate regions of the Old and New Worlds. References: Miller & Webster (1967)=Z; Govaerts, Frodin, & Radcliffe-Smith (2000)=Y; Webster in Kubitzki (2014).

- 1 Plant vining and trailing; larger leaf blades on a plant > 5 cm wide and > 8 cm long, deeply cordate at the base *T. cordata*
- 1 Plant not vining, erect; larger leaf blades on a plant < 3.5 cm wide and < 8 cm long, cuneate, rounded, truncate, or shallowly cordate at the base.
 - 2 Leaf base cuneate at base; leaf blade 3-20× as long as wide *T. urens*
 - 2 Leaf base cordate, subcordate, truncate, or broadly rounded at base; leaf blade 1-3× as long as wide.
 - 3 Petioles 1-4 mm long; leaves rounded to acute at the tip; stamens 2 (-3)..... *T. smallii*
 - 3 Petioles 3-35 mm long; leaves acute to acuminate at the tip; stamens 3 (-5).
 - 4 Pedicels of the staminate flowers 0.7-1 mm long, the lower persistent part 0.3-0.6 mm long; [rare disjunct eastward from a sc. US distribution] *T. betonicifolia*
 - 4 Pedicels of the staminate flowers 1.5-2 mm long, the lower persistent part 1-1.8 mm long; [widespread in our area]..... *T. urticifolia*

Tragia betonicifolia Nuttall. Glades and dry bluffs. MO and KS south to w. LA and TX; disjunct eastward in KY, TN, and possibly AL. [= K2, Y, Z; = *T. urticifolia* Michaux var. *texana* Shinnery]

Tragia cordata Michaux, Heartleaf Noseburn. Rocky calcareous woodlands, calcareous prairies. C. KY, s. IN to s. MO, south through c. TN, rarely to e. TN (Meigs County, in the Ridge and Valley Province) (Chester, Wofford, & Kral 1997), n. AL (Jackson Co.) (D. Spaulding pers. comm.) to sc. and sw. GA, Panhandle FL, and e. TX. [= C, K, WH3, Y, Z; = *T. macrocarpa* Willdenow – S]

Tragia smallii Shinnery, Gulf Coast Noseburn. Sandhills. Sw. GA south to c. peninsular FL, west to e. TX and sw. AR. Reports of *T. betonicifolia* from GA are based on misapplication of that name to material representing *T. smallii*. [= K, WH3, Y, Z; = *T. betonicaefolia* Nuttall – S, misapplied; = *T. betonicifolia* Nuttall, misapplied]

Tragia urens Linnaeus, Southeastern Noseburn, Wavyleaf Noseburn. Sandhills, sandy woodlands, other woodlands. May-Oct. Se. VA south to s. FL and west to TX, mostly on the Coastal Plain, but ranging into the mountains southward. [= C, F, G, K, RAB, S, Va, W, WH3, Y, Z; = *T. linearifolia* Elliott – S]

Tragia urticifolia Michaux, Nettleleaf Noseburn. Dry woodlands and rock outcrops, particularly over mafic or calcareous rocks. May-Oct. Sc. VA west to MO, KS, and CO, south to c. peninsular FL, Panhandle FL, and AZ. [= F, G, K, RAB, Va, W, WH3, Y, Z; = *T. urticaefolia* – S, orthographic variant]

Triadica Loureiro 1790 (Chinese Tallow-tree)

A genus of 3 species, native to tropical and subtropical Asia. The most recent monographers of *Sapium* and related genera (Kruijt 1996; Esser 2002) place our naturalized species in the genus *Triadica*, native to Asia; *Sapium* (excluding *Triadica*) is a genus of 21 species restricted to the neotropics. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Wurdack in FNA (in prep.); Kruijt (1996)=Z; Esser (2002)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000)=X; Webster in Kubitzki (2014).

* **Triadica sebifera** (Linnaeus) Small, Chinese Tallow-tree, Popcorn Tree. Marsh edges, shell deposits, disturbed areas; native of e. Asia. May-Jun; Aug-Nov. With *Euphorbia* and *Cnidocolus*, one of our few Euphorbiaceous genera with milky sap. *Triadica sebifera* has become locally common from Colleton County, SC southward through the tidewater area of GA, and promises to become a serious weed tree (as it is in parts of LA, TX, and FL). [= FNA, K1, K2, S, X, Y, Z; = *Sapium sebiferum* (Linnaeus) Roxburgh – GW, RAB, WH3]

Vernicia Loureiro 1790 (Tung-oil Tree)

A genus of 3-4 species, trees, native of se. Asia. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z; Webster in Kubitzki (2014).

* **Vernicia fordii** (Hemsley) Airy-Shaw, Tung-oil Tree, Tung Tree. Planted for the oil and for ornament; native of central and western China. Naturalized on the Gulf Coastal Plain from former plantations; planted and showing a tendency to naturalize in the Coastal Plain of NC (Mount Olive, Wayne Co.). [= K2, Z; = *Aleurites fordii* Hemsley – WH3]

189. PHYLLANTHACEAE Martinov 1820 (Leaf-flower Family) [in MALPIGHIALES]

A family of about 60 genera and 1800 species, trees, shrubs, and herbs, mainly tropical. References: Webster (1994); Chase et al. (2002); Webster in Kubitzki (2014).

- 1 Shrub; petals present; stamens 5-6.....*Phyllanthopsis*
- 1 Tree or annual herb; petals absent; stamens 3.

- 2 Tree; nectary disc absent; seed coat fleshy.....*Glochidion*
 2 Annual herb; nectary disc present; seed coat dry.....*Phyllanthus*

***Glochidion* J.R. Forster & G. Forster (Needlebush, Cheesetree)**

A genus of 300 species, shrubs and trees, of Asia, Australia, and nearby islands, perhaps to be combined into *Phyllanthus*.
 References: Levin in FNA (in prep.); Webster in Kubitzki (2014).

* ***Glochidion puber*** (Linnaeus) Hutchinson. Disturbed areas; native of China, Japan, and Taiwan. Apr-Aug; Jul-Nov. Fearn & Urbatsch (2001) discuss in detail its naturalization in s. AL (Mobile County), where it has now been found spreading at several locations (H. Horne, pers. comm., 2014). [= FNA; = *Glochidion puberum* – K2, orthographic variant; = *Phyllanthus puber* (Linnaeus) Müller of Aargau]

***Phyllanthopsis* (Scheele) Vorontsova & Petra Hoffman 2008 (Maidenbush)**

A genus of 2 species, shrubs, of sc. North America (United States and Mexico). Generic boundaries have been troublesome (see synonymy). References: Vorontsova & Hoffman (2008); Wurdack et al. (2004); Webster in Kubitzki (2014).

Phyllanthopsis phyllanthoides (Nuttall) Vorontsova & Petra Hoffman, Maidenbush. Barrens, including river-scour barrens, on limestone or other calcareous rock. C. MO, AR, and OK, south to c. TX; disjunct in c. AL and ec. TN. [= *Leptopus phyllanthoides* (Nuttall) G.L. Webster – K; = *Andrachne phyllanthoides* (Nuttall) Coulter – F, G]

***Phyllanthus* Linnaeus 1753 (Leaf-flower)**

A genus of 800-1300 species, trees, shrubs, and herbs, of tropical, subtropical and warm temperate regions of the Old and New Worlds. Heterogeneous and perhaps to be divided. References: Levin in FNA (in prep.); Rossignol, Rossignol, & Haicour (1987)=Z; Webster (1970)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000)=X; Webster in Kubitzki (2014).

- 1 Plant with “normal” arrangement of branches and leaves (leaves uniformly distributed on the stem and branches, alternate and either distichous or spirally arranged, the ultimate branches not deciduous, flowers produced on ultimate and penultimate orders of branches); [subgenus *Isocladus*].
 - 2 Leaves arranged distichously; stipules typically auriculate; [section *Loxopodium*].
 - 3 Stems terete; filaments free; seeds 0.8-1.0 mm long; [widespread in our area].....*P. caroliniensis* ssp. *caroliniensis*
 - 3 Stems flattened and winged; filaments connate; seeds 1.3-1.5 mm long; [of e. LA westward].....*P. evanescens*
 - 2 Leaves arranged spirally; stipules not auriculate; [section *Paraphyllanthus*].
 - 4 Plant herbaceous, with a single or few stems; seeds 1.7-1.8 mm long; calyx lobes 2.8-3.5 mm long (when in fruit); [endemic to FL Gulf Coast].....*P. liebmannianus* ssp. *platylepis*
 - 4 Plant suffruticose, with many stems clustered from the plant base; seeds 1.1-1.5 mm long; calyx lobes 1.5-2.5 mm long (when in fruit); [of e. LA westward].....*P. polygonoides*
- 1 Plant with “phyllanthoid” arrangement of branches, leaves, and flowers (leaves lacking on the main stem, the penultimate order of branches with scales arranged spirally, the ultimate order of branches deciduous, bearing normal leaves alternately and distichously, flowers produced only on the ultimate, deciduous branches).
 - 5 Stamens 5, filaments free; fruiting pedicels capillary, 3-7 mm long; seeds densely papillose; [subgenus *Kirganelia*].....*P. tenellus*
 - 5 Stamens 3, filaments connate into a column 0.1-0.15 mm long; fruiting pedicels thicker and often also shorter; seeds variously ribbed or striate; [subgenus *Phyllanthus*].
 - 6 Fruiting pedicels 0.5 mm long; seeds with 12-15 transverse ridges and sometimes 1-3 pits; male flowers borne toward the tip of the branchlets, female flowers toward the base; [section *Urinaria*].....*P. urinaria* ssp. *urinaria*
 - 6 Fruiting pedicels > 0.5 mm long; seeds longitudinally ribbed or striate; female flowers borne toward the tip of the branchlets, male flowers toward the base; [section *Phyllanthus*].
 - 7 Cymules bisexual (each with 1 female and 1 male flower); calyx lobes of male flowers 4 (-5).....*P. abnormis* var. *abnormis*
 - 7 Cymules unisexual; calyx lobes usually 6.....*P. fraternus*

Phyllanthus abnormis* Baill. var. *abnormis, Drummond’s Leaf-flower. Dunes. All year. Ne. FL south to s. peninsular FL; TX south into Mexico. Another variety occurs along the Rio Grande River in TX. [= FNA, K, X, Y; > *P. garberi* Small – S; < *P. abnormis* – WH3]

* ***Phyllanthus amarus*** Schumacher, Gale-of-wind, Carry-me-seed. Disturbed roadsides; native of s. Asia. Also reported for NC and SC (Radford, Ahles, & Bell 1968) and for AL and MS (Kartesz 2010); it appears that these reports represent misidentified material and are actually *P. tenellus* (Webster 1970). [= WH3] {not yet keyed or mapped}

Phyllanthus caroliniensis* Walter ssp. *caroliniensis, Carolina Leaf-flower. Roadsides, moist woodlands, forests, and fields, often in seasonally wet, muddy places. Jul-Nov. PA and IL south to c. peninsular FL and TX, and south to Argentina and Paraguay, the original range not clear, and perhaps introduced in part of the area. Ssp. *saxicola* (Small) G.L. Webster (sometimes treated as a species) is restricted to s. FL, the Bahamas, and Greater Antilles. [= FNA, K, Va, X, Y; < *P. caroliniensis* – RAB, F, G, Pa, W, WV; = *P. caroliniensis* var. *caroliniensis* – C, WH3; < *P. carolinensis* – GW, orthographic error; = *P. caroliniensis* – S]

Phyllanthus evanescens Brandege. Coastal prairies, disturbed areas. AL (Macon County) (Diamond 2014), LA (St. Charles Parish) west to TX; south into Mexico and Central America. Mar-Nov. [= FNA; > *Phyllanthus pudens* L.C. Wheeler – K, X, Y]

* *Phyllanthus fraternus* G.L. Webster. Disturbed areas; native of India and Pakistan. S. FL, MS, LA. Introduced in SC (Kartesz 1999, 2010). [= FNA, K, WH3, X, Y]

Phyllanthus liebmannianus Müller of Aargau *ssp. platylepis* (Small) G.L. Webster. Wet hammocks. Late Mar-late Jun. Endemic to the “Big Bend” area of the FL Gulf Coast (Dixie, Levy, and Taylor counties). Apparently closely related to *P. liebmannianus* *ssp. liebmannianus* of the western Gulf Coast (Tamaulipas south to Yucatan and Belize). [= FNA, K, WH3, X, Y; = *Phyllanthus platylepis* Small – S]

Phyllanthus niruri Linnaeus. Reports of *P. niruri* Linnaeus from NC and SC (Ahles, Bell, & Radford 1958) have proved to be *P. tenellus* (Webster 1970). {rejected; not keyed or mapped}

Phyllanthus pentaphyllus Wright, Fivepetal Leaf-flower. Unlikely to be correctly labeled from Darlington County, SC (as also indicated by RAB), is here excluded.

Phyllanthus polygonoides Nuttall ex Sprengel. Grasslands, calcareous glades. Apr-Oct. E. LA west to NM, south into Mexico. [= FNA, K, X, Y]

* *Phyllanthus tenellus* Roxburgh, Mascarene Island Leaf-flower. Disturbed areas, especially in and around greenhouses; native of the Mascarene Islands. This species appeared in FL in the 1920's, s. GA in the 1940's, SC in the 1950's, NC in the 1960's, and TN in the 1970's (Kral 1981). Reported from a single collection from VA, as a “contaminant in a container plant” (Virginia Botanical Associates 2007). [= FNA, GW, K, WH3, Y; = *P. amarus* – RAB, misapplied (misidentified); > *P. tenellus* var. *tenellus* – X]

* *Phyllanthus urinaria* Linnaeus *ssp. urinaria*, Chamber Bitter. Gardens and roadsides, apparently preferring nitrogen-rich soils; native of tropical Southeast Asia, now scattered in the tropics and subtropics of both hemispheres. Mar-Nov. This species appeared in the 1940's to 1960's in FL, GA, AL, LA, TX, and NC, and in the 1970's in TN (Kral (1981). [= FNA, X, Z; < *P. urinaria* – GW, K, WH3, Y]

190. ELATINACEAE Dumortier 1829 (Waterwort Family) [in MALPIGHIALES]

A family of 2 genera and about 35 species, herbs. References: Tucker & Grissom in FNA (in prep.); Tucker (1986); Kubitzki in Kubitzki (2014).

Elatine Linnaeus 1753 (Waterwort)

A genus of about 10 species, aquatic, tropical and temperate, especially North America and Eurasia. References: Tucker & Grissom in FNA (in prep.); Tucker (1986); Kubitzki in Kubitzki (2014).

- 1 Seeds mostly straight, the areoles elliptic, the rounded ends not dovetailing into adjacent rows, the longitudinal ridges thus appearing straight and distinct; seeds basal-axile, extending lengthwise through the capsule, not overlapping; leaves 1-5 mm long; flowers mostly 2-merous *E. minima*
- 1 Seeds mostly curved, the areoles 6-sided, the angular ends dovetailing into the adjacent rows, the longitudinal ridges thus appearing broken or irregular; seeds axile, attached along an elevated placenta at different levels, therefore overlapping; leaves 1-15 mm long; flowers mostly 3-merous.
 - 2 Leaves obovate to broadly spatulate, rounded at the tip, 3-8 mm long, the larger 1.5-5 mm wide; seeds with 20-30 pits in each row *E. americana*
 - 2 Leaves linear-lanceolate to narrowly spatulate, emarginate to truncate to rounded at the tip, 1-15 mm long, the larger 0.5-3 mm wide; seeds with 9-25 pits in each row.
 - 3 Leaves 1.5-4 mm long, 0.7-1.8 mm wide; seeds with 9-15 pits per row *E. brachysperma*

- 3 Leaves 2.8-15 mm long, 0.5-3 mm wide; seeds with 16-25 pits per row *E. rubella*

Elatine americana (Pursh) Arnott, American Waterwort. Cp (DE, VA), Mt (NC, SC): tidal flats, lakes; rare. Jul-Oct. Widespread in ne. United States, s. to NC and MO. The only known site for this species in NC is an artificial lake; it is uncertain whether it should be considered native or introduced. [= F, FNA, K, Pa, S, Va; < *E. triandra* Schkuhr – RAB, W; = *E. triandra* var. *americana* (Pursh) Fassett – C, G, GW]

Elatine brachysperma A. Gray, Shortseed Waterwort. Pd (GA): {habitat not known}; rare. It has been reported for nc. GA (Jones & Coile 1988). [= F, FNA, K; = *E. triandra* Schkuhr var. *brachysperma* (A. Gray) Fassett – C, G]

Elatine minima (Nuttall) Fischer & C.A. Meyer, Tiny Waterwort. Cp (DE, VA), Pd (NC, SC): tidal flats, lakes, mud flats; rare. Jul-Oct. First found in NC in 1990, *E. minima* is widespread in ne. United States, south to VA, NC, and SC (Horn, pers. comm. 2004). The only known site for this species in NC is the spillway of an artificial lake (Lake Butner, Granville County); it is uncertain whether it should be considered native or exotic in NC. It may have been introduced by waterfowl or humans. [= C, F, FNA, G, K, Pa, Va]

Elatine rubella Rydberg, Three-stamen Waterwort. Pd (SC): ponds; rare. This species occurs in AL (Fayette County) as well as north of our area (Haynes 1998). Hill & Horn (1997) reported *E. triandra* for SC, but the specimen may represent *E. rubella* Rydberg (Horn, pers. comm. 2004). [= FNA, K2]

196. CHRYSOBALANACEAE R. Brown 1818 (Coco-plum Family) [in MALPIGHIALES]

A family of about 18 genera and 530 species, trees and shrubs, of tropical and subtropical areas, especially tropical America. References: Prance & Sothers (2003); Prance (1970); Prance in Kubitzki (2014).

Licania Aublet (Gopher-apple)

A genus of about 218 species, trees and shrubs, mainly of tropical America, but with a few species in Africa and Asia. References: Prance (1970)=X; Prance (1972)=Y; Prance & Sothers (2003)=Z; Prance in Kubitzki (2014).

Licania michauxii Prance, Gopher-apple, Ground-oak. Sandhills, dry sandy pinelands. May-Jun; Sep-Oct. Se. SC south to s. FL, west to LA, becoming abundant and ubiquitous in dry sandy habitats in the southern part of its range. *L. michauxii* is one of 49 species of subgenus *Moquilea*, section *Moquilea*, which is distributed from se. North America through Central America and the West Indies to South America; our species may be most closely related to *L. retifolia* Blake, a small tree of sw. Mexico and El Salvador (Prance 1970; Prance & Sothers 2003). A rare upright shrub form (to over 15 dm tall) has been found in Brevard County, FL, suggesting that *L. michauxii* evolved from a taller and more upright ancestor (Ward & Taylor 1999). [= K, WH3, X, Y, Z; = *Chrysobalanus oblongifolius* Michaux – RAB; > *Geobalanus oblongifolius* (Michaux) Small – S; > *Geobalanus pallidus* Small – S]

Licania michauxii

199a. PASSIFLORACEAE A.L. de Jussieu ex Kunth 1817 (Passionflower Family) [in MALPIGHIALES]

A family of about 27 genera and 935 species, vines, shrubs, trees, and herbs, of tropical and warm temperate regions, especially America and Africa. Here circumscribed to exclude Turneraceae, counter the recommendation of Angiosperm Phylogeny Group (2009); see comments under Turneraceae. References: Feuillet & MacDougal in Kubitzki, Bayer, & Stevens (2007); Arbo in Kubitzki, Bayer, & Stevens (2007).

- 1 Corona present, of several series of frills; stamens elevated on an androgynophore; herbaceous vine or woody liana *Passiflora*
 1 Corona absent; stamens not elevated on an androgynophore; upright herb [see *Piriqueta* in TURNERACEAE]

Passiflora Linnaeus 1753 (Passionflower)

A genus of about 525 species, vines, shrubs, and trees, largely of tropical America, with a few species in warm temperate America and Asia. References: Ulmer & MacDougal (2004)=Z; Vanderplank (2000)=Y; Feuillet & MacDougal in Kubitzki, Bayer, & Stevens (2007).

Identification notes: *Passiflora* flowers are structurally striking. There are 5 sepals and either 0 or 5 petals; a **corona** of numerous linear structures is present, arranged in 1-several series. The ovary, 3 styles, and 5 stamens are basally adnate and elevated on an **androgynophore**.

Most species have **glands** on the leaves which function as extrafloral nectaries; these can be seen as paired glands on the leaf petiole (in all our species except *P. lutea*), and some species also have **laminar glands** on the leaf blade, near the margin.

- 1 Sepals 25-35 mm long, green on the outer surface, white on the inner surface; petals 30-40 mm long, lavender, violet, or mauve; berry 40-70 mm long; corona in 2-3 series, the longer 15-30 mm long; [subgenus *Passiflora*; supersection *Passiflora*] ***P. incarnata***
- 1 Sepals 5-20 mm long, green, pale yellow or white; petals 5-11 mm long, greenish yellow to white (or absent in *P. gracilis* and *P. pallida*); berry 6-40 mm long; [subgenus *Decaloba*].
- 2 Petiole lacking paired glands; leaf blade lacking laminar glands; berry 7-12 mm long; [subgenus *Decaloba*; supersection *Decaloba*] ***P. lutea***
- 2 Petiole with paired glands, variously positioned near the junction of the petiole and leaf blade, or toward the base of the petiole; leaf blade usually with at least a few laminar glands; berry **either** 6-15 mm long **or** 25-40 mm long.
- 3 Sepals 5-10 mm long; petals absent; corona in 2 series the outer 3-7 mm long; berry 6-10 (-15) mm long; [native, of ne. FL southward]; [subgenus *Decaloba*, supersection *Sieca*] ***P. pallida***
- 3 Sepals 10-20 mm long; petals **either** 4-11 mm long **or** absent; corona in 1-2 series, the longer 5-11 mm long; berry 20-40 mm long; [alien]; [subgenus *Decaloba*, supersection *Bryonioides*].
- 4 Petals absent; sepals 10-14 mm long, 2-4 mm wide; corona in 2 series, the outer (longer) 6-9 mm long, the inner ca. 1 mm long; berry 20-30 mm long, scarlet when ripe; leaves 3-lobed, entire, with petiolar glands toward the base of the petiole [***P. gracilis***]
- 4 Petals present, 43-11 mm long; sepals 13-20 mm long, 5-8 mm wide; corona in 1 series, 5-11 mm long; berry 30-40 mm long, purple or black when ripe; leaves 3 (-5)-lobed, serrate, with petiolar glands in the upper half of the petiole [***P. morifolia***]

* ***Passiflora caerulea*** Linnaeus, Blue Passionflower, Common Passionflower. Cultivated, sometimes escaped in disturbed areas, native of South America. Naturalized in s. AL and se. LA. [= K2] {not yet keyed}

* ***Passiflora gracilis*** Jacquin ex Link, Annual Passionflower. Native of Mexico, Central America, and n. South America. Reported for SC (Kartesz 1999). {investigate – not in SC Plant Atlas} [= K2, Y, Z]

Passiflora incarnata Linnaeus, Maypops, Purple Passionflower. Roadsides, fencerows, thickets, fields. May-Jul (-later); Jul-Oct. S. NJ, DE, MD, sw. PA, OH, and OK, south to s. FL and s. TX. Certainly one of our most interesting and beautiful flowers. [= C, F, G, K2, RAB, S, Va, W, WH3, WV, Z]

Passiflora lutea Linnaeus, Eastern Yellow Passionflower. Woodlands, forests, thickets, maritime forests. May-Sep; Aug-Oct. DE, PA, OH, IN, IL, MO, and e. KS, south to c. peninsular FL, s. AL, s. MS, s. LA, and s. TX. Sometimes divided into two varieties, the more eastern var. *lutea* (west to WV and AL) with pilose calyx, petioles, and stems, and more western var.

glabriflora Fernald (east to WV and AL) with glabrous calyx, petioles, and stems; it is not clear that this is anything more than a minor polymorphism. [= K1, K2, Pa, RAB, S, Va, W, WH3, Z; > *P. lutea* var. *lutea* – C, F, G, WV; > *P. lutea* var. *glabriflora* Fernald – C, F, G, Mo, WV]

* ***Passiflora morifolia*** Masters. Thickets; native of South America. May-Jul; Jul-Oct. [= K2, RAB, Z; > *P. morifolia* – Y; > *P. warmingii* Masters – S, Y]

Passiflora pallida Linnaeus, West Indian Corkystem Passionflower. Hammocks, shell middens. Ne. FL (Dixie and Duval counties) south to s. FL; West Indies; Yucatan. Ulmer & MacDougal (2004) state that the Florida and West Indian component of what has been broadly treated as *P. suberosa* warrants specific status. [= S; < *P. suberosa* Linnaeus – K2, WH3, Y, Z]

199b. TURNERACEAE Kunth ex A. de Candolle 1828 (Turnera Family) [in MALPIGHIALES]

A family of about 10 genera and 200 species, herbs, of tropical and subtropical America and Africa. Angiosperm Phylogeny Group (2009) treats this as included in Passifloraceae (along with Malesherbiaceae), but these 3 traditional families are each monophyletic and morphologically distinctive (Tokuoka 2012) and seem better retained at family rank. References: Tokuoka (2012).

Piriqueta Aublet 1775

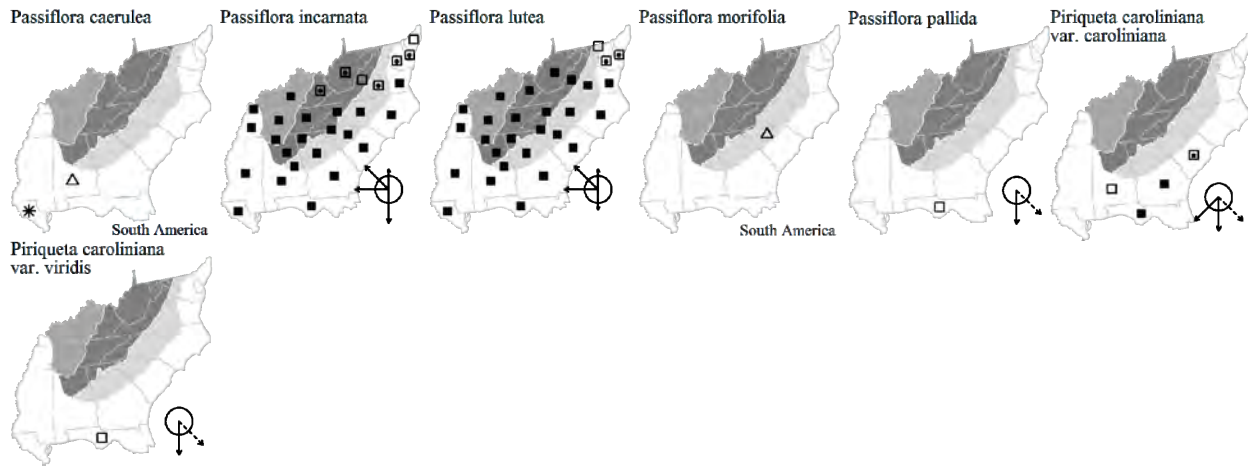

A genus of about 20-50 species, herbs and shrubs, of tropical and subtropical America (Thulin et al. 2012). References: Arbo (1990, 1995)=Z; Maskas & Cruzan (2000).

- 1 Foliage hirsute and tomentose throughout ***P. caroliniana* var. *caroliniana***
- 1 Foliage glabrous, at least in the inflorescence ***P. caroliniana* var. *viridis***

Piriqueta caroliniana (Walter) Urban var. *caroliniana*. Longleaf pine sandhills, sandy soils of roadsides, woodland edges, and disturbed areas. May-Sep. SC south to s. FL; Cuba and Hispaniola; and in Central and n. South America. Arbo (1990; 1995) treats *P. caroliniana* (and without infrataxa) as a subspecies of *P. cistoides*, but the morphological distinctions seem strong and the two taxa have widely overlapping distributions in the Neotropics. Moreover, variation in morphology and habitat seems to warrant recognition of several taxa at infraspecific rank, at least within Arbo's *P. cistoides* ssp. *caroliniana*. Maskas & Cruzan (2000) discuss variation and evolutionary taxa in this complex in the southeastern United States and the Bahamas. [< *P. caroliniana* – RAB; < *P. cistoides* (Linnaeus) Grisebach ssp. *caroliniana* (Walter) M.M. Arbo – K1, K2, WH3, Z; > *P. caroliniana* – S]

Piriqueta caroliniana (Walter) Urban var. *viridis* (Small) G.S. Torrey. Flatwoods, other pinelands. S. Florida extending northward to mid-peninsular FL, and (at least as introgressants with var. *caroliniana*) to n. FL; West Indies. [< *P. cistoides* (Linnaeus) Grisebach ssp. *caroliniana* (Walter) M.M. Arbo – K1, K2, WH3, Z; > *P. glabrescens* Small – S; > *P. viridis* Small – S]

* ***Piriqueta cistoides*** (Linnaeus) Grisebach. Reported for GA (Kartesz 1999), but the documentation is untraceable. [= *P. cistoides* ssp. *cistoides* – K1, K2, Z] {not keyed; rejected pending better documentation}

201. SALICACEAE de Mirbel 1815 (Willow Family) [in MALPIGHIALES]

A family of 55 genera and about 1010 species (as circumscribed to include the Flacourtiaceae), trees, shrubs, and subshrubs, nearly cosmopolitan. References: Argus, Eckenwalder, & Kiger in FNA (2010).

- 1 Leaf blades 0.8-2 (-3)× as long as wide; stamens 5-80; buds covered by several, overlapping scales; flowering catkins arching or drooping *Populus*
- 1 Leaf blades (2-) 3-30× as long as wide; stamens 1-9; buds covered by a single scale; flowering catkins usually erect or ascending *Salix*

Populus Linnaeus 1753 (Poplar, Aspen, Cottonwood)

A genus of about 35 species, trees, largely north temperate. References: Eckenwalder in FNA (2010); Eckenwalder (1977)=Z; Eckenwalder (1984)=Y; Eckenwalder (1996); Hamzeh & Dayanandan (2004).

- 1 Winter buds not viscid; stamens 5-20.
 - 2 Stamens 12-20; scales of the catkins deeply fimbriate; petioles terete; [section *Leucoides*] *P. heterophylla*
 - 2 Stamens 5-12; scales of the catkins dentate or with only 3-7 linear-triangular lobes; petioles strongly flattened laterally (90 degrees to the plane of the leaf blade), especially near the junction with the blade; [section *Populus*].
 - 3 Petioles strongly flattened laterally; leaves glabrous when mature (pubescent when young in *P. grandidentata*); [native trees].
 - 4 Leaf margins coarsely crenate- or undulate-toothed, with fewer than 12 (-15) teeth per side, the sinuses of the larger teeth 1.5-6 mm deep; leaves puberulent beneath when young (glabrate in age); buds gray-pubescent *P. grandidentata*
 - 4 Leaf margins finely crenulate-serrulate, with (12-) 15-35 (-45) teeth per side, the sinuses 0.5-1.0 mm deep; leaves glabrous; buds glossy brown *P. tremuloides*
 - 3 Petioles terete or nearly so; leaves densely pubescent (*P. alba*) or glabrescent (*P. ×canescens*); [exotic trees].
 - 5 Leaves of vigorous shoots palmately 3-5 (-7)-lobed (and also toothed); leaves densely white-tomentose beneath when young and mature *P. alba*
 - 5 Leaves of vigorous shoots merely toothed; leaves glabrescent when mature *P. ×canescens*
- 1 Winter buds viscid (sticky and shiny as if recently varnished); stamens (15-) 20-80.
 - 6 Petiole terete or dorsally flattened (in the plane of the leaf blade), and often also channeled above; leaf blades dark green above, glaucous white beneath; leaf margin not translucent, finely serrate with teeth < 1 mm deep; [section *Tacamahaca*].
 - 7 Petioles 7-10 cm long; leaves ovate, broader below the midpoint; leaf base rounded to subcordate; twigs terete or slightly angled in cross-section *P. balsamifera*
 - 7 Petioles < 2 cm long; leaves obovate, broader past the midpoint; leaf base cuneate to rounded; twigs strongly angled in cross-section [*P. simonii*]
 - 6 Petiole laterally flattened (90 degrees to the plane of the leaf blade), especially near the junction with the blade; leaf blades light green above, often paler beneath but not distinctly whitened; leaf margin translucent, finely to coarsely serrate with teeth > 1 mm deep.
 - 8 First-year branches reddish-brown; leaves noticeably paler beneath; flattened portion of petiole < 2× as deep as wide; early leaves with > 20 teeth per side, the largest < 2.5 mm deep; [probable intersectional hybrid of section *Aegeiros* and section *Tacamahaca*] *P. ×jackii*
 - 8 First-year branches yellow- to orange- brown; leaves nearly the same color above and below; flattened portion of petiole > 2× as deep as wide; early leaves usually with < 20 teeth per side, the largest < 2.5 mm deep; [section *Aegeiros*].
 - 9 Stigmas 3-4; stamens (30-) 40-80; [native tree, common] *P. deltoides* ssp. *deltoides*
 - 9 Stigmas 2-3; stamens (15-) 20-30; [alien trees, rare out of cultivation].
 - 10 Floral disk 2-4 mm wide; stigmas 2-3; ovules and seeds 6-14 (-20) per placenta *P. ×canadensis*
 - 10 Floral disk 1-2 mm wide; stigmas 2; ovules and seeds 4-8 per placenta *P. nigra*

* *Populus alba* Linnaeus, Silver Poplar, White Poplar. Disturbed areas, roadsides, forest edges, suburban woodlands; native of Europe. Mar-May. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WH3, WV]

Populus balsamifera Linnaeus, Balsam Poplar, Hackmatack, Tacamahac. Floodplains, disturbed areas. NL (Labrador) and AK south to PA, WV, OH, IN, IL, IA, SD, CO, ID, and OR; scattered farther south by introduction. Ranges south to s. PA (Rhoads & Block 2007), e. and c. KY (Clark et al. 2005), and to VA (according to Kartesz 1999). Also reported for n. GA (Jones & Coile 1988) and provisionally for SC (Kartesz 1999). Many of the attributions of this species to states in our area are based on misidentifications. [= C, FNA, G, Pa, WV; = *P. balsamifera* ssp. *balsamifera* – K; > *P. balsamifera* var. *balsamifera* – F; > *P. balsamifera* var. *magnifica* Marie-Victorin – F; > *P. balsamifera* var. *subcordata* Hylander; > *P. balsamifera* var. *michauxii* (Dode) Henry]

* **Populus ×canadensis** Moench (pro sp.) [*P. deltoides* × *nigra*], Hybrid Black Poplar. Disturbed areas. Reported for a county in c. GA (Jones & Coile 1988) and for NC and VA (Kartesz 1999). [= C, FNA, K, Mo, Pa]

* **Populus ×canescens** (Aiton) Sm. (pro sp.) [*P. alba* × *tremula*], Gray Poplar. Roadsides, disturbed areas; native of Europe. Mar-Apr. Occurs at scattered locations in TN, n. GA (Jones & Coile 1988), se. PA (Rhoads & Block 2007), and NC, SC, and VA (Kartesz 1999). See Poindexter (2006). [= C, FNA, K, Pa; = *P. canescens* (Aiton) Sm. – F, G]

Populus deltoides Bartram ex Marshall ssp. *deltoides*, Eastern Cottonwood. Riverbanks, bottomland forests (not found along blackwater streams), river bars, rarely weedy in upland situations. Mar-Apr. Ssp. *deltoides* ranges from QC west to MN, south to n. peninsular FL, Panhandle FL, and TX. Ssp. *monilifera* (Aiton) Eckenwalder [var. *occidentalis* Rydberg] is more western, primarily of the Great Plains. [= FNA, K, Mo, Z; = *P. deltoides* var. *deltoides* – C, GW, Va; < *P. deltoides* – G, Pa, RAB, W, WH3, WV; > *P. deltoides* var. *deltoides* – F; > *P. deltoides* var. *missouriensis* (A. Henry) A. Henry – F; = *P. balsamifera* Linnaeus – S, misapplied]

Populus grandidentata Michaux, Bigtooth Aspen. Dry, rocky, upland forests, old fields, forest edges, mesic forests. Mar-May. NS west to MN, south to w. NC, sc. TN, and n. MO. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV]

Populus heterophylla Linnaeus, Swamp Cottonwood. Blackwater and brownwater swamp forests, tidal swamp forests, depression ponds, interdune ponds. Mar-Apr. CT west to MI, south to Panhandle FL and LA, scattered and irregular in distribution, absent from the Appalachians. [= C, FNA, G, GW, K, Mo, Pa, RAB, S, Va, WH3]

* **Populus ×jackii** Sargent [probably *P. balsamifera* × *deltoides*], Balm-of-Gilead. Bottomlands, riverbanks, streambanks, spread from cultivation. Apr. This cultivar is of uncertain origin, considered by some to be a hybrid *P. balsamifera* × *deltoides*, by others to be an atypical pistillate clone of *P. balsamifera* Linnaeus. The cultivar 'gileadensis' is distinguished from the typical form by the petioles densely and stiffly pubescent (vs. petioles glabrous). *P. ×jackii* is locally abundant along the New River in Watauga, Ashe, and Alleghany counties, NC and downstream into VA. [= C, FNA, K, Mo, Pa, Y; = *P. candicans* Aiton – G, RAB, S, misapplied; > *P. ×gileadensis* Rouleau – F, W, WV]

* **Populus nigra** Linnaeus, Black Poplar, Lombardy Poplar. Disturbed suburban areas; native of s. Europe. Mar-May. Cultivated in various forms, especially the columnar 'Lombardy Poplar'; short-lived and weakly spreading to disturbed areas in the vicinity of plantings, especially by root sprouts (Diamond 2013). [= C, F, FNA, G, K, Mo, Pa; > *P. italica* (Du Roi) Moench – S; > *P. nigra* var. *italica* Du Roi – WV]

* **Populus simonii** Carrière, Chinese Poplar, Simon's Poplar. Riverbanks, apparently rarely naturalized or persistent (as in the Mountains of NC); native of China. [= FNA]

Populus ×smithii Boivin [*P. grandidentata* × *tremuloides*]. {habitat}. South to MD and WV. [= C, FNA, K] {not yet keyed}

Populus tremuloides Michaux, Quaking Aspen. Heath balds, rocky woodlands, exposed rock outcrops, clearings, floodplains. Mar-May. NL (Labrador) west to AK, south to NJ, n. VA, nw. NC (where perhaps not native), WV, MO, and (in the Rockies) to TX and Mexico. [= C, FNA, G, K, Mo, Pa, S, Va, W, WV; > *P. tremuloides* var. *tremuloides* – F]

Salix Linnaeus 1753 (Willow)

A genus of about 400 species, trees, shrubs, and subshrubs, mostly north temperate and boreal. References: Argus in FNA (2010); Argus (1986)=Z; Dorn (1995)=Y; Argus (1997); Chen et al. (2010). Key adapted from Z and FNA.

- 1 Leaves mostly alternate, but some opposite or subopposite; [subgenus *Vetrix*, section *Helix*]..... *S. purpurea*
- 1 Leaves all alternate.

- 2 Bud apex sharp-pointed; bud scale margin free and overlapping; leaf blades 2.5-16× as long as wide; [subgenus *Protitea*].
- 3 Leaf blades (4-) 7-10 (-16)× as long as wide; leaf undersurface glaucous or not; [section *Humboldtianae*].
- 4 Leaves glaucous beneath; pistils borne on stipes averaging 2 mm long (range 1-5 mm); stipules usually prominent and persistent, to 15 mm long; leaf blades (4-) avg. 7.5 (-13)× as long as wide *S. caroliniana*
- 4 Leaves not (or thinly) glaucous beneath; pistils borne on stipes averaging 1 mm long (range 0.5-1.5 mm); stipules usually small and caducous, to 12 mm long; leaf blades (4-) avg. 9 (-16)× as long as wide *S. nigra*
- 3 Leaf blades 2.5-5 (-6)× as long as wide; leaf undersurface glaucous.
- 5 Leaf apex acuminate to caudate; branchlets yellow; [midwestern species east and south to KY and WV]; [section *Humboldtianae*].....
..... *S. amygdaloides*
- 5 Leaf apex acute; branchlets reddish brown or green; [rare plant of sphagnous seepage of s. AL, s.GA, and FL]; [section *Floridanae*]..
..... *S. floridana*
- 2 Bud apex blunt; bud scale margin fused; leaf blades 2-30× as long as wide.
- 6 Leaves green or pale green beneath.
- 7 Leaves linear, (7-) 11-19 (-30)× as long as wide; leaf margin distinctly glandular-denticulate; stomates present on the upper leaf surface; pistils pubescent to glabrescent; stamens 2, the staminate floral bracts tawny, the aments on leafy branches; [subgenus *Longifoliae*, section *Longifoliae*]..... *S. exigua* var. *sericans*
- 7 Leaves lanceolate or elliptic-lanceolate, 2-6× as long as wide; leaf margin serrate; stomates usually absent on the upper leaf surface; pistils glabrous; stamens 3, or if 2 (*S. eriocephala*), the staminate floral bracts dark brown, the aments sessile with a few leafy bracts.
- 8 Stipules persistent on their margins; pistillate floral bracts present after flowering; petioles not glandular; stamens 2; [subgenus *Vetrix*, section *Cordatae*] *S. eriocephala* var. *eriocephala*
- 8 Stipules glandular on their margins (stipules caducous and often absent in *S. pentandra*); pistillate floral bracts deciduous after flowering; petioles glandular near the junction with the blade; stamens 3-9; [subgenus *Salix*, section *Salicaster*].
- 9 Stipules persistent and prominently glandular; young leaves and twigs with reddish-brown hairs, glabrescent or glabrous later; leaves long-acuminate; capsules 5-7 mm long *S. lucida*
- 9 Stipules caducous, inconspicuously glandular; young leaves and twigs glabrous; leaves short-acuminate; capsules 8-9 mm long *S. pentandra*
- 6 Leaves glaucous beneath.
- 10 Leaf margin entire or crenate (to slightly and irregularly serrate); [subgenus *Vetrix*, section *Cinerella*].
- 11 Leaves glabrate (sparsely pubescent when young), not revolute *S. discolor*
- 11 Leaves permanently pubescent, at least on the lower surface (densely villous or tomentose when young), revolute.
- 12 Leaf margin entire and undulate; pistillate aments 1-3.5 cm long; pistils borne on stipes mostly < 2 mm long; staminate aments 0.5-2 cm long; shrubs, < 2 m tall.
- 13 Leaves stipulate; leaf blades (5-) avg. 7 (-13) cm long, (12-) avg. 17 (-35) mm wide; staminate aments 1-2 cm long; pistillate aments 2-3.5 cm long *S. humilis*
- 13 Leaves exstipulate; leaf blades (2.5-) avg. 4 (-5) cm long, (5-) avg. 7 (-10) mm wide; staminate aments 0.5-1.1 cm long; pistillate aments 1-2 cm long *S. occidentalis*
- 12 Leaf margin crenate or irregularly serrate (rarely nearly entire); pistillate aments 3-8 cm long; pistils borne on stipes mostly > 2 mm long; staminate aments 2-5 cm long; shrubs to small trees, mostly 3-15 m tall.
- 14 Trees or tall shrubs, to 15 m tall; decorticated wood of 1-4 year old branches smooth or with a few ridges usually < 5 mm long *S. caprea*
- 14 Shrubs, 3-7 (12) m tall; decorticated wood of 1-4 year old branches with numerous ridges, many of them longer than 2 cm.
- 15 Leaves tomentose beneath with a mixture of white and rusty hairs *S. atrocinerea*
- 15 Leaves tomentose beneath with white or gray hairs *S. cinerea*
- 10 Leaf margin serrulate or serrate.
- 16 Shrubs to 6 m tall; leaves lacking stomates on the upper surface; [native to our area]; [subgenus *Vetrix*].
- 17 Stipules prominent, 5-15 mm long; branches flexible; mature leaves glabrous or glabrescent beneath; staminate aments borne on short, leafy branches; [section *Cordatae*] *S. eriocephala* var. *eriocephala*
- 17 Stipules absent or of small glands (rarely to 4 mm long on vigorous shoots); branches brittle; mature leaves short-sericeous beneath; staminate aments sessile, sometimes with a few leafy bracts; [section *Griseae*] *S. sericea*
- 16 Trees; leaves with stomates on the upper surface; [introduced in our area]; [subgenus *Salix*].
- 18 Leaf margin coarsely and irregularly serrate; leaves glabrous beneath; leaf blade 4-7 (-10)× as long as wide; petioles (7-) 10-20 mm long, glabrous; [section *Salix*] *S. fragilis*
- 18 Leaf margin minutely and uniformly serrulate; leaves long-sericeous or glabrate beneath; leaf blade 5-13× as long as wide; petioles 3-12 mm long, tomentose or sericeous.
- 19 Leaves long-sericeous beneath; branches ascending (rarely pendulous); leaves narrowly lanceolate, with length/width ratio of 5-6.5; petioles 3-6 mm long; petioles 3-6 mm long, sericeous; flowering branchlets 1-1.5 cm long; [section *Salix*] *S. alba*
- 19 Leaves glabrate beneath; branches normally pendulous; leaves very narrowly lanceolate, with length/width ratio of 6.5-13; petioles 7-12 mm long; petioles 7-12 mm long, tomentose; flowering branchlets ca. 0.3 cm long; [section *Subalbae*].
- 20 Branches yellowish, yellow-green, or yellow-brown *S. ×sepulcralis*
- 20 Branches yellow-brown to red-brown, or gray-brown.
- 21 Pistillate catkins on branchlets that are (0-) 2-4 mm long; ovary beak abruptly tapered to styles; anthers 0.4-0.5 mm long *S. babylonica*
- 21 Pistillate catkins on branchlets that are 3-14 mm long; ovary beak gradually tapered to styles; anthers 0.5-0.8 mm long.
- 22 Petioles glabrous, pilose, or velvety to glabrescent on the upper surface; branches yellow-brown, gray-brown, or red-brown; staminate catkins loosely flowered, stout, nectaries connate connate and shallowly cup-shaped *S. ×pendulina*
- 22 Petioles short-silky on the upper surface; branches yellow-brown; staminate catkins moderately densely flowered, slender, nectaries distinct *S. ×sepulcralis*

* *Salix alba* Linnaeus, European White Willow. Disturbed bottomlands, other moist to wet disturbed areas; native of Eurasia. Mar-May. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, Z]

Salix amygdaloides Andersson, Peachleaf Willow. Floodplains and other wet places. Apr-Jun. QC west to BC, south to PA, n. WV, w. KY, MO, TX, NM, NV, AZ, and OR. [= C, F, FNA, G, K, Mo, Pa, Z]

* *Salix atrocinerea* Brotero, Common Sallow, Olive-leaf Willow, Large Gray Willow. Disturbed areas; native of w. Europe. Apr. Also reported as naturalized in KY (Clark et al. 2005) and PA (Kartesz 1999). [= FNA, K, Pa; = *S. cinerea* Linnaeus ssp. *oleifolia* (Smith) Macreight - Z; < *S. cinerea* - C, F, G, RAB]

* *Salix babylonica* Linnaeus, Weeping Willow. Disturbed bottomlands, streambanks, roadsides, impoundments, other disturbed areas; native of Asia. Mar-Apr. Note that many trees identified as *S. babylonica* may actually be one of two commonly cultivated hybrids, *S. × pendulina* and *S. × sepulchralis*, with *S. babylonica* as one parent. [= C, F, FNA, G, K, Mo, RAB, Va, W, WH3, WV, Z; < *S. babylonica* complex - Pa]

Salix bebbiana Sargent, Long-beaked Willow, Gray Willow. Upland and wetland thickets. Widespread and rather common in PA (Rhoads & Klein 1993; Rhoads & Block 2007) and also occurs in MD (Argus 1986) and NJ. [= C, FNA, K, Pa, Z; > *S. bebbiana* var. *bebbiana* - F] {subgenus *Salix*, section *Fulvae*} {not yet keyed}

* *Salix caprea* Linnaeus, Goat Willow, Great Sallow. Disturbed areas; native of Eurasia. Apr. [= C, F, FNA, G, K, Mo, Pa, Z]

Salix caroliniana Michaux, Carolina Willow, Coastal Plain Willow. Riverbanks, sandbars, interdune ponds, canal banks, other wet sites. Mar-May. Widespread in the Southeast, *S. caroliniana* has a peculiar range, with three main centers of distribution, the Coastal Plain from VA south to s. FL and west to s. AL and the FL Panhandle, the Interior Low Plateau of KY, TN, and n. AL, and an area of MO, AR, e. KS, and e. OK centered on the Ozark-Ouachita Highlands. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, Va, WH3, WV, Z; > *S. amphibia* Small - S; > *S. longipes* Andersson - S]

* *Salix cinerea* Linnaeus, Gray Willow. Disturbed areas; native of Eurasia. Apr. [= FNA, K, Mo, Pa; = *S. cinerea* ssp. *cinerea* - Z; < *S. cinerea* - C, F, G, RAB, WV (circumscription uncertain but apparently including *S. atrocinerea*)]

Salix discolor Muhlenberg, Pussy Willow. Calcareous wetlands, disturbed areas; apparently native in DE, VA, and WV, introduced only in NC. Mar-Apr. NL (Newfoundland) and AB south to DE, w. VA, WV, KY, MO, SD, and MT. [= C, FNA, K, Mo, Pa, S, Va, Z; > *S. discolor* var. *discolor* - F, G, WV; > *S. discolor* var. *latifolia* Andersson - F, G, WV; > *S. discolor* var. *prinooides* (Pursh) Andersson - WV]

* *Salix elaeagnos* Scopoli, Hoary Willow, Rosemary Willow, Diamond Willow. Reported for SC (Kartesz 1999), perhaps in error. [= FNA, K] {subgenus *Vetrix*, section *Canae*} {not yet keyed}

Salix eriocephala Michaux, Heart-leaved Willow, Diamond Willow, Missouri Willow. Streambanks, riverbanks, calcareous fens and marshes, river-scour prairies, impoundments, and other disturbed wet areas. Apr-May. NL (Newfoundland) west to ND, south to w. FL and s. KS (Dorn 1995). [= C, FNA, K, Mo, Pa, W, WH3, Z; > *S. rigida* Muhlenberg var. *rigida* - F, G; > *S. rigida* var. *angustata* (Pursh) Fernald - F; > *S. rigida* var. *vestita* (Andersson) Ball - G; = *S. cordata* Muhlenberg - S, misapplied; > *S. rigida* - WV; = *S. eriocephala* ssp. *eriocephala* var. *eriocephala* - Y]

Salix exigua Nuttall var. *sericans* (Nees) Dorn, Sandbar Willow. Sandbars, riverbanks, creekbanks, flood scours. Mar-mid May and Jun-Aug. *S. exigua* occurs throughout North America except most of the Southeast, south to DE, se. VA, w. VA, e. TN, MS, LA, TX, and Mexico; var. *sericans* is the more eastern variety of the complex (Nesom 2002). [< *Salix exigua* - W, Z; > *S. exigua* ssp. *interior* (Rowlee) Cronquist var. *angustissima* (Andersson) Reveal & Broome - C, Pa; > *S. interior* Rowlee var. *interior* - F, G; = *S. interior* Rowlee - FNA, GW, K, Mo, S, WV]

Salix floridana Chapman, Florida Willow. Sphagnum seepages and along spring runs. Mar-Apr. C. GA and s. AL (north to Butler County) (Diamond 2013) south to c. peninsular and Panhandle FL. [= FNA, GW, K, S, WH3, Z]

* *Salix fragilis* Linnaeus, Crack Willow, Brittle Willow. Low areas; native to Asia Minor, introduced to Europe and thence to North America. [= C, F, G, K, Pa, S, WV, Z; = *S. × fragilis* Linnaeus - FNA]

Salix humilis Marshall, Upland Willow, Prairie Willow. Upland areas, often in open or semi-open sites, in barrens, fens, rocky woodlands, and grassy balds over mafic rocks (such as amphibolite) up to at least 1800m elevation, also in powerline rights-of-way, woodland borders, and other miscellaneous habitats. Mar-May. NL (Newfoundland) and MB, south to FL and

TX. [= C, G, S, WH3; < *S. humilis* – RAB, GW (also see *S. occidentalis*); = *S. humilis* var. *humilis* – FNA, K, Mo, Pa, W, Z; > *S. humilis* var. *humilis* – F, WV; > *S. humilis* var. *hyporhysa* Fernald – F, WV]

* ***Salix lucida*** Muhlenberg, Shining Willow. Seepages, low areas. May. Uncertainly indigenous to the one known VA population in Roanoke County. [= C, FNA, Pa, W, WV, Z; > *S. lucida* var. *lucida* – F, G; = *S. lucida* ssp. *lucida* – K]

* ***Salix matsudana*** Koidzumi, Corkscrew Willow. Disturbed areas; doubtfully naturalized, native of e. Asia. Reported for VA (Fairfax and Fauquier counties). [= K] {not keyed}

Salix nigra Marshall, Black Willow. Riverbanks, sandbars, bottomland forests, floodplain pools, tidal swamps, impoundments, ditches, other moist areas. Mar-May. NB, MN, NE, and CO, south to ne. FL, Panhandle FL, LA, and TX. [= F, FNA, G, GW, K, Mo, Pa, RAB, Va, W, WH3, WV, Z; ? *S. nigra* var. *nigra* – C; > *S. nigra* – S; *S. marginata* Wimmers ex Andersson – S]

Salix occidentalis Walter, Dwarf Upland Willow, Sage Willow. Barrens, glades, rocky or hardpan woodlands, prairies, powerline rights-of-way, rarely in depression ponds, especially often over mafic (such as amphibolite), ultramafic (such as olivine), or calcareous rocks. Mar-May. This species is less widespread than the related *S. humilis*, with a distribution centered in the central Appalachians. ME to ND, south to GA, LA, and OK. [= C, Va; < *S. humilis* – GW, RAB; = *S. humilis* var. *microphylla* (Andersson) Fernald – F, W, Z; = *S. tristis* Aiton – G, S, WV; = *S. humilis* var. *tristis* (Aiton) Griggs – FNA, K, Mo, Pa]

* ***Salix ×pendulina*** Wenderoth [*S. babylonica* × *euxina*], Weeping Willow. Disturbed areas; a hybrid introduced from Europe. Mar-Apr. [= FNA, K, Mo; < *S. babylonica* complex – Pa]

* ***Salix pentandra*** Linnaeus, Bay Willow. Disturbed areas, perhaps not established; native of Eurasia. Apr. [= C, F, FNA, G, K, Pa, Z]

Salix petiolaris Sm., Meadow Willow. Streambanks. Apr-Jun. [= K2, Mo, Pa] {research; not yet keyed; add to synonymy}

* ***Salix purpurea*** Linnaeus, Basket Willow, Purple Willow, Purple Osier. Floodplain forests, streambanks, wet, disturbed areas; native of Europe. Apr. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, WV, Z]

* ***Salix ×rubens*** Schrank (pro sp.) [*S. alba* × *fragilis*]. Scattered localities in NC, KY, VA, MD, NJ... {research} [= Pa]

* ***Salix ×sepulcralis*** Simonkai [*S. alba* × *babylonica*], Weeping Willow. Disturbed areas; a hybrid introduced from Europe. Mar-Apr. [= FNA, K, Mo; < *S. babylonica* complex – Pa]

Salix sericea Marshall, Silky Willow. Bogs, fens, seeps, seepage swamps, peaty swamps, banks of small streams. Mar-May. *S. sericea* is a northeastern species, ranging south to w. NC, ne. GA, e. TN, sc. TN, AL, and AR. [= C, F, FNA, G, GW, K, Mo, Pa, RAB, S, Va, W, WV, Z]

* ***Salix triandra*** Linnaeus, Almond-leaf Willow. Disturbed areas, stream banks; native of Eurasia. Apr-May. [= FNA] {not yet keyed}

202. VIOLACEAE Batsch 1802 (Violet Family) [in MALPIGHIALES]

A family of about 31 genera and 1100 species, herbs, shrubs, lianas, and trees, cosmopolitan in distribution, but especially diverse in the tropics. References: Ballard (in prep.); Wahlert et al. (2014); Paula-Souza & Ballard (2014); Ballard, Paula-Souza, & Wahlert in Kubitzki (2014); McKinney & Russell (2002)=X.

- 1 Plants acaulescent or caulescent, 0-4 dm tall, if caulescent, the leaves not at the same time cuneate, short-petiolate, and acuminate; petals white, yellow, violet, or blue, the lowermost spurred..... *Viola*
- 1 Plants caulescent, 3-10 dm tall, the leaves narrowly cuneate to a petiole 0-20 mm long, also long acuminate; petals green.
 - 2 Leaves 9-17 cm long, entire (or with a few obscure teeth); capsule 15-20 mm long; seeds ca. 4 mm long; [native, of nutrient-rich forests]... *Cubelium*
 - 2 Leaves 0.6-3 cm long, finely crenate; capsule 3-4 mm long; seeds ca. 1.5 mm long; [alien, of weedy areas]..... *[Pombalia]*

***Cubelium* Rafinesque ex Britton & A. Brown 1897 (Green-violet)**

A monotypic genus, a perennial herb, native to eastern North America. References: Ballard (in prep.)=Z; Paula-Souza & Ballard (2014); Wahlert et al. (2014); McKinney & Russell (2002)=X; Ballard, Paula-Souza, & Wahlert in Kubitzki (2014).

Cubelium concolor (T.F. Forster) Rafinesque ex Britton & A. Brown, Green-violet. Very nutrient-rich and mesic forests, especially over calcareous substrates such as limestone and dolomite, sometimes extending upslope into dry-mesic or even dry forests and woodlands when the soils are very basic. Cleistogamous flowers: Apr-early May; late May-Jun. Chasmogamous flowers: Late May-Jun; Aug-Oct. VT and s. ON west to MI and KS, south to SC, GA, and AR. [= Mo, S, Z; = *Hybanthus concolor* (T.F. Forster) Sprengel – C, F, G, K, Pa, RAB, W, WH3, WV, Va, X]

***Pombalia* Vandelli 1771 (Green-violet)**

A genus of about 41 species, shrubs, herbs, and small trees, of tropical and warm temperate regions of the New World. See Paula-Souza & Ballard (2014) for detailed information on this genus. References: Ballard (in prep.)=Y; Paula-Souza & Ballard (2014)=Z; Wahlert et al. (2014); Ballard, de Paula-Souza, & Wahlert in Kubitzki (2014); Wofford et al. (2004). [also see *Cubelium*]

* ***Pombalia parviflora*** (Mutis ex Linnaeus f.) Paula-Souza. Disturbed area; native of South America. Apr. First collected in North America in New Jersey in the 19th century; and again in 1998 by Tom Govus at Fort Pulaski National Monument (Chatham County, GA); it is unclear whether this is a recent introduction or an old weed introduced via ship's ballast (Wofford et al. 2004). [= Y, Z; = *Hybanthus parviflorus* (Mutis ex Linnaeus f.) Baillon]

***Viola* Linnaeus 1753 (Violet, Johnny-jump-up, Pansy)**

[contributed by Bruce A. Sorrie, Harvey E. Ballard, Jr., and Alan S. Weakley]

A genus of about 525 species, herbs (rarely subshrubs, shrubs, or treelets), of temperate regions of the Old and New Worlds. References: Ballard (in prep.)=U; Ballard (1992)=Z; Ballard (1994); Gil-ad (1998)=Y; McKinney & Russell (2002)=X; Haines (2001)=V; McKinney (1992); Ballard & Wujek (1994); Russell (1955); Ballard, Sytma, & Kowal (1999); Ballard, de Paula-Souza, & Wahlert in Kubitzki (2014). Key adapted, in part, from Ballard (1992) and Ballard & Wujek (1994).

Identification notes: *Viola* has presented numerous problems in taxonomy, distribution, and identification. Particularly troublesome are the so-called “acaulescent blue violets”, including *V. sororia*, *V. sagittata*, *V. palmata*, *V. septemloba*, etc. They may be difficult to identify due to morphological overlap, or trying to key plants without mature leaves; in some instances hybridization may be suspect. Leaf maturity is an important feature to recognize—the earliest 1-2 leaves produced in most of these taxa are generally ovate-cordate in outline and may not display characteristic lobing, toothing, or pubescence until more mature leaves are produced, 1-2 weeks later. Specimens thus collected early in the flowering period can present the botanist with a perplexing series of plants that do not key cleanly. A second troublesome group contains the small white violets, including *V. blanda*, *V. incognita*, and *V. macloskeyi*. These taxa have been dealt with in various ways, but resist a wholly satisfactory treatment, due to apparent hybridization (Russell, 1954, Amer. J. Bot. 41: 679-85; Russell, 1955, Amer. Midl. Nat. 54: 481-94). However, recent reviews of these 3 species in the Southeast show that *V. blanda* and *V. macloskeyi* are quite distinct, with *V. incognita* less so (but this may be due to paucity of specimens from the area). A third difficult group contains *V. appalachiensis*, *V. conspersa/labrodorica*, and *V. walteri*. They have been treated recently by Ballard (1992, 1994) and McKinney & Russell (2002). Despite the problems present in the genus, the great majority of plants encountered in the field may be successfully keyed out, particularly by botanists working within an area of several counties. Violet species are usually quite faithful to one or a few plant community types, so once learned these habitats can be valuable indicators as to which species to expect. Botanists working in larger regions (state, floristic province), however, must be aware of increased morphological variation and potential hybridization. All species possess brownish or reddish nectar guide striae in the corolla throat; these are ignored in the key. Hairs of the corolla throat and on leaf surfaces are important key characters; several plants should be inspected with a 10× lens before deciding the character state.

- 1 Plant caulescent (producing aerial stems bearing leaves and flowers at above-ground nodes).
 - 2 Corolla yellow, or white with a yellow center (sometimes drying lavender); stipules entire or erose **Key A**
 - 2 Corolla wholly cream-colored, or cream with a yellow center, or blue-violet, or multicolored (blue or violet with orange or yellow); stipules fringed or deeply lobed..... **Key B**
- 1 Plant acaulescent (with leaf petioles and flower stalks arising separately from the base of the plant).
 - 3 Plant producing stolons; corolla white (or blue in *V. odorata*)..... **Key C**
 - 3 Plant not producing stolons; corolla blue-violet (or yellow in *V. rotundifolia*)..... **Key D**

Key A – Caulescent Violets with yellow or white flowers

- 1 Corolla white with a yellow center (sometimes drying lavender); stipules long-triangular, attenuate..... *V. canadensis* var. *canadensis*

- 1 Corolla solid yellow; stipules ovate to narrowly ovate.
- 2 Leaf blades deeply 3-lobed *V. tripartita* var. *tripartita*
- 2 Leaf blades cordate or hastate.
- 3 Leaves at least as wide as long.
 - 4 Stems mostly 2 to several, commonly decumbent proximally or ascending in flower; basal leaves (1) 2 (-5); foliage glabrous or thinly pubescent on upper stem and petioles; leaf blades medium green (paler abaxially); cauline leaves distributed over much of the stem length, ovate, cordate at base, acute to abruptly short-acuminate at apex; [widespread in our region] *V. eriocarpa*
 - 4 Stems 1 (-2), erect in fl; basal lvs 0 (-2); foliage densely pubescent throughout, leaf blades gray-green (paler abaxially); cauline leaves clustered in the uppermost ¼ of the stem, broadly ovate to reniform, subcordate to broadly cuneate at base, broadly obtuse to rounded at apex; [montane in our region] *V. pubescens*
- 3 Leaves distinctly longer than wide.
 - 5 Leaf blades hastate, base subcordate to cordate; upper lf blade surface in life typically variegated, with lamina gray-green or silvery and veins contrasting deep green *V. hastata*
 - 5 Leaf blades narrowly ovate, base broadly rounded to cuneate; leaf blade surfaces uniformly green *V. tripartita* var. *glaberrima*

Key B – Caulescent Violets with blue, cream, or multicolored flowers

- 1 Corolla white, yellow, blue to purple or multicolored, with yellow throat; spur short, up to 3 mm long; stipules herbaceous and deeply lobed, or subherbaceous to partially or fully membranous and entire or weakly erose; leaves cuneate at the base; plants annual, without thickish rootstock; [of weedy habitats].
- 2 Petals shorter than the sepals or scarcely surpassing them by 1-2 mm, cream-white distally; capsules surpassed and nearly concealed by the sepals *V. arvensis*
- 2 Petals well surpassing the sepals, usually pale blue or multicolored; sepals neither surpassing nor concealing the capsules.
- 3 Petals uniformly pale blue or cream-white, concolorous distally; terminal lobe of stipules with 0-3 crenations on each side; quadrate stems recurved-puberulent or -hispidulous on face directly above a leaf node but essentially glabrous on the other faces; leaves all cauline *V. bicolor*
- 3 Petals variously colored, commonly with the lower three petals cream-white and upper two purple-black; terminal lobe of stipule with 4 or more crenations on each side; quadrate stems recurved-puberulent on the angles; leaves cauline and commonly also basal *V. tricolor*
- 1 Corolla blue to purple (corolla cream-colored in *V. striata*) with white throat; spur elongate, more than 3 mm long (measured from center of attachment of bottom sep to spur tip); stipules herbaceous, weakly to strongly lacerate or lacinate; leaves truncate or cordate at the base; plants perennial, with thickish rootstock; [mainly of natural habitats]; [section *Viola*].
- 4 Stems immediately becoming prostrate at time of flowering; stems persistent through winter, rooting at the nodes, and generating the following year's plants at their tips (plants thus mat-forming).
 - 5 Leaf blades glabrous except for scattered hairs on the upper blade surface (especially near the leaf margin); upper surface of leaf blade uniformly green; petioles, peduncles and stems glabrous; stipules shallowly lacerate, with marginal processes < ¼ as long as the stipule; [Appalachian, rare] *V. appalachensis*
 - 5 Leaf blades densely puberulent; upper surface of leaf blades silvery- to gray-green with darker green veins; petioles, peduncles and stems moderately to densely puberulent; stipules deeply lacinate with marginal processes > ½ as long as the stipule; [more widespread and common] *V. walteri*
- 4 Stems ascending to erect at time of flowering and fruiting; stems deciduous at end of growing season, not rooting at nodes (plants thus solitary).
 - 6 Corolla wholly cream-colored *V. striata*
 - 6 Corolla blue or blue-violet.
 - 7 Spur of basal petal 4-6 mm long; lateral petals bearded within; corolla uniformly blue *V. labradorica*
 - 7 Spur of basal petal 10-15 mm long; lateral petals beardless; corolla lavender, with a purple-black eyespot surrounding the throat *V. rostrata*

Key C – Acaulescent Violets with stolons and white (or rarely blue) flowers

- 1 Flowers generally blue (sometimes white or blue-and-white variegated); style terminating in a slender hook ca. 1 mm long; capsules hirtellous; [introduced, cultivated, rarely persistent or spreading] *V. odorata*
- 1 Flowers white; style broad at the tip, in most species resembling a scoop; capsules glabrous; [native].
- 2 Leaf blades > 1.5× as long as broad.
 - 3 Leaf blades ovate-lanceolate to ovate-triangular, 1.5-2× as long as broad, the base broadly rounded to subtruncate *V. primulifolia*
 - 3 Leaf blades lanceolate to linear-lanceolate, 3-15× as long as broad, base narrowly cuneate and somewhat decurrent onto petiole.
 - 4 Leaf blades lanceolate, < 8× as long as wide; plant glabrous *V. lanceolata* var. *lanceolata*
 - 4 Leaf blades linear or narrowly lanceolate, > 10× as long as wide; plant glabrous to pubescent *V. lanceolata* var. *vittata*
- 2 Leaf blades < 1.5× as long as broad.
 - 5 Leaf blades completely glabrous (petioles may be villous); [of wet, acidic seepage or swampy woods, often with *Sphagnum*] *V. pallens*
 - 5 Leaf blades pubescent, at least on the upper surface of the basal lobes; [of wet to more mesic situations].
 - 6 Lateral petals glabrous within; petioles and peduncles usually reddish-tinged; leaf apex acute; basal lobes of the leaf often overlapping; pubescence of the upper leaf surface often restricted to the basal lobes; [of mesic, often nutrient-rich forests] *V. blanda*
 - 6 Lateral petals bearded within; petioles and peduncles green; leaf apex obtuse to rounded; basal lobes of the leaf not overlapping; pubescence of the upper leaf surface usually widespread; [of mesic to wet situations] *V. incognita*

Key D – Acaulescent Violets without stolons, with blue-violet or yellow flowers

- 1 Corollas yellow; leaf blades rotund, lying nearly flat on ground *V. rotundifolia*
- 1 Corollas violet to bluish or purple, leaves various (flat on ground only in some *V. villosa* and *V. hirsutula*).
- 2 Leaf blades deeply divided throughout, or lobed basally, or deeply toothed basally (beware that in *V. pedata* the earliest 1-2 leaves may be uncut and cordate!, to shallowly lobed).
- 3 Blades **either** divided, lobed, or deeply toothed only on basal portion, **or** blades incised only in distal half.
- 4 Orange stamens conspicuously exsert and beak-like; blades incised only in distal half or only apically *V. pedata* var. *ranunculifolia*
- 4 Stamens not visible, not exsert; blades divided, lobed, or deeply toothed only on basal portion.
- 5 Blade outline oblong-lanceolate to ovate-triangular, much longer than wide.
- 6 Foliage uniformly densely pubescent; petioles commonly shorter than blades, in life ascending to prostrate, lvs around perimeter of rosette recumbent on the ground; leaf blades broadly oblong or ovate-oblong to broadly ovate, < 2× as long as broad, undivided in flower but producing 2-3 large coarse teeth at base in fruit; cleistogamous capsules on declined peduncles; [dry gravel or sand in savannas and open oak woods] *V. sagittata* var. *ovata*
- 6 Foliage glabrous, glabrescent or moderately pubescent; petioles soon elongating to much longer than blades, in life all strictly erect; leaf blades narrowly elliptic or narrowly oblong-lanceolate to lance-triangular, > 2× as long as broad, undivided or crenulate to incised in flower but commonly becoming more deeply incised or producing 2-3 falcate linear lobes at base in fruit; cleistogamous capsules on erect peduncles; [dry to wet sand in barrens and prairies, low openings in forests] *V. sagittata* var. *sagittata*
- 5 Blade outline ovate to subrotund, about as wide as long.
- 7 Plant moderately to densely pubescent, at least on petioles and undersurface of leaves; mature leaves trilobed; [of mesic to dryish woods] *V. palmata*
- 7 Plant glabrous or glabrate (hairs on leaf margins or atop lobes).
- 8 Spurred petal glabrous within (rarely with a few hairs); largest leaf blades 3- (5) lobed, sparsely hirtellous along veins adaxially; cleistogamous capsules on short prostrate to arching peduncles below the lvs, with red or purple spots or blotches; [of small blackwater streamsides and floodplains] *V. edulis*
- 8 Spurred petal densely bearded within; largest leaf blades commonly with 5-9 lobes, entirely glabrous; cleistogamous capsules on tall erect peduncles nearly or quite as long as the petioles, unspotted; spurred petal bearded; [of mesic to moist pine savannas and pocosin ecotones] *V. septemloba*
- 3 Blades deeply divided throughout into linear or lanceolate segments (or with several narrow lateral segments and a broadly lanceolate central segment), blades about as broad as long, or broader.
- 9 Lateral petals glabrous within; orange stamens conspicuously exsert and beak-like *V. pedata* var. *pedata*
- 9 Lateral petals bearded; stamens not visible, not exsert.
- 10 Central lobe of leaf blade mostly 1-2.5× the width of the first lateral lobes.
- 11 Blades pubescent, divisions mostly 7-11; [midwestern, disjunct to shale barrens of western VA] *V. species 1*
- 11 Blades glabrous or glabrate, divisions 5-11; [**either** of limestone glades **or** of Coastal Plain woodlands].
- 12 Blade divisions 7-11; [of Coastal Plain, moist to mesic hardwoods along rivers or streams] *V. brittoniana*
- 12 Blade divisions 5-9; [of inland regions, dry limestone glades or barrens] *V. eglestonii*
- 10 Central lobe of leaf blade mostly 3-4× the width of the first lateral lobes
- 13 All leaves homophyllous, the early ones not ovate, rotund, or cordate; blades pubescent; [of Piedmont and Mountains] *V. subsinuata*
- 13 Leaves heterophyllous, the early ones ovate, rotund, or cordate, the mature ones divided; blades pubescent or glabrate; [of various distributions].
- 14 Blades and petioles moderately to densely pubescent; lowermost lobe directed outward parallel to ground; [primarily of mesic hardwoods, widespread] *V. palmata*
- 14 Blades glabrous or glabrate; lowermost (outermost) lobe on each half of blade usually directed downward toward ground; [primarily of pine savannas on Coastal Plain] *V. septemloba*
- 2 Leaf blades merely serrate or crenate on margin; ovate to subrotund in outline, cordate or truncate basally.
- 15 Most or all blades longer than broad, narrowly ovate to long-triangular, tapering to an acute apex.
- 16 Blades and petioles moderately to densely pubescent; leaves distinctly longer than wide; [dry to xeric clearings and banks] *V. sagittata* var. *ovata*
- 16 Blades and petioles glabrous or glabrate.
- 17 Lateral petals bearded with clavate hairs; spurred petal glabrous within; [of swamps, seepages, bogs, and sphagnous streamsides] *V. cucullata*
- 17 Lateral petals with hairs of essentially uniform width; spurred petal bearded within.
- 18 All leaf teeth uniform; leaf bases cordate; [of mesic woods to moist seepages to streamsides].
- 19 Upper leaf surfaces with scattered small hairs; spurred petals densely bearded within; sepals lanceolate, acute at apex, ciliate along margins; seeds yellow-brown; [mostly east of the Mississippi River] *V. affinis*
- 19 Upper leaf surfaces strictly glabrous; spurred petals glabrous within; sepals ovate-lanceolate to narrowly ovate, obtuse to rounded at apex, sparsely to moderately ciliolate along margins; seeds orange-brown with minute dark spots; [mostly west of the Mississippi River] *V. missouriensis*
- 18 Basal teeth longer than others; leaf bases truncate to subcordate (ignore earliest 1-2 leaves).
- 20 Leaf outline broadly triangular, not much longer than wide; basal teeth of the leaf numerous, ± pectinate *V. brittoniana*
- 20 Leaf outline narrowly ovate-triangular, much longer than wide; basal teeth of the leaf few, very coarse *V. sagittata* var. *sagittata*
- 15 Blades as wide as long or wider, ovate to suborbicular, apex obtuse (to acute).
- 21 Lateral petals bearded with clavate hairs; foliage glabrous or glabrate.
- 22 Petals light blue or light blue-violet, with a dark eye (also with dark veins); sepals 8-12 mm long; no plants in population with lobed blades; [mostly Piedmont and Mountains, rare in Coastal Plain] *V. cucullata*

- 22 Petals blue-violet with a white eye (also with dark veins); sepals 6-7(-8) mm long; at least some plants in population with trilobed leaves; [mostly Coastal Plain, inhabiting small blackwater floodplains and streamsides] *V. edulis*
- 21 Lateral petals bearded with hairs of uniform width; foliage distinctly pubescent, glabrate, or glabrous.
- 23 Leaf blades moderately to densely pubescent on one surface or both, and on petioles.
- 24 Leaf blades equally pubescent on both surfaces.
 - 25 Leaf blades large, apex acute, carried aloft on long petioles, deciduous; peduncles shorter than to equaling petioles *V. sororia*
 - 25 Leaf blades small, apex very blunt or rounded, lie almost flat on ground; evergreen or tardily deciduous; peduncles much longer than petioles *V. villosa*
- 24 Leaf blades much more pubescent on one surface than the other.
 - 26 Leaf blades densely pubescent above, sparsely so beneath and on petiole; apex blunt to rounded; in life dark veins prominent on pale upper surface of blade *V. hirsutula*
 - 26 Leaf blades hairy beneath and on petiole, glabrate above; apex acute; veins same shade as blade surface *V. septentrionalis*
- 23 Leaf blades glabrous or glabrate, or with hairs confined to just the basal lobes; petioles glabrous or glabrate.
- 27 Leaf blades with obvious area of hairs confined to upper surface of basal lobes; spurred petal bearded; no plants in population with lobed leaves.
 - 28 Upper leaf surfaces with scattered small hairs; spurred petals densely bearded within; sepals lanceolate, acute at apex, ciliate along margins; seeds yellow-brown; [mostly east of the Mississippi River] *V. affinis*
 - 28 Upper leaf surfaces strictly glabrous; spurred petals glabrous within; sepals ovate-lanceolate to narrowly ovate, obtuse to rounded at apex, sparsely to moderately ciliate along margins; seeds orange-brown with minute dark spots; [mostly west of the Mississippi River] *V. missouriensis*
- 27 Leaf blades glabrous or glabrate.
 - 29 At least some plants in population with trilobed leaves; [southern and mainly Coastal Plain, of small blackwater streamsides and floodplains] *V. edulis*
 - 29 No plants with lobed leaves; spurred petal glabrous or glabrate, or densely bearded; [collectively widespread].
 - 30 Spurred petal densely bearded; leaf blades reniform; [northern, ranging south to PA and WV, of fens and swamps in alkaline soils] *V. nephrophylla*
 - 30 Spurred petal glabrous or glabrate; leaf blades ovate to widely triangular; [widespread, of mesic slopes to moist floodplains] *V. sororia*

Viola affinis LeConte, LeConte's Violet, Sand Violet. Moist to wet forests, swamps. ME to se. MN, south to GA, panhandle FL, and LA. [= F, G, GW, K, Mo, Pa, RAB, S, U, V, Va, W, WV, Y; < *V. sororia* - C; < *V. sororia* Willdenow var. *missouriensis* (Greene) L.E. McKinney - X]

Viola appalachiensis L.K. Henry, Appalachian Violet. Serpentine barrens, rich cove forests over mafic or ultramafic rocks (especially old road beds through coves). Apr-May. PA, MD, and WV south to sw. NC. See Grund & Isaac (2007) and Ballard & Wujek (1994) for discussion of the taxonomy of this species. [= K1, Pa, U, WV, Z; = *V. walteri* House var. *appalachiensis* (L.K. Henry) L.E. McKinney ex S.P. Grund & B.L. Isaac - K2, X]

* *Viola arvensis* Murray, European Field Pansy. Roadsides, fields, other disturbed habitats; native of Europe. Mar-Jul. [= C, F, G, K1, K2, Mo, Pa, RAB, S, U, Va, W, WV, X]

Viola bicolor Pursh, Wild Pansy, Field Pansy. Pastures, roadsides, lawns, other disturbed habitats, less commonly in dry rocky woodlands and barrens. Mar-May. MA and NY west to SD and CO, south to Panhandle FL, TX, and AZ. [= K1, K2, Mo, Pa, U, Va, WH3, X; = *V. rafinesquii* Greene - C, G, RAB, S, W, WV; = *V. kitaibeliana* J.A. Schultes var. *rafinesquii* (Greene) Fernald - F; = *V. rafinesquiei*]

Viola blanda Willdenow, Sweet White Violet. Northern hardwood forests, northern red oak forests, cove forests, other mesic to submesic forests. NH and QC west to MN and ne. ND, south to DE, MD, w. NC, n. GA, e. TN, OH, IN, IL, and e. IA. [= F, G, S, Va, WV; < *V. blanda* - C, Pa, RAB, W, X (also see *V. incognita*); = *V. blanda* var. *blanda* - K1, K2, U, V]

Viola brittoniana Pollard, Northern Coastal Violet, Coast Violet. Seeps, bogs, other low sphagnum ground, including brackish areas. Apr-May. MA to SC, along the coast. [= Pa, U, V, Va, Y; < *V. palmata* var. *palmata* - C; > *V. brittoniana* - F; > *V. pectinata* E.P. Bicknell - F; > *V. brittoniana* Pollard var. *brittoniana* - G, K1, K2, RAB; > *V. brittoniana* Pollard var. *pectinata* (E.P. Bicknell) Alexander - G, K1, K2, RAB; = *V. pedatifida* G. Don ssp. *brittoniana* (Pollard) McKinney - X; = *V. brittoniana* - V, Y]

Viola canadensis Linnaeus var. *canadensis*, Tall White Violet. Rich cove forests, other rich mesic situations, such as floodplains. Apr-Jul. NL (Newfoundland) to ON, south to GA, AL, TN, and AR. Other varieties are more western. [= K1, K2, U, V, Va; > *V. canadensis* var. *canadensis* - C, RAB; > *V. canadensis* var. *rugulosa* (Greene) C.L. Hitchcock - C, RAB (misapplied as to plants in our area); = *V. canadensis* - F, S; > *V. canadensis* - G; > *V. rugulosa* Greene - G (misapplied as to our plants); < *V. canadensis* - Pa, W, X]

Viola cucullata Aiton, Marsh Blue Violet, Bog Violet. Bogs, seeps, margins of spring branches. Apr-Jun. NL (Newfoundland) west to MN, south to SC, GA, AL, MS, and MO. [= C, G, GW, K1, K2, Mo, Pa, RAB, S, U, V, Va, W, X, Y; > *V. cucullata* var. *cucullata* - F; > *V. cucullata* - WV; > *V. obliqua* Hill]

Viola edulis Spach, Salad Violet. Small blackwater streamsides and floodplains. Feb-May. Se. VA south to n. peninsular FL, west to e. TX. The correct name for this taxon at species rank appears to be *V. edulis* (H. Ballard, pers. comm., 2014). [= U; = *V. esculenta* Elliott ex Greene – F, G, GW, S, Va; < *V. septemloba* – RAB; < *V. palmata* var. *palmata* – C; = *V. ×esculenta* Elliott ex Greene (pro sp.) (*septemloba* × *triloba*) – K1, K2; < *V. palmata* – WH3; = *V. palmata* Linnaeus var. *esculenta* Elliott ex D.B. Ward]

Viola eglestonii Brainerd. Calcareous barrens. In c. and se. TN (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), IN, KY, and AL (Kartesz 1999). [= K1, K2, U, Y; < *V. palmata* var. *pedatifida* – C; = *V. eglestonii* – F, G, orthographic variant; = *V. septemloba* LeConte ssp. *eglestonii* (Brainerd) L.E. McKinney – X]

Viola eriocarpa Schweinitz, Smooth Yellow Forest Violet. Mt (AL, GA, KY, MD, NC, SC, TN, VA, WV), Pd (DE, MD, NC, SC, VA), Cp (DE, NC, SC, VA): mesic forests; common (rare in DE Coastal Plain). Mar-May. QC west to MB south to DE, MD, w. NC, GA, AL, AR, and OK. [= G, S; = *V. pennsylvanica* Michaux – Va, WV; = *Viola pubescens* Aiton var. *scabriuscula* Schweinitz ex Torrey – K, Pa, U, V, X; = *V. eriocarpa* (Nuttall) Schweinitz var. *leiocarpa* Fernald & Wiegand – RAB; < *V. pubescens* – C, GW, W; > *V. pennsylvanica* Michaux var. *pennsylvanica* – F; > *V. pennsylvanica* var. *leiocarpa* (Fernald & Wiegand) Fernald – F; = *V. eriocarpon* (Nuttall) Schweinitz var. *leiocarpon* Fernald & Wiegand; > *V. pubescens* Aiton var. *leiocarpon* (Fernald & Wiegand) Seymour]

Viola hastata Michaux, Spearleaf Violet, Silverleaf Violet, Halberd-leaf Violet, Halberd-leaved Yellow Violet. Acidic coves, dry-mesic oak forests, bluff forests. Late Mar-May. PA and OH south to GA and AL. [= C, F, G, K1, K2, Pa, RAB, S, U, Va, W, WV, X]

Viola hirsutula Brainerd, Wood Violet. Bottomlands, moist slopes, dry forests and clearings. CT, NY, PA, OH, and s. IN, south to Panhandle FL, AL, and MS. Leaves usually mottled around the veins with silver-gray or purple, and also often purple beneath. [= F, G, K1, K2, Pa, RAB, S, W, U, V, Va, WV, X; < *V. villosa* Walter – C]

Viola incognita Brainerd. Moist to wet forests. Apr-Jun. NL (Labrador) to MN, south to DE, PA, and WI, and in the Appalachians south to w. NC. [= S, Va, WV; < *V. blanda* – C, Pa, RAB, X; > *V. incognita* var. *incognita* – F, G; > *V. incognita* var. *forbesii* Brainerd – F, G; = *V. blanda* Willdenow var. *palustriformis* A. Gray – K1, K2, U, V]

Viola labradorica Schrank, American Dog-violet. Moist alluvial woodlands and forests, seepage slopes, marl ravines, hammocks. Late Mar-May. NL (Labrador) west to AK, south to e. VA, nw. SC (Gaddy et al. 1984), n. GA, c. AL, and OH; disjunct in sw. GA and Panhandle FL. Ballard (1992) concluded that *V. conspersa* was not distinct from *V. labradorica*. [= K1, K2, Pa, U, V, Va, WH3, X, Z; > *V. conspersa* Reichenbach – C, F, G, GW, RAB, S, W, WV]

Viola lanceolata Linnaeus var. *lanceolata*, Lanceleaf Violet, Narrow-leaved Violet. Bogs, seepage slopes, pitcher plant seepage bogs, streamheads and their margins, small swamp forests, depression ponds, interdune swales and ponds, other wet habitats. Mar-May. NB west to MN, south to FL and e. TX. [= C, F, Pa, U, V, Va; < *V. lanceolata* – RAB, W, WH3, X; = *V. lanceolata* – G, S, WV; = *V. lanceolata* ssp. *lanceolata* – GW, K1, K2, Mo]

Viola lanceolata Linnaeus var. *vittata* (Greene) Weatherby & Griscom, Strap-leaved Violet. Depression ponds, Carolina bays, other wetlands. Feb-May. Se. VA south to FL, west to e. TX. [= C, F, U, V, Va; < *V. lanceolata* – RAB, W, WH3, X; = *V. vittata* Greene – G, S; = *V. lanceolata* ssp. *vittata* (Greene) Russell – GW, K1, K2]

Viola missouriensis Greene, Missouri Violet. Moist to wet forests, swamps. Apr-Jun (Oct-Nov); May-Jul (chasm.), Jun-Sep (cleist.). C. IN west to MN, south to w. MS and e. TX. [= F, G, K, Mo, U, Y; < *V. sororia* – C; < *V. sororia* Willdenow var. *missouriensis* (Greene) L.E. McKinney – X]

Viola nephrophylla Greene, Northern Bog Violet. Bogs. May. NL (Newfoundland) and YT south to PA, WV, VA (where perhaps only introduced), IN, IL, LA, TX, and CA. [= C, F, G, K, Mo, U, V, WV] {add to synonymy}

* *Viola odorata* Linnaeus, Sweet Violet, English Violet. Gardens, lawns, disturbed places, persistent or weakly spreading from horticultural use; native of Europe. [= C, F, G, K, Pa, S, U, V, Va, Z]

Viola pallens (Banks ex A.P. de Candolle) Brainerd, Wild White Violet. Brookbanks, seepages. NL (Labrador) west to NT, south to GA, AL, MS, MO, SD, CO, UT, NV, and CA. There seems to be no rational basis for the recently fashionable treatment of regarding *V. pallens* as synonymous with or only infraspecifically distinct from the narrowly distributed *V. macloskeyi*, of CA, OR and e. NV. Ballard et al. (2001; in prep.; pers. comm. 2014) suggest that Hispaniolan *V. domingensis* Urban is conspecific with *V. pallens*. [= F, GW, Mo, S, U, WV; = *V. macloskeyi* F. Lloyd var. *pallens* (Banks ex A.P. de Candolle) C.L.

Hitchcock – C, RAB, Va; > *V. pallens* var. *pallens* – G; > *V. pallens* var. *subreptans* Rousseaux – G; = *V. macloskeyi* ssp. *pallens* (Banks ex A.P. de Candolle) M.S. Baker – K, Pa, V, W; < *V. macloskeyi* F. Lloyd – X]

Viola palmata Linnaeus, Wood Violet. Moist to dry forests. ME west to WI, south to FL, AL, MS, and LA. [= K2, Mo, Pa, V, Va, X; > *V. palmata* var. *palmata* – RAB, WV; > *V. palmata* var. *triloba* (Schweinitz) Gingins ex A.P. de Candolle – RAB, WV; < *V. palmata* var. *palmata* – C; > *V. triloba* Schweinitz var. *triloba* – F, G, K1; > *V. stoneana* – F, G; >> *V. palmata* – F, G, S, W, in the narrow sense; > *V. chalcosperma* Brainerd – F, S; < *V. palmata* Linnaeus (pro sp.) – K; ? *V. triloba* Schweinitz – S, W; < *V. palmata* – WH3; = *V. palmata* var. *palmata* – U]

Viola pedata Linnaeus var. *pedata*, Bird's-foot Violet. Dry rocky or sandy forests, woodlands, glades, and roadbanks. Mar-May; May-Jun. NH, NY, MI, WI, MN, and ND south to s. GA, s. AL, s. MS, s. LA, and e. TX. [= Va, X; = *V. pedata* – C, Pa, U, W; < *V. pedata* – K, Mo, RAB, S, V; > *V. pedata* var. *pedata* – F, G, WV; > *V. pedata* var. *lineariloba* A.P. de Candolle – F, G, WV]

Viola pedata Linnaeus var. *ranunculifolia* (Jussieu ex Poiret) Gingins ex A.P. de Candolle, Sandhills Bird's-foot Violet. Sandhills. {distribution} [= X; < *V. pedata* – RAB, K, S, V]

Viola pedatifida G. Don, Crowfoot Violet. Organic loam of dry-mesic to mesic prairies. Apr-May. ON west to AB, south to OH, IN, AR, OK, NM, and AZ; material disjunct in w. VA attributed as *V. pedatifida* is a new species, *Viola species 1*. [= F, G, Mo, U; = *V. palmata* Linnaeus var. *pedatifida* (G. Don) Cronquist – C; < *V. pedatifida* – K2; = *V. pedatifida* G. Don ssp. *pedatifida* – X] {keyed; not mapped; not in our area}

Viola primulifolia Linnaeus, Primrose-leaf Violet. Bogs, wet savannas, pocosins, moist organic soils along small streams. Mar-May. NL (Newfoundland) to ON, south to FL, and west to TX and se. OK. [= C, GW, Pa, RAB, S, U, V, Va, W, WH3, WV, X; > *V. primulifolia* var. *primulifolia* – F, G; > *V. primulifolia* var. *acuta* (Bigelow) Torrey & A. Gray – F; > *V. primulifolia* var. *villosa* Eaton – F, G; = *V. primulifolia* Linnaeus (pro sp.) (*lanceolata* × *macloskeyi*) – K]

Viola pubescens Aiton, Hairy Yellow Forest Violet. Mt (MD, NC, TN, VA, WV), Pd (DE, MD), Cp (DE): rich deciduous forests; common in WV Mountains, common in DE Piedmont (rare in DE Coastal Plain). Mar-May. ME and s. QC west to SD, south to DE, NC, TN, MO, and NE. [= F, G, S, Mo, Va, WV; = *V. pubescens* var. *pubescens* – K, Pa, U, V, X; = *V. eriocarpa* (Nuttall) Schweinitz var. *eriocarpa* – RAB; < *V. pubescens* – C, GW, W; > *V. pubescens* var. *pubescens* – F; > *V. pubescens* var. *peckii* House – F; *V. eriocarpon* (Nuttall) Schweinitz var. *eriocarpon*]

Viola rostrata Pursh, Long-spurred Violet. Acidic cove forests, other mesic forests, often under *Tsuga canadensis*. Apr-May. NH and QC west to WI, south to GA and AL. [= F, G, K, Pa, RAB, S, U, V, Va, W, WV, X, Z]

Viola rotundifolia Michaux, Round-leaf Yellow Violet, Early Yellow Violet. Rich coves. Mar-Apr. ME to s. ON, south to w. NC, n. GA, and e. TN. [= C, F, G, K, Pa, RAB, S, U, V, Va, W, WV, X]

Viola sagittata Aiton var. *ovata* (Nuttall) Torrey & A. Gray. Dry soils, glades, prairies. Apr. NS west to MN, south to n. FL, AL, LA, and OK. [= K, Pa, V, Va, X; = *V. fimbriatula* J.E. Smith – F, G, RAB, S, W, WV, Y; < *V. sagittata* – C, Mo]

Viola sagittata Aiton var. *sagittata*, Arrowhead Violet. Dry to moist forests and woodlands. Apr. MA west to MN, south to GA and e. TX. [= K, Pa, U, V, Va, X; = *V. sagittata* – S, W, WV, Y; > *V. emarginata* (Nuttall) Le Conte var. *emarginata* – F, G, RAB; > *V. emarginata* var. *acutiloba* Brainerd – F, G, RAB; < *V. sagittata* – C, Mo; ? *V. emarginata* – S]

Viola septemloba Le Conte. Sandy pinelands. Late Mar-early May. E. NC south to s. FL, west to LA, mainly on the Coastal Plain. [= F, G, GW, K, S, U, W, Y; < *V. septemloba* – RAB (also see *V. edulis*); < *V. palmata* var. *palmata* – C; < *V. palmata* – WH3; ? *V. septemloba* ssp. *septemloba* – X]

Viola septentrionalis Greene. Moist woods, moist thickets. NL (Newfoundland) to BC south to PA, w. NC (P. McMillan, pers. comm.), e. TN (Chester, Wofford, & Kral 1997), MI, WI, MT, and WA. [= G, K, U, Va, W, WV, Y; < *V. sororia* – C, Mo, V; ? *V. septentrionalis* var. *septentrionalis* – F; < *V. sororia* var. *sororia* – X; = *V. sororia* Willdenow var. *septentrionalis* (Greene) XXX {comb. nov.}]

Viola sororia Willdenow, Dooryard Violet, Confederate Violet, Common Blue Violet. Bottomlands, lawns, moist forests. Feb-May. NL (Newfoundland) west to MB, south to s. FL and TX. [= U; = *V. sororia* – Va, W, Y; > *V. palmata* var. *sororia* (Willdenow) Pollard – RAB; > *V. papilionacea* Pursh – RAB, F, S, WV; < *V. sororia* – C, Mo, V, WH3 (also see *V. affinis*, *V. septentrionalis*); > *V. sororia* – F, G, K, Pa, S; > *V. langloisii* Greene – F, K, S; > *V. latiuscula* Greene – F; > *V. papilionacea* var. *papilionacea* – G; > *V. papilionacea* var. *priceana* (Pollard) Alexander – G; > *V. priceana* Pollard – S; = *V. sororia* var. *sororia* – X]

Viola species 1, Shale Barren Violet. Endemic to shale barrens of w. VA. Apr; May (chasm.), May-Aug (cleist.). [*Viola pedatifida* G. Don – K2, Va; = “*V. virginiana*”, in prep.]

Viola striata Aiton, Creamy Violet. Mesic forests and woodlands, disturbed areas. Mar-Jun. MA west to WI, south to GA, AR, and e. OK. [= C, F, G, GW, K, Mo, Pa, RAB, S, U, V, Va, W, WV, X, Z]

Viola subsinuata Greene, Wavy-leaved Violet. Rich, dry-mesic and dry upland forests, probably associated with mafic rocks. Apr-May; Apr-Jun (chasm.), May-Aug (cleist.). VT, MA, and sc. MI south to GA, AL, and MS. [= Pa, U, V, Va, X; < *V. palmata* var. *palmata* – C; ? *V. triloba* Schweinitz var. *dilatata* (Elliott) Brainerd – F, G, K; > *V. palmata* var. *dilatata* Elliott – U; > *V. subsinuata* – U]

* **Viola tricolor** Linnaeus, Pansy, Johnny-jump-up. Lawns, garden borders, railroad rights-of-way, commonly cultivated; native of Europe. Mar-Jun (and sporadically later). [= C, F, G, K, Mo, Pa, RAB, U, V, WH3]

Viola tripartita Elliott var. **glaberrima** (A.P. de Candolle) R.M. Harper. Moist slopes and bottomlands, especially over mafic or calcareous rocks. Late Mar-May; Apr-Jun (chasm.), Jul-Sep (cleist.). Sw. PA, s. OH south to SC, GA, Panhandle FL, and ne. MS. May warrant specific rank. [= G, Pa, RAB, S, U, W; < *Viola tripartita* – C, F, K, Va, WH3, WV, X]

Viola tripartita Elliott var. **tripartita**. Moist slopes and bottomlands, especially over mafic or calcareous rocks. Late Mar-May; Apr-Jun (chasm.), Jul-Sep (cleist.). Sw. PA, s. OH south to SC, GA, Panhandle FL, and ne. MS [= *V. tripartita* var. *tripartita* – G, RAB, S, U, W < *V. tripartita* – C, F, K, Va, WH3, WV, X]

Viola villosa Walter, Southern Woolly Violet. Poccosin ecotones, other sites with moist soils. Late Feb-early Apr. MD south to n. peninsular FL, west to TX and OK. Reported for VA by Kartesz (1999), on the basis of Massey (1961); report requiring additional documentation. [= F, G, K, RAB, S, WH3, X, Y; < *V. villosa* – C (also see *V. hirsutula*)]

Viola walteri House, Walter's Violet, Prostrate Blue Violet. Nutrient-rich woodlands and forests, especially over mafic or calcareous rocks. (Late Jan-) Mar-May. W. VA west to s. OH and AR, south to n. peninsular FL and e. TX. [= F, G, K1, RAB, S, W, WH3, Z; = *V. walteri* House var. *walteri* – K2, Va, X]

Viola ×wittrockiana Gams, Garden Pansy. Cultivated, very sporadically persistent or remnant after planting. [= K2] {not keyed}

208. LINACEAE A.P. de Candolle ex Perleb 1818 (Flax Family) [in MALPIGHIALES]

A family of about 10-14 genera and 250-350 species, trees, vines, shrubs, and herbs, cosmopolitan. References: Robertson (1971)=Y; Dressler, Replinger, & Bayer in Kubitzki (2014).

Linum Linnaeus 1753 (Flax)

A genus of about 180 species, herbs, of temperate and subtropical areas. References: Rogers (1984)=Z; Rogers (1963)=Y; Dressler, Replinger, & Bayer in Kubitzki (2014).

- 1 Petals blue, red, or pink; capsule 5-10 mm long; [section *Linum*].
- 2 Petals red or pink ***L. grandiflorum***
- 2 Petals blue.

- 3 Inner sepals with minutely ciliate margins; stigmas slender, elongate; capsule 6-10 mm long *L. usitatissimum*
- 3 Inner sepals entire; stigmas capitate; capsule 5-7 mm long.
 - 4 Flowers homostylous (flowers with stigmas at about the level to slightly above the anthers) *L. lewisii* var. *lewisii*
 - 4 Flowers heterostylous (some flowers with stigmas below the anthers, others with stigmas well above the anthers) *L. perenne*
- 1 Petals yellow; capsules 1-4 mm long; [section *Linopsis*].
 - 5 Inner and outer sepals all very conspicuously glandular-toothed; annual; leaves with 2 brownish glands flanking the attachment to the stem; styles united basally for (0.2-) 0.5-1.2 (-1.8) mm; [section *Linopsis*, subsection *Rigida*].
 - 6 Sepals 2.3-3.5 mm long, acute; inflorescence consisting of 1 or more elongate and racemiform branches; dried plants dark, purple-dotted *L. harperi*
 - 6 Sepals (3.1-) 3.6-5 (-7.3) mm long, acuminate; inflorescence an open panicle; dried plants pale green *L. sulcatum*
 - 5 Outer sepals entire (very rarely sparsely glandular-toothed), inner sepals entire or sparsely to conspicuously glandular-toothed; perennial; leaves without brownish glands flanking the attachment to the stem; styles free; [section *Linopsis*, subsection *Linopsis*].
 - 7 Fruit broader than long, its apex depressed, flattened, or broadly rounded, (1.3-) 1.5-2.1 (-2.3) mm long; leaves mostly 1.9-9.3 mm wide.
 - 8 Margins of the inner sepals with conspicuous stalked glands; mature fruits of dried specimens usually adhering to the plant *L. medium* var. *texanum*
 - 8 Margins of the inner sepals glandless, or with a few inconspicuous, sessile glands; mature fruits of dried specimens usually shattering and falling freely.
 - 9 Inflorescence paniculate, the lower inflorescence branches not elongate, their tips not nearly reaching the tips of the upper inflorescence branches; branchlets striate-ridged; leaves mostly opposite (usually to beyond the midpoint from the base of the plant to the first inflorescence branch) *L. striatum*
 - 9 Inflorescence corymbose, some (at least) of the lower branches of the inflorescence elongate, their tips nearly equaling the tips of the upper inflorescence branches; branchlets terete or nearly so; leaves mostly alternate (usually the opposite leaves of the lower stem not extending beyond the midpoint from the base of the plant to the first inflorescence branch) *L. virginianum*
 - 7 Fruit as long as broad or longer, its apex acute, apiculate, or obtuse, (2-) 2.2-3.2 (-3.3) mm long; leaves mostly 1.3-4.3 mm wide.
 - 10 Leaves opposite; fruit subspherical, abruptly short-pointed *L. westii*
 - 10 Leaves all or mostly alternate (a few pairs of leaves at the base of the stem sometimes opposite); fruit ovoid to pyriform.
 - 11 Leaves (1.2-) 2.3-4.3 (-5.6) mm wide, mostly 25-50 below the inflorescence; septa of the fruit sparsely but conspicuously ciliate; false septa incomplete; fruit apex acute, the exposed portions purple *L. intercursum*
 - 11 Leaves (1.0-) 1.3-2.0 (-3.2) mm wide, mostly 50-165 below the inflorescence; septa of the fruit glabrous; false septa virtually complete; fruit apex rounded to apiculate, the exposed portions purple or yellow.
 - 12 Fruit 3.4-3.8 mm long, 3.2-3.4 mm in diameter *L. macrocarpum*
 - 12 Fruit (2.0- 2.3-3.2 (-3.3) mm long, 1.7-3.1 mm in diameter
 - 13 Fruit pyriform, (2.0-) 2.3-2.8 (-3.0) mm long, 1.7-2.6 mm in diameter, the apex rounded, the exposed portions purple; seeds (1.6-) 1.7-2.0 (2.1) mm long; anthers averaging 0.8 mm long *L. floridanum* var. *floridanum*
 - 13 Fruit ovoid, (2.8-) 3.0-3.2 (-3.3) mm long, 2.5-3.1 mm in diameter, the apex minutely apiculate, the exposed portions yellow; seeds 2.1-2.4 mm long; anthers averaging 1.2 mm long *L. floridanum* var. *chrysocarpum*

Linum floridanum (Planchon) Trelease var. *chrysocarpum* C.M. Rogers, Yellow-fruited Yellow Flax. Wet savannas. Jun-Oct. Se. NC south to s. FL and west to s. MS. [= K, Y, Z; < *L. virginianum* var. *floridanum* Planchon - RAB; < *L. floridanum* - GW, WH3; < *Cathartolinum floridanum* (Planchon) Small - S]

Linum floridanum (Planchon) Trelease var. *floridanum*, Florida Yellow Flax. Savannas, sandhill seeps. Jun-Oct. E. NC south to s. FL and west to LA, also in the West Indies, essentially limited to the Coastal Plain. [= K, Y, Z; < *L. virginianum* var. *floridanum* Planchon - RAB (also see *L. floridanum* var. *chrysocarpum* and *L. intercursum*); < *L. floridanum* - C, F, G, GW, WH3; < *Cathartolinum floridanum* (Planchon) Small - S; > *Cathartolinum macrosepalum* Small - S]

* *Linum grandiflorum* Desfontaines, Red Flax. Disturbed areas; native of Africa. [= F, K, WH3; = *Adenolinum grandiflorum* (Desfontaines) W.A. Weber]

Linum harperi Small, Harper's Grooved Flax. Dry pinelands. This is a rare taxon of longleaf pine woodlands or savannas in w. FL, sw. GA, and c. AL. It is probably distinct from *L. sulcatum* at the species level, needing additional study. [= *L. sulcatum* Riddell var. *harperi* (Small) Rogers - K, Y, Z; = *Cathartolinum harperi* (Small) Small - S; < *L. sulcatum* - WH3]

Linum intercursum E.P. Bicknell, Bicknell's Yellow Flax. Dry to moist places. Jun-Oct. MA south to c. TN, nw. GA, and c. AL; from MA to MD, nearly restricted to the Coastal Plain, in VA, NC, SC, GA, AL, and se. TN, however it is primarily on the Piedmont and Mountains. It also occurs disjunctively in n. IN near the Great Lakes. [= C, F, G, K, Pa, Va, W, Y, Z; < *L. virginianum* var. *floridanum* (Planchon) - RAB; = *Cathartolinum intercursum* (E.P. Bicknell) Small - S]

Linum lewisii Pursh var. *lewisii*, Prairie Flax. Calcareous glades and barrens. A western blue-flowered species, ranging from NU west to AK, south to MI, LA, TX, NM, AZ, and CA; disjunct at Smoke Hole Caverns, WV, and several adjacent counties. [= K; < *L. perenne* - C, apparently misapplied to WV material; < *L. lewisii* - F; < *L. perenne* Linnaeus var. *lewisii* (Pursh) Eaton & J. Wright - G; < *Adenolinum lewisii* (Pursh) A. & D. Löve]

Linum macrocarpum C.M. Rogers, Spring Hill Flax. Pitcher plant bogs, wet savannas. FL Panhandle west through s. AL and s. MS to se. LA. [= K, WH3, Y, Z]

Linum medium (Planchon) Britton var. *texanum* (Planchon) Fernald, Texas Yellow Flax. Dry to moist places. Var. *texanum* ranges from s. ME, MI, and n. IL south to s. FL and TX, and in the West Indies. Var. *medium* is limited to area around the Great Lakes. [= C, F, GW, K, Mo, Pa, Va, W, WH3, WV, Y, Z; < *L. virginianum* var. *medium* Planchon – RAB; < *L. medium* – G; < *Cathartolimum medium* (Planchon) Small – S; = *L. medium* ssp. *texanum* (Planchon) A. Haines]

* *Linum perenne* Linnaeus, Perennial Flax. Disturbed areas; native of Europe. Cultivated and "rarely naturalized along roadsides" in scattered locations in PA (Rhoads & Klein 1993; Rhoads & Block 2007) and reported tentatively for VA (Kartesz 1999). [= K, Pa; < *L. perenne* – C (also see *L. lewisii* var. *lewisii*)]

Linum striatum Walter, Ridgestem Yellow Flax. Bogs, seepages, other wet places, often growing in *Sphagnum*. Jun-Oct. MA, PA, MI, and IL south to Panhandle FL, LA, and e. TX. [= C, G, GW, K, Mo, Pa, RAB, Va, W, WH3, Y, Z; > *L. striatum* var. *striatum* – F; = *Cathartolimum striatum* (Walter) Small – S]

Linum sulcatum Riddell, Grooved Yellow Flax. Dry rocky woodlands and barrens over calcareous, mafic, or ultramafic rocks (and sometimes also weedy in adjacent disturbed areas). May-Aug. Primarily a species of the Great Plains of s. MB, ND, and MN south through SD, IA, WI, NE, MO, IL, KS, and MO to OK, *L. sulcatum* occurs farther east as a rare disjunct on glades or barrens over rocks such as limestone or diabase. [= C, F, G, Pa, RAB, Va, W, WV; = *Linum sulcatum* Riddell var. *sulcatum* – K, Mo, Y, Z; = *Cathartolimum sulcatum* (Riddell) Small – S; = *Mesynium sulcatum* (Riddell) A. & D. Löve]

* *Linum usitatissimum* Linnaeus, Common Flax. Disturbed places; native of Europe. May-Sep. This is the flax of commerce, used for its fiber (the source of flax/linen), seeds, and the oil expressed from its seeds (linseed oil). [= C, F, G, K, Mo, Pa, RAB, S, Va, WH3, WV, Z]

Linum virginianum Linnaeus, Virginia Yellow Flax. Dry or moist places. Jun-Oct. MA, NY, ON, MI, and IL south to SC, GA, AL, and MO. [= C, F, G, GW, K, Mo, Pa, Va, W, WV; = *L. virginianum* var. *virginianum* – RAB; = *Cathartolimum virginianum* (Linnaeus) Reichenbach – S]

Linum westii C.M. Rogers, West's Flax. Bogs, margins of flatwoods ponds. Ne. FL; Panhandle FL. [= K, WH3, Y, Z]

213. *PODOSTEMACEAE* Richard ex C. Agardh 1822 (Riverweed Family) [in MALPIGHIALES]

A family of about 47-49 genera and 280 species, aquatic herbs, of tropical, subtropical, and rarely temperate regions of the New World and Old World. References: Graham & Wood (1975); Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007).

Podostemum Michaux 1803 (Riverweed)

A genus of about 7-17 species, reduced aquatic herbs, of tropical to temperate America. References: Graham & Wood (1975)=S; Philbrick & Crow (1983); Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007).

Identification notes: *Podostemum* is a curious plant, seeming more like an alga than a vascular plant in color, texture, mode of attachment to substrate (by a fleshy disk), and irregular thalloid branching.

Podostemum ceratophyllum Michaux, Threadfoot, Riverweed, Riffleweed. Attached to rocks and dams in rapidly or slowly flowing water. May-Jul. NS, ME, and QC south to sw. GA, s. AL, s. MS, se. LA (Florida parishes), AR, and w. TN; disjunct in the Ozark-Ouachita Highlands of w. AR and se. OK; Dominican Republic; Honduras. Fehrmann, Philbrick, & Halliburton (2012) demonstrate very low genetic diversity in the populations north of the glacial maximum, in the Ozark-Ouachita Highlands, and in Central America, and high genetic diversity in the portion of the unglaciated southeast east of the Mississippi River. [= C, F, G, K, Pa, RAB, Va, W, WV, Z; = *Podostemon ceratophyllum* – GW, orthographic variant; > *Podostemon ceratophyllum* – S, orthographic variant; > *Podostemon abrotanoides* Nuttall – S]

214. **HYPERICACEAE** A.L. de Jussieu 1789 (St. John's-wort Family) [in MALPIGHIALES]

A family of 7-9 genera and 480-560 species, herbs, shrubs, and trees, nearly cosmopolitan. It appears from molecular analysis that recognition of the Hypericaceae may (after all) be warranted. *Hypericum* is in a clade with *Podostemum* and *Bonnetia*, sister to a clade including Clusiaceae s.s. (Savolainen et al. 2000), and unless the morphologically very different Podostemaceae is to be included in a broad Clusiaceae, Hypericaceae and Podostemaceae must be recognized. References: Adams (1973)=Z; Godfrey (1988)=Y; Wood & Adams (1976); Stevens in Kubitzki, Bayer, & Stevens (2007).

Hypericum Linnaeus 1753 (St. John's-wort)

A genus of 370-420 species, trees, shrubs, and herbs, primarily temperate. *Hypericum* in our area is a large, complex, and interesting genus, with a number of unresolved questions remaining. Following Nürk et al. (2103), it seems best to circumscribe *Hypericum* to include *Triadenum* and *Thornea* (the latter not relevant to our area), but not *Vismia* and *Harungana*. The species treated in Key B have often been treated in the segregate genus *Ascyrum*; evidence from a variety of disciplines now suggests that they should be included in *Hypericum* (Adams & Robson 1961; Calie, Schilling, & Webb 1983; Robson 1996; Nürk et al. 2013). *Triadenum*, while almost basal in *Hypericum*, should also be included (Nürk et al. 2013). References: Sorrie (2012)=U; Adams (1973)=Z; Godfrey (1988)=Y; Robson (1977, 1981, 1990, 1996, 2001, 2002, 2006)=X; Adams (1962)=V; Allison (2011)=Q; Adams (1957); Webb (1980); Robson & Adams (1968); Adams & Robson (1961); Calie, Schilling, & Webb (1983); Culwell (1970); Nürk et al. (2013); Cooperrider (1989); Stevens in Kubitzki, Bayer, & Stevens (2007). Key based in part on Adams (1973), Godfrey (1988), C, and GW.

- 1 Petals pale pink; stamens fascicled, in 3 fascicles of 3 stamens each; staminodia (hypogynous glands) present, alternating with the fascicles of stamens; perianth 5-merous; ["*Triadenum*"]..... **Key H**
- 1 Petals yellow; stamens fascicled or not, if fascicled then not into 3 fascicles of 3 stamens each; staminodia (hypogynous glands) lacking; perianth 4-5-merous.
- 2 Leaves with an articulation at the very base, this appearing as a narrow line, groove, or abrupt change of color and texture which extends across the petiole; shrub; [section *Myriandra*].
- 3 Leaves needle-like, 0.5-1.5 (-2) mm wide, the margins essentially parallel (*H. galioides* keyed here and below); [subsection *Centrosperma*]..... **Key A**
- 3 Leaves, at least the largest on the plant, not needle-like, wider than 2 mm, the margins not parallel, the widest point often beyond the middle.
 - 4 Petals 4; sepals 4 (rarely 2); plant 5-100 cm tall; leaves 2-40 mm long; [subsection *Ascyrum*]..... **Key B**
 - 4 Petals 5; sepals 5; plant 50-250 cm tall; leaves (10-) 20-70 mm long; [subsections *Centrosperma* and *Brathydium*]..... **Key C**
- 2 Leaves without an articulation at the very base, the petiole merging gradually into the stem with no break, groove, or abrupt change in color or texture; herb, decumbent shrub, or shrub.
 - 6 Leaves ascending or appressed, 1-nerved, < 1 mm wide; inflorescence a compound raceme; annual herbs; [section *Brathys*]..... **Key D**
 - 6 Leaves spreading or ascending, generally multi-nerved, > 1 mm wide; inflorescence a dichasial cyme; herbs or shrubs.
 - 7 Capsule 3 (-4) locular; stamens connate at the base into 3 or 5 fascicles; leaves with black glandular dots as well as translucent glandular dots when backlit (except in *H. perforatum*); sepals and/or petals marked with black glandular dots or lines; perennial herbs; [section *Hypericum*]..... **Key E**
 - 7 Capsule 1-locular; stamens separate or connate at the base, but not grouped into fascicles; leaves with translucent glandular dots, without black glandular dots (when backlit); sepals and petals with translucent glandular lines or dots only, not also marked with black glandular dots or lines.
 - 8 Shrubs, decumbent shrubs, or suffruticose herbs; [section *Myriandra*, subsections *Pseudobrathydium* and *Suturosperma*]..... **Key F**
 - 8 Herbs; [section *Trigynobrathys*, and section *Myriandra* subsection *Suturosperma*]..... **Key G**

Key A – shrubby St. John's-worts with needle-like leaves and flowers with 5 petals and 5 sepals
[section *Myriandra*, subsection *Centrosperma*]

Identification notes: “Longest leaves” should be sought at branch nodes.

- 1 Longest leaves 5-16 mm.
- 2 Upper leaf surface convex, merging gradually with revolute margins; leaves oblanceolate to linear-oblanceolate (“oblinear”); [east and west of the Mississippi River in the Coastal Plain]..... ***H. galioides***
- 2 Upper leaf surface plane, abruptly angled to the revolute portion; leaves linear; [east of the Mississippi in the Coastal Plain].
- 3 Capsules 3-4.5 (-6) mm long; longest leaves 7-16 mm long; corollas 13-17 mm in diameter; seeds reddish-amber or brown, the alveoli not in distinct longitudinal rows, the seed lacking longitudinal ridges except for the two marginal sutures; primary branches with two

- ridged or winged angles running the length of the internodes, extending from the leaf midribs (but not the margins) at the base of the paired leaves; leaf surface glossy; [of alfisols and ultisols of wet pine savannas, flatwoods, and seepage bogs] *H. brachyphyllum*
- 3 Capsules 6-9 mm long; longest leaves 5-10 (-11); corollas 13-15 mm long; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles running the length of the internodes, extending from the midribs and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry sodosol pine flatwoods and interdune flats and hollows] *H. tenuifolium*
- 1 Longest leaves 13-30 mm.
- 4 Plant a low shrub, <4 dm tall, more-or-less decumbent, forming dense clumps or patches; flowers 10-12 mm in diameter; inflorescence elongate (flowers at up to 5 nodes); [of dry to mesic soils of the lower Piedmont and inner Coastal Plain from sc. VA to ec. AL; disjunct to rock outcrops of the sc. GA Coastal Plain] *H. lloydii*
- 4 Plant an erect shrub, 5-40 dm tall, with single main stem branched above; flowers 13-26 mm diameter; inflorescence elongate (3-7 nodes) or short (1-3 nodes in *H. fasciculatum* and *H. chapmanii*); [of wet soils of the Coastal Plain].
- 5 Undersurface of most leaves easily visible (exposed) on both sides of the midrib, the veins usually obvious on the undersurface; leaves narrowly oblanceolate to linear-oblanceolate ("oblinear"), 1.5-5 (-7) mm wide; inflorescence elongate (3-7 nodes) *H. galioides*
- 5 Undersurface usually not visible except for the midrib (leaf margins nearly touching the midrib for its entire length), if the undersurface visible then no veins visible; leaves linear, needle-like, 0.5-1.5 mm wide; inflorescence elongate or short.
- 6 Plant <1 m tall; stem <1 cm wide at base; plant unbranched or few-branched, wand-like with a narrow crown; [endemic to FL Panhandle] *H. exile*
- 6 Plant normally >0.8 m tall; stem 1-several cm wide at base; crown broader with many ascending to spreading branches.
- 7 Young branches, leaves, and sepals strongly glaucous; bark of upper stem and branches silvery gray and smooth; mature plant 2-4 m tall with ascending branches imparting a tree-like or vase-like aspect; [restricted to shores of sinkhole ponds in Bay and Washington Counties, FL Panhandle] *H. lissophloeus*
- 7 Young branches, leaves, and sepals not glaucous; bark of upper stem and branches not silvery gray and smooth (except some *H. chapmanii*); mature plants 0.8-3 (-4) m tall, variously shaped; [more widespread in our area, Coastal Plain of se. NC south to FL < and west to se. LA].
- 8 Inflorescence elongate (3-7 nodes); stem bark tight, thin, not exfoliating or exfoliating in narrow strips, not revealing buff or pale cinnamon color; leaf undersurface, if exposed at all, distinctly paler than the upper surface; [usually associated with flowing water (blackwater streams and impoundments)] *H. nitidum*
- 8 Inflorescence short (1-3 nodes); stem bark corky-thickened to spongy, exfoliating in broad strips or sheets revealing buff or pale cinnamon color; leaf undersurface, if exposed at all, about the same color as the upper surface; [usually associated with static water (Carolina bays, impoundments, beaver ponds, borrow pits, flatwoods depressions, cypress-gum ponds and stringers)].
- 9 Mature plant 2-3 (-4) m tall; branches ascending and imparting a tree-like or vase-like aspect (younger plants may be bushy); youngest internodes terete; [of flatwoods depressions and cypress-gum ponds and stringers of FL Panhandle only] ...
..... *H. chapmanii*
- 9 Mature plant 0.8-1.5 (-2) m tall; branches spreading and imparting a bushy or gumdrop aspect; youngest internodes with distinct winged ridge on either side; [of Carolina bays, impoundments, beaver ponds, borrow pits, widespread]
..... *H. fasciculatum*

Key B – shrubby St. John's-worts with 4 petals and 4 (rarely 2) sepals
[section *Myriandra*, subsection *Ascyrum*]

- 1 Styles and carpels 3 (rarely 4); leaves (5-) 7-20 mm wide, rounded, subcordate, or cordate-clasping at the base; plant an erect shrub.
- 2 Leaves rounded or subcordate at the base; [widespread in our area] *H. crux-andreae*
- 2 Leaves cordate-clasping at the base; [of e. GA southward] *H. tetrapetalum*
- 1 Styles and carpels 2 (3 in *H. microsepalum*); leaves 1-7 mm wide, mostly cuneate (or if rounded the leaves < 8 mm long and 3 mm wide); erect or decumbent shrub.
- 3 Sepals nearly equal in size; styles 3; [s. GA south to n. FL] *H. microsepalum*
- 3 Sepals markedly unequal, one opposite pair large and enclosing the capsule; styles 2; [collectively widespread].
- 4 Pedicels 6-13 mm long, soon reflexed; subtending bractlets located near the last pair of leaves; decumbent shrub, to 2 dm tall
..... *H. suffruticosum*
- 4 Pedicels 1-5 mm long, erect; subtending bractlets located midway between the base of the flower and the last pair of leaves; erect or decumbent shrub, mostly 1-15 dm tall.
- 5 Erect shrub, usually with a single stem, freely branched well above ground level (or from ground level if injured, as by fire, but then the multiple branches still erect rather than decumbent), to 1 m or more tall; leaves usually variable in size and shape, widest near the middle *H. hypericoides*
- 5 Decumbent, matted shrub, with several prostrate stems arising from a primary rootstock near ground level, each with numerous erect branchlets, rarely over 3 dm tall; leaves usually relatively uniform in size and shape, widest above the middle *H. stragulum*

Key C – shrubby St. John's-worts with broader leaves (mostly lanceolate or oblanceolate)
and flowers with 5 petals and 5 sepals

- 1 Leaves cordate-clasping at the base, ovate; [of s. SC southward]; [section *Myriandra*, subsection *Brathydium*] *H. myrtifolium*
- 1 Leaves cuneate at the base, oblanceolate, oblong, elliptic, or narrowly elliptic; [collectively widespread]; [section *Myriandra*, subsection *Centrosperma*].
- 2 Leaves mostly narrowly oblanceolate, the larger 2-3 cm long, 2-5 (-7) mm wide, mostly 5-10× as long as wide; seeds 0.4-0.8 mm long, dark brown *H. galioides*
- 2 Leaves mostly oblong, elliptic, narrowly elliptic, or broadly oblanceolate, the larger (2-) 3-7 cm long, 5-15 mm wide, mostly 2.5-5× as long as wide; seeds 0.8-1.3 mm long, amber to medium brown.

- 3 Flowers solitary, terminal (or in 3-flowered terminal cymes); petals 10-20 mm long; sepals 7-15 mm long; shrubs to 1 m tall *H. frondosum*
- 3 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepals 1.5-8 mm long; shrubs to 3 m tall.
- 4 Flowers (1-) 3-7 per inflorescence; capsules (6-) 7-14 mm long; larger leaves (4-) 7-14 mm wide *H. prolificum*
- 4 Flowers 7-many per inflorescence; capsules (3-) 4.5-6 mm long; larger leaves 1-7 (-11) mm wide.
- 5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [widespread]..... *H. densiflorum* var. *densiflorum*
- 5 Leaves 1.0-3.7 (-4.1) mm wide; [of the Ridge and Valley of nw. GA, c. and nw. AL, and e. TN] *H. densiflorum* var. *interior*

**Key D – herbaceous St. John's-worts with leaves ascending or appressed,
1-nerved, < 1 mm wide and with a diffuse, racemose inflorescence**

- 1 Leaves linear-subulate, (5-) 8-20 mm long; capsules 1-1.75× as long as the sepals; seeds coarsely rugose-areolate; stamens 10-22 *H. drummondii*
- 1 Leaves scale-like, 1-5 mm long; capsules ca. 2-3× as long as the sepals; seeds minutely and inconspicuously reticulate; stamens 5-10 *H. gentianoides*

**Key E – herbaceous St. John's-worts with broad leaves, 3 (-4) locular capsules, stamens connate at base into 3 or 5 fascicles,
leaves with black dots as well as translucent glands (except in *H. perforatum*), and sepals and/or petals marked with black dots or lines**

- 1 Smaller stems strongly wing-angled; seeds 1.0-1.3 mm long; leaves of the main stem (8-) 11-20 (-26) mm long, those of the lateral branches typically much smaller; leaves punctate primarily with translucent glands; [alien, usually in disturbed habitats]; [section *Hypericum*] *H. perforatum*
- 1 Smaller stems not wing-angled; seeds 0.6-1.1 mm long; leaves of the main stem (11-) 21-48 (-64) mm long, those of the lateral branches nearly to quite as large; leaves punctate with black glands; [native, in a variety of habitats]; [section *Graveolentia*].
- 2 Petals (3.0-) 4.3-12.2 (-14.0) mm long; sepals 1.5-6 mm long, conspicuously punctate with black glands (sometimes also black-lined); capsules (2.5-) 3.0-5.4 (-6.0) mm long; [collectively widespread, occurring in the Coastal Plain, Piedmont, and Mountains of NC, SC, and VA].
- 3 Sepals 3-6 mm long; styles (2.5-) 5.4-7.4 (-9.0) mm long; petals (6.0-) 9.2-12.2 (-14.0) mm long; leaf apices acute *H. pseudomaculatum*
- 3 Sepals 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse to slightly retuse... *H. punctatum*
- 2 Petals 6-18 mm long; sepals 4-10 mm long, with or without black lines (sometimes also black-punctate); capsules (3.0-) 4.0-7.7 (-10.0) mm long; [endemic to moderate to high elevations of w. NC, sw. VA, and e. TN].
- 4 Styles (3.0-) 5.6-10.0 (-12.0) mm long; sepals without black lines; petals (5.0-) 11.5-16.1 (-18.0) mm long, without black lines and with round black glands only along the petal margin; longest stamens (8.0-) 10.7-16.3 (-22.0) mm long; cymes relatively few-flowered, (2-) 5-14 (-22) flowers per plant *H. graveolens*
- 4 Styles (1.5-) 1.9-2.9 (-5.0) mm long; sepals with black lines; petals (6.0-) 7.0-9.2 (-11.0) mm long, with black lines and round black glands scattered over the surface of the petal; longest stamens (4.0-) 6.1-8.5 (-10.0) mm long; cymes relatively many-flowered, (5-) 13-61 (124) flowers per plant *H. mitchellianum*

Key F – shrubby and subshrubby St. John's-worts

- 1 Plant a matted, decumbent shrub, 0.5-3 (rarely to 5) dm tall; leaves 1.5-2.5× as long as wide, without axillary fascicles of leaves; flowers solitary or in small simple cymes; [endemic to rock outcrops at moderate to high elevations in the Mountains of sw. NC, nw. SC, and ne. GA]; [section *Myriandra*, subsection *Pseudobrathydium*] *H. buckleyi*
- 1 Plant an erect suffrutescent herb, 1.5-10 dm tall; leaves 1.5-5× as long as wide, with or without axillary fascicles of leaves; flowers in compound cymes; [mostly of the Coastal Plain and Piedmont, very rarely in the Mountains and then at low elevations]; [section *Myriandra*, subsection *Suturosperma*].
- 2 Larger leaves 4-10 mm wide, 3-5× as long as wide; axillary leaf fascicles present in main leaf axils; seeds pale brown, faintly reticulate, 0.4-0.5 mm long *H. cistifolium*
- 2 Larger leaves 10-30 mm wide, 1.5-3× as long as wide; axillary leaf fascicles absent; seeds dark brown, strongly reticulate, 1.5-2 mm long.
- 3 Flowers in simple 3-flowered cymes or in compound cymes with up to 8 flowers; sepals 3 mm long, oblong, obtuse apically; capsules ovoid, 8-10 mm long (excluding the styles) and 5-7 mm broad; seeds 1.8-2.0 mm long, cylindrical, sometimes slightly falcate, dull brown when mature *H. apocynifolium*
- 3 Flowers usually in many-flowered cymes terminating branches; sepals 1.5-2.0 mm long, usually triangular-acute; capsules ovoid to subglobose, 4-5 mm long (excluding the styles) and 4-5 mm broad; seeds 1.5-1.8 mm long, usually falcate-cylindrical, dark purplish-brown and lustrous when mature *H. nudiflorum*

**Key G – herbaceous St. John's-worts with broad leaves, 1-locular capsules,
stamens separate or connate at base, but not grouped into fascicles, leaves with translucent dots, without black dots,
sepals and petals with translucent lines or dots only, not marked with black dots or lines**

- 1 Stems and leaves pubescent; [section *Trigynobrathys*] *H. setosum*
- 1 Stems and leaves glabrous.
- 2 Styles united, persistent as a single straight beak on the capsule; [section *Myriandra*, subsection *Suturosperma*].
- 3 Leaves 3-6 cm long, 4-6× as long as wide, the margins revolute *H. adpressum*

- 3 Leaves 1-3 (-4) cm long, 2-3× as long as wide, the margins not revolute *H. ellipticum*
- 2 Styles separate, more or less divergent, not persistent as a beak on the capsule; [section *Trigynobrathys*].
- 4 Styles 2-4 mm long; stamens 50-80.
 - 5 Punctate glands absent on the stem (rarely very few on the internodes of the inflorescence); punctate glands of the leaves small, round, distributed on the lower leaf surface, becoming sparse toward the base of the leaf and toward the midrib; midstem leaves mostly broadest at or beyond the middle..... *H. virgatum*
 - 5 Punctate glands frequent on the stem; punctate glands of the leaves and stem large, oval, distributed evenly and densely on the lower leaf surface, also dense on the upper leaf surface in *H. denticulatum* and *H. harperi* (absent on upper leaf surface in *H. species 1*); midstem leaves usually broadest at or below the middle.
 - 6 Upper surface of the leaf with no punctate glands; inflorescence branches typically with 3-12 pairs of bracteal leaves about 1/2 as large as the foliage leaves; [of shallow soil mats on granitic domes in the upper Piedmont of NC] *H. radfordiorum*
 - 6 Upper surface of the leaf with abundant punctate glands; inflorescence branches with at most a few pairs of very small bracts; [of Coastal Plain wetlands, very rarely disjunct inland and then in wetlands].
 - 7 Leaves 5-20 (-24) mm long, 5-15 mm wide, 1.5-3× as long as wide, ovate to obovate to narrowly elliptic, mostly appressed to the stem, mostly shorter than the internodes; sepals 4.0-8.0 mm long, 2.0-4.0 mm wide, acute; lower stem not spongy-thickened with aerenchymatous tissue; [of moist pinelands of the Coastal Plain, very rarely disjunct inland to bog habitats in the Piedmont and Mountains] *H. denticulatum*
 - 7 Leaves 10-35 (-40) mm long, 3-8 (-12) mm wide, 3-10× as long as wide, lanceolate to linear-lanceolate, mostly ascending to spreading, often equaling the internodes; sepals 3.0-5.0 mm long, 0.8-2.5 mm wide, acute to acuminate; lanceolate to linear-lanceolate; upper portion of stem with numerous axillary branches; lower stem usually spongy-thickened with aerenchymatous tissue; [of upland depression ponds of the Coastal Plain, growing where seasonally inundated] *H. harperi*
- 4 Styles 0.5-1.5 mm long; stamens 5-22.
 - 8 Leaves lanceolate to linear, 6-30 mm long, 0.5-3 mm wide, the leaf base attenuate to cuneate..... *H. canadense*
 - 8 Leaves ovate to elliptic, 3-35 mm long, 2-15 mm wide, the leaf base rounded to cordate-clasping.
 - 9 Sepals broadest near the base; inflorescence with few or no normally sized leaves, these only low in the inflorescence, giving the inflorescence a naked appearance; [of Coastal Plain pinelands]..... *H. gymnanthum*
 - 9 Sepals broadest near the middle; inflorescence with many normally sized leaves and leaflike bracts, giving the inflorescence a leafy appearance; [collectively widespread].
 - 10 Ultimate bracts of the inflorescence elliptic, much like the leaves; leaves not paler beneath; sepals obtuse, much shorter than the capsule; capsule 3-5 mm long *H. boreale*
 - 10 Ultimate bracts of the inflorescence linear, differing conspicuously from the leaves; leaves paler beneath; sepals acute, about equaling the capsule; capsule 2-3.5 mm long.
 - 11 Inflorescence branches from the upper 1-6 nodes of the stem, the further branching repeatedly monochasial; stem with apical internode well developed, usually longer than the internode below; sepals broader above the middle, more-or-less imbricate; [of the Coastal Plain]..... *H. mutilum* var. *latisepalum*
 - 11 Inflorescence branches from the upper 2-10 nodes of the stem, the further branching mostly dichasial; stem with apical internode shorter than the internode below or even essentially absent; sepals broader below the middle, not imbricate (rarely broader above the middle and imbricate); [widespread] *H. mutilum* var. *mutilum*

Key H – “Triadenum”

- 1 Leaves narrowed to the cuneate or broadly cuneate (rarely truncate) base.
 - 2 Lower leaves sessile; sepals 5-7 mm long, acute (to obtuse); leaves lacking translucent or dark glands or punctae; styles 0.5-1.5 mm long (best seen in fruit) *H. tubulosum*
 - 2 Lower leaves petiolate; sepals 3-5 mm long, obtuse; leaves with translucent glands and dark punctae; styles 1.5-3 mm long (best seen in fruit) *H. walteri*
- 1 Leaves clasping, cordate, or subcordate at the base.
 - 3 Sepals 2.5-5 mm long at maturity, obtuse to acute; styles 0.5-1 (-1.5) mm long (best seen in fruit)..... *H. fraseri*
 - 3 Sepals 5-8 mm long at maturity, acute to acuminate; styles 1.8-3 mm long (best seen in fruit)..... *H. virginicum*

Hypericum adpressum W.P.C. Barton, Bog St. John's-wort, Creeping St. John's-wort. Boggy depressions. Jul-Aug. E. MA south to sw. GA in the Coastal Plain; disjunct inland in e. WV (Greenbrier County), IN, IL, and sc. TN. See discussion on its habitats and rarity in Sorrie (1998b). [= C, F, G, GW, K, Pa, RAB, S, V, Va, WV, X, Z]

Hypericum apocynifolium Small. Mesic bluffs and ravines, ridges and natural levees in floodplains. C. GA, s. GA, and Panhandle FL west to se. AR and e. TX. [= S, V, WH3, X, Y; < *H. nudiflorum* – GW, K, Z]

Hypericum ascyron Linnaeus ssp. *pyramidatum* (Aiton) N. Robson, American Great St. John's-wort. Swamps, bottomlands. Jun-Aug. The species is of e. North America and e. Asia; the North American ssp. *pyramidatum* occurs from QC west to MN, south to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), MD (Robson 2000), and WV (Harmon, Ford-Werntz, & Grafton 2006). [= X; < *H. ascyron* Linnaeus – K; = *H. pyramidatum* Aiton – C, F, G, Pa] {not yet keyed} {section *Roscyna*}

Hypericum boreale (Britton) E.P. Bicknell, Dwarf St. John's-wort, Northern St. John's-wort. Sinkhole ponds in the Mountains, interdune ponds in the outer Coastal Plain, boggy places. NL (Newfoundland) and QC west to w. ON, south to VA, nw. NC (?), OH, IN, and n. IL. Hybrids with *H. canadense* have been called *H. ×dissimulatum* E.P. Bicknell (pro sp.). [= C, F, G, K, Pa, Va, WV; = *H. mutilum* Linnaeus ssp. *boreale* (Britton) J.M. Gillett – X]

Hypericum brachyphyllum (Spach) Steudel. Ponds and wet pinelands. Se. NC south to s. FL, west to s. MS. Material from se. NC was at one point thought to perhaps represent a new taxon. [= GW, K, U, V, WH3, X, Y, Z; < *H. aspalathoides* – S]

Hypericum buckleyi M.A. Curtis, Granite Dome St. John's-wort. Thin soil in seasonal seepage around rock outcrops, particularly granitic exfoliation domes. Jun-Aug. Sw. NC south to nw. SC and ne. GA, a Southern Appalachian endemic. Wilbur (1995) showed that Curtis's spelling of the epithet, "*buckleyi*", should be maintained; however, changes in the

International Code of Botanical Nomenclature have reversed this (Robson 1996). [= GW, RAB, S, W, V, X, Z; = *H. buckleyi* – K, orthographic variant]

* *Hypericum calycinum* Linnaeus, Aaron's-beard. Disturbed areas, naturalized from plantings; native of se. Europe and Asia Minor. Naturalized in Knox County, TN (D. Estes, pers. comm., 2012). {not yet keyed; add to synonymy}

Hypericum canadense Linnaeus, Canada St. John's-wort Bogs, pine savannas, ditches. Jul-Sep. NL (Newfoundland) and QC west to MN, south to s. GA, ne. FL, Panhandle FL, and MS; also in Holland and Ireland, where considered by some to be native. Hybrids with *H. mutilum* and/or *H. boreale* have been called *H. ×dissimulatum* E.P. Bicknell (pro sp.). [= C, G, GW, K, Pa, RAB, S, Va, W, WH3, WV, X, Z; > *H. canadense* var. *canadense* – F; > *H. canadense* var. *galiiforme* Fernald – F]

Hypericum chapmanii W.P. Adams, Apalachicola St. John's-wort, Tree St. John's-wort. Margins of pond-cypress ponds, pond-cypress stringers, often growing with *Cyrilla parvifolia* and *Nyssa ursina*. Endemic to Panhandle FL (9 counties). [= GW, K, U, V, WH3, X, Y, Z; < *H. fasciculatum* – S; = *H. arborescens* Chapman]

Hypericum cistifolium Lamarck. Pine savannas, wet pine flatwoods. Jun-Aug. E. NC south to s. FL, west to e. TX. [= GW, K, RAB, V, WH3, X, Y, Z; > *H. cistifolium* – S, in a narrower sense; > *H. opacum* Torrey & A. Gray – S]

Hypericum crux-andreae (Linnaeus) Crantz, St. Andrew's Cross, St. Peter's-wort. Pine flatwoods, pine savannas, bogs, seeps, mesic to dryish forests and woodlands. Jun-Oct. NY (Long Island) and NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to w. NC and n. GA, also north in the interior to c. TN, s. KY, c. AR, and se. OK. [= GW, K, Pa, W, WH3, X, Y; = *H. stans* (Michaux ex Willdenow) W.P. Adams & Robson – C, RAB, V, Z; = *Ascyrum stans* Michaux ex Willdenow – F, G; > *Ascyrum stans* – S; > *Ascyrum cuneifolium* Chapman – S]

Hypericum densiflorum Pursh var. *densiflorum*, Mountain Bushy St. John's-wort. Bogs, streambanks, dry to moist forests, rock outcrops, moist forests, pine savannas. Jun-Sep. Sw. PA south to n. GA and c. AL in and near the Mountains; NJ south to SC in the Coastal Plain; s. GA west to TX in the Coastal Plain. The related *H. lobocarpum* Gattinger is more western, extending east to TN; the basis for attribution of *H. lobocarpum* to "Blue Ridge, N.C." by Small (1933) is unknown. [< *H. densiflorum* – C, GW, K, Pa, RAB, Va, W, WV, X, Z; < *H. densiflorum* var. *densiflorum* – F, G (also see *H. interior*); > *H. densiflorum* Small – S; > *H. glomeratum* Small – S]

Hypericum densiflorum Pursh var. *interior* (Small) Sorrie & Weakley, Interior Bushy St. John's-wort. Rocky forests, riverbanks. E. and c. TN, nw. GA south to c. AL. Probably best treated as a variety of *H. densiflorum*; see Weakley et al. (2011). Potentially to be re-elevated to species rank, if more carefully studied. [= *H. interior* Small – S; < *H. densiflorum* Pursh – K, V, X, Z; ? *H. revolutum* R. Keller]

Hypericum denticulatum Walter, Coppery St. John's-wort. Savannas, wet pine flatwoods, adjacent ditches, borrow scrapes, blackwater stream shores. Jul-Sep. S. NJ south to e. GA (McIntosh County) (Sorrie 1998b) on the Coastal Plain; disjunct inland in c. and w. NC, sc. TN, and in s. AL. See discussion under *H. virgatum*. [= K, Pa, Q, S, Va; = *H. denticulatum* var. *denticulatum* – C, F, G, RAB, Z; < *H. denticulatum* – GW, WH3 (also see *H. virgatum*); = *H. denticulatum* ssp. *denticulatum* – X]

Hypericum dolabriforme Ventenat, Glade St. John's-wort. Limestone glades and barrens. In nw. GA (Jones & Coile 1988) and e. TN (Chester, Wofford, & Kral 1997); this species should be sought in sw. VA. [= C, F, G, K, S, V, X, Z] {not yet keyed}

Hypericum drummondii (Greville & Hooker) Torrey & A. Gray, Nits-and-lice, Drummond's St. John's-wort. Dry woodlands, woodland borders, fields. Jul-Sep. MD west to OH, IL, and se. KS, south to Panhandle FL and c. TX. [= C, F, G, GW, K, Pa, RAB, Va, W, WH3, WV, X, Z; = *Sarothra drummondii* Greville & Hooker – S]

Hypericum ellipticum Hooker, Pale St. John's-wort. Swamp forests, wet places along streams, wet meadows. Jul-Aug. NL (Newfoundland) and NS west to w. ON, south to NY, DE, MI, and MN, and in the mountains to WV, NC (?), and ne. TN (Johnson County) (Chester, Wofford, & Kral 1997), and NC (?). The documentation for C's attribution of *H. ellipticum* to NC is unknown. [= C, F, G, K, Pa, V, Va, WV, X]

Hypericum erythrae (Spach) Steudel, Georgia St. John's-wort, Sparse-leaved St. John's-wort, Grit St. John's-wort. Seepage bogs, roadside ditches. Apparently nearly endemic to the Altamaha Grit region of the GA Coastal Plain, extending to Beaufort County, SC (Allison, in press). [= Q] {not yet keyed}

Hypericum exile W.P. Adams. Pine flatwoods. Endemic to Panhandle FL (Bay, Franklin, Gulf, Liberty, and Washington counties). There seems nothing in particular to recommend Robson's reduction of *H. exile* to a subspecies of *H. nitidum*. [= GW, K, U, V, WH3, Y, Z; = *H. nitidum* Lamarck ssp. *exile* (W.P. Adams) N. Robson - X]

Hypericum fasciculatum Lamarck, Peelbark St. John's-wort. Wet pine savannas, beaver ponds, upland depression ponds. May-Sep. E. NC south to s. FL, west to s. MS. [= GW, K, RAB, U, V, WH3, X, Y, Z; < *H. fasciculatum* - S (also see *H. nitidum* and *H. chapmanii*)]

Hypericum fraseri Spach, Fraser's Marsh St. John's-wort. Bogs, peaty wetlands, seepage swamps. Jul-Aug. NL (Newfoundland) and QC west to MN, south to NY, PA, w. VA, ne. TN, w. NC, OH, n. IN, and NE. Closely related to *T. virginicum* and reduced to a variety of (or included in) that species by some authors. [= Va; = *Triadenum fraseri* (Spach) Gleason - C, G, K, Pa; = *Hypericum virginicum* Linnaeus var. *fraseri* (Spach) Fernald - F, WV; < *T. virginicum* - W, Z]

Hypericum frondosum Michaux. Rock outcrops and rocky woodlands; also in dry disturbed areas. Late May-Aug. This species is native and widespread as far east as e. TN (Chester, Wofford, & Kral 1997), GA, and FL. [= C, F, G, K, V, Va, W, WH3, Y, Z; > *H. aureum* Bartram - S; > *H. splendens* Small - S]

Hypericum galioides Lamarck. Wet pine savannas, wet pine flatwoods, pools, edges of bottomlands. Jun-Aug. E. NC south to c. peninsula FL, west to se. TX. [= GW, K, RAB, U, V, WH3, X, Y, Z; > *H. ambiguum* Elliott - S; > *H. galioides* - S]

Hypericum gentianoides (Linnaeus) Britton, Sterns, & Poggenburg, Pineweed, Orange-grass. Fields, rock outcrops, woodland borders, eroding areas, pond margins, flatwoods. Jul-Oct. ME and ON west to MN, south to s. FL and TX. [= C, F, G, K, Pa, RAB, Va, W, WH3, WV, X, Z; = *Sarothra gentianoides* Linnaeus - S]

Hypericum graveolens Buckley, Mountain St. John's-wort. Grassy balds, grassy openings, forests, at high elevations (1200 m or more). Jul-Aug. Nw. NC and ne. TN south to sw. NC, a Southern Appalachian endemic. This and the related *H. mitchellianum* (another narrow endemic to the Southern Appalachians) hybridize, forming local hybrid populations with intermediate characteristics (Culwell 1970). [= GW, K, RAB, S, W, X, Z]

Hypericum gymnanthum Engelmann & A. Gray, Claspingleaf St. John's-wort. Pine savannas, wet pine flatwoods, sinkhole ponds (Auga and Rockingham counties, VA), other wet to moist habitats. Jun-Sep. S. NJ south to ne. FL, Panhandle FL, west to c. TX, and scattered inland in PA, WV, sc. TN, OH, IN, IL, MO, and e. KS; also disjunct in Guatemala (introduced?). Added to the flora of KY in 2013 by Martina Hines (Littlefield (2014)). [= C, F, G, GW, K, Pa, RAB, S, Va, WH3, X, Z]

Hypericum harperi R. Keller, Harper's St. John's-wort. Clay-based Carolina bays, other upland depression ponds, with *Taxodium ascendens*. Jul-Sep. E. and c. SC south to sw. GA and e. Panhandle FL. *H. harperi* should be sought in sc. and se. NC, where it may well occur. This species has generally been considered a part of *H. denticulatum* or *H. virgatum*, but Webb (1980) makes a convincing argument for its recognition, including the ecological differentiation and absence of intermediates or hybrids when growing in proximity to *H. denticulatum*. See *H. virgatum* for additional discussion. [= Q, WH3, X; < *H. denticulatum* var. *acutifolium* - RAB, Z; < *H. denticulatum* - GW; < *H. harperi* - K; < *H. acutifolium* - S]

Hypericum hypericoides (Linnaeus) Crantz, St. Andrew's Cross. Dry forests and woodlands. May-Aug. NJ, w. VA, c. KY, se. MO, and c. OK, south to s. FL and e. TX; also in the West Indies, Mexico, and Central America. [= C, GW, RAB, V, Va, W, WH3, Y, Z; > *Ascyrum hypericoides* Linnaeus var. *hypericoides* - F, G; > *Ascyrum hypericoides* Linnaeus var. *oblongifolium* (Spach) Fernald - F, G; = *H. hypericoides* ssp. *hypericoides* - K, X; > *Ascyrum hypericoides* Linnaeus - S; > *Ascyrum linifolium* Spach - S]

Hypericum lissophloeus W.P. Adams. Margins of sinkhole ponds. Endemic to Panhandle FL (Bay and Washington counties). [= GW, K, U, V, WH3, X, Y, Z]

Hypericum lloydii (Svenson) W.P. Adams, Lloyd's St. John's-wort. Dry woodlands, sandhills, edges of granitic flatrocks, edges of Altamaha Grit outcrops, roadbanks. Jun-Sep. Sc. VA (Sorrie & LeBlond 2008) south to c. AL. [= K, RAB, U, V, Va, X, Z; = *Hypericum galioides* Lamarck var. *lloydii* Svenson]

Hypericum lobocarpum Gattinger. Streambanks, river bottoms, pinelands. C. KY, c. TN (Chester, Wofford, & Kral 1997) and s. MS west to s. IL, se. OK, and e. TX; credited to SC by Robson (1996), based on specimens debated and dismissed by Adams (1973). Late May-Sep. [= C, K, S, V, X, Z; = *H. densiflorum* var. *lobocarpum* (Gattinger) Svenson – F, G; < *H. densiflorum* – GW] {not yet keyed}

Hypericum majus (A. Gray) Britton. Wet meadows and shores. Jul-Sep. NL (Newfoundland) west to BC, south to s. NJ, n. DE, nw. PA (Rhoads & Block 2007), OH, IN, IL, MO, OK, CO, and OR (Kartesz 1999). [= C, F, G, K, Pa, X] {not yet keyed}

Hypericum microsepalum (Torrey & A. Gray) A. Gray ex S. Watson. Moist to wet pine flatwoods. S. GA south to Panhandle FL. [= GW, K, V, WH3, X, Y, Z; = *Crookea microsepala* (Torrey & A. Gray) Small – S]

Hypericum mitchellianum Rydberg. Blue Ridge St. John's-wort. Grassy balds, grassy openings, forests, seepages, at moderate to high elevations (generally at 1000-1900 m or more). Jul-Aug. W. VA, e. WV, and e. TN south to sw. NC, a Southern Appalachian endemic. Robson (2006) interprets this as a hybrid of *H. graveolens* and *H. punctatum* but offers no evidence other than its general morphological intermediacy. [= C, F, G, GW, K, RAB, S, Va, W, WV, Z; = *H. ×mitchellianum* Rydberg, pro sp. – X]

Hypericum mutilum Linnaeus var. *latisepalum* Fernald, Southern Dwarf St. John's-wort. Marshes and other wet habitats. Jun-Oct. Se. SC south to peninsular FL, west to TX (and, according to F, north to s. NJ). Hybrids with *H. canadense* have been called *H. ×dissimulatum* E.P. Bicknell (pro sp.). [= F; < *H. mutilum* – RAB, G, GW, K, S, W, WH3, Z; = *H. mutilum* ssp. *latisepalum* (Fernald) N. Robson – X]

Hypericum mutilum Linnaeus var. *mutilum*. Common Dwarf St. John's-wort. Bogs, fens, marshes, shores, other wet habitats. Jun-Oct. NL (Newfoundland) and QC west to MB, south to s. FL and c. TX; scattered (probably as an adventive) farther west in North America, in Central and South America, and Europe. Hybrids with *H. canadense* have been called *H. ×dissimulatum* E.P. Bicknell (pro sp.). [= F, Va; < *H. mutilum* – C, G, GW, K, Pa, RAB, S, W, WH3, WV, Z; = *H. mutilum* ssp. *mutilum* – X]

Hypericum myrtifolium Lamarck, Myrtle-leaf St. John's-wort. Ponds. Small (1933) reports this species from SC; this distribution is now documented by a specimen from Jasper Co., SC (P. McMillan, pers. comm.). Se. SC south to s. FL, west to se. MS, a Southeastern Coastal Plain endemic. [= GW, K, S, V, WH3, X, Y, Z]

Hypericum nitidum Lamarck. Usually in flowing water of blackwater streams. Jun-Aug. C. SC south to Panhandle FL, west to sw. AL. [= GW, K, RAB, U, V, WH3, Y, Z; = *H. nitidum* ssp. *nitidum* – X]

Hypericum nudiflorum Michaux ex Willdenow. Streambanks, moist forests. Jun-Jul. Se. VA south to Panhandle FL, west to e. TX, s. AR, and se. OK; disjunct in Cumberland Plateau of TN. [= C, F, G, RAB, S, W, WH3, V, Va, X, Y; < *H. nudiflorum* – GW, K, Z (also see *H. apocynifolium*)]

* ***Hypericum perforatum*** Linnaeus, European St. John's-wort. Fields, pastures, roadsides, woodland borders; native of Europe. Jun-Sep. See Duncan (1985) for documentation for GA. [= C, F, G, K, Pa, RAB, S, Va, W, WV, Z; = *H. perforatum* ssp. *perforatum* – X]

Hypericum prolificum Linnaeus, Shrubby St. John's-wort. Bogs, seepages, dry rocky forests, rock outcrops, riverside prairies. Jun-Oct. NY west to s. MI and MN, south to GA and LA. [= C, G, K, W, Pa, RAB, S, V, Va, WH3, WV, X, Z; = *H. spathulatum* (Spach) Steudel – F]

Hypericum pseudomaculatum Bush. Wet, moist, or dry forests. Jun-Sep. SC south to Panhandle FL, west to TX, north in the interior to e. TN, c. IL, s. MO, and c. OK. {records east of the Ozarks need to be studied more carefully} [= C, G, K, RAB, S, WH3, X, Z; = *H. punctatum* Lamarck var. *pseudomaculatum* (Bush) Fernald – F]

Hypericum punctatum Lamarck, Spotted St. John's-wort. Fields, woodland borders. Jun-Sep. QC west to MN, south to c. peninsular FL and TX. [= C, G, K, Pa, RAB, Va, W, WH3, WV, X, Z; = *H. punctatum* var. *punctatum* – F; > *H. punctatum* – S; > *H. subpetiolatum* E.P. Bicknell ex Small – S]

Hypericum radfordiorum Weakley ex J.R. Allison, Radfords' St. John's-wort, Brushy Mountain St. John's-wort. Shallow circumneutral soil mats of granitic domes in the Brushy Mountains. Apparently endemic to the Brushy Mountains of Alexander and Wilkes counties, NC. This taxon, included in *H. denticulatum* var. *acutifolium* by Webb (1980), differs from typical *H. virgatum* in being profusely branched from the medial and upper nodes (rather than being little if at all branched, and then only from the uppermost nodes), in having leaves with acuminate (rather than acute to obtuse) apices, and electrophoretically (Webb 1980). Additionally, these plants have numerous bracteal leaves along the inflorescence branches (vs. few or none), the punctate glands of the foliage are large and oval, resembling those of *H. denticulatum* (vs. small and round), and the punctate glands are distributed on the lower leaf surface and stem (vs. lower leaf surface only). It is notable that these same outcrops are phytogeographically interesting, with other disjunct and weakly differentiated races (see *Allium cuthbertii*) and disjunct populations. See Allison (2011) for more detailed information. [= Q; < *H. denticulatum* (included in concept of *H. denticulatum* (= *H. denticulatum* var. *acutifolium*, *H. denticulatum* ssp. *acutifolium*) by most earlier authors]

Hypericum setosum Linnaeus, Hairy St. John's-wort. Pine savannas, wet pine flatwoods, boggy areas, adjacent ditches, fireflow lines, and scrapes. May-Sep. Se. VA south to c. peninsular FL, west to se. TX. [= C, F, G, GW, K, RAB, S, Va, WH3, X, Z]

Hypericum sphaerocarpum Michaux, Barrens St. John's-wort. Limestone barrens. C. OH, s. MI, s. WI, IA, and se. NE south through KY, e. and c. TN (Chester, Wofford, & Kral 1997), to nw. GA (GAHP 2003), c. AL, c. MS, LA, and ne. TX; also reported for sw. PA, where considered adventive (Rhoads & Klein 1993). [= C, F, G, K, Pa, V, X, Z; > *H. turgidum* Small – S; > *H. sphaerocarpum* var. *turgidum* (Small) Svenson] {not yet keyed}

Hypericum stragulum W.P. Adams & Robson, Low St. John's-wort, Stragging St. John's-wort. Dry rocky or sandy woodlands. May-Aug. MA (Nantucket Island, NY (Long Island), west to s. PA, s. OH, s. IN, s. IL, c. MO, se. KS, and c. OK, south to ne. NC, c. SC, c. GA, n. AL, n. MS, n. LA, and c. TX. [= C, Pa, V, Va, W, Z; = *H. stragulum* – RAB, misspelling; = *Ascyrum hypericoides* Linnaeus var. *multicaule* (Michaux ex Willdenow) Fernald – F, G, WV; = *H. hypericoides* (Linnaeus) Crantz ssp. *multicaule* (Michaux ex Willdenow) Robson – K, X]

Hypericum suffruticosum W.P. Adams & Robson, Pineland St. John's-wort. Pine savannas and flatwoods. Apr-Jun. Se. NC south to c. peninsular FL, west to se. LA. [= K, RAB, V, WH3, X, Y, Z; = *Ascyrum pumilum* Michaux – S]

Hypericum tenuifolium Pursh, Sandhill St. John's-wort. Pine flatwoods, pine savannas, sandhills. Jun-Sep. Se. NC south to s. peninsular FL; Panhandle FL and se. AL. Robson (1996) indicates that the older name *H. tenuifolium* Pursh has now been adequately shown to apply to this taxon. [= U, WH3, X; = *H. reductum* (Svenson) W.P. Adams – GW, K, RAB, V, Y, Z; < *H. aspalathoides* Willdenow – S (also including *H. brachyphyllum*)]

Hypericum tetrapetalum Lamarck. Wet pinelands and in depressional wetlands (open or dominated by *Taxodium ascendens*). E. GA (within a few counties of se. SC), south to s. FL, west to Panhandle FL. [= GW, K, V, WH3, X, Y; = *Ascyrum tetrapetalum* (Lamarck) Vail – S]

Hypericum tubulosum Walter, Southern Marsh St. John's-wort. Bogs, peaty wetlands, drawdown sloughs along rivers, drawdown shorelines along man-made reservoirs. Aug-Sep. Se. VA south to Panhandle FL, west to LA, and north in the interior to se. and c. TN, s. IL and s. OH. [= RAB, Va; = *Triadenum tubulosum* (Walter) Gleason – C, G, GW, K, WH3, Z; = *Hypericum tubulosum* Walter – RAB; = *Hypericum tubulosum* Walter var. *tubulosum* – F; = *T. longifolium* Small – S]

Hypericum virgatum Lamarck, Strict St. John's-wort. Hardpan woodlands, rock outcrops, woodland borders, glades and barrens (especially over mafic or ultramafic rocks). Late Jun-Sep. MD west to s. OH, s. IN, and s. IL, south to c. NC, c. SC, sw. GA, Panhandle FL, s. MS, and se. LA. Though treated by most recent authors as a variety of *H. denticulatum*, *H. virgatum* is better considered as a distinct species. Webb (1980) recognized *H. harperi* as a separate species (it had previously been considered a part of *H. virgatum*), and continued to recognize this taxon as a variety of *H. denticulatum*. However, based on the nature of the punctate glands, size of seeds, inland distribution, etc., it appears that *H. virgatum* is more distantly related to *H. denticulatum* and *H. harperi* than they are to one another; recognition at the species level is warranted for *H. virgatum*. As

pointed out by Webb, *H. denticulatum* is primarily tetraploid (n = 24), while *H. virgatum* and *H. harperi* are (as far as is known) strictly diploid. Additionally, the aberrant populations from granitic outcrops in the Brushy Mountains of Alexander and Wilkes counties, NC referred by Webb (1980) to this taxon are distinct, and more closely allied to *H. denticulatum* and *H. harperi*; see *Hypericum radfordiorum* for additional discussion. [= K, Q, Va; < *H. denticulatum* Walter var. *acutifolium* (Elliott) Blake – C, F, G, RAB, W, Z (also see *H. harperi*); > *H. denticulatum* var. *recognitum* Fernald & Schubert – RAB, F, WV; < *H. denticulatum* – GW, WH3; < *H. acutifolium* Elliott – S (also see *H. harperi*); = *H. denticulatum* ssp. *acutifolium* (Elliott) N. Robson – X]

Hypericum virginicum Linnaeus, Common Marsh St. John's-wort. Bogs, fens, tidal swamps and marshes, other peaty wetlands. Jul-Sep. NS west to OH and s. ON, south to s. FL and MS, mostly on the Coastal Plain but scattered inland. [= RAB; = *Triadenum virginicum* (Linnaeus) Rafinesque – C, G, GW, K, Pa, S, WH3; = *Hypericum virginicum* var. *virginicum* – F, WV; < *T. virginicum* – W, Z (also see *T. fraseri*)]

Hypericum walteri J.F. Gmelin, Walter's Marsh St. John's-wort. Swamp forests and marshes. Jul-Sep. MD south to n. peninsular FL, west to e. TX, and north in the interior to s. MO, s. IL, and OH. [= RAB, Va; = *Triadenum walteri* (J.F. Gmelin) Gleason – C, G, GW, K, Pa, W, WH3, Z; = *Hypericum tubulosum* Walter var. *walteri* (J.F. Gmelin) Lott – F, WV; = *T. petiolatum* (Walter) Britton – S]

215. GERANIACEAE A.L. de Jussieu 1789 (Geranium Family) [in GERANIALES]

A family of about 5-11 genera and 700-835 species, herbs and shrubs, mostly temperate. References: Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves pinnately cleft or compound; fertile stamens 5, staminodia 5..... ***Erodium***
- 1 Leaves palmately cleft or compound; fertile stamens 10 (except in *G. pusillum*, and note that anthers are readily deciduous in all species)..... ***Geranium***

Erodium L'Héritier in Aiton 1789 (Stork's-bill, Filaree)

A genus of about 60-80 species, herbs, mainly Old World. References: Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves simple, deeply lobed but not divided..... [***E. texanum***]
- 1 Leaves compound, with 3 or more leaflets.
 - 2 Primary leaflets sessile or nearly so, sometimes connected by blade tissue; blades of the primary leaflets divided nearly or quite to the base; apical pits of mericarp lacking sessile glands..... ***E. cicutarium***
 - 2 Primary leaflets petiolulate; blades of the primary leaflets divided <0.75× to the base; apical pits of mericarp with sessile glands..... [***E. moschatum* var. *moschatum***]

* ***Erodium cicutarium*** (Linnaeus) L'Héritier, Heron's-bill, Common Stork's-bill, Redstem Filaree, Alfileria, Pin-clover. Disturbed areas, fields, lawns; native of Europe. Mar-Jun; Apr-Jul. [= C, F, G, K2, Mo, Pa, RAB, S, Va, W, WH3; > *E. cicutarium* ssp. *cutarium* – K1]

* ***Erodium moschatum*** (Linnaeus) L'Héritier var. *moschatum*, Whitestem Filaree. Disturbed areas, waste area near wool-combing mill; native of Mediterranean Europe. Apr-Sep. Naturalized south to DE and PA; also in SC Coastal Plain. [= F, K1, K2; < *E. moschatum* – C, G, Pa, S]

* ***Erodium texanum*** A. Gray, Texas Stork's-bill. Waste areas near wool-combing mill, probably merely a waif; native of sc. and sw. United States. Mar-May. [= K1, K2, Mo]

Geranium Linnaeus 1753 (Geranium, Crane's-bill)

A genus of about 350-430 species, mainly perennial herbs, also annuals and dwarf shrubs, mainly temperate. House plants called 'geranium' are members of the genus *Pelargonium*. References: Aedo (2012)=Z; Aedo, Aldasoro, & Navarro (1998); Yeo (1984); Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007).

- 1 Perennial, from a stout rhizome; [subgenus *Geranium*].
 - 2 Cymules 1-flowered (rarely a few cymules 2-flowered); pedicels with eglandular hairs only.
 - 3 Petals 15-22 mm long; fruit 28-42 mm long..... ***G. sanguineum***
 - 3 Petals 4-6 mm long; fruit 14-20 mm long..... ***G. sibiricum***
 - 2 Cymules 2-flowered; pedicels with a mixture of glandular and eglandular hairs (except with eglandular hairs only in *G. maculatum*).
 - 4 Pedicels with eglandular hairs only; petals 11-16 mm long; [native, common in much of our area (and also sometimes cultivated)].....

- 4 Pedicels with a mixture of glandular and eglandular hairs; petals **either** 6-9 or 12-29 mm long; [alien, rare and in disturbed situations] *G. maculatum*
- 5 Fruit 30-37 mm long; petals 12-24 mm long *G. pratense*
- 5 Fruit 14-27 mm long; petals **either** 6-9 mm long or 15-29 mm long.
- 6 Petals 15-29 mm long; mericarp callus absent; fruits 15-27 mm long *G. ibericum*
- 6 Petals 6-9 mm long; mericarp callus present; fruits 14-20 mm long *G. thunbergii*
- 1 Annual, from a taproot.
- 7 Leaves compound, at least the terminal segment (and often also the two lateral segments) petiolulate, not connected to the lateral segments by leaf tissue; petals 9-14 mm long; [rare in our area, mainly northward]; [subgenus *Robertium*, section *Robertium*] *G. robertianum*
- 7 Leaves dissected, but not compound, all segments interconnected by leaf tissue; petals 2-10 mm long; [collectively common and widespread in our area].
- 8 Sepals blunt or acute, or terminating in a minute callus tip (mucro) < 0.3 mm long; [subgenus *Robertium*, section *Batrachioidea*].
- 9 Mericarps appressed pubescent across the surface, not ridged; stem pubescence of short (< 0.3 mm long), gland-tipped and eglandular hairs; stamens partly sterile (the inner 5 fertile, the outer 5 lacking anthers) *G. pusillum*
- 9 Mericarps glabrous across the surface (slightly to densely ciliate at the base), **either** reticulately ridged or not; stem pubescence an admixture of long eglandular hairs (1.0-1.7 mm long) and short (< 0.5 mm long) gland-tipped and eglandular hairs; stamens (all 10) fertile (note that anthers may fall readily).
- 10 Mericarps not reticulately ridged [*G. aequale*]
- 10 Mericarps reticulately ridged *G. molle*
- 8 Sepals awned or subulate, the subulate awn 0.7-3 mm long.
- 11 Mature pedicels < 1.5× as long as the calyx.
- 12 Mericarps with spreading hairs about 0.5 mm long, these often gland-tipped; [subgenus *Geranium*, section *Dissecta*] *G. dissectum*
- 12 Mericarps with long appressed hairs about 1 mm long, these not gland-tipped; [subgenus *Geranium*, section *Geranium*] *G. carolinianum*
- 11 Mature pedicels > 2× as long as the calyx; [subgenus *Geranium*, section *Geranium*].
- 13 Pedicels glandular-villous *G. bicknellii*
- 13 Pedicels retrorsely strigose *G. columbinum*

* *Geranium aequale* (Babington) Aedo. Disturbed areas; native of w. Europe. Apr-Jun. Reported by Aedo (2012) for nc. KY, Coastal Plain of NJ, and other areas north of our area. [= K2, Z; = *G. molle* Linnaeus var. *aequale* Babington]

Geranium bicknellii Britton, Northern Cranebill, Bicknell's Crane's-bill. Open woods and clearings. Jun-Sep. NL (Newfoundland) and AK south to PA, WV, IN, IL, MO, CO, UT, and CA; previous reports for TN (Davidson and Johnson counties) are based on misidentifications (Wofford, pers. comm. 2011). [= C, G, K1, K2, Pa, W, WH3, Z; > *G. bicknellii* var. *bicknellii* - F]

Geranium carolinianum Linnaeus, Carolina Crane's-bill. Fields, roadsides, lawns, pastures, gardens, disturbed areas. Mar-Jun (and sometimes later). MA, MI, WY, and BC south to FL, CA, and n. Mexico (and introduced in various places in the Old and New World). Varieties are sometimes recognized, with two in our area: var. *carolinianum*, with the inflorescence diffusely corymbiform (because of long upper internodes), mostly 4-12-flowered, and pubescence of the stem mostly < 0.5 mm long, and var. *confertiflorum*, with the inflorescence a compact corymb (because of notably short upper internodes), mostly 5-25-flowered, and pubescence of the stem mostly > 0.75 mm long. [= Mo, Pa, RAB, S, Va, W, WH3, WV, Z; > *G. carolinianum* var. *carolinianum* - C, F, G; > *G. carolinianum* var. *confertiflorum* Fernald - C, F, G; > *G. carolinianum* var. *carolinianum* - K1, K2]

* *Geranium columbinum* Linnaeus, Long-stalk Crane's-bill. Roadsides, pastures, disturbed areas; native of Europe. Apr-Jul. [= C, F, G, K1, K2, Mo, Pa, RAB, S, Va, W, WV, Z]

* *Geranium dissectum* Linnaeus, Cutleaf Crane's-bill. Roadsides, pastures, disturbed areas; native of Europe, c. Asia, n. Africa. Apr-Aug. [= C, F, G, K1, K2, Mo, Pa, RAB, S, Va, W, WV, Z]

* *Geranium ibericum* Cavanilles, Iberian Crane's-bill. Spread from horticultural use; native of Europe. Recently found in Great Smoky Mountains National Park, in both NC and TN (K. Langdon, pers. comm.). [= F, K, Z; ? *G. nepalense* - C] {not yet keyed}

Geranium maculatum Linnaeus, Wild Geranium. Cove forests, bottomland forests, other mesic, base-rich forests. Apr-Jun (and rarely later). ME west to MB, south to SC, GA, FL Panhandle (Gadsden County) (Kunzer et al. 2009) and ne. OK. Sometimes cultivated. [= C, F, G, K1, K2, Mo, Pa, RAB, S, Va, W, WH3, WV, Z]

* *Geranium molle* Linnaeus, Dove's-foot Crane's-bill. Roadsides, pastures, disturbed areas; native of Europe and w. Asia. Apr-Aug. Reported for MS (Majure et al. 2011). [= C, F, G, K1, K2, Mo, Pa, RAB, S, Va, W, WV, Z]

* *Geranium pratense* Linnaeus, Meadow Crane's-bill. Disturbed areas; native of Eurasia. Jun-Jul. Reported for MD (Prince Georges County) (Kartesz 2010). [= C, F, G, K2, Z]

- * **Geranium pusillum** Linnaeus, Small-flowered Crane's-bill. Roadsides, pastures, disturbed areas; native of Europe, c. Asia, and n. Africa. Apr-Aug. [= C, G, K1, K2, Mo, Pa, RAB, S, Va, W, WV, Z]
- * **Geranium robertianum** Linnaeus, Herb Robert. Rocky woodlands, especially over calcareous rocks. Jun-Oct. NF west to MB, south to e. MD, w. VA, e. WV, IL, and MN; also in Europe, c. Asia, and n. Africa. Considered by some authors (such as C and G) to be introduced in North America, but apparently native based on its occurrence in remote and high quality natural communities. [= C, F, G, K1, Pa, W, WV, Z; = *G. robertianum* ssp. *robertianum* – K2]
- * **Geranium sanguineum** Linnaeus, Blood-red Crane's-bill. Roadbanks, roadsides, persistent or spread from cultivation; native of Europe. [= C, F, G, K1, K2, Z] {not yet keyed; add to synonymy}
- * **Geranium sibiricum** Linnaeus. Disturbed areas, roadsides; native of Eurasia. Jul-Sep. Naturalized south to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007). [= C, F, K1, K2, Z]
- * **Geranium thunbergii** Siebold & Zuccarini ex Lindley & Paxton. Field edges, disturbed areas, lawn along Blue Ridge Parkway; native of e. Asia. Reported for NC by Nesom (2000) on the basis of a 1936 specimen. [= K, Pa, Z; ? *G. ibericum* Cavanilles – C, apparently misapplied; = *G. nepalense* Sweet var. *thunbergii* (Siebold & Zuccarini ex Lindley & Paxton) Kudo – F, G]

218. COMBRETACEAE R. Brown 1810 (Combretum Family) [in MYRTALES]

A family of about 14 genera and 500 species, trees and shrubs, of the neotropics and paleotropics. References: Stace in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves alternate; flowers aggregated into cone-like spikes, these in axillary or terminal panicles or racemes; [tribe *Combreteae*] **Conocarpus**
- 1 Leaves opposite; flowers single, in axillary or terminal panicles or racemes; [tribe *Laguncularieae*] **Laguncularia**

Conocarpus Linnaeus 1753 (Buttonwood)

A genus of 2 species, trees or shrubs, of the neotropics and tropical Africa and Yemen. References: Stace in Kubitzki, Bayer, & Stevens (2007).

Conocarpus erectus Linnaeus, Buttonwood, Button Mangrove. Tidal swamps. N. FL peninsula southwards (from Volusia County on the east coast and Levy County on the west coast) to s. FL; widespread in the Neotropics north to s. TX; West Indies; w. Africa. [= GW, K2, WH3; = *C. erecta* – S, orthographic variant]

Laguncularia C.F. Gaertner 1807 (White Mangrove)

A genus of 1 species, a tree or shrub, of the neotropics and tropical w. Africa. References: Stace in Kubitzki, Bayer, & Stevens (2007).

Laguncularia racemosa (Linnaeus) C.F. Gaertner, White Mangrove. Tidal swamps. N. FL peninsula southwards (from Volusia County on the east coast and Levy County on the west coast) to s. FL; widespread in the Neotropics north to s. TX; West Indies; w. Africa. [= GW, K2, S, WH3]

Map key: square=ative, triangle=exotic, diamond=maybe exotic, EN = endemic. More info on pg 9

219. **LYTHRACEAE** J. St.-Hilaire 1805 (Loosestrife Family) [in MYRTALES]

A family of about 27-35 genera and about 600 species, herbs, shrubs, and trees, primarily tropical (a few warm temperate).

References: Graham (1975)=Z; Graham in Kubitzki, Bayer, & Stevens (2007). Keys adapted, in large part, from Z. [including *PUNICACEAE* and *TRAPACEAE*]

- 1 Plant woody or suffrutescent, a shrub or a small tree 1-10 m tall; petals present, showy, 8-20 mm long.
 - 2 Aquatic shrubs with arching suffrutescent or woody stems; leaves opposite or whorled; [native] *Decodon*
 - 2 Terrestrial shrubs or small trees with erect woody stems; leaves alternate to subopposite; [aliens cultivated and sometimes persistent].
 - 3 Flowers in many-flowered terminal or axillary cymose panicles; fruit a loculicidal capsule..... *Lagerstroemia*
 - 3 Flowers solitary or several in terminal or axillary clusters; fruit a leathery berry (pomegranate)..... [*Punica*]
- 1 Plant not woody, an herb 0.1-1.2 m tall; petals absent or present, inconspicuous or showy, 1-10 mm long.
 - 4 Fruit with 2-4 prominent spines; leaves coarsely toothed..... *Trapa*
 - 4 Fruit not spinose; leaves entire.
 - 5 Stems pubescent.
 - 6 Floral tube (hypanthium) swollen obliquely at its base; capsule dehiscing longitudinally along the upper surface *Cuphea*
 - 6 Floral tube (hypanthium) symmetrical; capsule dehiscing septically at the apex *Lythrum*
 - 5 Stems glabrous.
 - 7 Floral tube cylindric to turbinate, about 2× as long as wide *Lythrum*
 - 7 Floral tube campanulate to globose, about 1× long as wide.
 - 8 Flowers or fruits (1-) 3-10 in the leaf axils (at least some axils with 2 or more flowers or fruits on a given plant)..... *Ammannia*
 - 8 Flowers or fruits solitary in the leaf axils (never > 1 per axil).
 - 9 Capsule indehiscent; petals 0; sepals 4, broadly triangular, lacking intersepaly appendages; seeds spatulate or oblanceolate, about 1 mm long, minutely granular on one face and smooth on the other..... *Didiplis*
 - 9 Capsule dehiscing septically; petals 4; sepals 4 (-6), triangular, with intersepaly appendages of size about equal to the calyx lobes; seeds hemispheric, about 0.3 mm long, the surface very finely reticulate..... *Rotala*

Ammannia Linnaeus 1753 (Toothcup)

A genus of about 80 species, herbs, cosmopolitan. The circumscription of the genus here includes *Nesaea* and *Hionanthera*, following Graham, Diazgranados, & Barber (2011) and Graham (2007). References: Graham (1985)=Y; Graham (1975)=Z; Graham in Kubitzki, Bayer, & Stevens (2007). Key based in part on Y.

- 1 Style included (when in fruit), thick, 0.5-1.0 mm long (much shorter than the ovary); calyx lobes obtuse, often with the apices minutely mucronate; petals 0, 1, or 4, pale pink to white, to 1 mm long and 1 mm wide *A. latifolia*
- 1 Style exerted (when in fruit), filiform, 1.5-3.0 mm long (equal to or longer than the ovary); calyx lobes triangular, with acute apices; petals 4 (-5), deep rose-purple or pale lavender, ca. 2 mm long and 2 mm wide.
 - 2 Inflorescence usually a short- or long-pedunculate cyme (sometimes reduced); flowers usually > 3 per axil; petals deep rose-purple; fruits 3.5-5 mm in diameter *A. coccinea*
 - 2 Inflorescence sessile; flowers usually 1-3 per axil; petals pale lavender; anthers yellow; fruits 4-6 mm in diameter *A. robusta*

Ammannia auriculata Willdenow, Eared Redstem. Swamps, ditches, other wetlands. May-Jul. MS, LA, SD, NM, and AZ, south to TX and Mexico. [= GW, K2, Y, Z] {not yet keyed}

Ammannia coccinea Rottbøll. Marshes, ditches, exposed muddy river shores and banks, wet pine flatwoods, other wet places. Jul-Oct. NJ, OH, IN, IL, IA, and SD south to s. FL and TX; disjunct in CA; south through Mexico and Central America to n. South America. [= C, K1, K2, Mo, Pa, RAB, Va, W, WH3, Y; > *A. coccinea* ssp. *purpurea* (Lamarck) Koehne - G; < *A. coccinea* - F, GW, S, Z]

Ammannia latifolia Linnaeus, Pink Redstem. Tidal marshes, wet places, ditches. Jul-Sep. NJ south to s. FL and west to TX (mostly on the Coastal Plain), and also in the West Indies, Yucatan, Central America, and South America. All plants in North America north of Florida have flowers with petals; most plants from FL south through the West Indies into Central and South America have flowers without petals. Graham (1985) considered these forms; additional study is warranted. The name *A. koehnei* Britton is available for the petaliferous North American plant should its recognition prove warranted. [= C, GW, K1, K2, Va, W, WH3, Y, Z; > *A. teres* Rafinesque - G, RAB; > *A. teres* var. *teres* - F; > *A. teres* var. *exauriculata* (Fernald) Fernald - F; > *A. latifolia* - S; > *A. koehnei* Britton - S]

Ammannia robusta Heer & Regel, Grand Redstem. Marshes, ditches, swamps. OH and BC south to w. KY, w. TN, LA, TX, CA, Mexico, and Belize; West Indies; introduced in NJ and n. South America. [= C, K1, K2, Mo, Y; < *A. coccinea* - F, GW, S, Z]

Lythrum Linnaeus 1753 (Loosestrife)

A genus of about 36 species, herbs, cosmopolitan. References: Graham (1975)=Z; Haines (2010)=Y; Graham in Kubitzki, Bayer, & Stevens (2007).

- 1 Flowers numerous in terminal spike-like thyrses; stamens usually 12; leaves opposite or whorled..... **L. salicaria**
- 1 Flowers solitary or paired in axils; stamens usually (4-) 6; leaves opposite or alternate.
 - 2 Annual; flowers present in nodes more-or-less throughout the plant; flowers homostylous, all alike, the stamens always included **L. hyssopifolia**
 - 2 Perennial by basal stoloniferous outshoots; flowers present only at upper nodes; flowers heterostylous (either with an exerted style and included stamens, or vice versa)
 - 3 Leaves opposite throughout, mostly shorter than to as long as the internodes, 1-4 mm wide..... **L. lineare**
 - 3 Leaves opposite below, alternate above, mostly longer than the internodes, 2-14 mm wide.
 - 4 Floral tube 3-4 mm long; petals 2-3 mm long; calyx appendages about the same length as the calyx lobes; branch leaves abruptly and definitely reduced in size relative to the stem leaves, and widely spaced; [of sw. GA southward]..... **L. curtissii**
 - 4 Floral tube 5-6 mm long; petals 5-6 mm long; calyx appendages about 2× as long as the calyx lobes; branch leaves gradually reduced relative to the stem leaves, dense and overlapping; [collectively widespread in our area].
 - 5 Leaves ovate to lanceolate, widest at a point 1/6 to 1/2 of the way from the base to the apex, the base rounded to subcordate; stems mostly slender, to 8 dm tall; bracteoles mostly at the base of the pedicel **L. alatum**
 - 5 Leaves lanceolate to linear-lanceolate, widest at a point 1/3 to 2/3 of the way from the base to the apex, the base cuneate, often narrowly so; stems stout, to 13 dm tall; bracteoles mostly on the upper pedicel, immediately below the floral tube..... **L. lanceolatum**

Lythrum alatum Pursh, Northern Winged Loosestrife. Calcareous meadows, marl fens, and disturbed wet calcareous places. Jun-Sep. ME, NY, MI, and ND south to sc. VA, e. TN, nw. GA, n. AL, n. AR, ne. OK, and CO. [= F, Pa, S, Va, W, WV; = *L. alatum* var. *alatum* – C, G, GW, K, Mo, WH3, Z; = *L. alatum* ssp. *alatum* – Y]

Lythrum curtissii Fernald, Curtiss's Loosestrife. Calcareous swamps, seepage areas. Jun-early Sep. Sw. GA south to Panhandle FL, and disjunct in ne. FL (St. Johns County [Slaughter 2014]); the report from Emanuel County, GA (Jones & Coile 1988) is in error. [= GW, K, S, WH3, Z]

*? **Lythrum hyssopifolia** Linnaeus, Annual Loosestrife. Salt marshes, other wet soils; probably only adventive from Eurasia, but sometimes interpreted as native from ME to NJ. Jun-Sep. [= C, F, G, K, Pa]

Lythrum lanceolatum Elliott, Southern Winged Loosestrife. Moist to wet places, ditches. May-Sep. Se. VA, se. NC, SC, GA, AL, MS, n. AR, s. MO, and OK south to s. FL, s. TX, and in the West Indies. Although Graham (1975) argues that *L. lanceolatum* should be reduced to a variety of *L. alatum*, her evidence can also be interpreted as warranting specific status. [= F, RAB, S, Va; = *L. alatum* Pursh var. *lanceolatum* (Elliott) Torrey & A. Gray ex Rothrock – C, G, GW, K, Mo, WH3, Z; = *L. alatum* ssp. *lanceolatum* (Elliott) A. Haines – Y]

Lythrum lineare Linnaeus, Narrowleaf Loosestrife, Wand Loosestrife. Nearly fresh, brackish, and saline marshes. Jul-Oct. NJ south to s. FL and west to TX. [= C, F, G, GW, K, RAB, S, Va, WH3, Z]

* **Lythrum salicaria** Linnaeus, Purple Loosestrife. Swamps, marshes, other wet places; native of Eurasia. Jun-Sep. An extremely noxious weed in the ne. United States, aggressively colonizing and coming to dominate a wide variety of freshwater wetlands, sometimes to the near exclusion of native vegetation. [= C, G, K, Mo, Pa, RAB, Va, W, WV, Z; > *L. salicaria* var. *salicaria* – F; > *L. salicaria* var. *gracilior* Turczaninow – F; > *L. salicaria* var. *tomentosum* (P. Miller) A.P. de Candolle – F]

Punica Linnaeus 1753 (Pomegranate)

A genus of 2 species, trees, of Mediterranean Europe and w. Asia. Sometimes treated in the monogeneric family Punicaceae; here included in Lythraceae, following Angiosperm Phylogeny Group (2003, 2009); *Punica* is deeply embedded phylogenetically

in Lythraceae (Graham, Diazgranados, & Barber 2011). References: Zohary & Hopf (1994); Graham in Kubitzki, Bayer, & Stevens (2007).

* ***Punica granatum*** Linnaeus, Pomegranate. Suburban areas, cultivated and at least persistent; native of Mediterranean Europe. Reported as cultivated on Hatteras Island (Dare County, NC) (Brown 1959). This species has been cultivated in the Old World for at least five millenia. [= K, S]

Rotala Linnaeus 1771 (Toothcup)

A genus of about 44 species, wetland herbs, of temperate to tropical areas, closely related to *Didiplis*. References: Graham (1975)=Z; Graham in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves linear to oblanceolate, > 3× as long as wide..... ***R. ramosior***
- 1 Leaves broadly elliptical to orbicular, < 1.5× as long as wide ***R. rotundifolia***

Rotala ramosior (Linnaeus) Koehne, Toothcup. Marshes, ditches, exposed drawdown muds and silts. Jun-Oct. VT, NY, ON, MI, WI, MN, SD, MT, and BC, south to s. FL, TX, AZ, CA, and south through Mexico to Central America and , South America; West Indies. [= C, GW, K, Mo, Pa, RAB, S, Va, W, WH3, Z; > *R. ramosior* var. *ramosior* – F, G; > *R. ramosior* var. *interior* Fernald & Griscom – F, G]

* ***Rotala rotundifolia*** (Buchanan-Hamilton) Koehne, Dwarf *Rotala*, Roundleaf Toothcup. Disturbed wet areas, perhaps just a waif; native of Asia. Mar-Aug. [= K2, WH3]

Trapa Linnaeus 1753 (European Water-chestnut)

A genus of 1 highly polymorphic or up to 45 more narrowly defined species, annual aquatic herbs, native of the Old World. Often placed in a monogeneric family, Trapaceae, but *Trapa* is deeply embedded phylogenetically in Lythraceae (Graham, Diazgranados, & Barber 2011). References: Angiosperm Phylogeny Group (2003, 2009); Graham in Kubitzki, Bayer, & Stevens (2007).

* ***Trapa natans*** Linnaeus, European Water-chestnut, Water-caltrop. Farm ponds and other stagnant or slow-moving water; native of Eurasia and Africa. Jun-Sep. [= C, F, G, K, Pa, Va]

220. ONAGRACEAE A.L. de Jussieu 1789 (Evening-primrose Family) [in MYRTALES]

A family of about 18 genera and 655 species, herbs, shrubs, and rarely trees, cosmopolitan (especially of temperate and subtropical America). References: Wagner, Hock, & Raven (2007); Munz (1965)=X; Crisci et al. (1990).

- 1 Flowers 2-merous, the petals white; fruits with uncinete trichomes; leaves opposite, decussate, borne spreading at right angles to the stem, mostly ovate, on petioles mostly 0.5-8 cm long; [subfamily *Onagroideae*; tribe *Circaeae*]..... **2. *Circaea***
- 1 Flowers (3-) 4 (-7)-merous, the petals yellow, pink, or white (or absent); fruits lacking uncinete trichomes; leaves alternate (rarely opposite), not decussate, usually ascending or appressed (rarely spreading at right angles to the stem), mostly lanceolate, mostly sessile or subsessile.
- 2 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; [subfamily *Onagroideae*; tribe *Onagreae*]..... **5. *Oenothera***
- 2 Fruit dehiscent; seeds (10-) 50-many per capsule, 0.3-2 mm long.
- 3 Seeds with an elongate coma at one end (wind-dispersed); petals pink or white; [subfamily *Onagroideae*; tribe *Epilobieae*].
- 4 Leaves all alternate; flowers numerous in a terminal raceme (with small bracts); flower buds reflexed, the flowers held horizontally or ascending; petals 10-20 mm long; stigma 4-lobed; plants 10-30 dm tall **3. *Chamerion***
- 4 Leaves all or at least the lowermost opposite; flowers few, axillary, or in poorly developed, leafy racemes; flower buds not reflexed, the flowers ascending; petals 2-8 mm long (except 10-15 mm long in *E. hirsutum*); stigma capitate (except 4-lobed in *E. hirsutum*); plants 1-20 dm tall **4. *Epilobium***
- 3 Seeds not comose (gravity-dispersed); petals yellow or absent (rarely white or pink).
- 5 Calyx tube not extended beyond the summit of the ovary; sepals persistent on the capsule (rarely deciduous); stamens 4, 8, or 10-14; petals yellow or absent; [primarily of wetlands]; [subfamily *Ludwigioideae*]..... **1. *Ludwigia***
- 5 Calyx tube extended beyond the summit of the ovary; sepals deciduous; stamens 8; petals yellow (rarely pink or white); [primarily of uplands]; [subfamily *Onagroideae*; tribe *Onagreae*]..... **5. *Oenothera***

1. *Ludwigia* Linnaeus 1753 (Seedbox, Water-primrose, Water-purslane)

A genus of about 82 species, herbs and shrubs, cosmopolitan. References: Wagner, Hoch, & Raven (2007)=U; Peng (1989)=Z; Munz (1965)=X; Nesom & Kartesz (2000)=Q; Zardini, Gu, & Raven (1991)=V; Peng (1984, 1986, 1988); Peng & Tobe (1987); Raven (1963); Munz (1938, 1944); Eyde (1977, 1978, 1981); Raven & Tai (1979); Duke (1955). Key based in part on GW, Z, and Q.

Identification notes: Many natural hybrids are known, not necessarily in our area. Hybrids are generally recognizable from their intermediate morphology and usual association with their two parents. However some hybrids resemble one parent much more than the other, and some hybrids are found in populations independent (and even disjunct) from one or both parents. Allopolyploidy may have had a major role in the evolution of this genus, especially section *Microcarpium*, which has a majority of polyploid species.

- 1 Leaves opposite; plants creeping (rooting at the nodes); [section *Isnardia*]..... **Key A**
- 1 Leaves alternate; plants erect or ascending (not rooting at the nodes), or creeping (rooting at the nodes).
 - 2 Stamens 8-14; sepals 4-7; petals 4-7; [of various habits, including annual and perennial herbs and shrubs, variously erect, ascending, creeping, or forming floating mats]..... **Key B**
 - 2 Stamens 4; sepals 4; petals 0-4; [perennial herbs, with erect ascending flowering stems]..... **Key C**

Key A – *Ludwigia* with opposite leaves (section *Isnardia*)

- 1 Pedicels of flowers and fruits 5-35 mm long.
 - 2 Petals 7-11 mm long; pedicels of capsules 15-35 mm long, longer than the leaves..... *L. arcuata*
 - 2 Petals 4-5 mm long; pedicels of capsules 5-16 mm long, shorter than to equaling the leaves..... *L. brevipes*
- 1 Pedicels of flowers and fruits 0-3 mm long.
 - 3 Stems, leaves, capsules, and calyx densely hirsute; seeds dark reddish-brown, 0.3-0.4 mm long..... *L. spatulata*
 - 3 Stems, leaves, capsules, and calyx glabrous to sparsely puberulent; seeds tan, 0.4-0.8 mm long.
 - 4 Petals 0; floral tubes and capsules with 4 longitudinal dark green bands; bractlets (borne at or near base of floral tube) absent or present, if present then 0-1 mm long..... *L. palustris*
 - 4 Petals 4; floral tubes and capsules lacking green banding; bractlets (borne at or near base of floral tube) present, 2-4 mm long..... *L. repens*

Key B – *Ludwigia* with alternate leaves, 8-14 stamens, 4-7 sepals, and 4-7 petals (sections *Pterocaulon*, *Macrocarpon*, *Seminuda*, and *Oligospermum*)

- 1 Sepals 4; stamens 8; seeds in 2-several vertical series in each locule, free of endocarp tissue.
 - 2 Internodes of the stem conspicuously winged on the angles by 2 decurrent wings running down from each leaf base; petals 0.6-1.2 cm long; capsule 1.0-2.0 cm long, 4-angled or 4-winged; [section *Pterocaulon*]..... *L. decurrens*
 - 2 Internodes of the stem not winged on the angles (or very faintly so); petals 1.0-5.0 cm long; capsule (1.5-) 2-5 cm long, obtusely 4-angled; [section *Macrocarpon*].
 - 3 Petals (1.5-) 3-5 cm long; sepals ca. 10 mm wide at base..... *L. bonariensis*
 - 3 Petals 1-2 cm long; sepals 3-5 mm wide at base..... *L. octovalvis*
- 1 Sepals 5 (-7); stamens 10 (-14); seeds in 1 vertical series in each locule, loosely embraced or embedded in endocarp tissue.
 - 4 Stems erect; floral tube much longer than the pedicel; seeds loosely embraced by a corky, horseshoe-shaped segment of endocarp; [section *Seminuda*]..... *L. leptocarpa*
 - 4 Stems (at least the lower portions) decumbent, creeping, or floating in mats (the flowering stems more-or-less erect in *L. grandiflora* and *L. hexapetala*); floral tube much shorter than the pedicel; seeds embedded in the woody endocarp; [section *Oligospermum*].
 - 5 Flowering stems decumbent, floating, or creeping; stem and leaves glabrous or glabrescent; petals mostly 1-1.5 cm long; anthers 1-1.7 mm long..... *L. peplodes* var. *glabrescens*
 - 5 Flowering stems more-or-less erect; stem and leaves sparsely to densely pubescent with long soft hairs; petals (1.2-) 1.6-3 cm long; anthers 2.5-3.5 mm long.
 - 6 Sepals (6-) 8-11 (-14) mm long; primary leaves 5-8.5 cm long, 7-11 mm wide, usually linear-lanceolate, usually widest below the middle; petals (1.2-) 1.6-2.0 (-2.6) cm long; style 4.7-6.7 (-8.2) mm long; stems densely villous..... *L. grandiflora* ssp. *grandiflora*
 - 6 Sepals (8-) 12-19 mm long; primary leaves 5.5-13 cm long, 9-18 mm wide, usually narrowly elliptic to oblanceolate, usually widest above the middle; petals (1.5-) 2.0-2.9 (-3) cm long; style (5.8-) 6-10 mm long; stems sparsely to densely villous (rarely glabrous)..... *L. grandiflora* ssp. *hexapetala*

Key C – *Ludwigia* with alternate leaves, 4 stamens, 4 sepals, and 0-4 petals (sections *Ludwigia* and *Microcarpium*)

- 1 Pedicels 2-15 mm long; capsules subglobose to spheric or cubic, about as long as wide, box-like, 4-angled, dehiscence by an apical pore (later sometimes also irregularly loculicidal); petals present, 4-15 mm long, persistent or caducous; roots fascicled, fusiform, tuberous; plants lacking basal, stoloniform shoots; [section *Ludwigia*].
 - 2 Leaves cuneate at base; pedicels 2-5 mm long; nectary discs at base of style flattish, inconspicuous; [widespread in our area, in a wide variety of habitats]..... *L. alternifolia*
 - 2 Leaves rounded or truncate at base; pedicels 4-15 mm long; nectary discs at base of style domed, prominent; [nearly restricted to the Coastal Plain, primarily of pinelands].
 - 3 Styles 6-10 mm long; plants glabrous, glabrescent, or pubescent with very short hairs; sepals strongly reflexed in fruit..... *L. virgata*
 - 3 Styles 1.5-3 mm long; plants glabrescent or pubescent with short to long, spreading to shaggy hairs; sepals strongly reflexed, spreading, or ascending in fruit.

- 4 Sepals narrowly deltoid, broadest at or near the base, 3-4× as long as wide, ascending or spreading in fruit; plants glabrescent to hirtellous with long spreading hairs *L. hirtella*
- 4 Sepals ovate, broadest near the middle, ca. 2× as long as wide, strongly reflexed in fruit; plants pubescent with relatively short, appressed to spreading hairs *L. maritima*
- 1 Pedicels 0-1 (-5) mm long; capsules subglobose, obconic, or obpyramidal, about as long as wide or longer than wide, circular to quadrangular in cross-section, dehiscence irregularly loculicidal; petals absent or present, if present (*L. linearis*, *L. linifolia*) then 0-6 mm long and caducous; roots fibrous or rhizomatous; plants frequently with basal, stoloniform shoots; [section *Microcarpium*].
- 5 Capsules cylindrical, narrowly obconical, or narrowly obpyramidal, at least 2.5-5× as long as broad; petals present or absent.
- 6 Primary leaves of the flowering stems narrowly elliptical, 6-12 (-20) mm wide; petals absent *L. glandulosa*
- 6 Primary leaves of the flowering stems linear, 1.5-5 mm wide; petals present.
- 7 Sepals (3.3-) 4-7 mm long; lateral and marginal veins obscure on lower leaf surface; seeds reddish brown; capsules cylindrical, parallel-sided through most of their length, not grooved; anthers 0.5-1.1 mm long *L. linifolia*
- 7 Sepals 2.3-5 (-5.6) mm long; lateral and marginal veins distinct on lower leaf surface; seeds yellowish; capsules elongate obpyramidal, tapering through most or all of their length, with a shallow longitudinal groove on each face; anthers 1.1-2 mm long.
- 8 Sepals 2.3-4 mm long, acuminate, the surfaces densely and minutely papillose, the papillae 0.02-0.05 mm long and appressed; capsules 5-8.5 (-10) mm long, 2-4 (-5) mm in diameter; pedicels 0-0.4 mm long; seed surface cells elongate parallel to the seed length (as seen at 20× or more); anthers 1.1-1.6 mm long *L. linearis* var. *linearis*
- 8 Sepals 3-5 (-5.6) mm long, elongate-acuminate to cuspidate, the surfaces densely minutely strigillose, the hairs 0.06-0.10 mm long and appressed to ascending; capsules 5-10 (-12) mm long, 3-5.5 mm in diameter; pedicels 0-3.5 (-5) mm long; seed surface cells elongate transverse to the seed length, or irregular (as seen at 20× or more); anthers (1.1-) 1.3-2 mm long *L. linearis* var. *puberula*
- 5 Capsules subglobose, obovoid, or broadly obpyramidal, 1-1.5 × as long as broad; petals absent.
- 9 Flowers in compact, headlike or elongate spikes, the inflorescence lacking well-developed leaves; stems rarely branched; rhizomes often present *L. suffruticosa*
- 9 Flowers axillary in the axils of well-developed leaves; stems usually much branched; rhizomes absent.
- 10 Plants densely pubescent throughout.
- 11 Sepal apex elongate-acuminate or subcuspidate, reflexed; pubescence of stems and leaves hirtellous (the hairs spreading); seed surface cells suborbicular (as seen at 20× or more); anthers 0.6-0.9 (-1.3 mm long; style 1-2 mm long *L. pilosa*
- 11 Sepal apex acuminate, ascending; pubescence of stems and leaves strigillose (the hairs appressed) or hirtellous (the hairs spreading); seed surface cells elongate; anthers 0.3-0.8 mm long; style 0.25-1 (-1.25) mm long.
- 12 Plants hirtellous; capsules oblong-obovoid; sepals greenish on the upper surface; bracteoles (1.5-) 2-4.3 mm long, borne at or near the base of the capsule; seed surface cells elongate transverse to the seed length; anthers 0.3-0.35 mm long; style 0.25-0.5 mm long *L. ravenii*
- 12 Plants strigillose; capsules subglobose; sepals yellowish on the upper surface; bracteoles 0.5-1.5 mm long, usually borne on the short pedicel; seed surface cells in patches, some patches with cells elongate parallel to seed length, others with cells transverse to seed length, others with cells diagonal (rather resembling a badly laid-out parquet floor); anthers 0.5-0.8 mm long; style 0.55-1 (-1.25) mm long *L. sphaerocarpa*
- 10 Plants glabrous or subglabrous throughout.
- 13 Primary leaves of the flowering stems 4-17 mm long, 1.5-10 mm wide, mostly obovate-spatulate and 1.5-3× as long as wide; capsules 1-1.5 (-2) mm long, containing 10-20 dark reddish-brown seeds; plants typically 1-4 dm tall *L. microcarpa*
- 13 Primary leaves of the flowering stems (18-) 30-110 mm long, 2-10 (-20) mm wide, mostly elliptic, lanceolate, oblanceolate, or linear and 4-20× as long as wide; capsules 1.8- 2-7 mm long, containing 40-500 light brown, yellowish, or tan seeds; plants typically 3-10 dm tall.
- 14 Capsules obpyramidal, the corners narrowly winged with wings 0.3-0.9 mm wide; bracteoles 1.5-4.7 mm long.
- 15 Stems often distinctly ridged or winged; sepals creamy-white, nearly as long as the capsule; capsule wall bulging out longitudinally between the wings; seed surface cells elongate parallel to the seed length *L. alata*
- 15 Stems nearly smooth or slightly ridged; sepals greenish, about 1/2 as long as the capsule; capsule wall flat between the wings; seed surface cells suborbicular *L. lanceolata*
- 14 Capsules oblong-ovoid or subglobose, the corners not winged; bracteoles either 0.5-1.5 mm or 3.5-6.5 (-8) mm long.
- 16 Bracteoles 3.5-6.5 (-8) mm long; sepals green, the apex long-acuminate, reflexed; capsules oblong-obovoid; seed surface cells elongate parallel to the seed length; [known from our area only in the Piedmont of VA] *L. polycarpa*
- 16 Bracteoles 0.5-1.5 mm long; sepals yellowish, the apex acuminate, ascending capsules subglobose; seed surface cells in patches, some patches with cells elongate parallel to seed length, others with cells transverse to seed length, others with cells diagonal (rather resembling a badly laid-out parquet floor); [of the Coastal Plain of GA, NC, SC, and VA in our area] *L. sphaerocarpa*

Ludwigia alata Elliott, Winged Seedbox. Interdune ponds, freshwater to slightly brackish (oligohaline) marshes; rare. Jun-Sep. Se. VA south to s. FL, west to se. LA; disjunct in Jamaica. This species is a hexaploid ($n = 24$). One third of the genome of *L. alata* is apparently derived from *L. microcarpa* or its ancestor (Peng 1988). [= C, F, G, K, RAB, U, Va, WH3, Z; > *L. alata* – GW (also see *L. lanceolata*); > *L. alata* – S; > *L. simulata* Small – S]

Ludwigia alternifolia Linnaeus, Alternate-leaf Seedbox. Freshwater tidal marshes, ditches, other marshes, open wet places, disturbed wet places. May-Oct. MA west to s. ON, s. MI, IA, and KS, south to n. FL and e. TX. [= G, GW, K, Mo, Pa, RAB, S, U, Va, W, WH3; > *L. alternifolia* var. *alternifolia* – C, F, WV; > *L. alternifolia* var. *pubescens* E.J. Palmer & Steyermark – C, F; > *L. alternifolia* var. *linearifolia* Britton – WV]

Ludwigia arcuata Walter. Marshes or submerged in water of natural Coastal Plain ponds. Jun-Sep. SC south to s. FL, west to Panhandle FL and s. AL. [= GW, K, RAB, U, WH3; = *Ludwigiantha arcuata* (Walter) Small – S]

* *Ludwigia bonariensis* (M. Micheli) Hara. Freshwater tidal marshes and adjacent disturbed areas; apparently native of tropical America. Jun-Sep. Locally abundant in disturbed edges of freshwater tidal marshes near Wilmington, NC, perhaps introduced on ship's ballast. Material from Wilmington apparently has larger flowers than material of *L. bonariensis* elsewhere;

its source and appropriate taxonomic treatment uncertain and needing further study. First reported for SC by Leonard (1971b). [= GW, K, RAB, U, WH3; = *Jussiaea neglecta* Small – S]

Ludwigia brevipes (B.H. Long ex Britton, A. Braun, & Small) Eames, Long Beach Seedbox, Coastal Plain Water-purslane. Pondshores, blackwater rivers, interdunal swales, borrow ponds, ditches, impoundments, marshes. Jul-Oct. NJ south to e. GA (Jones & Coile 1988), in the Coastal Plain. [= C, F, G, GW, K, RAB, U, Va, WH3]

Ludwigia curtissii Chapman, Curtiss's Seedbox. Pine savannas, flatwoods. S. MS and n. FL, Panhandle FL, and s. MS south to s. FL. [= GW, K1, K2, WH3; > *L. curtissii* – S; > *L. simpsonii* Chapman – S; > *L. spatulifolia* Small – S] {not yet keyed}

Ludwigia decurrens Walter, Wingstem Water-primrose. Swamp forests, ditches. Jun-Oct. MD, w. VA, WV, s. IN, s. IL, and MO, south to s. FL and TX; also in tropical America. [= C, GW, K, Mo, Pa, RAB, U, Va, W, WH3; = *Jussiaea decurrens* (Walter) A.P. de Candolle – F, G, S, WV]

Ludwigia erecta (Linnaeus) H. Hara, Yerba de Jicotea. Marshes, swamps, pineland ponds. FL; West Indies; tropical America; tropical Africa and Madagascar. [= GW, K2, WH3; = *Jussiaea erecta* Linnaeus – S]

Ludwigia glandulosa Walter, Small-flowered Seedbox. Low forests, marshes, ditches. Jun-Sep. E. MD south to n. FL, west to e. TX, north in the interior to c. TN, w. KY, s. IN, s. IL, se. MO, c. AR, and se. OK, primarily on the Southeastern Coastal Plain. A related species, treated by Peng as *L. glandulosa* ssp. *brachycarpa* (Torrey & A. Gray) Peng, ranges from sw. LA north and west to s. OK and c. TX. This species is tetraploid (n = 16). [= Va; < *L. glandulosa* – C, F, G, GW, RAB, S, WH3; = *L. glandulosa* ssp. *glandulosa* – K, Mo, U, Z]

* ***Ludwigia grandiflora*** (Michaux) Greuter & Burdet ssp. *grandiflora*, Showy Water-primrose. Ponds, lakes, sluggish waters of ditches or streams. May-Sep. Se. SC south to FL, west to TX; disjunct in MO, Guatemala, and in s. South America. This taxon is hexaploid (n = 24). See Zardini, Gu, and Raven (1991) and Nesom & Kartesz (2000) for additional information. [= Q; < *L. uruguayensis* (Cambessedes) Hara – RAB, C, GW, K); = *L. grandiflora* (Michaux) Zardini, Gu, & Raven – Mo, U, V; = *L. grandiflora* var. *grandiflora*; < *L. grandiflora* – WH3]

Ludwigia grandiflora (Michaux) Greuter & Burdet ssp. *hexapetala* (Hooker & Arnott) Nesom & Kartesz, Common Water-primrose. Ponds, lakes, sluggish waters of ditches or streams. May-Sep. NC south to FL, west to OK and TX; also in CA, Europe, South America, Mexico; also introduced farther north in North America. This taxon is decaploid (n = 40). See Zardini, Gu, and Raven (1991) and Nesom & Kartesz (2000) for additional information. [= Q, Va; < *L. uruguayensis* (Cambessedes) Hara – C, GW, K, Pa, RAB, W; < *Jussiaea uruguayensis* Cambessedes – F, G, WV; ? *Jussiaea michauxiana* Fernald – F; = *L. hexapetala* (Hooker & Arnott) Zardini, Gu, & Raven – U, V; < *L. grandiflora* – WH3; = *L. grandiflora* var. *hexapetala* (Hooker & Arnott) D.B. Ward]

Ludwigia hirtella Rafinesque, Rafinesque's Seedbox. Savannas, rarely inland in boggy seepage. Jun-Sep. S. NJ south to Panhandle FL, west to e. TX, north in the interior to KY, c. TN, AR, and se. OK. [= C, F, G, GW, K, RAB, S, U, WH3, Va, W]

Ludwigia lanceolata Elliott, Lanceleaf Seedbox. Interdune ponds, open wet areas. Aug-Sep. Se. NC south to c. peninsular FL, west to Panhandle FL. This species is tetraploid (n = 16). [= K, RAB, S, U, WH3, Z; < *L. alata* – GW]

Ludwigia leptocarpa (Nuttall) Hara, Water-willow. Riverbanks, marshes, swamps, and ditches, often on logs or tree bases in deep swamps. Jun-Oct. VA south to c. peninsular FL, west to e. TX, north in the interior along the Mississippi and Ohio rivers to se. MO, s. IL, and w. WV; and in tropical America. [= C, GW, K, Mo, RAB, U, Va, W, WH3; = *Jussiaea leptocarpa* Nuttall – F, G, S, WV]

Ludwigia linearis Walter var. *linearis*, Eastern Narrowleaf Seedbox. Savannas. Jun-Sep. Var. *linearis* ranges from s. NJ south to c. peninsular FL, west to se. LA, extending inland to the Cumberland Plateau of nc. AL and c. TN. Var. *linearis* is here interpreted to be equivalent to Peng's subglabrous morph. Peng (1989) declined to recognize infraspecific taxa in *L. linearis*, but his discussion makes clear that 2 distinctive entities are present, as characterized by orientation of seed surface cells and characters of leaves, bracteoles, pedicels, sepals, stigmas, and styles (see key). The orientation of seed surface cells, recognized as a distinctive character in other difficult species pairs (such as *L. alata* and *L. lanceolata*) is the most reliable character separating the 2 varieties. This species is diploid (n = 8). [< *L. linearis* – C, F, G, GW, K, RAB, S, U, Va, W, WH3, Z] {not yet mapped}

Ludwigia linearis Walter var. *puberula* Engelmann & A. Gray, Western Narrowleaf Seedbox. Savannas, interdunal swales. Jun-Sep. Var. *puberula* ranges primarily from c. AL west to c. AR and e. MO, south to e. TX, with intergradational material

extending as far north and east as n. FL and e. NC. *Var. puberula* is here interpreted to include Peng's intermediate morph, densely strigillose morph, and completely glabrous morph (Peng 1989). As pointed out by Peng (1989), the glabrous morph is exactly like the densely strigillose morph except for the absence of pubescence. They often grow together, have essentially the same distribution, and may differ only at a single allele. Peng's intermediate morph is heterogeneous; some likely being truly intermediate between (and possibly hybrid derivatives of) the two varieties here recognized, while others clearly belong to *var. puberula* (based on surface cell orientation and floral characteristics) and merely have an amount of pubescence intermediate between the densely strigillose and completely glabrous morphs. [*L. linearis* – C, F, G, GW, K, Mo, RAB, S, U, W, WH3, Z] {not yet mapped}

Ludwigia linifolia Poiret, Flaxleaf Seedbox. Limesink ponds (dolines) and *Taxodium ascendens* savannas. Jun-Sep. Nc. NC south to s. FL, west to s. MS; disjunct in Tabasco, Mexico. This species is diploid ($n = 8$). [= GW, K, RAB, S, U, WH3, Z]

Ludwigia maritima R.M. Harper, Harper's Seedbox. Pine savannas, pine flatwoods, bogs. Jun-Sep. E. NC south to s. peninsular FL, west to e. LA. [= GW, K, RAB, S, U, WH3]

Ludwigia microcarpa Michaux, Small-fruited Seedbox. In circumneutral or alkaline soils of moist places, over calcareous rock, mafic rock, shell hash, or brackish sands, such as in maritime wet grasslands, savannas and adjacent ditches over coquina limestone ("marl"), and wet clay flats over diabase, often in roadside ditches, and inland in calcareous fens. Jul-Oct. Ne. NC south to s. FL, west to se. TX (Brown & Marcus 1998); disjunct inland on calcareous or mafic rocks in nc. NC, n. GA, n. AL, c. TN, and sc. MO; also in the Bahamas, Cuba, and Jamaica. This species is diploid ($n = 8$). [= F, GW, K, Mo, RAB, S, U, W, WH3, Z]

Ludwigia octovalvis (Jacquin) Raven. Marshes, disturbed areas. May-Sep. Se. NC south to s. FL, west to TX; and widespread in tropical America. [= GW, U, WH3; > *L. octovalvis* ssp. *octovalvis* – K; > *L. octovalvis* ssp. *sessiliflora* (M. Micheli) Raven – K; > *Jussiaea angustifolia* Lamarck – S; > *Jussiaea scabra* Willdenow – S]

Ludwigia palustris (Linnaeus) Elliott, Common Water-purslane. Moist to wet disturbed areas. May-Nov. Widespread in North America, Eurasia, and Africa. [= C, GW, K, Mo, Pa, RAB, U, Va, W, WH3; > *L. palustris* var. *americana* (A.P. de Candolle) Fernald & Griscom – F, G, WV; > *L. palustris* var. *nana* Fernald & Griscom – F; = *Isnardia palustris* Linnaeus – S]

*? ***Ludwigia peploides*** (Kunth) Raven var. ***glabrescens*** (Kuntze) Shinnars. Pools, ditches, disturbed places. May-Oct. PA, VA and NC south and west to FL and AZ, widespread in the West Indies, Central and South America. Doubtfully native in all or part of our area. [= C, RAB, Va; ? *L. peploides* ssp. *peploides* – GW; > *Jussiaea diffusa* Forsk. – S; > *Jussiaea grandiflora* Michaux – S; = *Jussiaea repens* Linnaeus var. *glabrescens* Kuntze – F, misapplied; = *Jussiaea repens* – G, misapplied; = *L. peploides* ssp. *glabrescens* (Kuntze) Raven – K, Mo, Pa, U, WH3; < *L. peploides* – W]

Ludwigia peploides (Kunth) Raven var. ***montevidensis*** (Sprengel) Shinnars. {add information}. [= *L. peploides* ssp. *montevidensis* (Sprengel) Raven – K2] {not yet keyed}

*? ***Ludwigia peruviana*** (Linnaeus) Hara, Primrose-willow. Swamps, pondshores. In s. GA (Jones & Coile 1988). Reported for NC (Kartesz 1999). All or part of the Southeastern distribution is as an alien species. {investigate} [= GW, K, U, WH3; = *Jussiaea peruviana* Linnaeus – S] {not yet keyed}

Ludwigia pilosa Walter, Hairy Seedbox. Ditches, wet places. Jun-Oct. Se. VA south to n. FL, west to se. TX, restricted to the Coastal Plain except for disjunct occurrences inland in NC, VA, and n. AL. This species is tetraploid ($n = 16$). [= K, U, Va, W, WH3, Z; < *L. pilosa* – C, F, G, GW, RAB, S (also see *L. ravenii*)]

Ludwigia polycarpa Short & R. Peter. Wet meadows, swales. Jun-Sep; Jul-Oct. MA, CT, and w. VT west to s. ON, MI, WI, MN, and c. NE, south to c. VA, KY, s. IL, s. MO, and e. KS. This species is tetraploid ($n = 16$). [= C, F, G, GW, K, Mo, Pa, S, U, Z]

Ludwigia ravenii Peng, Raven's Seedbox. Savannas, swamps, marshes, wet open places. Jun-Oct. Se. VA south to ne. FL (no known records for GA), restricted to the Coastal Plain. For further information, see Peng (1984, 1988, 1989). This species is tetraploid ($n = 16$). [= K, U, Va, WH3, Z; < *L. pilosa* – C, F, G, GW, RAB, S]

Ludwigia repens Forster, Creeping Seedbox. Ditches, pools, and streams. Jun-Sep. Se. VA south to s. FL, west to TX and n. Mexico, north in the interior to TN, MO, and OK; also in CA, Bermuda, and the West Indies. Reveal et al. (2003) propose the name *L. repens* for nomenclatural conservation with a conserved type; if this proposal is not accepted, *L. natans* Elliott will become the name of this species. [= GW, K, RAB, U, WH3; = *Ludwigia natans* Elliott – F, G; = *Isnardia repens* – S]

Ludwigia spathulata Torrey & A. Gray, Southern Water-purslane. Sinkhole ponds, cypress-gum ponds, depression meadows, boggy shores. Jun-Oct. SC south to Panhandle FL and s. AL. [= GW, K, RAB, U, WH3; = *Isnardia spathulata* (Torrey & A. Gray) Small – S]

Ludwigia sphaerocarpa Elliott, Globe-fruited Seedbox. Boggy areas, pools, ditches, river marshes, interdune swales, river and pondshores. Jun-Sep. E. MA south to n. FL, west to e. TX, primarily on the Coastal Plain, spottily distributed in that range, and also disjunct in w. NY, sc. TN, s. IN, and nw. IN and ne. IL. This species is tetraploid (n = 16). Peng (1989) considers it likely that *L. sphaerocarpa* is of allopolyploid origin, one or both of its parents now extinct. [= C, GW, K, Pa, RAB, S, U, Va, WH3, Z; > *L. sphaerocarpa* var. *sphaerocarpa* – F, G; > *L. sphaerocarpa* var. *jungens* Fernald & Griscom – F, G]

Ludwigia suffruticosa Walter, Shrubby Seedbox. Periodically to seasonally flooded portions of limesink ponds (dolines) and clay-based Carolina bays. Jun-Oct. Se. NC south to s. peninsular FL, west to Panhandle FL and se AL. This species is tetraploid (n = 16). Peng (1989) reports that "with its whitish creamy sepals, which are very showy in the dense flower aggregates, the cross-pollinating *L. suffruticosa* successfully attracts many insects, mostly bumblebees, honeybees, and wasps." [= GW, K, RAB, S, U, WH3, Z; = *L. capitata* Michaux]

Ludwigia virgata Michaux, Savanna Seedbox. Wet savannas. Jun-Sep. Se. VA south to s. peninsular FL, west to Panhandle FL and se. AL. [= C, F, GW, K, RAB, S, U, Va, WH3]

2. *Circaea* Linnaeus 1753 (Enchanter's-nightshade)

A genus of 8 species (14 taxa), herbs, of temperate and boreal regions of the Northern Hemisphere. References: Xie et al. (2009)=V; Boufford (1983)=Z; Boufford (2005)=Y; Munz (1965)=X; Wagner, Hoch, & Raven (2007)=U; Averett & Boufford (1985); Skvortsov (1979). Key based on Z.

Identification notes: Sometimes confused in vegetative condition with *Phryma*; the leaf teeth are quite different.

- 1 Flowers opening before elongation of the raceme axis, therefore clustered and corymbiform at the apex of the raceme, borne on erect or ascending pedicels; plant 5-25 (-30) cm tall; fruits clavate, 2.0-2.5 mm long, 0.7-1.2 mm thick, 1-locular..... *C. alpina* ssp. *alpina*
- 1 Flowers opening after elongation of the raceme axis, more or less loosely spaced, borne on spreading pedicels; plants (12-) 20-100 cm tall; fruits obovoid to pyriform, 2.8-3.9 (-4.5) mm long, 1.5-3.6 mm thick, 2-locular, or the fruits sterile and aborting shortly after anthesis, 1-2-locular when present.
- 2 All, or nearly all, ovaries developing to maturity; fruit with corky-thickened ribs separated by deep grooves..... *C. canadensis*
- 2 All ovaries aborting shortly after anthesis (very rarely a few persistent after anthesis); fruit (when somewhat persistent) with low ribs and shallow grooves..... *C. ×sterilis*

Circaea alpina Linnaeus ssp. *alpina*, Alpine Enchanter's-nightshade. Moist organic soil at high elevations (especially in spruce-fir and northern hardwood forests), rocky or gravelly seepages, in spray behind waterfalls, at dripping cliff bases. Jun-Sep. *C. alpina* is treated by Z as a circumboreal complex of six subspecies. Ssp. *alpina* is itself circumboreal, in North America ranging from NL (Newfoundland) and NL (Labrador), west to AK, south to MD, w. NC, e. TN, KY, n. IL, MN, MT, and WA, disjunct in montane sites southward in the w. United States, such as the Black Hills of SD, and isolated montane sites in CO, AZ, and NM. Another subspecies occurs in w. North America, and four subspecies occur in humid and montane parts of Asia. [= K, Pa, U, Va, X, Z; < *C. alpina* – F, G, GW, RAB, S, W, WV; = *C. alpina* var. *alpina* – C]

Circaea canadensis (Linnaeus) Hill, Canada Enchanter's-nightshade. Mesic, nutrient-rich forests. Jun-Aug. NS and NB west to se. MB and ND, south to e. NC, c. SC, s. GA, LA, OK, and NE. The systematics of this taxon is controversial, and treatments have changed over the years. Most recently, Xie et al. (2009) support species status for *C. canadensis*, a conclusion followed here. Previously, Boufford (2005) treated the complex as two species, *C. canadensis* and *C. lutetiana*, the former with two subspecies, ssp. *canadensis* of eastern North America and ssp. *quadrisulcata* of Asia. Before that, Boufford (1983) treated the complex as a circumboreal complex of three subspecies of *C. lutetiana*, including the North American ssp. *canadensis* (Linnaeus) Ascherson & Magnus, the primarily Asian ssp. *quadrisulcata* (Maximowicz) Ascherson & Magnus, and the European ssp. *lutetiana*. Other authors have preferred varietal status for the three entities, full species status, no formal status at all (*C. lutetiana* as a polymorphic complex), or associating the more similar pair (North American and Asian) as two subspecies separate from the European at specific rank. Boufford (1983) and Averett & Boufford (1985) show convincingly that separate taxonomic status for the three entities is warranted, and that ssp. *canadensis* is more closely related to ssp. *quadrisulcata*. The question of the appropriate taxonomic level remains. Boufford (1983) states that "although subspp. *canadensis* and *quadrisulcata* are placed in *C. lutetiana*, this might not ultimately prove to be the best treatment." Later, flavonoid data showed strong differences between the three taxa, stronger than the differences between many of the other species in the genus (Averett & Boufford 1985). Morphologic differences between the three taxa are fairly subtle but appear to be consistent. The complicated synonymy is

perhaps an example of a too-zealous attempt to have nomenclature reflect subtleties of relationship and evolutionary divergence, our understanding of which is unclear and changeable. [= Mo, V; = *C. lutetiana* var. *canadensis* Linnaeus – C; = *C. quadrisulcata* (Maximowicz) Franchet & Savatier var. *canadensis* (Linnaeus) Hara – G, WV; > *C. canadensis* var. *canadensis* – F; > *C. canadensis* var. *virginiana* Fernald – F; = *C. lutetiana* Linnaeus ssp. *canadensis* (Linnaeus) Ascherson & Magnus – K, RAB, W, X, Z; = *C. canadensis* ssp. *canadensis* – Pa, U, Va, Y; = *C. latifolia* Hill – S; = *C. quadrisulcata* ssp. *canadensis* (Linnaeus) Löve & Löve]

Circaea ×sterilis Boufford, Hybrid Enchanter's-nightshade. Mesic, nutrient-rich forests. Jun-Aug. NL (Newfoundland) west to ON and MN, south to w. NC, OH, and WI; it appears to be rare in our area, but should be sought more carefully. *C. ×sterilis* is reported to occur frequently in the absence of one or both of its parents (Boufford 1983; Skvortsov 1979), and is therefore treated separately and keyed here. Recognition of *C. canadensis* (Linnaeus) Hill as distinct from *C. lutetiana* renders the hybrid binomial name *C. ×intermedia* inappropriate for North American plants, since it is the hybrid of *C. alpina* ssp. *alpina* and the European *C. lutetiana*. [= U, Y; = *C. ×intermedia* Ehrhart (pro sp.) – C, K, Pa, RAB, W, X, Z (misapplied to our material if *C. canadensis* is accepted as a species, as here); > *C. canadensis* var. *canadensis* – F, misapplied; > *C. canadensis* var. *virginiana* Fernald – F; = *C. canadensis* (Linnaeus) Hill – G, WV, misapplied]

3. *Chamerion* Rafinesque ex Holub 1972 (Fireweed)

A genus of 8 species (9 taxa), herbs, of arctic, boreal, and temperate Northern Hemisphere. There is increasingly strong evidence for the recognition of this group of plants as a genus separate from *Epilobium*. References: Wagner, Hoch, & Raven (2007)=U; Mosquin (1966)=Z; Holub (1972)=Y; Munz (1965)=X.

Chamerion platyphyllum (Daniels) Löve & Löve, Great Willow-herb, Fireweed. Mt (NC, VA, WV), Pd (DE), Cp (DE): grassy balds, roadsides, montane fields, burned areas, disturbed areas; uncommon (rare in DE and NC). Jul-Sep. *Chamerion platyphyllum* has a circumboreal distribution; it is a member of a circumboreal complex, consisting of several related taxa that differ in chromosome number, a variety of morphological characters, and distribution. The tetraploid *C. platyphyllum* is generally more southern, extending south in North America to NJ, montane w. NC and ne. TN, n. IN, MN, SD, AZ, NM, and CA; it may be more appropriately treated as a variety or subspecies of *C. angustifolium*. The diploid *Chamerion angustifolium* (Linnaeus) Holub is arctic and boreal, extending south in North America to NB, QC, ON, alpine WY, and BC. The hexaploid is *Chamerion danielsii* D. Löve. [= Va; < *Epilobium angustifolium* – G, GW, Pa, RAB, W, WV; = *E. angustifolium* var. *canescens* Alph. Wood – C; >> *E. angustifolium* var. *angustifolium* – F, X; > *E. angustifolium* var. *platyphyllum* (Daniels) Fernald – F; = *Chamerion angustifolium* (Linnaeus) Holub ssp. *circumvagum* (Mosquin) Kartesz – K1, K2, U; < *Chamaenerion angustifolium* (Linnaeus) Scopoli – S; < *Chamerion angustifolium* (Linnaeus) Holub – Y; = *E. angustifolium* Linnaeus ssp. *circumvagum* Mosquin – Z; = ***Chamaenerion angustifolium*** (Linnaeus) Scopoli ssp. *circumvagum* (Mosquin) Moldenke]

4. *Epilobium* Linnaeus 1753 (Willow-herb) [also see *Chamerion*]

A genus of ca. 165 species (ca. 185 taxa), herbs, distributed primarily in boreal and alpine latitudes and elevations. All five of the species in our area reach or approach their southern limits in eastern North America in our area. All members of the genus in our area are placed in section *Epilobium*. References: Wagner, Hoch, & Raven (2007)=U; Munz (1965)=Z.

- 1 Stigma 4-cleft; petals 10-15 mm long..... ***E. hirsutum***
- 1 Stigma capitate; petals 2-8 mm long.
 - 2 Leaves linear to narrowly lanceolate, broadest near the middle, revolute, the larger generally < 10 mm wide, not toothed; stem pubescence general.
 - 3 Pubescence appressed, the upper leaf surface finely and rather densely pubescent ***E. leptophyllum***
 - 3 Pubescence spreading ***E. strictum***
 - 2 Leaves lanceolate, distinctly broader below the middle, flat, the larger generally at least 10 mm wide, toothed; stem pubescence in lines decurrent from the leaf bases.
 - 4 Principal leaves 3-7 cm long, with obscure marginal teeth, the apices merely acute, not gray-green in color, not rugose-veiny in texture; internodes (below the inflorescence) glabrous, glabrescent, or with pubescence scattered over the surface; mature coma (attached to plump seeds) nearly white; plants often strict or sparingly branched; seeds striate (with well-developed papillae arranged conspicuously in lines) ***E. ciliatum* ssp. *ciliatum***
 - 4 Principal leaves 5-15 cm long, with conspicuous and often irregular marginal teeth, the apices acuminate to attenuate, the leaf color often grayish and the leaves rugose-veiny in texture; internodes (below the inflorescence) with lines of pubescence (some internodes on a given plant sometimes with scattered pubescence or glabrous); mature coma cinnamon (attached to plump seeds) brown (pale when immature); plants generally well-branched, with a bushy habit; seeds papillose (the papillae sometimes forming weak lines) ***E. coloratum***

Epilobium ciliatum Rafinesque ssp. ***ciliatum***, American Willow-herb. Bogs, seeps, disturbed wet places (such as moist edges of logging roads). Jun-Sep. NL (Newfoundland) and NL (Labrador) west to AK, south to VA, w. NC, ne. TN, IN, IA, CA, TX, Mexico, Central America; disjunct in Chile and Argentina. [= K, Mo, U, Va; < *E. ciliatum* – Pa, RAB, W; = *E. ciliatum* var. *ciliatum* – C; > *E. ciliatum* – F, X, in a narrower sense; > *E. glandulosum* Lehm. var. *adenocaulon* (Hausknecht) Fernald – F, WV; > *E. adenocaulon* Hausknecht var. *adenocaulon* – G, Z]

Epilobium coloratum Biehler, Bronze Willow-herb, Eastern Willow-herb. Seepages, moist open places. Jun-Oct. ME west to MN, south to NC, n. GA, AL, AR, and TX. There are some difficulties in distinguishing this species and *E. ciliatum* in our area. [= C, F, G, GW, K, Mo, Pa, RAB, S, U, Va, W, WV, Z]

* ***Epilobium hirsutum*** Linnaeus, Hairy Willow-herb. Disturbed areas; native of Eurasia. Jul-Sep. Naturalized south to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), MD, and WV (Kartesz 1999, 2010). [= C, F, G, K, Pa, U, Z]

Epilobium leptophyllum Rafinesque, Narrowleaf Willow-herb, American Marsh Willow-herb. Bogs, fens, seepages, and boggy meadows. Apr-Oct. NL (Newfoundland) and NT west to BC, south to w. NC, ne. TN, KS, ne. TX (Mink, Singhurst, & Holmes 2011b), and CA. [= C, F, G, GW, K, Mo, Pa, RAB, U, Va, W, WV, Z]

Epilobium strictum Muhlenberg ex Sprengel, Northeastern Willow-herb, Downy Willow-herb, Soft Willow-herb. Marshes, bogs. QC west to MN, south to n. VA (?), OH, and n. IL. Reported for Arlington County, VA; the single record is regarded as questionable. [= C, F, G, K, Pa, U, Z]

5. ***Oenothera*** Linnaeus 1753 (Evening-primrose)

A genus of about 145 species (188 taxa), herbs, of America (especially temperate regions). This treatment provisional, with further revision likely, especially in the *O. fruticosa*-*O. tetragona*-*O. pilosella* complex. References: Wagner, Hoch, & Raven (2007)=U; Dietrich, Wagner, & Raven (1997)=Z; Dietrich & Wagner (1988)=Y; Munz (1965)=X; Straley (1977)=V. Keys adapted in part from those references.

- 1 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; [section *Gaura*].
 - 2 Pedicels 2-4 mm long; fruit with a stipe at maturity; clumped or matted perennials from woody rhizomes or rootstocks.
 - 3 Clumped perennial; petals 4-10 mm long; body of the fruit 5-10 mm long; stipe of the fruit 0.5-4.5 mm long..... *O. filipes*
 - 3 Mat-forming perennial; petals 7-15 mm long; body of the fruit 8-15 mm long; stipe of the fruit 2-8 mm long..... *O. sinuosa*
 - 2 Pedicels 0-1 mm long; fruit without a stipe; annual, winter annual, or biennial.
 - 4 Sepals 2-3.5 mm long; petals 1.5-3 mm long *O. curtiflora*
 - 4 Sepals 2.5-12 mm long; petals 2.5-15 mm long.
 - 5 Sepals 2.5-8 mm long; leaves 0.1-1.3 cm wide; flowers 3-4-merous (often mixed on a plant); fruits 3-4-angled (often mixed on a plant) *O. simulans*
 - 5 Sepals 8-17 mm long; leaves 0.3-2.5 cm wide; flowers 4-merous; fruits 4-angled.
 - 6 Petals 6-9 mm long; sepals 10-12 mm long; leaves ca. 4× as long as wide, to 25 mm wide *O. gaura*
 - 6 Petals 10-15 mm long; sepals 8-17 mm long; leaves ca. 6× as long as wide, to 13 mm wide *O. lindheimeri*
 - 1 Fruit dehiscent; seeds (10-) 50-many per capsule, 0.3-2 mm long.
 - 7 Ovary essentially terete; fruit terete or with 4 rounded ridges; stamens equal in length (except in *O. speciosa*).
 - 8 Flowers white or pink; flower buds nodding; [section *Hartmannia*] *O. speciosa*
 - 8 Flowers yellow; flower buds erect; [section *Oenothera*]
 - 9 Fruit linear, nearly isodiametric through its length; seeds borne ascending in the locules, rounded or fusiform, more or less regularly pitted; [section *Oenothera*, subsection *Raimannia*].
 - 10 Petals acute to rounded at the apex.
 - 11 Inflorescence dense, with > 2 flowers per spike opening each day; leaves gray-green *O. clelandii*
 - 11 Inflorescence lax, 1-2 flowers per spike opening on each day; leaves green *O. curtissii*
 - 10 Petals truncate to emarginate at the apex.
 - 12 Nonflowering portion of stems stiff, densely strigillose or sometimes also villous; leaves gray-green, densely strigillose, usually subtentire to shallowly dentate (rarely lyrate); [in maritime situations].
 - 13 Sepals 2.0-3.3 cm long; petals 2.5-4.5 cm long; stigma elevated above the anthers at anthesis; capsule 2.5-5.5 cm long; rosette leaves 5-14 cm long, 1-2 cm wide *O. drummondii* ssp. *drummondii*
 - 13 Sepals 0.3-1.1 cm long; petals 0.45-1.6 cm long; stigma surrounded by the anthers at anthesis; capsule 1.5-4.5 cm long; rosette leaves 4-8 cm long, 0.7-1.0 cm wide *O. humifusa*
 - 12 Nonflowering portion of stem not stiff, moderately to sparsely strigillose to sometimes densely villous, and also ± glandular puberulent; leaves green, sparsely to moderately strigillose and usually villous, deeply lobed to dentate (rarely some of them subtentire); [in inland disturbed situations].
 - 14 Petals 2.5-4 cm long; style 4-7.5 cm long; stigma lobes well elevated above the anthers at anthesis *O. grandis*
 - 14 Petals 0.5-2.2 cm long; style 2-5 cm long; stigma lobes surrounded by the anthers at anthesis *O. laciniata*

- 9 Fruit thickest near the base, tapering to the apex; seeds borne horizontally in the locules, angled-prismatic, not regularly pitted; [section *Oenothera*, subsection *Oenothera*].
- 15 Stigma elevated above the anthers at anthesis; petals 2.5-5 cm long.
- 16 Cauline leaves 0.4-1.0 cm wide; apex of the inflorescence curved; free sepal tips subterminal, usually spreading; capsules spreading at nearly right angles to the stem, long-attenuate toward apex, usually conspicuously arcuate..... *O. argillicola*
- 16 Cauline leaves 1.5-6 cm wide; apex of the inflorescence erect; free sepal tips terminal, erect; capsules erect or slightly spreading, gradually attenuate toward the apex.
- 17 Upper stem, ovary, floral tube, and sepals always conspicuously pubescent, usually with at least some red-pustulate hairs; bracts green, persistent; sepals often flushed with red, or red-stripped [*O. glazioviana*]
- 17 Upper stem, ovary, floral tube, and sepals often apparently glabrous without magnification; pustulate hairs absent, or if present not red (in fresh material); bracts often pale-green and deciduous; sepals yellowish green, or flushed with some red...
..... *O. grandiflora*
- 15 Stigma surrounded by or below the anthers at anthesis; petals 0.7-2.5 (-3) cm long.
- 18 Plant appearing exclusively appressed-pubescent (as seen without magnification).
- 19 Apex of the inflorescence curved; free sepal tips subterminal in bud, erect to spreading; dry capsules usually rusty brown
..... *O. oakesiana*
- 19 Apex of the inflorescence erect; free sepal tips erect in bud; dry capsules gray-green or dull green.
- 20 Leaves green to pale green; stems, ovary, floral tube, and sepals sparsely appressed-pubescent *O. biennis*
- 20 Leaves dull green to gray-green; stems, ovary, floral tube, and sepals densely appressed-pubescent ...*O. villosa* ssp. *villosa*
- 18 Plant appearing **either** glabrous **or** with a mixture of long pustular hairs and appressed pubescence (as seen without magnification).
- 21 Apex of inflorescence curved; free sepal tips subterminal in bud.
- 22 Plant (at least the lower portions) predominantly strigillose; leaves dull green to gray-green; dry capsules rusty brown
..... *O. oakesiana*
- 22 Plant predominantly erect-pubescent or appearing glabrous (as seen without magnification); leaves usually bright green; dry capsules usually dark green or black *O. parviflora*
- 21 Apex of inflorescence erect; free sepal tips terminal or subterminal in bud.
- 23 Inflorescence conspicuously pubescent *O. biennis*
- 23 Inflorescence glabrous (or appearing so without magnification).
- 24 Free sepal tips terminal in bud; petals 1.4-2.5 (-3) cm long; bracts caducous, pale green; capsules dull green when dry; petals fading yellowish-white to translucent *O. nutans*
- 24 Free sepal tips subterminal in bud; petals 0.8-1.5 (-2) cm long; bracts persistent, green; capsules usually black or dark green when dry; petals fading pale yellow, usually opaque *O. parviflora*
- 7 Ovary 4-angled or 4-winged (at least near its tip); fruit sharply 4-angled or 4-winged; stamens of two lengths (except *O. triloba* and *O. macrocarpa* ssp. *macrocarpa*).
- 25 Leaves all basal, pinnatifid; [section *Lavauxia*, subsection *Lavauxia*] *O. triloba*
- 25 Leaves in part cauline, entire or toothed.
- 26 Petals 50-70 mm long; flowers opening in the evening; wings of the fruit 10-25 mm wide; [section *Megapterium*]
..... *O. macrocarpa* ssp. *macrocarpa*
- 26 Petals 3-30 mm long; flowers opening in the day; wings of the fruit <3 mm wide; [section *Kneiffia*]
- 27 Cauline leaves linear, < 1 mm wide; petals 3-5 (-7) mm long; floral bracts shorter than the subtended ovaries; mature fruits ellipsoid-rhomboid, 4-6 mm long; annual; [section *Kneiffia*, subsection *Peniophyllum*] *O. linifolia*
- 27 Cauline leaves lanceolate to ovate, > 1 mm wide; petals 5-30 mm long; floral bracts longer than the subtended ovaries; mature fruits clavate to oblong-elliptic, 8-20 mm long; perennial; [section *Kneiffia*, subsection *Kneiffia*].
- 28 Petals 5-10 mm long; inflorescence usually nodding *O. perennis*
- 28 Petals 15-30 mm long; inflorescence usually erect.
- 29 Plant conspicuously pilose-hirsute with hairs 1-3 mm long; free sepal tips 1-4 mm long, divergent *O. pilosella*
- 29 Plant either with shorter or appressed pubescence, of glandular or nonglandular hairs; free sepal tips 0-2 (-6) mm long, divergent or not.
- 30 Capsules oblong, widest near the middle, usually abruptly tapered to a stipe 0.1-3 (-7) mm long; hairs of the ovary and capsule predominantly glandular (or the ovary glabrous); leaves subglabrous or sparsely pubescent, more or less dentate.
- 31 Petals (20-) 25-35 mm long; cauline leaves lanceolate to ovate, 2-7 cm long, 1-3 cm wide, often glaucous beneath
..... *O. tetragona* var. *fraseri*
- 31 Petals 12-20 (-25) mm long; cauline leaves linear to lanceolate, 2-7 cm long, 0.5-1.0 (-1.5) cm wide
..... *O. tetragona* var. *tetragona*
- 30 Capsules clavate, widest above the middle, gradually tapered to a stipe 3-10 mm long; hairs of the ovary and capsule nonglandular (or with a mixture of glandular and nonglandular hairs); leaves generally pubescent, subentire.
- 32 Petals 15-30 mm long; stems 7-12 dm tall, freely branched, slightly pubescent; cauline leaves lanceolate, 5-12 cm long, 0.5-1.5 cm wide; [of tidal marshes, usually with spongy lower stems and adventitious roots where regularly submerged] *O. riparia*
- 32 Petals (8-) 15-22 mm long; stems 1-8 dm tall, less branched (unless mowed, grazed, or otherwise damaged), more pubescent; cauline leaves 2-6 (-8) cm long, 0.2-1.0 (-1.2) cm wide.
- 33 Capsule vestiture a mixture of glandular and nonglandular hairs.
- 34 Cauline leaves not velutinous, 5-10× as long as wide *O. tetragona* var. *brevistipata*
- 34 Cauline leaves velutinous, 2-4× as long as wide.
- 35 Petals 7-12 mm long; leaves lance-oblong, obtuse; [of barrens of TN, KY, and AL] ... *O. tetragona* var. *sharpii*
- 35 Petals 15-20 mm long; leaves lanceolate, acute; [of the Atlantic Coastal Plain] *O. tetragona* var. *velutina*
- 33 Capsule vestiture strictly nonglandular.
- 36 Free sepal tips 1-3 mm long, cartilaginous and often arching after the sepals have reflexed; calyx strigose
..... *O. fruticosa* var. *unguiculata*
- 36 Free sepal tips < 1 mm long; calyx various.

- 37 Capsule body 6-11 mm long, the pubescence rather coarse..... *O. fruticosa* var. *fruticosa*
- 37 Capsule body 3-5 mm long, the pubescence very fine.
- 38 Capsule body 3.5-4 mm long, strigose-pilose; [of Coastal Plain bogs]..... *O. fruticosa* var. *microcarpa*
- 38 Capsule body 4-5 mm long; very finely strigillose; [of Piedmont rock outcrops].....
..... *O. fruticosa* var. *subglobosa*

Oenothera argillicola Mackenzie, Shale-barren Evening-primrose. Shale barrens and woodlands. Jul-Sep. Sc. PA south through MD to e. WV and w. VA (south to Montgomery County). [= C, F, G, K1, K2, Pa, U, Va, W, WV, Z; > *O. argillicola* var. *argillicola* - X; > *O. argillicola* var. *pubescens* Core & Davis - X]

Oenothera berlandieri (Spach) Steudel ssp. *berlandieri*. AL. [= U; = *Calylophus berlandieri* Spach ssp. *berlandieri* - K2] {not yet keyed}

Oenothera biennis Linnaeus, Common Evening-primrose. Fields, pastures, roadsides, disturbed areas. Jun-Oct. Ranging widely in e. North America and Europe, and scattered in w. North America. [= K1, K2, Mo, Pa, U, W, WH3, Z; < *O. biennis* - G, RAB, S, Va, WV; = *O. biennis* var. *biennis* - C; > *O. biennis* var. *biennis* - F; > *O. biennis* var. *pyncocarpa* (Atkinson & Bartlett) Wiegand - F; > *O. biennis* ssp. *caeciarum* Munz - X; > *O. biennis* ssp. *centralis* Munz - X]

* ***Oenothera clelandii*** W. Dietrich, Raven, & W.L. Wagner, Sand Evening-primrose. Sand prairies, riverbanks, dry, sandy disturbed areas. Jun-Oct. MI, WI, and MN south to KY and AR; scattered further east as introductions. Reported for SC (Kartesz 1999); {investigate} [= C, K1, K2, Mo, U, Y; < *O. rhombipetala*, misapplied]

* ***Oenothera curtiflora*** W.L. Wagner & Hoch, Small-flowered Gaura, Velvety Gaura. Sandy fields, disturbed areas, and clearings. May-Jul. IN and IL west to WA, south to MS, and Mexico; apparently introduced eastward to MA, TN, GA, and SC (the exact eastern edge of the native distribution uncertain). Kartesz's (1999) adoption of *Gaura mollis* as the name for this taxon has been rejected (Wagner & Hoch 2000, Brummitt 2001). [= K2, U; = *Gaura parviflora* Douglas ex Lehmann - F, G, Q, RAB, S, WH3; = *Gaura mollis* James - K1; > *Gaura parviflora* var. *parviflora* - X; > *Gaura parviflora* var. *lachnocarpa* Weatherby - X]

Oenothera curtissii Small. Sandhills, sandy fields. May-Sep. Se. SC south to n. peninsular FL, west to s. AL. Closely related to *O. rhombipetala*, which is restricted to the Great Plains, with scattered occurrences east to AR, IL, and MI. [= K1, K2, WH3, U, Y; < *O. rhombipetala* Nuttall ex Torrey & A. Gray - RAB, X, misapplied; = *Raimannia curtissii* (Small) Rose ex Small - S]

*? ***Oenothera drummondii*** Hooker ssp. *drummondii*, Drummond's Evening-primrose. Sandy ocean beaches; perhaps only introduced or adventive from the Gulf Coast. Apr-Oct. Ssp. *drummondii* ranges from se. NC south to s. FL, west to se. TX, and south to Tamaulipas and Vera Cruz. Ssp. *thalassiphila* (Brandege) W. Dietrich & W.L. Wagner is restricted to the southern tip of Baja California. [= U, Y; < *O. drummondii* - RAB, K1, K2, WH3; < *Raimannia drummondii* (Hooker) Rose ex Sprague & Riley - S; = *O. drummondii* var. *drummondii* - X]

Oenothera filiformis (Small) W.L. Wagner & Hoch, Large-flowered Gaura. Glades, prairies, woodlands, disturbed areas. Jun-Oct. MI, WI, MN, SD, and NE, south to AL, MS, LA, TX, and Mexico. [= Mo, U; = *Gaura longiflora* Spach - K1, K2, preoccupied name; = *Gaura biennis* Linnaeus var. *pitcheri* Torrey & A. Gray - C, F, G, X; > *Gaura filiformis* Small - S; > *Gaura longiflora* - S] {not yet keyed}

Oenothera filipes (Spach) W. L. Wagner & Hoch, Threadstalk Gaura. Sandy fields, disturbed areas, and clearings. Apr-Jul. SC west to n. TN and s. IN, south to ne. FL and e. LA. [= U; = *Gaura filipes* Spach - C, G, K1, K2, Q, RAB, W, WH3; > *Gaura filipes* var. *filipes* - F, X; > *Gaura filipes* var. *major* Torrey & A. Gray - F, X; = *Gaura michauxii* Spach - S]

Oenothera fruticosa Linnaeus var. *fruticosa*, Southern Sundrops. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, VA, WV): dry forests and woodlands, glades, and rock outcrops; common (rare in DE). Apr-Aug. MA west to IN, south to FL and LA. [= F, G, X; < *O. fruticosa* - C, RAB, Va, WH3; < *O. fruticosa* ssp. *fruticosa* - K1, K2, Mo, Pa, U, V, W; > *O. fruticosa* var. *linearis* (Michaux) S. Watson - F, WV; > *O. fruticosa* var. *humifusa* Allen - F, G, X; > *Kneiffia fruticosa* (Linnaeus) Raimann - S; > *Kneiffia arenicola* Small - S; > *Kneiffia semiglandulosa* Pennell - S]

Oenothera fruticosa Linnaeus var. *microcarpa* Fernald, Small-fruited Sundrops. Cp (NC, SC, VA): boggy depressions. Apr-Aug. E. MD south to e. SC. [= F, X; < *O. fruticosa* - C, RAB, Va; < *O. fruticosa* ssp. *fruticosa* - K1, K2, U, V]

Oenothera fruticosa Linnaeus var. *subglobosa* (Small) Munz, Flatrock Sundrops. Pd (GA): granite flatrocks and domes; rare. GA to AL. [= X; < *O. fruticosa* - C, RAB; < *O. fruticosa* ssp. *fruticosa* - K1, K2, U, V; = *Kneiffia subglobosa* Small - S]

Oenothera fruticosa Linnaeus var. *unguiculata* Fernald, Southern Sundrops. Sandhills, moist to wet loamy savannas. Apr-Aug. Se. VA south to e. SC. [= F, X; < *O. fruticosa* – C, RAB, Va; < *O. fruticosa* ssp. *fruticosa* – H, K1, K2, U, V]

Oenothera gaura W.L. Wagner & Hoch, Biennial Gaura, Northeastern Gaura. Roadsides, woodlands, streambanks, fields, disturbed areas. Jun-Oct. MA and NY west to WI, se. MN, and IA, south to sw. NC, c. GA (Jones & Coile 1988), sc. TN, and c. IL. [= U, Va; = *Gaura biennis* Linnaeus – K1, K2, Pa, Q, RAB, S, W, WV; > *Gaura biennis* var. *biennis* – C, F, G, X]

* *Oenothera glazioviana* Micheli in Martius, Garden Evening-primrose. Disturbed areas. Aug-Oct. This species apparently arose as a garden hybrid, and has been widely cultivated and naturalized nearly worldwide. [= K1, K2, Pa, U, Z; < *O. biennis* Linnaeus – Va; = *O. erythrosepala* Borbás – X]

Oenothera grandiflora L'Héritier ex Aiton. Woodlands, river-banks, disturbed areas. Jun-Oct. Apparently native to Panhandle FL, AL, and MS; scattered elsewhere as a horticultural plant. [= F, K1, K2, Pa, S, U, WH3, X, Z]

* *Oenothera grandis* (Britton) Smyth. Roadsides; introduced from farther west. Mar-Jul. The native range of this species is centered in KS, OK, and TX. [= K1, K2, Mo, U, WH3, X, Y; = *O. laciniata* Hill var. *grandiflora* (S. Watson) B.L. Robinson – F, G, RAB]

Oenothera heterophylla Spach ssp. *orientalis* W. Dietrich, Raven, & W.L. Wagner, Alabama Evening-primrose. Endemic to w. AL (Pickens and Sumter counties) and sw. AR. Ssp. *heterophylla* is distributed from LA and AR west to c. TX. [= K2, U] {not yet keyed}

Oenothera humifusa Nuttall, Seabeach Evening-primrose, Spreading Evening-primrose. Coastal sand dunes. Early May-Oct. S. NJ south to s. FL, west to s. LA, along the coast. [= C, F, G, K1, K2, RAB, U, Va, WH3, X, Y; > *Raimannia humifusa* (Nuttall) Rose – S; > *Raimannia mollissima* (Linnaeus) Sprague & Riley – S, misapplied]

Oenothera laciniata Hill, Cutleaf Evening-primrose. Disturbed areas. Feb-Nov. ME west to ND, south to s. FL and TX; also in CA. [= K1, K2, Mo, Pa, U, Va, W, WH3, WV; = *O. laciniata* var. *laciniata* – C, F, G, RAB; = *Raimannia laciniata* (Hill) Rose – S; = *O. laciniata* ssp. *laciniata* – X]

Oenothera lindheimeri (Engelmann & A. Gray) W.L. Wagner & Hoch. Disturbed areas. W. LA and TX; scattered eastwards (perhaps only as introductions) in e. LA (the Florida parishes), s. MS, s. AL, and Panhandle FL. [= U; = *Gaura lindheimeri* Engelmann & A. Gray – K2, WH3]

Oenothera linifolia Nuttall, Threadleaf Sundrops, Flaxleaf Sundrops. Dry openings and fields. May-Jul. C. VA west to s. IL and se. KS, south to Panhandle FL and se. TX. Occurrences east of the Mississippi River may be mainly or entirely adventive. Belden et al. (2004) discuss the Virginia occurrence. [= C, F, G, K1, K2, RAB, U, Va, W, WH3, V, X; = *Peniophyllum linifolium* (Nuttall) Pennell – S]

Oenothera macrocarpa Nuttall ssp. *macrocarpa*, Missouri Evening-primrose, Wingfruit Evening-primrose. Glades on calcareous substrates. May-Aug. IL west to WY, south to n. AR and c. TX; disjunct in c. TN. [= K1, K2, U; < *O. missouriensis* Sims – F; < *O. macrocarpa* Nuttall – C, G; = *O. missouriensis* Sims var. *missouriensis* – X; ? *Megapterium missouriense* (Sims) Spach]

Oenothera nutans Atkinson & Bartlett. Roadsides, openings, forest edges, pastures. Jun-Oct. ME west to MI, south to n. FL, s. AL, and s. MO. [= K1, K2, Mo, Pa, U, WH3, Z; < *O. biennis* – G, RAB, S, WV; = *O. biennis* Linnaeus var. *austromontana* (Munz) Cronquist – C; = *O. biennis* var. *nutans* (Atkinson & Bartlett) Wiegand – F; = *O. austromontana* (Munz) Raven, Dietrich, & Stubbe – H, W; < *O. biennis* Linnaeus – Va; = *O. biennis* ssp. *austromontana* Munz – X]

Oenothera oakesiana (A. Gray) Robbins ex S. Watson & Coulter. Disturbed areas, roadsides. NS west to MB, south to e. NC, sc. VA, PA, n. IN, n. IL, and s. MN. [= G, K1, K2, Pa, U, Z; = *O. parviflora* Linnaeus var. *oakesiana* (A. Gray) Fernald – C, F; < *O. biennis* Linnaeus – Va; = *O. parviflora* ssp. *parviflora* var. *oakesiana* (A. Gray) Fernald – X]

Oenothera parviflora Linnaeus, Small-flowered Evening-primrose, Northern Evening-primrose. Fields, disturbed areas. May-Oct. NS west to MB, south to NC, TN, KY, and MO. Reported for GA (GANHP). [= G, K1, K2, Mo, Pa, RAB, U, W, Z; > *O. parviflora* var. *parviflora* – C, F, WV; > *O. parviflora* var. *angustissima* (R.R. Gates) Wiegand – F, WV; < *O. biennis* Linnaeus – Va; > *O. parviflora* ssp. *parviflora* var. *parviflora* – X; > *O. parviflora* ssp. *angustissima* (R.R. Gates) Munz – X]

Oenothera patriciae W.L. Wagner & Hoch. East to MS. [= U; = *Gaura brachycarpa* Small – K2] {not yet keyed}

Oenothera perennis Linnaeus, Little Sundrops. Bogs, sphagnum seeps, moist fields. May-Aug. NS west to MB, south to w. NC, nw. SC, KY, and MO. [= C, G, K1, K2, Pa, RAB, U, Va, W, X, WV; > *O. perennis* var. *perennis* – F; = *Kneiffia perennis* (Linnaeus) Pennell – S]

Oenothera pilosella Rafinesque, Midwestern Evening-primrose. Fens, marshes, swamps, moist fields, disturbed areas. May-Jul. NH west to ON, south to s. VA, KY, n. AL, c. MS, and c. LA. *O. sessilis* (Pennell) Munz, treated by Straley (1977) as *O. pilosella* ssp. *sessilis* (Pennell) Straley, is best recognized as a species; it is restricted to West Gulf Coastal Plain (west of our area). [= F, G, Mo, Pa, Va, WV, X; = *O. pilosella* ssp. *pilosella* – C, K1, K2, U, V; > *Kneiffia pratensis* Small – S; = *O. fruticosa* Linnaeus var. *hirsuta* Nuttall ex Torrey & A. Gray]

Oenothera rhombipetala Nuttall ex Torrey & A. Gray, Longspike Evening-primrose, Sand Evening-primrose. Riverbanks, prairies, disturbed areas. May-Oct. [= C, G, K2, Mo, U] {not yet keyed};

Oenothera riparia Nuttall, Riverbank Evening-primrose. Tidal marshes. Jun-Jul. Se. VA (?) south to se. NC and e. SC. Distinct from *O. fruticosa*. Present in the freshwater tidal portions of the Waccamaw, Northeast Cape Fear, Black, Greater Pee Dee, and Cape Fear (?) rivers. [= U, Va; < *O. fruticosa* – RAB; < *O. fruticosa* ssp. *fruticosa* – K1, K2, V; = *Kneiffia riparia* (Nuttall) Small – S; = *O. tetragona* Roth ssp. *glauca* (Michaux) Munz var. *riparia* (Nuttall) Munz – X]

Oenothera serrulata Nuttall, Yellow Sundrops. River banks. May-Sep. ON west to AB, south to w. KY (Jones 2005), w. AR, TX, NM, and Mexico. Sometimes treated as *Calylophus serrulatus* (see synonymy), but better included a broadly-circumscribed *Oenothera*, based on Wagner, Hoch, & Raven (2007). [= F, G, Mo, U; = *Calylophus serrulatus* (Nuttall) Raven – C, K1, K2] {not yet keyed; synonymy incomplete};

Oenothera simulans (Small) W.L. Wagner & Hoch, Southeastern Gaura. Open woodlands, sandy fields, roadsides, primarily in the outer Coastal Plain. May-Sep. E. NC (Dare County) south to s. FL, west to e. TX, endemic to the Coastal Plain. [= Mo, U; = *Gaura angustifolia* Michaux – K1, K2, Q, RAB, S, WH3; > *Gaura angustifolia* var. *angustifolia* – X]

* ***Oenothera sinuosa*** W.L. Wagner & Hoch, Texas Gaura. Sandy fields, disturbed areas, and clearings; native of farther west. Apr-Oct. AR and OK south to s. TX, introduced eastward to SC and FL. [= Mo, U; = *Gaura sinuata* Nuttall ex Seringe – K1, K2, Q, RAB, WH3, X]

Oenothera spachiana Torrey & A. Gray. [= K2, U] {not yet keyed};

* ***Oenothera speciosa*** Nuttall, White Evening-primrose, Pink-ladies. Roadsides and fields, also cultivated as an ornamental; introduced from farther west. May-Aug. [= C, F, G, K1, K2, MO, Pa, RAB, U, Va, W, WH3, X; = *Hartmannia speciosa* (Nuttall) Small – S]

Oenothera tetragona Roth var. *brevistipata* (Pennell) Munz. Dry forests and woodlands, roadsides. May-Aug. SC and KY, south to GA and MS. Should perhaps be considered more closely related to *O. fruticosa* (where placed in synonymy by Straley), if it is determined to be valid. [= G; < *O. tetragona* – C, RAB; < *O. fruticosa* Linnaeus ssp. *fruticosa* – H, K1, K2, U, V, W; = *Kneiffia brevistipata* Pennell – S; = *O. tetragona* ssp. *tetragona* var. *brevistipata* – X] {not yet mapped};

Oenothera tetragona Roth var. *fraseri* (Pursh) Munz, Appalachian Sundrops. Dry to moist forests and woodlands, roadsides. May-Aug. NY and PA, south to nw. SC and n. GA. This is the more montane and high elevation variant of *O. tetragona*. [= F, G, X; < *O. tetragona* – C, RAB, Va; > *O. tetragona* var. *hybrida* (Michaux) Fernald – F, WV; > *O. tetragona* var. *latifolia* (Rydberg) Fernald – F, WV; < *O. fruticosa* Linnaeus ssp. *glauca* (Michaux) Straley – H, K1, K2, Pa, U, V, W; > *Kneiffia glauca* (Michaux) Spach – S; > *Kneiffia hybrida* (Michaux) Small – S; > *Kneiffia latifolia* Rydberg – S; = *O. tetragona* ssp. *glauca* var. *glauca* – X] {not yet mapped};

Oenothera tetragona Roth var. *sharpii* Munz. Known from the Eastern Highland Rim of TN, AL, and KY. [< *O. tetragona* – C, RAB; < *O. tetragona* var. *tetragona* – G; < *O. fruticosa* Linnaeus ssp. *fruticosa* – H, K1, K2, U, V, W; = *O. tetragona* ssp. *tetragona* var. *sharpii* – X] {not yet mapped};

Oenothera tetragona Roth var. *tetragona*, Northern Sundrops. Dry forests and woodlands, roadsides. May-Aug. NL (Newfoundland) west to MI, south to e. VA and MO. [= F; < *O. tetragona* – C, RAB, Va; > *O. tetragona* var. *longistipitata* (Pennell) Munz – F, WV; < *O. tetragona* var. *tetragona* – G; < *O. fruticosa* Linnaeus ssp. *glauca* (Michaux) Straley – H, K1, K2, Mo, Pa, U, V, W, WV; = *Kneiffia tetragona* (Roth) Pennell – S; = *O. tetragona* ssp. *tetragona* var. *tetragona* – X] {not yet mapped};

Oenothera tetragona Roth var. *velutina* (Pennell) Munz. Dry sandy soils. Se. NY (Long Island) south to se. VA. Should perhaps be considered more closely related to *O. fruticosa* (where placed in synonymy by Straley), if it is determined to be valid. [= F, G; < *O. tetragona* – RAB, C; < *O. fruticosa* Linnaeus ssp. *fruticosa* – H, K1, K2, U, V, W; = *Kneiffia velutina* Pennell – S; = *O. tetragona* ssp. *tetragona* var. *velutina* – X] {not yet mapped};

Oenothera triloba Nuttall, Stemless Evening-primrose. Limestone glades (in GA), blackbelt prairies, disturbed areas (in VA); perhaps only introduced in VA, though native into eastern KY and TN (GA Watch List). Apr-Jun. MO and KS south through AR, OK, and e. NM to ne. LA, TX, and Mexico; also scattered east of the Mississippi River in both native and apparently introduced populations. [= C, F, G, H, K1, K2, Mo, Pa, U, X; = *Lavauxia triloba* (Nuttall) Spach – S]

* **Oenothera villosa** Thunberg *ssp. villosa*. Disturbed areas; apparently naturalized in our area from an original distribution in the Great Plains. Jun-Oct. [= K1, K2, Mo, U, Z; ? *O. biennis* var. *canescens* Torrey & A. Gray – C, F; ? *O. strigosa* (Rydberg) Mackenzie & Bush – G; < *O. villosa* – Pa; < *O. biennis* Linnaeus – Va; ? *O. strigosa* (Rydberg) Mackenzie & Bush *ssp. canovirens* (Steele) Munz – X]

* **Oenothera xenogaura** W.L. Wagner & Hoch. Disturbed areas. AR south to TX and LA; disjunct eastward in GA (Kartesz 1999), where apparently introduced. [= U; = *Gaura drummondii* (Spach) Torrey & A. Gray – K1, K2] {not yet keyed}

222. MYRTACEAE A.L. de Jussieu 1789 (Myrtle Family) [in MYRTALES]

A family of about 100-142 genera and 3500-5500 species, trees and shrubs, nearly worldwide in tropical and subtropical areas. References: Wilson (1960c); Wilson in Kubitzki (2011).

- 1 Leaves alternate, lanceolate, > 4× as long as wide; fruit dry, capsular; [subfamily *Myrtoideae*; tribe *Melaleuceae*]**Melaleuca**
- 1 Leaves opposite, ovate, elliptic, or orbicular, < 3× as long as wide; fruit fleshy (or dry in *Eucalyptus*).
- 2 Leaves orbicular, clasping; fruit dry, a capsule; [subfamily *Myrtoideae*; tribe *Eucalypteae*].....**Eucalyptus**
- 2 Leaves ovate or elliptic, petiolate or subsessile; fruit fleshy, a berry or drupe-like; [subfamily *Myrtoideae*; tribe *Myrteae*].
- 3 Fruit a many-seeded berry, 20-60 mm in diameter.....**Psidium**
- 3 Fruit with 1 (-2) seeds, drupelike, 6-12 mm in diameter.
- 4**Eugenia**
- 4**Myrcianthes**

Eucalyptus L’Héritier 1789 (Gum, Eucalyptus, Stringybark)

A genus of about 800 species, trees and shrubs, nearly all of Australia. References: Wilson in Kubitzki (2011).

Identification notes: Other species of *Eucalyptus* are more rarely planted and may eventually naturalize.

* **Eucalyptus cinerea** F. Mueller ex Bentham, Silver-dollar Eucalyptus, Silver-dollar Tree, Argyle-apple, Mealy Stringybark. Planted (becoming very popular across the warmer parts of the se. United States as an ornamental), sometimes persistent and appearing naturalized; native of se. Australia. [= K2]

Eugenia Linnaeus 1753 (Stopper)

A genus of ca. 550 species, trees and shrubs, of the tropics and subtropics, especially the Neotropics. References: Wilson in Kubitzki (2011); Wilson (1960c).

Eugenia axillaris (Swartz) Willdenow, White Stopper. Coastal hammocks. N. FL peninsula (Levy County on the west coast and Volusia County on the east coast) south to s. FL; West Indies; Mexico through Central America to n. South America. [= WH3; > *E. axillaris* – S; > *E. anthera* Small – S]

Melaleuca Linnaeus 1767 (Cajeput, Bottlebrush, Punktree)

A genus of ca. 300 species (if circumscribed, as here, to include *Callistemon*), trees and shrubs, of tropical and subtropical Australia and nearby Asia and Pacific Islands. References: Wilson in Kubitzki (2011); Wilson (1960c)=Z.

- 1 Filaments red or crimson; flowers attached to the inflorescence axis singly**M. citrina**
- 1 Filaments white, greenish, or yellowish; flowers attached to the inflorescence in triads **M. quinquenervia**

* **Melaleuca citrina** (Curtis) Dumont de Courset, Crimson Bottlebrush. Disturbed areas; native of Australia. [= *Callistemon citrinus* (Curtis) Skeels – K2]

* **Melaleuca quinquenervia** (Cavanilles) Blake, Punktree, Paperbark Tree, Meleleuca. Wetlands, disturbed areas; native of Australia. [= GW, K2, WH3; = *M. leucadendra* Linnaeus – S, misapplied; = *M. leucodendron* (Linnaeus) Linnaeus – Z]

Myrcianthes O. Berg 1856 (Stopper)

A genus of ca. 30 species, trees and shrubs, of the New World tropics and subtropics. References: Wilson (1960c)=Z; Wilson in Kubitzki (2011).

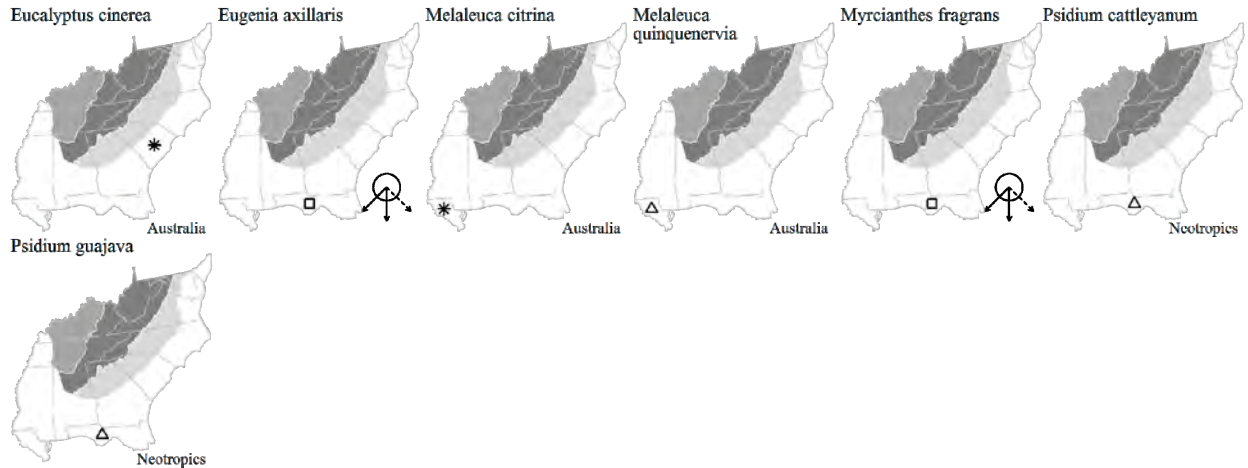

Myrcianthes fragrans (Swartz) McVaugh, Twinberry; Simpson's Stopper, Pale Stopper. N. peninsular FL (on the east coast from St. Johns County southward) to s. FL; West Indies; Mexico through Central America to n. South America. [= WH3; > *Ananomis fragrans* (Swartz) Grisebach – S; > *Ananomis simpsonii* Small – S; > *M. dicrana* (O. Berg) K.A. Wilson – Z; > *M. simpsonii* (Small) K.A. Wilson – Z]

Psidium Linnaeus 1753 (Guava)

A genus of ca. 70 species, shrubs and trees, of the Neotropics. References: Wilson (1960c)=Z; Wilson in Kubitzki (2011).

- 1 Leaves glabrous on the lower surface; leaf venation not distinctly impressed on the upper surface and raised on the lower surface ***P. cattleianum***
- 1 Leaves pubescent on the lower surface; leaf venation distinctly impressed on the upper surface and raised on the lower surface [***P. guajava***]

* ***Psidium cattleianum*** Sabine, Strawberry Guava. Disturbed areas; native of Brazil. Reported for most counties in the FL peninsula north to Marion and Volusia counties (Kartesz 2010; Wunderlin & Hansen 2008). [= *P. cattleianum* – K2, WH3, Z, orthographic variant]
 * ***Psidium guajava*** Linnaeus, Guava. Disturbed areas, hammocks; native of the Neotropics. Reported for most counties in the FL peninsula north to Volusia and Lake counties (Kartesz 2010; Wunderlin & Hansen 2008). [= K2, S, WH3]

223. MELASTOMATACEAE A.L. de Jussieu 1789 (Melastome Family) [in MYRTALES]

A family of about 200 genera and 4500-5000 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and warm temperate areas.

Rhexia Linnaeus 1753 (Meadow-beauty)
 [contributed by Richard J. LeBlond]

A genus of about 13 species, herbs, of North America. *Rhexia* is the only genus of the Melastomataceae to occur in North America north of s. FL. References: Kral & Bostick (1969)=Z; Nesom (2012a)=Y; Bounds (1987); Wurdack & Kral (1982); Snyder (1996).

Identification notes: Measurements of the hypanthium are to the base of the calyx lobes.

- 1 Anthers 1-3.5 (-4) mm long, straight to slightly curved.
- 2 Petals white (rarely pale lavender); anthers (2-) 3-3.5 (-4) mm long, usually longer than the filaments; [pond margins in sw. GA and Panhandle FL]; [section *Rhexia*] ***R. parviflora***
- 2 Petals **either** yellow **or** lavender-rose to pink; anthers 1-2.5 mm, usually shorter than the filaments; [collectively more widespread].
- 3 Stem internodes with at least some hairs; leaves oblong, linear, or spatulate; petals yellow; [section *Luteorhexia*] ***R. lutea***
- 3 Stem internodes glabrous; leaves ovate, suborbicular, or widely elliptic; petals lavender-rose to pink; [section *Brevianthera*].
- 4 Calyx lobes blunt to acute; hypanthium densely glandular-pubescent; surface of seeds irregularly ridged; [of s. GA south to s. FL]..... ***R. nuttallii***

- 4 Calyx lobes acuminate-aristate; hypanthium nearly glabrous except along the calyx lobes; surface of seeds pebbled; [widespread in the Coastal Plain from se. VA southward to s. FL and west to e. TX, and rarely inland]..... *R. petiolata*
- 1 Anthers 5-11 mm long, distinctly curved.
 - 5 Stem nodes and internodes glabrous; stem and foliage blue-green; [section *Cymborhexia*] *R. alifanus*
 - 5 Stem nodes and usually also the internodes hirsute; stem and foliage green; [section *Rhexia*].
 - 6 Sepal lobes aristate, the awn-tip 0.5-1.5 mm long, and also with flaring, yellowish, stiff hairs 3-5 mm long *R. aristosa*
 - 6 Sepal lobes obtuse to acuminate, not aristate, the hairs shorter and not yellowish or stiff.
 - 7 Leaves 1-5 (-8) mm wide, linear, linear-elliptic, narrowly oblong, or narrowly spatulate.
 - 8 Leaves twisted at base, borne in a vertical plane; four stem faces subequal, the angles narrowly winged; mature hypanthium neck shorter than body; calyx lobes 1.5-2 mm long; anthers 4-5 mm long *R. salicifolia*
 - 8 Leaves not twisted at base, borne more or less horizontally; four stem faces markedly unequal, the angle wings inconspicuous or absent; mature hypanthium neck as long as or longer than body; calyx lobes 2-4 mm long; anthers 5-10 mm long.
 - 9 Petals lavender-rose, (1-) 1.5-2 (-2.5) cm long; mature hypanthium 10-14 mm long, with glandular hairs; marginal nerves of leaf abaxial surface either absent or obscure and discontinuous; anthers 7-10 mm long *R. cubensis*
 - 9 Petals white to pink (-rose-purple), (7-) 0.9-1.4 cm long; mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; marginal nerves of leaf abaxial surface prominent; anthers 5-8 mm long *R. mariana* var. *exalbida*
 - 7 Leaves (5-) 7-20 (-35) mm wide, lanceolate, elliptic, or ovate.
 - 10 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale, the arrangement of broader and narrower faces alternating at each subsequent internode.
 - 11 Mature hypanthium 6-10 (-11) mm long, glandular-setose; petals 12-15 (-18) mm long, glabrous on the lower surface; anthers 5-8 mm long *R. mariana* var. *mariana*
 - 11 Mature hypanthium (9-)10-15 (-20) mm long, glabrous or glabrate; petals (18-) 20-25 mm long, glandular-hairy on the lower surface (best seen in bud); anthers 8-11 mm long *R. nashii*
 - 10 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
 - 12 Roots tuberous; stem angles at mid-stem conspicuously winged; hypanthium 7-10 mm long, the neck shorter than the body *R. virginica*
 - 12 Roots not tuberous; stem angles sharp to narrowly winged; hypanthium 10-13 mm long, the neck as long as or longer than the body.
 - 13 Hypanthium 7-9 (-10) mm long; petals 8-12 mm long; seeds irregularly ridged, especially along the crest [of KY, TN, and AL westwards, west of the Appalachians] *R. interior*
 - 13 Hypanthium (9-) 10-12 mm long; petals 10-25 mm long; seeds papillate, the papillae in concentric lines [of NJ to SC east of the Appalachians] *R. ventricosa*

Alternate Key based largely on vegetative characters

- 1 Stem internodes glabrous.
 - 2 Stem nodes as well as internodes glabrous, leaf margins entire or remotely low-toothed apically, glabrous *R. alifanus*
 - 2 Stem nodes hirsute, leaf margins toothed, the teeth often tipped with hairs.
 - 3 Longest leaves 1.5 (-2) cm long, ovate or suborbicular
 - 4 Leaf apex obtuse to acute, margins subentire to blunt-toothed or serrulate, teeth hairs if present shorter than 1 mm *R. nuttallii*
 - 4 Leaf apex acute to acuminate, serrulate, the teeth tipped with a hair 1 mm long or slightly longer, the margin appearing long-ciliate *R. petiolata*
 - 3 Longest leaves > 2 cm long, lanceolate, elliptic, or ovate.
 - 5 Rhizomes present, roots not tuberiferous or spongy-thickened *R. ventricosa*
 - 5 Rhizomes absent, roots tuberiferous or spongy-thickened.
 - 6 Stem leaves gradually reduced upward *R. virginica*
 - 6 Stem leaves gradually lengthening from the base to mid-stem *R. aristosa*
 - 1 Stem internodes (and nodes) hirsute or glandular-hairy.
 - 7 Leaves lanceolate, elliptic, or ovate, broadest at or below the middle.
 - 8 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale.
 - 9 Mature hypanthium 6-10 mm long, glandular-hairy; petals 1.2-1.5 cm long, glabrous on the lower surface *R. mariana* var. *mariana*
 - 9 Mature hypanthium 10-15 mm long, glabrous or glabrate; petals 2.0-2.5 cm long, glandular-hairy on lower surface (best seen in bud) *R. nashii*
 - 8 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
 - 10 Roots not rhizome-like; roots tuberiferous or spongy-thickened *R. virginica*
 - 10 Some roots rhizome-like, with adventitious buds; roots not tuberiferous or spongy-thickened.
 - 11 Hypanthium 7-9 (-10) mm long; petals 8-12 mm long; seeds irregularly ridged, especially along the crest [of KY, TN, and AL westwards, west of the Appalachians] *R. interior*
 - 11 Hypanthium (9-) 10-12 mm long; petals 10-25 mm long; seeds papillate, the papillae in concentric lines [of NJ to SC east of the Appalachians] *R. ventricosa*
 - 7 Leaves linear, narrowly elliptic, or broadest above the middle.
 - 12 Plant bushy-branched *R. lutea*
 - 12 Plant simple below the cymose inflorescence.
 - 13 Leaves twisted at base, borne in a vertical plane; four stem faces subequal, the angles narrowly winged *R. salicifolia*
 - 13 Leaves not twisted at base, borne more or less horizontally; four stem faces markedly unequal, the angle wings inconspicuous or absent.
 - 14 Mature hypanthium 10-14 mm long, with glandular hairs; petals lavender-rose, 1.5-2.0 cm long *R. cubensis*
 - 14 Mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; petals white, 1.2-1.5 cm long *R. cubensis*

{add *R. parviflora*}

Rhexia alifanus Walter, Smooth Meadow-beauty. Pine flatwoods and savannas, pocosin borders, more able to tolerate merely moist soils than other *Rhexia* species. May-Sep. A Southeastern Coastal Plain species: e. NC south to n. peninsular FL and west to se. Texas (Singhurst, Mink, & Holmes 2010). Our tallest and showiest *Rhexia*: the unbranched (unless injured), wand-like stems, with strongly ascending, bluish-green, generally entire leaves make this species unmistakable. [= GW, K, RAB, S, WH3, Y, Z]

Rhexia aristosa Britton, Awned Meadow-beauty, Bristly Meadow-beauty. Clay-based Carolina bays, depression meadows, and limesink ponds (dolines). Jun-Sep. This species has a very local and disjunct range extending (strictly on the Coastal Plain) from NJ south to AL. The long yellowish bristles at the summit of the calyx/hypanthium are diagnostic. *R. aristosa* × *virginica* is known from the Coastal Plain of NJ (Snyder 1996). [= C, F, G, GW, K, RAB, S, Y, Z]

Rhexia cubensis Grisebach, West Indies Meadow-beauty. Limesink ponds (dolines). Jun-Sep. Se. NC south to s. FL and west to sw. MS; also in the West Indies. [= GW, K, RAB, S, WH3, Y, Z]

Rhexia interior Pennell. Moist to wet areas, ditches, prairies. Jun-Oct. S. IN, s. IL, s. MO, and se. KS south to c. AL, c. MS, n. LA, and se. OK. [= F, G, Y; = *R. mariana* Linnaeus var. *interior* (Pennell) Kral & Bostick – GW, K, Mo, Z; < *R. interior* – C]

Rhexia lutea Walter, Yellow Meadow-beauty, Golden Meadow-beauty. Wet pine flatwoods and savannas, seepage slopes, and bogs. Apr-Jul (and later in response to growing-season fire). A Southeastern Coastal Plain species: e. NC south to ne. FL and Panhandle FL, and west to se. TX. The only yellow-flowered *Rhexia* and also our bushiest species. [= GW, K, RAB, S, WH3, Y, Z]

Rhexia mariana* Linnaeus var. *exalbida Michaux, White Meadow-beauty. Wet pine flatwoods and savannas, wet meadows, ditches, and wet roadsides. Jun-Sep. NC south to FL and west to MS. Allegedly merging into *R. mariana* var. *mariana* from FL westward, var. *exalbida* appears quite distinct in NC. The white flowers and linear leaves are diagnostic. [= RAB; = *R. lanceolata* Walter – S; < *R. mariana* var. *mariana* – GW, K, Z; < *R. mariana* – WH3]

Rhexia mariana* Linnaeus var. *mariana, Maryland Meadow-beauty, Dull Meadow-beauty, Pale Meadow-beauty. Pine flatwoods, wet meadows, bog margins, ditches, wet roadsides, often weedy. May-Oct. E. MA south to s. FL, west to TX, and north to s. IN and IL. [= G, W, Mo, RAB, Va; < *R. mariana* var. *mariana* – F, GW, K, Z (also see *R. mariana* var. *exalbida*); > *R. mariana* var. *leiosperma* Fernald & Griscom – F; > *R. delicatula* Small – S; > *R. mariana* – S; < *R. mariana* – Pa, WH3, WV]

Rhexia nashii Small, Hairy Meadow-beauty, Maid Marian. Wet pine flatwoods and savannas; pond shores, bogs, marshes, ditches, wet roadsides. May-Oct. Primarily a Southeastern Coastal Plain species: e. VA south to s. FL and west to se. LA. [= GW, K, S, Va, WH3, Y, Z; = *R. mariana* var. *purpurea* Michaux – F, G, RAB]

Rhexia nuttallii C.W. James, Nuttall's Meadow-beauty. Pine flatwoods, bogs. Coastal Plain of se. GA west to FL Panhandle, south to s. peninsular FL. [= GW, K, WH3, Y, Z; = *R. serrulata* Nuttall – S]

Rhexia parviflora Chapman, Small-flowered White Meadow-beauty, Apalachicola Meadow-beauty. Limesink pond margins. Sw. GA (Mitchell County) and se. AL south into Panhandle FL. [= GW, K, S, WH3, Y, Z]

Rhexia petiolata Walter, Ciliate Meadow-beauty, Short-stemmed Meadow-beauty. Wet pine flatwoods and savannas, pocosin borders, and ditches. Jun-Sep. May-Oct. A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to se. TX. The flowers are sessile, the petals ascending. [= C, G, GW, K, RAB, Va, WH3, Y, Z; = *R. ciliosa* Michaux – F, S]

Rhexia salicifolia Kral & Bostick, Willowleaf Meadow-beauty, Panhandle Meadow-beauty. Drawdown zones of Coastal Plain depression ponds and interdune swales. Sw. GA and FL Panhandle west to s. AL (Jensen 2007). [= GW, K, WH3, Y, Z]

Rhexia ventricosa Fernald & Griscom, Swollen Meadow-beauty. Pine flatwoods and savannas, clearings in cypress-hardwood swamps, ditches, wet roadsides. Jun-Sep. S. NJ south to e. SC. This taxon is seemingly closely related to *R. interior* Pennell, which is distributed west of the Appalachians. [= F, RAB, Va, Y; = *R. mariana* Linnaeus var. *ventricosa* (Fernald & Griscom) Kral & Bostick – GW, K, W, Z; < *R. interior* Pennell – C]

Rhexia virginica Linnaeus, Virginia Meadow-beauty, Deergrass, Handsome Harry, Wing-stem Meadow-beauty. Wet pine flatwoods and savannas, pond shores, bogs, and ditches. May-Oct. E. Canada and WI south to ne. FL, Panhandle FL, and TX.

[= C, G, GW, K, Mo, Pa, Va, W, WH3, WV, Y, Z; > *R. virginica* var. *purshii* (Sprengel) C.W. James – RAB; > *R. virginica* var. *virginica* – F, RAB; > *R. virginica* var. *septemnervia* (Walter) Pursh – F; = *R. stricta* Pursh – S]

230. STAPHYLEACEAE Martynov 1820 (Bladdernut Family) [in CROSSOSOMATALES]

A family of 2 genera and about 45 species, trees and shrubs, of mainly temperate Northern Hemisphere, especially e. Asia. References: Brouillet in FNA (2014); Spongberg (1971)=Z; Simmons in Kubitzki, Bayer, & Stevens (2007).

Staphylea Linnaeus 1753 (Bladdernut)

A genus of 23 species, trees and shrubs, mainly of temperate Eurasia and e. North America, but extending into Central and South America. References: Brouillet in FNA (2014); Simmons in Kubitzki, Bayer, & Stevens (2007).

Identification notes: The opposite, trifoliolate leaves with serrulate margins are diagnostic.

Staphylea trifolia Linnaeus, Bladdernut. Nutrient-rich bottomland forests, extending upslope over calcareous or mafic rocks. Apr-May; Aug-Oct. QC west to MN, south to sw. GA, Panhandle FL, n. AL, n. MS, and OK. [= C, F, G, GW, K, Mo, Pa, RAB, S, Va, W, WH3, WV, Z]

238. BURSERACEAE Kunth 1824, nom. cons. (Frankincense Family) [in SAPINDALES]

A family of about 19 genera and 700 species, trees and shrubs, largely tropical in distribution. References: Daly, Harley, Martínez-Habibe, & Weeks in Kubitzki (2011).

Bursera Jacquin ex Linnaeus 1762 (Gumbo-limbo)

A genus of about 100 species, FL peninsula and sw. United States south through the West Indies, Mexico, and Central America to n. South America. References: Daly, Harley, Martínez-Habibe, & Weeks in Kubitzki (2011).

Bursera simaruba (Linnaeus) Sargent, Gumbo-limbo, Gum-elemi, Turpentine-tree. Coastal hammocks, shell middens. From Volusia County on the east coast (just south of our area) and Hillsborough County on the west coast of the FL peninsula, south to s. FL; West Indies; Central and South America. [= K1, K2, WH3]

239. ANACARDIACEAE R. Brown 1818, nom. cons. (Cashew Family) [in SAPINDALES]

A family of about 70-81 genera and about 800-875 species, trees, shrubs, lianas, and rarely herbs, of tropical, subtropical, and temperate regions. Our representatives are all classed in subfamily Anacardioideae (Pell et al. 2011). References: Pell et al. in Kubitzki (2011); Barkley (1937).

- 1 Leaves simple *Cotinus*
- 1 Leaves compound.
 - 2 Leaves even-pinnate [*Pistacia*]
 - 2 Leaves odd-pinnate.
 - 3 Fruits both red and glabrous..... *Schinus*
 - 3 Fruits not simultaneously red and glabrous.
 - 4 Fruits red, glandular pubescent; foliage and stems lacking contact poisons; inflorescences dense, either terminal or lateral on last year's growth; sepal margins ciliate..... *Rhus*
 - 4 Fruits white or yellow, glabrous or puberulent (the hairs not glandular); foliage and stems containing contact poisons; inflorescences openly branched, axillary; sepal margins entire..... *Toxicodendron*

Cotinus P. Miller 1754 (Smoketree)

A genus of 4-8 species, of se. and sc. North America and temperate Eurasia. References: Barkley (1937)=Z; Pell et al. in Kubitzki (2011).

- 1 Leaves elliptic, to 10 cm long; [planted tree, rarely persistent]..... [*C. coggygia*]
 1 Leaves obovate, to 20 cm long; [native tree of calcareous habitats]..... *C. obovata*

* *Cotinus coggygia* Scopoli, European Smoketree. Suburban areas; native of Europe and Asia. May-Jun. *C. coggygia* is planted as an ornamental, and is reported as naturalized in various states in ne. United States. There is little evidence of its true naturalization or persistence in our area. [= II, K1, K2, Pa]

Cotinus obovata Rafinesque, American Smoketree. Limestone woodlands and glades. Se. TN (Cumberland Plateau) (Chester, Wofford, & Kral 1997), nw. GA, and n. AL west to OK and e. and sc. TX. A small tree of limestone woodlands and glade margins, occasionally planted as an ornamental tree. [= *C. obovatus* Rafinesque – K1, K2, orthographic variant; = *C. americanus* Nuttall – S, Z]

Pistacia Linnaeus 1753 (Pistachio)

A genus of about 12 species, trees and shrubs, of tropical and temperate Asia, n. Africa. Mediterranean Europe, and s. North America and c. America. References: Pell et al. in Kubitzki (2011).

* *Pistacia chinensis* Bunge, Chinese Pistachio. Uncommonly planted, rarely persistent or naturalizing; native of China, the Philippines, and Taiwan. Mar-Apr. Krings (2011) documents its occurrence in the Piedmont of NC (Wake County). [= K1; > *P. chinensis* ssp. *subintegerrima* (Stewart) Rechner f. – K2]

Rhus Linnaeus 1753 (Sumac)

A genus of about 35 species, trees, shrubs, and lianas, temperate and subtropical, of Eurasia, Hawaii, North America, and n. Central America. The subgenera and sections follow Andrés-Hernández et al. (2014). References: Barkley (1937)=Z; Andrés-Hernández et al. (2014); Pell et al. in Kubitzki (2011); Yi, Miller, & Web (2007); Hardin & Phillips (1985a); Miller, Young, & Wen (2001).

Identification notes: Two hybrids have been documented to occur naturally in our area: *Rhus* × *borealis* Greene (*glabra* × *typhina*) and *Rhus* × *ashei* (Small) Greene (*glabra* × *michauxii*). They are intermediate between their parents. For instance, *R. ashei* has sparsely pubescent leaves and stems, slight winging of the rachis between the terminal leaflets, greater potential stature than *R. michauxii*, and leaflets with a length/width ratio of 2.5-3. Hardin & Phillips (1985b) discuss other natural and artificial hybrids in *Rhus*.

- 1 Leaves 3-foliolate; shrub to 2 m tall; inflorescence of small lateral and terminal clusters; pedicels < 1 mm long, with bracteoles; [subgenus *Lobadium*; section *Lobadium*].
 2 Terminal leaflet rhombic to ovate, toothed, acute at the tip; flowers produced before expansion of the leaves; pedicels 1-2 mm long, glabrous; petals glabrous on the inner surface; fruits 4-5 mm in diameter; [widespread in our area]..... *R. aromatica* var. *aromatica*
 2 Terminal leaflets broadly rhombic or obovate, 3-lobed, and also scalloped or toothed, rounded or angled at the tip; flowers produced at or after the expansion of the leaves; pedicels 2-3 mm long, glabrous to densely woolly; petals usually hairy on the inner surface; fruits 5-6 mm in diameter; [perhaps entering our area as a disjunct from west of the Mississippi River]..... *R. aromatica* var. *serotina*
 1 Leaves (5-) 7-31-foliolate; shrub or small tree, to 12 m tall; inflorescence of dense, terminal panicles; pedicels 1.5-2.5 mm long, lacking bracteoles; [subgenus *Rhus*].
 3 Rachis of the leaf winged between each pair of adjacent leaflets; stems and petioles puberulent; leaflets entire to remotely toothed.
 4 Leaflets 11-25, attenuate to base, 2-9 cm long, 1-2 cm wide, **either** >3× as long as wide **or** < 4 cm long; leaflet margins entire (rarely serrate); leaflet apex rounded, obtuse, acute, or acuminate (often at least the more basal leaflets with an obtuse tip)..... *R. copallinum* var. *copallinum*
 4 Leaflets 5-13, rounded to base on the upper side, 4-9 cm long, 1.5-5 cm wide, > 2.5× as long as wide; leaflet margins entire or serrate; leaflet apex acute or acuminate tip..... *R. copallinum* var. *latifolia*
 3 Rachis of the leaf not winged between each pair of adjacent leaflets (sometimes winged between the last 1 or 2 pairs of leaflets on each side of the rachis); stems and petioles either densely villous or essentially glabrous; leaflets sharply and rather coarsely serrate.
 5 Leaflets densely pubescent (rarely sparsely pubescent); short shrubs to 1 m tall; stems densely long-pubescent; rachis of the leaf often winged terminally; leaflets mostly ovate, averaging about 2× as long as wide, acute..... *R. michauxii*
 5 Leaflets glabrous, glaucous beneath; medium shrubs to small trees, to 12 m tall; stems densely long-pubescent or essentially glabrous; rachis of the leaf not winged; leaflets mostly lanceolate, averaging 3-4× as long as wide, acuminate.
 6 Stems essentially glabrous; pubescence of the fruit short and blunt-tipped..... *R. glabra*
 6 Stems densely long-pubescent; pubescence of the fruit long and pointed..... *R. typhina*

Rhus aromatica Aiton var. *aromatica*, Fragrant Sumac, Squawbush. Rocky, rather dry, woodlands, usually over mafic rocks (such as gabbro or diabase) or calcareous rocks, less commonly in sandy soils. Late Feb-early May; late Apr-Jun. The species ranges throughout much of temperate North America; var. *aromatica* is the most eastern component of the complex, distributed from NH, ON, and MN south to Panhandle FL and TX. The foliage of *R. aromatica* bears some superficial resemblance to *Toxicodendron pubescens*. [= C, F, G, II, K, Pa, Va, WV; < *R. aromatica* – RAB, W, WH3; = *Schmaltzia crenata* (P. Miller) Greene – S; = *R. aromatica* – Z; = *R. aromatica* ssp. *aromatica*]

Rhus aromatica Aiton var. *serotina* (Greene), Midwestern Fragrant Sumac. Rocky woodlands. Apr-May. Occurring just west of area, and some populations east of the Mississippi River in TN, KY, and AL may represent this taxon (D. Estes, pers. comm., 2012). [= C, II, K2; = *R. trilobata* Nuttall var. *serotina* (Greene) Barkley - Z; = *R. aromatica* ssp. *serotina* (Greene) R.E. Brooks]

Rhus copallinum Linnaeus var. *copallinum*, Winged Sumac, Flameleaf Sumac. Sandhills, dry woodlands, maritime thickets (especially from VA northward), old fields, roadsides. S. NY south to s. FL, mainly on the Coastal Plain and lower Piedmont. The Linnaean epithet “*copallinum*” (traditionally capitalized as “*Copallinum*”) is grammatically a noun in apposition rather than an adjective, and therefore does not change grammatical gender. [= K, Va; < *R. copallina* - Pa, RAB, W; < *R. copallinum* - C, G, WH3, orthographic error; = *R. copallina* var. *copallina* - F; > *R. copallinum* - S, orthographic error; > *R. leucantha* Jacquin - S; > *R. obtusifolia* (Small) Small - S; > *R. copallina* var. *leucantha* (Jacquin) A.P. de Candolle - Z; > < *R. copallina* var. *copallina* - Z]

Rhus copallinum Linnaeus var. *latifolia* Engler, Eastern Winged Sumac. Rocky glades, dry woodlands. S. ME to n. IL, south to c. GA, AL, LA, and e. TX. [= K, Va; < *R. copallina* - II, Pa, RAB, W; < *R. copallinum* - C, G, S, orthographic error; = *R. copallina* var. *latifolia* - F; < *R. copallina* var. *copallina* - Z]

Rhus glabra Linnaeus, Smooth Sumac. Disturbed areas, clearings, roadsides, woodlands. Late May-Jul; Jun-Oct. ME west to BC, south to Panhandle FL, TX, CA, and beyond. [= C, G, II, K, Pa, RAB, S, Va, W, WH3, WV; > *R. glabra* var. *glabra* - F, Z; > *R. glabra* var. *laciniata* Carrière - Z]

Rhus michauxii Sargent, Michaux's Sumac, Dwarf Sumac. In the fall line sandhills characteristically in submesic, loamy swales, usually associated with such species as *Paspalum bifidum*, *Helianthus divaricatus*, *Tridens carolinianus*, *Rhus copallinum*, *Anthaenantia villosa*, *Gymnopogon* sp., and *Aristida lanosa*; in the eastern Piedmont on sandy soils derived from granite; in the central Piedmont on clayey soils derived from mafic rocks such as gabbro or mafic Carolina slates, probably all of its habitats (formerly) in frequently burned situations. Jun; Aug-Sep. Rare and scattered (though formerly more common) from s. VA south to GA; disjunct in Alachua County, FL. Large populations were found in sc. VA (Nottoway and Dinwiddie counties) in frequently burned military artillery "impact areas" (Fleming & Ludwig 1996). Barden & Matthews (2004) present a detailed account of its discovery by André Michaux in 1794 in what is now Union County, NC. [= K, RAB, S, Va, WH3, Z; = *R. pumila* Michaux]

Rhus typhina Linnaeus, Staghorn Sumac. Roadsides, old pastures, thickets, clearings, rock outcrops, barrens. May-Jun; Jun-Sep. NS and NB west to MN, south to n. GA, AL, MS, and KS. The apparently older epithet "*hirta*" was formally rejected in 1999. The species, especially in its cut-leaved forms, forma *laciniata* (Wood) Rehder and forma *dissecta* Rehder, is very popular in Europe as a cultivated ornamental. [= C, F, G, K, Pa, RAB, Va, W, WV; = *R. hirta* (Linnaeus) Sudworth - II, S; > *R. typhina* var. *typhina* - Z; > *R. typhina* var. *laciniata* Wood - Z]

Schinus Linnaeus 1753 (Brazilian-pepper)

A genus of about 15 species, shrubs and trees of the tropics. References: Pell et al. in Kubitzki (2011).

* *Schinus terebinthifolia* Raddi, Brazilian-pepper. Disturbed areas, especially moist or wet; native of Brazil and Paraguay. A noxious invasive in the FL peninsula. [= WH3; = *S. terebinthifolius* Raddi - GW, orthographic variant; > *S. terebinthifolius* var. *raddianus* Engler - K2]

Toxicodendron P. Miller 1754 (Poison Ivy, Poison Oak, Poison Sumac)

A genus of about 10-15 species, trees and shrubs, primarily temperate, of North America, n. South America, Indonesia, and e. Asia. References: Gillis (1971)=Z; Pell et al. in Kubitzki (2011).

- 1 Leaflets 7-13, entire; small tree..... *T. vernix*
- 1 Leaflets 3, toothed, lobed, or entire; shrub or vine.

- 2 Fruits pubescent or papillose; leaflets entire, coarsely toothed, undulate, or round-lobed; lower surfaces of leaflets either velvety puberulent, sometimes becoming glabrate in age (*T. pubescens*) or glabrous (glabrescent or rarely pilose beneath) but with prominent tufts of tannish hairs present in the vein axils (*T. radicans* var. *radicans*).
- 3 Leaves sparsely pubescent (rarely pilose beneath), the apex and the lobes (if present) generally acute to acuminate; drupes papillose, scabrous or puberulent; plant a high-climbing vine or stoloniferous shrub; [of mesic, swampy, or dry habitats]..... *T. radicans* var. *radicans*
- 3 Leaves velvety puberulent (sometimes becoming glabrate in age), the apex and the lobes (if present) generally obtuse to broadly acute; drupes pubescent (becoming glabrate); plant a stoloniferous shrub; [of dry habitats, especially sandhills]..... *T. pubescens*
- 2 Fruits glabrous (or very sparsely pubescent); leaflets coarsely toothed or notched (rarely entire); lower surfaces of leaflets glabrous to pubescent, but without tufts of tannish hairs in the vein axils.
- 4 Leaves densely pilose and velvety on the lower surface; leaves pubescent on the upper surface; pubescence of the leaves erect..... *T. radicans* var. *pubens*
- 4 Leaves glabrous to sparsely strigose on the lower surface; leaves glabrous on the upper surface; pubescence of the leaves appressed.
- 5 Leaflets suborbicular or broadly ovate, nearly as wide as long; petiole glabrous (rarely glabrescent); plant a shrub, the stems upright, entirely lacking aerial roots, not vining; fruits (3-) 4-7 mm in diameter *T. rydbergii*
- 5 Leaflets ovate to lanceolate; petiole puberulent to densely pubescent; plant a shrub or vine, the stems upright or twining; fruits 2.5-5.5 mm in diameter *T. radicans* var. *negundo*

Toxicodendron pubescens P. Miller, Poison Oak. Dry woodlands, around dry rock outcrops in the Piedmont and Mountains, especially prevalent in sandhills. Late Apr-May; Aug-Oct. Primarily Southeastern: NY (Long Island) south to n. FL, west to e. TX, inland to WV, e. TN, c. TN, se. MO, and s. KS. The nomenclatural confusion may still not be resolved. [= C, II, K, Va, WH3; = *Rhus toxicodendron* - F, G, RAB; = *T. toxicodendron* (Linnaeus) Britton - S; = *T. toxicarium* Gillis - W, Z; = *T. quercifolium* (Michaux) Greene]

Toxicodendron radicans (Linnaeus) Kuntze var. ***negundo*** (Greene) Reveal, Midwestern Poison Ivy. In a wide range of habitats, including mesic forests, rock outcrops, open areas, and disturbed ground. Late Apr-May; Aug-Oct. NY west to MI, MN, and NE, south to sw. VA, KY, AR, and TX, almost entirely in or west of the Appalachians. In our area seemingly mostly in the New River drainage; to be expected in nw. NC. [= C, II, Va; = *Rhus radicans* var. *vulgaris* (Michaux) A.P. de Candolle forma *negundo* (Greene) Fernald - F, G; = *T. radicans* ssp. *negundo* (Greene) Gillis - K, Z; < *T. radicans* - Pa]

Toxicodendron radicans (Linnaeus) Kuntze var. ***pubens*** (Engelmann ex S. Watson) Reveal. Xeric limestone sites. S. IL and MO south to se. LA and s. TX; disjunct eastward in c. KY, c. TN, and w. VA (Virginia Botanical Associates 2006). [= Va; < *T. radicans* - GW, W; < *T. radicans* var. *radicans* - II; = *T. radicans* ssp. *pubens* (Engelmann ex S. Watson) Gillis - K, Z; < *Rhus radicans*]

Toxicodendron radicans (Linnaeus) Kuntze var. ***radicans***, Eastern Poison Ivy. In a wide range of habitats, including mesic forests, rock outcrops, swamp forests, brackish marshes, open areas, disturbed ground, usually in more mesic to hydric sites than *T. pubescens*, and particularly common in areas with fertile soils, such as bottomlands or over calcareous rocks or calcareous sands (as in maritime forests). Late Apr-May; Aug-Oct. Var. *radicans* is the typical poison ivy of the Atlantic and Gulf Coastal Plain, rarely found west of the Appalachians. It ranges from NS south to s. FL (and the Bahamas), west to e. TX, inland to VT, c. PA, WV, KY, and AR. It is normally a vine, climbing by adventitious roots, and can attain diameters of 10 cm and climb to the crowns of forest trees. It can also resemble *T. pubescens* in habit, producing numerous meter-high upright stems from rhizomes. *T. radicans* var. *radicans* is ubiquitous in our area, absent only from the high mountains of NC. [= C, Va; > *Rhus radicans* var. *radicans* - F, G, WV; > *Rhus radicans* var. *vulgaris* (Michaux) A.P. de Candolle forma *vulgaris* - F, G; < *T. radicans* - GW, Pa, S, W, WH3; < *T. radicans* var. *radicans* - II; = *T. radicans* ssp. *radicans* - K; < *Rhus radicans* Linnaeus - RAB; > *Rhus radicans* var. *vulgaris* (Michaux) A.P. de Candolle - WV]

Toxicodendron rydbergii (Small ex Rydberg) Greene, Western Poison Ivy. Acid pine-oak forests and woodlands at moderate elevations. May-Jul. NS west to BC, south to New England, NY, n. OH, n. IL, IA, w. KS, w. TX, AZ, and OR; disjunct in the Appalachians in PA, WV, and VA. Reported for NC by Gillis (1971), but the location (Cumberland Co., in the fall-line Sandhills), does not seem plausible {investigate further with specimen}. [= C, II, K, Pa, Va, Z; = *Rhus radicans* var. *rydbergii* (Small) Rehder - F, G, WV; = *T. radicans* (Linnaeus) Kuntze var. *rydbergii* (Small ex Rydberg) Erskine]

Toxicodendron vernix (Linnaeus) Kuntze, Poison Sumac, Thunderwood. In peaty habitats, in the Coastal Plain frequent in streamhead pocosins and sandhill seepage bogs, in the mountains in bogs. May-Jun; Aug-Sep. NS west to MN, south to c. peninsular FL and TX. The leaf rachis and leaflet petiolules are usually a dark red or maroon color. The leaves turn a very attractive shade of orange-red in autumn. [= C, GW, II, K, Pa, S, Va, W, WH3; = *Rhus vernix* Linnaeus - RAB, F, G, RAB, WV]

240. SAPINDACEAE A.L. de Jussieu 1789 (Soapberry Family) [in SAPINDALES]

A family of about 133-141 genera and 1465-1900 species, trees, shrubs, vines, and herbs, primarily of tropical (rarely temperate) regions of the Old World and New World. APG III (2009), Acevedo-Rodríguez et al. (2011), and others have recently included Hippocastanaceae and Aceraceae in the Sapindaceae; though Buerki et al. (2010) make a well-reasoned case for recognition of

the segregate and monophyletic families Aceraceae, Hippocastanaceae, Sapindaceae, and Xanthoceraceae as more diagnosable families with long traditional usage. References: Acevedo-Rodríguez, van Welzen, Adema, and van der Ham in Kubitzki (2011); Buerki et al. (2009, 2010).

- 1 Leaves simple (lobed and/or toothed); fruits winged.
 - 2 Leaves 0.8-2× as long as wide, orbicular in outline, lobed, the margin often also toothed; fruit a schizocarp of 2 samaras; [subfamily *Hippocastanoideae*; tribe *Acereae*] **1. Acer**
 - 2 Leaves 3-10× as long as wide, oblanceolate, unlobed, margin entire; fruit a winged capsule; [subfamily *Dodonoideae*; tribe *Dodonoaeae*] **6. Dodonaea**
- 1 Leaves compound; fruits winged or not.
 - 3 Leaves palmately compound; [subfamily *Hippocastanoideae*; tribe *Hippocastaneae*] **2. Aesculus**
 - 3 Leaves pinnately or biternately compound.
 - 4 Herbaceous vine; leaves biternately compound; [subfamily *Sapindoideae*; tribe *Paullinieae*] **3. Cardiospermum**
 - 4 Tree or shrub; leaves pinnately compound.
 - 5 Leaflets entire; fruit drupe-like; [native, of coastal hammocks of se. SC southward]; [subfamily *Sapindoideae*] **5. Sapindus**
 - 5 Leaflets coarsely toothed; fruit a samara or inflated "pod;" [native or alien, collectively widespread].
 - 6 Fruit winged; [native]; [subfamily *Hippocastanoideae*; tribe *Acereae*] **1. Acer**
 - 6 Fruit inflated; [alien ornamental, rarely escaped]; [subfamily *Sapindoideae*] **4. Koeleruteria**

I. *Acer* Linnaeus 1753 (Maple)

A genus of about 111-126 species, trees and shrubs, primarily north temperate. References: Murray (1970)=Z; van Gelderen, de Jong, and Oterdoom (1994); Acevedo-Rodríguez, van Welzen, Adema, and van der Ham in Kubitzki (2011).

Section *Parviflora*, Series *Caudata*: *spicatum*

Section *Palmata*, Series *Palmata*: *palmatum*

Section *Negundo*, Series *Negundo*: *negundo*

Section *Rubra*: *drummondii*, *rubrum*, *saccharinum*

Section *Macrantha*: *pensylvanicum*

Section *Platanoidea*: *platanoides*, *campestre*

Section *Acer*, Series *Acer*: *pseudoplatanus*

Section *Acer*, Series *Saccharodendron*:

Section *Ginnala*: *ginnala*

- 1 Leaves pinnately compound, divided into 3-7 (-9) leaflets; [section *Negundo*].
 - 2 Twigs glabrous **A. negundo var. negundo**
 - 2 Twigs puberulent **A. negundo var. texanum**
- 1 Leaves simple, generally shallowly to deeply 3-5 (-7) lobed.
 - 3 Leaves not toothed, or often with a few rounded, coarse, and irregular teeth on the principal lobes, these teeth 0-5 per principal lobe; sinuses between the principal leaf lobes generally broadly rounded, the sinus broader than deep.
 - 4 Petioles and young twigs exuding milky sap when broken; inflorescence peduncled, the flowers on ascending, moderately stout pedicels; paired samaras held at >135° from one another; [section *Platanoidea*]; [alien].
 - 5 Leaves 3-5-lobed, 4-8 (-10) cm wide **A. campestre**
 - 5 Leaves 5-7-lobed, 10-18 cm wide **A. platanoides**
 - 4 Petioles and young twigs exuding clear sap when broken; inflorescence sessile, the flowers on drooping, filiform pedicels; paired samaras held at <110° from one another; [section *Acer*, series *Saccharodendron*]; [native, also widely planted].
 - 6 Leaves pale, grayish, silvery-gray, or strongly glaucous beneath, glabrous, pubescent on the veins, or pubescent across the surface; leaf sinuses on either side of the terminal lobe deep, the two sides of each sinus forming an angle of < 70 degrees (the terminal lobe typically with parallel margins, or even narrower toward the base than toward the tip); leaves usually planar, but sometimes with drooping lobe tips, especially in *A. floridanum*, and especially also in sun-exposed individuals of *A. floridanum* or *A. saccharum*.
 - 7 Leaves small, (3.5-) avg. 8 (-11) cm broad; leaf undersurface usually pubescent; fruits 20-25 mm long; medium to large trees; bark gray, smooth and beech-like, becoming irregularly furrowed or plated in large individuals; [primarily of the Coastal Plain and Piedmont, extending into the Mountains in GA] **A. floridanum**
 - 7 Leaves large, (8-) avg. 15 (-20) cm broad; leaf undersurface glabrous or pubescent only on the veins; fruits 25-30 mm long; large trees; bark grayish-brown, with loose-edged plates; [primarily of the Mountains and upper Piedmont] **A. saccharum**
 - 6 Leaves green beneath, moderately to densely pubescent across the surface; leaf sinuses on either side of the terminal lobe shallow, the two sides of each sinus forming an angle of > 90 degrees (the terminal lobe typically broadly triangular); leaves sometimes planar, more usually with drooping lobe tips.
 - 8 Leaves small, (3-) avg. 6 (-11) cm broad; small trees, often multi-trunked and crooked; bark whitish (in part because of dense growth of crustose lichens), becoming cracked and blackened on larger stems; [primarily of the Piedmont, extending into the lower Mountains in w. SC and n. GA] **A. leucoderme**
 - 8 Leaves large, (8-) avg. 15 (-20) cm broad; large trees, single-trunked; bark dark brown or blackish, becoming furrowed in large individuals; [primarily of the Mountains and westward] **A. nigrum**
 - 3 Leaves finely to coarsely toothed, the toothing often regular, the teeth 8-50 per principal lobe; sinuses between the principal leaf lobes generally sharp, forming a definite angle (or if rounded, then the sinus much deeper than broad).
 - 9 Leaves deeply lobed, the two sinuses on either side of the central lobe deep and narrow, approaching the midrib, the terminal lobe thus narrower at its base than at its middle; flowers **either** with petals (*A. palmatum*) **or** without petals (*A. saccharinum*).
 - 10 Leaves green beneath (or purple in many forms); main leaf lobes 5-9, these main lobes merely toothed or in some cultivars variously further divided; [small exotic tree, commonly planted and weakly naturalizing]; [section *Palmata*] **A. palmatum**

- 10 Leaves silvery white beneath; main leaf lobes 3-5, these main lobes with coarse teeth and smaller lateral lobes; [large native tree (also extensively planted)]; [section *Rubra*] *A. saccharinum*
- 9 Leaves shallowly lobed, the two sinuses on either side of the central lobe broadly wedge-shaped, not approaching the midrib, the terminal lobe thus broadest at its base and progressively (though often irregularly) narrowing toward the tip; flowers with petals.
- 11 Winter buds stalked, with 2-4 valvate scales; inflorescence an elongate drooping raceme or erect panicle; petals green to bright yellow, 2-10 mm long; fruits maturing in midsummer to autumn; leaves green beneath; shrub, small tree, or medium tree (to 35 cm DBH).
- 12 Bark with narrow white stripes on a green background (best seen on stems 3-10 cm in diameter); leaf blades 12-20 (-30) cm long and wide, finely serrate (5-10 teeth per cm), pubescent beneath with yellow to orange hairs 0.1-0.3 mm long (as seen at 10× magnification); inflorescence a drooping raceme; [section *Macrantha*] *A. pensylvanicum*
- 12 Bark brownish, never conspicuously striped; leaf blades 8-12 (-14) cm long and wide, coarsely serrate (2-3 teeth per cm), pubescent beneath with whitish hairs 0.3-1.0 mm long (as seen at 10× magnification); inflorescence an erect panicle; [section *Parviflora*] *A. spicatum*
- 11 Winter buds sessile, with 4-10 imbricate scales; inflorescence **either** a drooping panicle (*A. pseudoplatanus*) **or** a sessile or subsessile cluster or fascicle; fruits maturing **either** in midsummer to autumn (*A. pseudoplatanus*) **or** in spring; leaves slightly to strongly glaucous-whitened beneath; medium to large tree (to 100 cm DBH).
- 13 Inflorescence a drooping panicle, flowering in May-Jun, fruiting Aug-Sep (and persisting overwinter); petals yellowish-green; leaf blades 8-17 cm long; [section *Acer*, series *Acer*] *A. pseudoplatanus*
- 13 Inflorescence a sessile or subsessile cluster or fascicle, flowering in Jan-Mar, fruiting Apr-Jul (and dropping); petals red (rarely yellowish), 1-3 mm long; leaf blades < 10 cm long; [section *Rubra*].
- 14 Mature leaves densely white tomentose (felty-pubescent) beneath; petioles usually with white tomentum; mature samaras 2.7-5 cm long *A. drummondii*
- 14 Mature leaves glabrous to densely pubescent (but not white-tomentose) beneath; petioles usually glabrous; mature samaras 1.5-3 cm long.
- 15 Leaves (3-) 5 (-9)-lobed, the central lobe 4-8 cm long, the 2 upper lateral lobes 2-5 cm long; leaf base generally cordate (rarely rounded); leaves 7-18 cm wide; [widespread, in nearly all habitats] *A. rubrum* var. *rubrum*
- 15 Leaves unlobed or 3 (-5)-lobed, the central lobe 1-5 cm long, the lateral lobes (if present) 0.5-2 (-3) cm long; leaf base broadly cuneate to rounded or subcordate; leaves 2-10 cm wide; [primarily of wetlands, especially in the Coastal Plain] *A. rubrum* var. *trilobum*

* *Acer campestre* Linnaeus, Hedge Maple. Suburban woodlands, planted and persistent and weakly spreading; native of Europe and w. Asia. May-Jun. Reported to be "occasionally spreading from cultivation to moist, rocky, disturbed woods" in sc. and se. PA (Rhoads & Klein 1993; Rhoads & Block 2007). Intraspecific taxa are often recognized in its native area. [= C, F, G, II, K, Pa, Z]

Acer drummondii Hooker & Arnott ex Nuttall, Drummond's Maple, Swamp Red Maple, Drummond's Red Maple.

Swamps and floodplains, often in deeply flooded situations. Jan-Mar; Mar-Jun. *A. drummondii* is mostly southern, ranging north to NJ (?), IN, and MO, reaching its greatest abundance in the basin of the Mississippi River. As a hybrid derivative between *A. rubrum* and *A. saccharinum* (Saeki et al. 2011), *A. drummondii* should be accorded species status and not treated as an infrataxon of *A. rubrum*. [= II; < *A. rubrum* - C, GW, RAB, Va, WH3; = *A. rubrum* Linnaeus var. *drummondii* (Hooker & Arnott ex Nuttall) Sargent - F, G, K1, K2; = *Rufacer drummondii* (Hooker & Arnott ex Nuttall) Small - S; = *A. rubrum* ssp. *drummondii* (Nuttall) A.E. Murray - Z]

Acer floridanum (Chapman) Pax, Southern Sugar Maple, Florida Maple. Bottomland forests, mesic slopes, especially common over mafic or calcareous rocks, but not at all limited to such situations. Apr-May; Jun-Oct. S. VA, w. KY, se. MO, e. OK, c. OK, and n. TX, south to c. peninsular FL and e. TX. It is widely planted in southern cities and towns as a street tree. Ward (2004b) discusses the reasons for accepting *A. floridanum* as the correct name for this species; the Michauxian name *A. barbatum* is associated with specimens that are demonstrably *A. saccharum*. [= Va; = *A. saccharum* ssp. *floridanum* (Chapman) Desmarais - RAB, WH3, Z; = *Acer barbatum* Michaux - C, II, K; > *A. barbatum* var. *barbatum* - F, G; > *A. barbatum* var. *longii* (Fernald) Fernald - F, G; = *Saccharodendron floridanum* (Chapman) Nieuwland - S]

* *Acer ginnala* Maximowicz, Amur Maple. Cultivated, rarely and sparingly escaped to disturbed areas, suburban woodlands; native of e. Asia. Late May-Jun. Reported as "cultivated and occasionally escaped" in s. PA (Rhoads & Klein 1993; Rhoads & Block 2007). Intraspecific taxa are often recognized in its native area. [= F, II, K, Pa, Z] {not yet keyed}

Acer leucoderme Small, Chalk Maple. Rocky slopes and bluffs, particularly over mafic or calcareous rock, on the Gulf Coast in floodplains. Mar-Apr; May-Sep. A species of se. North America, primarily of the Piedmont from NC to AL, less commonly in the Ridge and Valley of se. TN (Chester, Wofford, & Kral 1997), low Blue Ridge of w. NC and adjacent TN and GA, Coastal Plain of Panhandle FL, GA, AL, MS, LA, and se. TX, and in sw. AR and se. OK. The leaves, at least those on lower and inner branches, tend to dry a tawny color and remain on the tree until spring, reminiscent of beech. [= K, W; = *A. saccharum* ssp. *leucoderme* (Small) Desmarais - RAB, WH3, Z; = *Saccharodendron leucoderme* (Small) Nieuwland - S]

Acer negundo Linnaeus var. *negundo*, Eastern Box Elder, Ash-leaved Maple. Riverbanks, swamps, bottomlands, also upslope on calcareous substrates. Mar-Apr; May-Oct. The species ranges nearly across North America, including well into the arid west along rivers. Var. *negundo* occurs from NB west to MB, south to c. peninsular FL and TX; also allegedly in nw. United States. *A. negundo* often grows on the banks of rivers, leaning out over the water at a 45 degree angle. The leaves can resemble poison ivy (*Toxicodendron radicans*), which has alternate leaves. The coarse toothing (approaching lobing) distinguishes it readily from any of our ashes (*Fraxinus*). [= C, Va; < *A. negundo* - GW, Pa, RAB, W, WH3; > *A. negundo* var. *negundo* - F, G, II, K, Z; > *A. negundo* Linnaeus var. *violaceum* (Kirchner) Jaeger - F, G, II, K, Z; < *Negundo negundo* (Linnaeus) Karsten - S]

Acer negundo Linnaeus var. *texanum* Pax, Texas Box Elder. Riverbanks and bottomlands. Apr; Jun-Oct. Sw. NC, KY, MO, KS, and NM south to AL, MS, and TX. The status of this variety in our area is poorly known at present. [= C, F, G, II, K, Z; < *A. negundo* – GW, RAB, W; < *Negundo negundo* (Linnaeus) Karsten – S]

Acer nigrum Michaux f., Black Maple. Riverbanks, streambanks, cove forests, river slope forests, especially over calcareous rocks. May-Jun; Jun-Sep. NH west to MN, south to NC, GA, AL, AR, and KS, primarily west of the Appalachians. [= C, F, G, K, Pa, Va, W; > *A. nigrum* var. *nigrum* – II; > *A. nigrum* var. *palmeri* Sargent – II; = *A. saccharum* Marshall ssp. *nigrum* (Michaux f.) Desmarais – RAB, Z; = *Saccharodendron nigrum* (Michaux f.) Small – S; *A. saccharum* Marshall var. *viride* (Schmidt) A.E. Murray]

* *Acer palmatum* Thunberg, Japanese Maple. Suburban woodlands; native of e. Asia. Apr-May; Aug-Sep. Frequently planted in its numerous cultivars. Intraspecific taxa are recognized in its native area. It is also reported as escaped in the DC area (Shetler & Orli 2000). [= II, K, Pa, Z]

Acer pensylvanicum Linnaeus, Striped Maple. Dry to mesic forests. May; Jun-Sep. NS west to MB, south to w. NC, nw. SC, ne. GA, e. TN, WI, and MN. The prominently striped bark of this common, mid-elevation understory tree is unmistakable. [= C, F, G, K, Pa, RAB, S, Va, W, Z]

* *Acer pictum* Thunberg. Moist forests; native of Eurasia. [= *A. mono* Maximowicz] {not yet keyed}

* *Acer platanoides* Linnaeus, Norway Maple. Suburban woodlands, disturbed forests, hedgerows; native of Europe. Mar-Apr. In much of the ne. United States, *A. platanoides* has become a noxious weed tree. A commonly planted cultivar has purple foliage. [= C, F, G, II, K, Pa, Va, W, Z]

* *Acer pseudoplatanus* Linnaeus, Sycamore Maple. Suburban woodlands; native of Europe. Planted widely in our area as a street and yard tree, especially in the mountains. It may be naturalized more extensively in our area; northward it is a noxious weed tree. [= C, G, II, K, Pa, Z; = *Acer pseudo-platanus* – F, orthographic variant]

Acer rubrum Linnaeus var. *rubrum*, Eastern Red Maple. Upland deciduous forests, up to at least 1500m elevation, moist bottomlands and slopes. Jan-Mar; Feb-Jul. This variety is the most widespread and common in our area; indeed it is one of the most ubiquitous and common trees of e. North America. It is probably more abundant than formerly, because of its weedy abilities. Overall, it ranges throughout e. North America. Whether the varieties of *A. rubrum* are worthy of recognition is a matter of disagreement; I choose here to try to distinguish them. [= F, II, K1, K2, Z; < *A. rubrum* – C, GW, Pa, RAB, Va, W, WH3; < *A. rubrum* var. *rubrum* – G (also see var. *trilobum*); = *Rufacer rubrum* (Linnaeus) Small – S]

Acer rubrum Linnaeus var. *trilobum* Torrey & A. Gray ex K. Koch, Carolina Red Maple. Wetlands, especially peaty, acid sites. Jan-Mar; Feb-Jun. Primarily a Southeastern Coastal Plain variety, the range of var. *trilobum* is unclear, possibly extending well inland and northward (see F). This variety has greatly increased in abundance in the Coastal Plain of our area because of fire suppression and mechanical disturbance of peaty wetlands. Former large pocosin tracts, such as the Dismal Swamp, are now largely dominated by this tree. [= F, II, K1, K2, Z; < *A. rubrum* – C, GW, Pa, RAB, Va, WH3; < *A. rubrum* var. *rubrum* – G; = *Rufacer carolinianum* (Walter) Small – S]

Acer saccharinum Linnaeus, Silver Maple, Soft Maple. Bottomlands, riverbanks, and disturbed areas. Feb-Apr; Apr-Jul. NS west to SK, south to Panhandle FL, LA, and OK, rare and mostly introduced east of the Appalachians and south of VA. This is an abundant tree along major rivers in the Piedmont of VA. In our area (particularly from c. NC south), the species is more common as a street tree or an escape from cultivation than as a native tree. On the Coastal Plain of NC and SC, *A. saccharinum* is largely confined to the banks and levees of large brownwater rivers, such as the Roanoke and Congaree. The silvery undersides of the leaves are obvious in windy conditions. The hybrid *Acer* × *freemanii* A.E. Murray [*A. rubrum* × *saccharinum*] has been collected at scattered locations in our area. [= C, F, G, GW, II, K, Pa, RAB, Va, W, WH3, Z; = *Argentacer saccharinum* (Linnaeus) Small – S]

Acer saccharum Marshall, Sugar Maple, Hard Maple, Sugar Tree. Cove forests, other rich forests, especially over mafic and calcareous rocks, on calcareous soils common and typical in dry-mesic forests and dry woodlands as well, less typically extending to high elevation northern hardwood forests where sometimes in acidic situations (as in Highlands County, VA), in parts of the Piedmont perhaps more common as an introduction by ornamental planting than as a native, at least south of VA. Apr-Jun; Jun-Sep. Two varieties are sometimes recognized. Var. *saccharum* is distributed from NS west to ND, south to GA, LA, and OK. Var. *schneckii* Rehder, with petioles and lower leaf surfaces densely pubescent, considered to approach our area in

s. PA (Rhoads & Klein 1993), IN, IL, and MO, is probably only a form. *A. saccharum* is the primary source of maple sugar and maple syrup; formerly, commercial sugaring was done in w. NC and w. VA. Large individuals of this species are the favorite substrate of a number of lichens, including *Lobaria pulmonaria*. The brown, platy bark is often similar to that of *Aesculus flava*. For its bright orange fall color, *A. saccharum* is one of our most prized ornamental trees. In NC, it is most common northward and on mafic rocks, thus reaching perhaps its best development in the amphibolite peaks of Ashe, Watauga, Avery, and Mitchell counties; it is more general in VA. [= C, Pa, Va; > *A. saccharum* var. *saccharum* – F, G, Il, K, Z; > *A. saccharum* var. *rugelii* (Pax) Rehder – Il; > *A. saccharum* var. *schneckii* Rehder – Il; = *A. saccharum* ssp. *saccharum* – RAB, W; = *Saccharodendron barbatum* (Michaux) Nieuwland – S]

Acer spicatum Lamarck, Mountain Maple. High elevation forests (northern hardwoods or spruce-fir), generally above 1500 m in NC, above 900 m in VA, especially common in periglacial boulderfields. May-Jul; Aug-Oct. NL (Newfoundland), NL (Labrador), and SK south to PA, OH, and IA, and in the mountains to w. NC, e. TN, ne. GA, and ne. AL. The foliage is quite similar to that of *A. rubrum* var. *rubrum*, with which it can occur; in addition to the key characters, *A. spicatum* can be distinguished from *A. rubrum* by its leaves which have a strongly rugose texture, the secondary and tertiary veins impressed on the upper surface, distinctly raised on the lower (vs. not rugose, the secondary and tertiary veins only slightly impressed on the upper surface, and slightly raised on the lower). *A. spicatum* is also sometimes confused with *A. pensylvanicum*, but these two species are readily distinguished by their leaves (see key). [= C, F, G, K, Pa, RAB, S, Va, W, Z]

2. *Aesculus* Linnaeus 1753 (Buckeye)

A genus of about 13 species, trees and shrubs, of temperate e. North America, w. North America, e. Asia, and se. Europe. References: Hardin (1957a, 1957b)=Z; Harris, Xiang, & Thomas (2009) Acevedo-Rodriguez, van Welzen, Adema, and van der Ham in Kubitzki (2011).

Identification notes: The following hybrids are known from our area: *Aesculus* × *neglecta* Lindley [*flava* × *sylvatica*] and *Aesculus* × *mutabilis* (Spach) Scheele [*pavia* × *sylvatica*]. They can be recognized by their intermediate morphology.

- 1 Petals usually 5, white with a reddish mark near the cordate base of the petal blade; buds glutinous (sticky); fruit spiny; leaflets 7 (-9) per leaf; [alien, uncommonly planted, rarely naturalized]; [section *Aesculus*] *A. hippocastanum*
- 1 Petals 4 (or 4-5 in *A. parviflora*), cream-colored, yellow, red; or white (and then lacking a red blaze); buds not glutinous; fruit smooth (or with some prickles in *A. glabra* var. *glabra*); leaflets 5 (-7) per leaf; [native].
 - 2 Petals white, unmarked with red; stamens exserted, 2-4× as long as the petals; inflorescence 2-5 dm long; [section *Macrothyrsum*] *A. parviflora*
 - 2 Petals cream-colored, yellow, or red; stamens included or exserted, 1-2× as long as the petals; inflorescence 1-2.5 dm long; [section *Pavia*].
 - 3 Stamens about 2× as long as the petals, well-exserted beyond the corolla; petals only slightly unequal in size; fruit spiny with short prickles (rarely essentially smooth) *A. glabra* var. *glabra*
 - 3 Stamens about 1× as long as the petals, included or barely exserted beyond the corolla; petals markedly unequal in size; fruit smooth.
 - 4 Petal margins stipitate-glandular; petals scarlet; fruits 3-6 cm in diameter *A. pavia* var. *pavia*
 - 4 Petal margins villous, not glandular; petals yellow; fruits 2-8 cm in diameter.
 - 5 Calyx and pedicels stipitate-glandular; large tree; petiolules 2-3 (-4) mm long; fruits 5-8 cm in diameter *A. flava*
 - 5 Calyx and pedicels puberulent; shrub to small tree; petiolules 3-12 mm long; fruits 2-4 cm in diameter *A. sylvatica*

Aesculus flava Solander, Yellow Buckeye. Moist forests, up to nearly 2000m, especially prominent in seepy cove forests, in the Piedmont only in "montane" habitats. Late Apr-mid Jun; Aug-Sep. A broad Southern Appalachian endemic: sw. PA, s. OH, s. IN, and s. IL south through KY, WV, sw. VA, and TN to n. AL, n. GA, nw. SC, and w. NC. *A. flava* is one of the largest, most massive, and commonest trees in Southern Appalachian coves, recognizable in winter by the bark of large plate-like slabs, thick twigs, and massive form. Meyer & Hardin (1987) discuss the nomenclatural issues relating to the names "*A. flava*" and "*A. octandra*." [= C, K1, K2, Pa, Va, W; = *A. octandra* Marshall – F, G, RAB, Z; < *A. octandra* – S (also see *A. sylvatica*)]

Aesculus glabra Willdenow var. *glabra*, Ohio Buckeye. Mesic forests over limestone. Apr-May. Largely midwestern, but ranges east to sw. PA, e. TN, and nw. GA (Jones & Coile 1988); it is also sometimes introduced eastward of that distribution. It occurs in TN counties adjacent to both VA and NC. Var. *arguta* (Buckley) B.L. Robinson occurs west of the Mississippi River from IA and NE south to e. and c. TX; it differs in having 7-11 leaflets, each 1-3 (-5) cm wide (vs. 5-7 leaflets, each (2-) 3-6 (-8) cm wide). [= C, F, G, K1, K2, Mo, Z; < *A. glabra* – Pa, S, WV]

* ***Aesculus hippocastanum*** Linnaeus, Horsechestnut. Urban and suburban areas, perhaps not definitely naturalized, but fairly often planted as a street tree and escaping as seedlings in the vicinity of plantings; native of se. Europe. May. [= C, F, G, K, Pa, Z]

Aesculus parviflora Walter, Bottlebrush Buckeye. Mesic forests on bluffs and in ravines (the SC occurrence is on Fall Line river bluffs, with shaley, subcalcareous soils). Wc. GA west to nc. AL, south to sw. GA and sw. AL; disjunct in wc. SC (Aiken

County). See Wyatt (1985) for a discussion of the interesting, relictual occurrence in SC. Occasionally planted outside its native range. [= K, Pa, S, Z]

Aesculus pavia* Linnaeus var. *pavia, Red Buckeye. Swamp forests, usually stagnant, usually blackwater (not receiving significant alluvium), and especially over marl (coquina limestone). Apr-early May; Jul-Aug. Var. *pavia* ranges from se. NC south to c. peninsular FL and west to e. TX, extending north in the Mississippi Embayment to se. MO and s. IL, and in scattered occurrences off the Coastal Plain, as in sc. TN; also it is sometimes cultivated farther inland and persistent or slightly naturalizing. Var. *flavescens* (Sargent) Correll occurs in the Edwards Plateau of c. TX. Fernald reports this species from VA and WV, but there is likely taxonomic or nomenclatural confusion. [= K, Z; < *A. pavia* – C, G, Mo, RAB, S, W, WH3; > *A. pavia* – F; > *A. discolor* Pursh – F]

***Aesculus sylvatica* Bartram**, Painted Buckeye. In the Piedmont in mesic, nutrient-rich forests, on bottomlands, lower slopes, and in ravines, in the Coastal Plain primarily on floodplains of brownwater (alluvium-carrying) rivers (most notably the Roanoke River in NC), in the Mountains only at low elevations. Apr-mid May; Jul-Aug. Primarily a Southeastern Piedmont endemic, occurring primarily in the Piedmont from sc. VA south through c. NC, c. SC, and nc. GA to nc. AL, with an extension north into e. TN. [= C, F, K, RAB, Va, W, Z; = *A. neglecta* Lindley – G, misapplied; < *A. octandra* – S (also see *A. flava*); > *A. georgiana* Sargent]

3. *Cardiospermum* Linnaeus 1753 (Balloon Vine)

A genus of about 14-15 species, vines, of tropical America. References: Acevedo-Rodríguez, van Welzen, Adema, and van der Ham in Kubitzki (2011).

- 1 Capsule inflated, 2.5-4.5 cm long; seeds 4-6 mm in diameter; leaflets to ca. 8 cm long; [widespread in our area] ***C. halicacabum***
 1 Capsule not inflated, 0.8-1.7 cm long; seeds 3-4.5 mm in diameter; leaflets to ca. 3.5 cm long; [FL peninsula southwards] ***C. microcarpum***

* ***Cardiospermum halicacabum* Linnaeus**, Balloon Vine, Heartseed, Love-in-a-puff. Cultivated or abandoned fields, other disturbed areas; native of tropical America. Jul-Sep. [= F, G, K, Mo, Pa, RAB, S, Va, WH3; = *C. halicababum* – C, orthographic error; = *C. halicacabum* var. *halicacabum*]

***Cardiospermum microcarpum* Kunth**, Heartseed. Hammocks, pine flatwoods. Jan-Dec. N. FL peninsula (Marion County) south to s. FL; West Indies; Mexico through Central America to n. South America. [= K2, S, WH3; = *C. halicacabum* Linnaeus var. *microcarpum* (Kunth) Blume]

4. *Koelreuteria* Laxmann 1772 (Golden Rain Tree)

A genus of 4 species, trees, of temperate China, Taiwan, and Japan. References: Meyer (1976)=Z; Acevedo-Rodríguez, van Welzen, Adema, and van der Ham in Kubitzki (2011). Key based on Meyer (1976).

- 1 Leaves pinnate (rarely bipinnate in part), the leaflets coarsely crenate to lobulate; capsule valves ovate, ca. 2 × as long as wide; capsules greenish to tawny when young, aging to dark brown ***K. paniculata***
 1 Leaves bipinnate, the leaflets entire to shallowly serrate; capsule valves orbicular, 0.9-1.4 × as long as wide; capsules rose-purple when young, aging to tawny-brown.
 2 Leaflets weakly oblique, acute to short-acuminate, entire to uniformly serrate; petals 4 (-5) [***K. bipinnata***]
 2 Leaflets strongly oblique, long acuminate to caudate, entire to irregularly crenate-serrate; petals (4-) 5 [***K. henryi***]

* ***Koelreuteria bipinnata* Franchet**, Bougainvillea Golden Rain Tree. Disturbed areas, roadsides; native of s. China. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive. [= Z]

* ***Koelreuteria henryi* Dümmer**, Flamegold. Disturbed areas, roadsides; native of Taiwan. This taxon appears to be distinct morphologically and geographically from *K. elegans*, and warrants recognition at the species level. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive, and established just south of our area in peninsular FL. [= *Koelreuteria elegans* (Seemann) A.C. Smith ssp. *formosana* (Hayata) F.G. Meyer – K, WH3, Z]

* ***Koelreuteria paniculata* Laxmann**, Golden Rain Tree. Disturbed areas, roadsides, frequently cultivated as an ornamental tree, rarely escaped; native of n. China. May-Aug; Sep-Oct. [= C, F, G, K, Mo, Pa, RAB]

5. *Sapindus* Linnaeus 1753 (Soapberry)

A genus of about 10-13 species, trees, of tropical and warm temperate regions of the Old and New World. References: Acevedo-Rodríguez, van Welzen, Adema, and van der Ham in Kubitzki (2011).

1
1

Sapindus marginatus Willdenow, Florida Soapberry. Coastal marsh hammocks, shell middens. May-Jun. Se. SC (?) and e. GA south to c. peninsular FL (Lee and Brevard counties), and on the Gulf Coast in s. MS. Small (1933) reports this species from SC, but there is doubt whether this species was actually ever documented to occur in SC; there are no recent records. Although sometimes combined with the tropical *Sapindus saponaria*, I follow most recent Florida authors (Clewell 1985, Tomlinson 1986, Godfrey 1988, Nelson 1994, Nelson 1996) in maintaining it as distinct. *S. marginatus* is a species of n. FL, e. GA, and possibly SC and has wingless rachises, acuminate leaflets, and globose fruits; *S. saponaria* is a species of s. FL and tropical America and has winged rachises, rounded leaflet tips, and ovoid to globose fruits. [= RAB, S; < *S. saponaria* Linnaeus var. *saponaria* – K; < *S. saponaria* – WH3]

Sapindus saponaria Linnaeus var. *drummondii* (Hooker & Arnott) L.D. Benson. May-Jul. [= K2, Mo; = *S. drummondii* Hooker & Arnott] {EXPAND}

6. *Dodonaea* P. Miller 1754 (Varnishleaf, Hopbush)

A genus of about 65-67 species, shrubs, mainly Australian, a few species pantropical. References: Acevedo-Rodríguez, van Welzen, Adema, and van der Ham in Kubitzki (2011).

Dodonaea viscosa (Linnaeus) Jacquin ssp. *viscosa*, Varnishleaf, Hopbush. Dunes, dry hammocks, dry pinelands. Widespread in the Old World and New World tropics, north in FL to St. Johns County. [< *D. viscosa* – K, S, WH3]

241. RUTACEAE A.L. de Jussieu 1789 (Citrus Family) [in SAPINDALES]

A family of about 154-156 genera and 1800-2100 species, trees, shrubs, vines, and rarely herbs, cosmopolitan (but mainly tropical and subtropical). References: Kubitzki, Kallunki, Duretto, & Wilson in Kubitzki (2011).

- 1 Leaves **either** simple **or** unifoliolate (and appearing simple)
 - 2 Fruit a green, yellow, or orange hesperidium; [subfamily *Aurantioideae*]..... *Citrus*
 - 2 Fruit a red or black, fleshy, drupe-like; [subfamily *Rutoideae*, tribe unresolved]..... *Skimmia*
- 1 Leaves pinnately or palmately compound.
 - 3 Leaves 2-pinnatifid; suffrutescent herb or shrub to 1.5 m tall; [subfamily *Rutoideae*, tribe *Ruteae*]..... *Ruta*
 - 3 Leaves palmately 3-foliolate or 1-pinnate (5-19-foliolate); shrub or tree, usually over 1.5 m tall (potentially to 20 m in *Zanthoxylum*).
 - 4 Leaves pinnately 5-19-foliolate
 - 5 Leaves opposite; stems and leaves unarmed; [subfamily *Toddalioideae*]..... *Phellodendron*
 - 5 Leaves alternate; stems and leaves armed with prickles; [subfamily *Rutoideae*, tribe *Zanthoxyleae*] *Zanthoxylum*
 - 4 Leaves palmately 3-foliolate.
 - {add *Amyris*}
 - 6 Branches conspicuously armed with stout spines; [subfamily *Aurantioideae*]..... *Citrus*
 - 6 Branches not armed with spines; [subfamily *Toddalioideae*]..... *Ptelea*

Amyris P. Browne 1756 (Torchwood)

A genus of about 40 species, trees and shrubs, of tropical America. References: Kubitzki et al. in Kubitzki (2011).

Amyris elemifera Linnaeus, Smooth Torchwood, Sea Amyris, Candlewood, Cuabilla. Coastal hammocks. Year-round. East coast of the FL peninsula (Flagler County southwards); West Indies; Central America. [= K2, S, WH3]

Atalantia Corrêa 1805 (Box-orange)

A genus of ca. 17 species (here defined to include *Severinia*), trees and shrubs, of tropical and subtropical Asia. References: Bayer et al. (2009); Kubitzki et al. in Kubitzki (2011)=Z.

* *Atalantia buxifolia* (Poiret) Oliver, Box-orange. Suburban woodlands; native of Asia. [= Z; = *Severinia buxifolia* (Poiret) Tenore – K2, WH3] {not yet keyed}

*Citrus* Linnaeus 1753

(Citrus, Orange, Grapefruit, Lemon, Lime, Citron, Pummelo, Kumquat, Trifoliolate Orange)

A genus of about 27-35 species, trees, of s. and se. Asia. Recent studies (followed here) provide compelling arguments in favor of a broad circumscription including *Poncirus* and *Fortunella*, based on DNA analyses and other considerations (Bayer et al. 2009; Araújo, Queiroz, & Machado 2003; Mabberley 1997). The recognition of *Poncirus* and other segregate genera would render *Citrus* paraphyletic because of the position of *Citrus medica* (the type species of *Citrus*) as basal to these genera and the rest of *Citrus*. References: Mabberley (1997)=Z; Araújo, Queiroz, & Machado (2003)=Y; Pfeil & Crisp (2008); Kubitzki et al. in Kubitzki (2011).

Identification notes: *Citrus* has simple to trifoliolate, evergreen, coriaceous, acuminate, glossy green leaves, and the familiar spherical fruits. *Citrus ×limon* (Linnaeus) Burmann f., Lemon, *C. ×paradisi* Macfadyen in Hooker (pro sp.), Grapefruit, and *C. sinensis* (Linnaeus) Osbeck, Orange, have been grown on the Outer Banks of North Carolina in Buxton, Dare County, NC (Brown 1959). They are apparently not naturalized, being killed outright or severely damaged by occasional colder winters, and are not keyed or otherwise treated here.

- | | | |
|---|--|----------------------|
| 1 | Leaves trifoliolate; fruit densely pubescent, 3-6 cm long..... | <i>C. trifoliata</i> |
| 1 | Leaves unifoliolate; fruit glabrous, 4.5-25 cm long..... | <i>C. ×aurantium</i> |
| 2 | Petiole winged, and with an articulation at the juncture with the blade; fruit 4.5-15 cm long..... | <i>C. ×aurantium</i> |
| 2 | Petiole not winged, and lacking an articulation at the juncture with the blade; fruit 15-25 cm long..... | [<i>C. medica</i>] |

* *Citrus ×aurantium* Linnaeus (pro sp.), Sour Orange, Grapefruit, Sweet Orange. Cultivated horticulturally, sometimes persistent; native of se. Asia. Reported from several counties in s. and e. GA (Jones & Coile 1988). [= WH3, Z; = *C. aurantium* – K]

* *Citrus japonica* Thunberg, Kumquat. Suburban woodlands and disturbed hammocks; native of se. Asia. Reported as naturalizing in suburban woodlands in the Tallahassee (Leon Co., FL) area by Clewell & Tobe (2011). [> *Fortunella margarita* (Loureiro) Swingle – K2] {not yet keyed}

* *Citrus medica* Linnaeus, Citron. Disturbed hammocks; native of se. Asia. Apparently naturalized in the FL Panhandle (Franklin County) (Wunderlin & Hansen 2003). [= K, S, WH3]

* *Citrus trifoliata* Linnaeus, Trifoliolate Orange, Hardy Orange. Woodlands, thickets, bottomlands, and streambanks, especially in suburban areas; native of temperate China. Mar-Jun; Sep-Oct. See Nesom (2014a) for a detailed discussion of various aspects of this species in the se. United States. Planted in our area as an ornamental, as a “living fence,” and also used as a grafting stock for citrus, *C. trifoliata* is a small tree or shrub that seems to be made up almost entirely of “thorns” (actually, stipular spines). The fruits closely resemble an orange, but are small (ca. 4 cm in diameter), densely pubescent, and sour. *Citrus trifoliata* is often placed in a separate genus, *Poncirus*, but differs very little from *Citrus* morphologically, has been shown to be phylogenetically nested within *Citrus* (Araújo, Queiroz, & Machado 2003), and thus seems best included in *Citrus*. [= Mo, Va, Y; = *Poncirus trifoliata* (Linnaeus) Rafinesque – F, G, K, Pa, RAB, S, WH3]

***Phellodendron* Ruprecht 1857 (Cork-tree)**

A genus of about 2 (-10) species, trees, native of e. Asia. References: Ma et al. (2006)=Z; Kubitzki et al. in Kubitzki (2011).

* ***Phellodendron amurense*** Ruprecht, Northern Cork-tree, Amur Cork-tree, Japanese Cork-tree. Suburban woodlands; native of Japan, Taiwan, Korea, ne. China, and e. Russia. Late Apr-early Jun; Aug-Oct. [= K2, Pa, Z; > *P. japonicum* Maximowicz – C, K1]

***Ptelea* Linnaeus 1753 (Hop-tree, Wafer-ash, Stinking Ash)**

A genus of 3-11 species, shrubs and small trees, of North America (south into Mexico). References: Bailey (1962)=Z; Kubitzki et al. in Kubitzki (2011).

Ptelea trifoliata Linnaeus, Hop-tree. Rocky bluffs, especially calcareous or mafic, open woodlands, calcareous Coastal Plain river bluffs, granitic domes. Apr-Jun; Jun-Aug. NJ, w. NY, MI, s. WI, and NE south to c. peninsular FL, c. AL, c. MS, e. and s. TX. Bailey (1962) treats two varieties in our area, doubtfully distinguishable; they need additional study. [= Pa, RAB, Va, WH3; > *P. trifoliata* var. *mollis* – F, WV; > *P. trifoliata* var. *trifoliata* – F, WV; > *P. trifoliata* ssp. *trifoliata* var. *mollis* Torrey & A. Gray – C, K, Z; > *P. trifoliata* ssp. *trifoliata* var. *trifoliata* – C, K, Z; = *P. trifoliata* var. *trifoliata* – G; > *P. trifoliata* ssp. *trifoliata* – Mo; > *P. trifoliata* – S; > *P. serrata* Small – S; > *P. microcarpa* Small – S; > *P. baldwinii* Torrey & A. Gray – S]

***Ruta* Linnaeus 1753 (Rue)**

A genus of about 7 species, perennial herbs and semi-shrubs, of the Old World. References: Kubitzki et al. in Kubitzki (2011).

* ***Ruta graveolens*** Linnaeus, Rue. Cultivated in gardens as a medicinal herb, persistent and rarely escaping, sometimes locally abundant in pastures over limestone or gravelly floodplains; native of Eurasia. May-Aug; Jun-Sep. This plant causes dermatitis in some people, apparently by removing the skin's sun-resistance. *Ruta* has a disagreeable smell, and has toxic properties. [= C, F, G, K, Mo, Pa, RAB, S, WV]

***Skimmia* Thunberg 1783 (Skimmia)**

A genus of 4 species, shrubs and small trees, native of e. Asia. References: Kubitzki et al. in Kubitzki (2011).

* ***Skimmia japonica*** Thunberg, Japanese Skimmia. Cultivated as an ornamental, rarely escaped into suburban woodlands; native of e. Asia.

***Zanthoxylum* Linnaeus 1753 (Prickly-ash, Toothache Tree)**

A genus of about 225-250 species, trees, of America, Africa, Asia, and Australia. References: Porter (1976)=Z; Kubitzki et al. in Kubitzki (2011).

- | | | |
|---|---|---------------------------------|
| 1 | Petiole and rachis winged; leaflets to 3 cm long, rounded, obtuse, or retuse at the apex; [of n. peninsular FL southwards]..... | <i>Z. fagara</i> |
| 1 | Petiole and rachis unwinged; leaflets to 9 cm long, acute to acuminate at the apex; [widespread in our area]. | |
| 2 | Leaves thin in texture, pubescent; flowers in small axillary clusters..... | <i>Z. americanum</i> |
| 2 | Leaves coriaceous in texture, glabrous and waxy; flowers in large terminal compound cymes..... | <i>Z. clava-herculis</i> |

Zanthoxylum americanum P. Miller, Northern Toothache Tree, Northern Prickly-ash. Woodlands and forests over calcareous or mafic rocks, often forming extensive colonies near outcrops. Mar-May; Jul-Aug. S. QC west to e. ND, south to e. SC, c. GA, Panhandle FL, e. TN, c. TN, and OK. Sometimes planted. There is only a single known site in SC. [= C, G, K, Mo, Pa, RAB, S, Va, W, WH3, WV, Z; = *Xanthoxylum americanum* – F, orthographic variant]

Zanthoxylum clava-herculis Linnaeus, Southern Toothache Tree, Hercules'-club, Sea-ash, Southern Prickly-ash, Pepperbark, Tickle-tongue. Maritime forests, dunes, shell middens, shell hammocks, maritime scrub, inland (in FL and GA) in hammocks. Apr-May; Jul-Sep. A Southeastern Coastal Plain endemic: se. VA south to FL and west to TX, AR, and OK. The compound leaves are armed with stout prickles along the rachis. The twigs are also spiny. On the larger branches and trunks, the spines become elevated on conical, pyramidal, or cylindrical corky bases up to 5 cm long and 4 cm in diameter, giving the trunk a

very peculiar appearance. Many of the common names come from the numbing effect on the mouth of chewing the leaf or twig, the flavor, smell, and effect being very similar to *Ctenium aromaticum*, Toothache Grass. In the northern part of its distribution, it is restricted to the outer Coastal Plain, nearly entirely on barrier islands. Although normally a small tree, it can reach considerable size, up to about 60 cm DBH. In the 5 km immediately north of Buxton, Dare County, NC one can see several hundred individuals growing on open, *Uniola*-dominated dunes. Because of salt-pruning, the trees often have 5 times as wide a spread as they are tall. Some trees have a basal diameter of 30-40 cm, a short trunk less than a meter tall, a total height of 2-3 m, and a spread of 10 m. [= C, G, K, RAB, S, Va, WH3, Z; = *Xanthoxylum clava-herculis* – F, orthographic variant]

Zanthoxylum fagara (Linnaeus) Sargent, Wild Lime, Colima, Lime Prickly-ash, Uña de Gato. Hammocks. Mar-Jun (and often again in October). N. FL peninsula (Citrus, Marion, and Flagler counties) south to s. FL; West Indies; Mexico and Central America. [= K2, WH3, S, Z]

242. SIMAROUBACEAE A.P. de Candolle 1811 (Quassia Family) [in SAPINDALES]

A family of about 13-22 genera and 110-115 species, trees and shrubs of primarily tropical areas of the New World and Old World. The Leitneriaceae has been traditionally considered to be a monotypic family, endemic to se. North America; a variety of recent studies have suggested its inclusion in the Simaroubaceae (Angiosperm Phylogeny Group 1998, 2003, 2009; Bogle in FNA 1997). References: Clayton in Kubitzki (2011); Angiosperm Phylogeny Group (1998, 2003). [including *LEITNERIACEAE*]

- 1 Leaves pinnately compound, with prominent glands along the margin of the leaflets; perianth present, with 5 sepals and 5 petals; [species alien, aggressively naturalizing in upland sites] ***Ailanthus***
- 1 Leaves unifoliolate (appearing simple), lacking glands; perianth absent or vestigial; [species native, in wetland sites] ***Leitneria***

Ailanthus Desfais 1788 (Tree-of-Heaven)

A genus of 5 species, trees, native to Asia and Australia. References: Hu (1979); Clayton in Kubitzki (2011).

* ***Ailanthus altissima*** (P. Miller) Swingle, Tree-of-Heaven, Copal Tree, Stink-tree. Roadsides, forests, disturbed areas, including cities, especially in moist, fertile soils; native of e. Asia. May-Jun; Jul-Oct. In our area, this tree is now an aggressive and noxious weed, colonizing even undisturbed forests and outcompeting the native vegetation. It can be recognized vegetatively by its large pinnately compound leaves, very stout twigs (often over 1 cm thick), and the characteristic and unpleasant odor of the crushed foliage. [= C, F, G, K, Mo, Pa, RAB, S, Va, W, WH3]

Leitneria Chapman 1860 (Corkwood)

As reinterpreted by Schrader & Graves (2011), a genus of 2 species, one with 2 subspecies, endemic to scattered areas of se. North America; Yatskievych (2013) expresses skepticism that the three populations are reliably distinct based on the morphological characters presented by Schrader & Graves (2011). References: Schrader & Graves (2011)=Z; Bogle in FNA (1997); Channell & Wood (1962); Clayton in Kubitzki (2011).

Leitneria floridana Chapman, Corkwood. Swamps and cabbage palm / sawgrass marshes. Feb-Mar. Sw. GA and Panhandle FL. More western populations in se. MO, e. AR, and se. TX are now placed in *L. pilosa* J.A. Schrader & W.R. Graves ssp. *pilosa* (se. TX) and *L. pilosa* ssp. *ozarkana* J.A. Schrader & W.R. Graves (se. MO and e. AR). [= Z; < *L. floridana* – FNA, GW, K1, K2, Mo, S, WH3]

D243. MELIACEAE

243. MELIACEAE A.L. de Jussieu 1789 (Mahogany Family) [in SAPINDALES]

A family of about 50 genera and 565-575 species, trees and shrubs, of tropical and subtropical areas. The only native member of the family in e. North America is *Swietenia mahogani* (Linnaeus) Jacquin (West Indian Mahogany), a very valuable timber tree which ranges north to s. FL. References: Mabberley in Kubitzki (2011).

- 1 Leaves 2× odd-pinnately compound; fruit a drupe; [widely planted and naturalized in our area, especially southward] *Melia*
- 1 Leaves 1× even-pinnately compound; fruit a capsule; [rarely planted and naturalized]..... *Toona*

Melia Linnaeus 1753 (Chinaberry)

A genus of 3 species, trees, of the Old World tropics. References: Mabberley in Kubitzki (2011); Miller (1990)=Z.

* *Melia azedarach* Linnaeus, Chinaberry, Carolina Mahogany, Umbrella-tree, Pride-of-India, “White Cedar,” “Persian Lilac.” Disturbed areas, abandoned rural yards and fields; native to se. Asia (Indomalesia), commonly cultivated in our area (mainly in the Coastal Plain) and commonly escaped. Apr-May; Sep-Oct. The fruits are sometimes used as beads; they are very poisonous if ingested. [= C, F, G, K, RAB, S, Va, WH3, Z]

Toona (Endlicher) M. Roemer 1846 (Australian Red-cedar)

A genus of 4-5 species of se. Asia and Australia. References: Mabberley in Kubitzki (2011).

* *Toona ciliata* M. Roemer var. *australis* (F. Mueller) Bahadur, Toon, Australian Red-cedar. Suburban woodlands; native of Australia. Apr-Jun; Oct-Nov. Naturalizing rather aggressively in Montgomery County, MD (W. Knapp, pers. comm. 2011). [= *T. ciliata* ssp. *ciliata* var. *australis* (F. Mueller) Bahadur – K2]

250. MALVACEAE A.L. de Jussieu 1789 (Mallow Family) [in MALVALES]

Malvaceae has always been difficult to circumscribe cleanly, relative to members of such families as Sterculiaceae and Tiliaceae. Molecular evidence now adds to morphologic evidence that traditional circumscriptions of these families are highly polyphyletic. Bayer et al. (1999) present a new classification of an expanded Malvaceae, with 9 subfamilies recognized. If circumscribed broadly (as here) to include Sterculiaceae and Tiliaceae, a family of about 243 genera and 4000-4500 species, herbs, shrubs, and trees, of cosmopolitan distribution, but especially diverse in the tropics and subtropics. This family includes several economically important species, including cotton (*Gossypium* spp.), cacao or chocolate, *Theobroma cacao* Linnaeus, and cola, *Cola acuminata* R. Brown. References: Bayer et al. (1999); Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell (1988). [including STERCULIACEAE and TILIACEAE]

- 1 Petals absent; carpels 5, whorled, each expanding into a stalked and papery structure which bears 1-4 pea-sized seeds along its margins; tree; leaves 10-40 cm wide, 3-5 lobed, the lobes acute, the margins entire; [subfamily *Sterculioideae*] **6. Firmiana**
- 1 Petals present; carpels 1, 5, or many, united or separate, but not as above; tree, shrub, or herb; leaves < 15 cm wide, lobed or unlobed, but if lobed then also serrate.
 - 2 Epicalyx of bracts (immediately subtending the calyx) absent.
 - 3 Stamens 5; [subfamily *Byttnerioideae*].
 - 4 Ovary with 5 carpels and 5 styles; capsule with 5-10 seeds; corolla pink, purple, or white **1. Melochia**
 - 4 Ovary with 1 carpel and 1 style; capsule with 1 seed; corolla orange to yellow [**2. Waltheria**]
 - 3 Stamens >10.
 - 5 Stamens free.
 - 6 Tree; fruit a woody drupe; [subfamily *Tilioideae*] **5. Tilia**
 - 6 Herb or shrub; fruit a capsule; [subfamily *Grewioideae*, tribe *Apeibeae*].
 - 7 Leaves rounded or subcordate at base, acute at apex; fruit much longer than broad, unarmed **3. Corchorus**
 - 7 Leaves cuneate at base, acuminate at apex; fruit subglobose, with hooked spines **4. Triumfetta**
 - 5 Stamens united into a staminal column adnate to the corolla at its base; [subfamily *Malvoideae*; tribe *Malveae*].
 - 8 Seeds 2 or more per carpel **14. Abutilon**
 - 8 Seed 1 per carpel.
 - 9 Leaves palmately and deeply cleft (> 9/10s of the way to the midrib) into linear segments **24. Callirhoe**
 - 9 Leaves unlobed or lobed (if lobed, < 4/5's of the way to the midrib and the lobes broad).
 - 10 Flowers many in a terminal panicle; corolla white; style branches filiform, the stigmatic surface elongate along the inner side of the branches; leaves >10 cm wide, deeply 5-9-lobed; plants 1-2 m tall **18. Napaea**
 - 10 Flowers solitary or a few in leaf axils (or many in a terminal panicle in *Sida hermaphrodita*); corolla blue-purple, yellow, or white; style branches truncate, the stigmatic surface terminal and capitate; leaves < 2 cm wide, unlobed (or leaves > 10 cm wide and deeply 3-7-lobed in *Sida hermaphrodita*); plants < 1 m tall (or 1-4 m tall in *Sida hermaphrodita*).
 - 11 Corolla blue to purple; lateral walls of the carpels disintegrating at maturity of the fruit **20. Anoda**
 - 11 Corolla yellow or white; lateral walls of the carpels persistent **15. Sida**
 - 2 Epicalyx of bracts (immediately subtending the calyx) present.
 - 12 Fruit a loculicidal capsule or fleshy and berry-like.

- 13 Fruit fleshy and berry-like; [subfamily *Malvoideae*; tribe *Hibisceae*] **12. *Malvaviscus***
- 13 Fruit a loculicidal capsule.
- 14 Calyx spathe-like, soon falling after anthesis; [subfamily *Malvoideae*; tribe *Hibisceae*] **9. *Abelmoschus***
- 14 Calyx radially symmetrical, 5-lobed.
- 15 Style branches short, erect, the stigmas nearly sessile; epicalyx bracts 3, large, foliaceous, and incised; seeds bearing long white fibers; [subfamily *Malvoideae*; tribe *Gossypiae*] **13. *Gossypium***
- 15 Style branches elongate, spreading; epicalyx bracts 6-15, linear to lanceolate and untoothed; seeds sometimes pubescent but not with long white fibers; [subfamily *Malvoideae*; tribe *Hibisceae*].
- 16 Locules of the fruit several-seeded; capsule longer than broad, the apex pointed or rounded; petals yellow, white, red, or pink (if pink, then > 4 cm long, or the plant a shrub) **7. *Hibiscus***
- 16 Locules of the fruit 1-seeded; capsule depressed-globose, indented at the apex; petals pink, 2-4 cm long **8. *Kosteletzkya***
- 12 Fruit of radially disposed, 1- to several-seeded, dry carpels that split apart at maturity.
- 17 Bracts of the epicalyx 5 or more.
- 18 Shrubs or woody herbs, with leaves not basally disposed; flowers in axils of well-developed leaves; fruit spiny (or lacking spines in *Pavonia hastata*); [of SC southward]; [subfamily *Malvoideae*; tribe *Hibisceae*].
- 19 Bracts of the epicalyx 5-15, distinct; fruit with 0-3 spines per carpel; leaves lacking foliar nectaries **11. *Pavonia***
- 19 Bracts of epicalyx 5, fused basally; fruit covered with numerous glochidiate spines; leaves with 1-3 foliar nectaries (glands) on undersurface near base **10. *Urena***
- 18 Herbs, with leaves basally disposed; flowers in terminal bracteates spikes or racemes; fruit lacking spines; [collectively widespread]; [subfamily *Malvoideae*; tribe *Malveae*].
- 20 Plant 1.5-3 m tall, usually unbranched; flowers 6-10 cm across **21. *Alcea***
- 20 Plant 0.5-1.2 m tall, branched; flowers 2-3 cm across **22. *Athaea***
- 17 Bracts of the epicalyx 2-3; [subfamily *Malvoideae*; tribe *Malveae*].
- 21 Ovules and seeds 2 or more per carpel.
- 22 Herb 0.5-2.5 m tall, upright; petals 2-3 cm long, pink-purple; carpels not beaked at the tip **16. *Hianna***
- 22 Herb to 0.5 m tall, prostrate to ascending; petals 0.3-0.5 cm long, orange-red; carpels beaked at the tip **19. *Modiola***
- 21 Ovules and seeds 1 per carpel.
- 23 Leaf blades 1.5-8× as long as wide.
- 24 Style branches filiform, the stigmatic surface elongate along the inner side of the branches **24. *Callirhoe***
- 24 Style branches truncate, the stigmatic surface terminal and capitate **17. *Malvastrum***
- 23 Leaf blades orbicular, about as wide as long.
- 25 Leaves deeply palmately cleft **24. *Callirhoe***
- 25 Leaves unlobed or shallowly lobed **23. *Malva***

1. *Melochia* Linnaeus 1753 (Chocolate-weed)

A genus of about 54 species, herbs and shrubs, of tropical regions, especially America. References: Brizicky (1966)=Y; Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Inflorescence umbel-like, leaf-opposed; flowers pedicellate; capsules 8-14 mm across [***M. pyramidata***]
- 1 Inflorescence cymose, either terminal or axillary; flowers sessile or subsessile; capsules 2.5-6 mm across.
- 2 Petioles >1.5 cm long; pubescence of the stem and leaves sparse, of stellate, forked, and/or simple hairs; cymes compact, terminal on primary and secondary branches ***M. corchorifolia***
- 2 Petioles < 1 cm long; pubescence of the stem and leaves dense (tomentose), of stellate hairs; cymes spikelike, in upper leaf axils [***M. spicata***]

* ***Melochia corchorifolia*** Linnaeus, Chocolate-weed. Sandy fields, especially in low, wet places; native of the Old World tropics. Aug-Oct. [= GW, K, Mo, RAB, S, WH3, Y, Z]

* ***Melochia pyramidata*** Linnaeus, Pyramid-flower. Disturbed areas; native of the Neotropics (as far north as s. FL and s. TX). Apr-Nov. [= K2, WH3]

* ***Melochia spicata*** (Linnaeus) Fryxell, Bretonica-peluda. Disturbed areas; native of tropical America, the original distribution uncertain. In GA (Kartesz 1999) and FL (Brizicky 1966). [= K, WH3; = *Riedlea hirsuta* (Cavanilles) A.L.P.P. de Candolle – S; = *Melochia villosa* (P. Miller) Fawcett & Rendle – Y]

2. *Waltheria* Linnaeus 1753 (Raichie)

A genus of ca. 60 species, herbs and shrubs, pantropical. References: Saunders in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* ***Waltheria indica*** Linnaeus, Sleepy Morning. On ballast, perhaps only a waif. Jan-Dec. Pantropical, native north to c. peninsular FL. [= K, WH3; > *W. americana* Linnaeus – S]

3. *Corchorus* Linnaeus 1753 (Jute)

A genus of 40-100 species, shrubs and herbs, broadly tropical and subtropical in distribution. References: Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Capsule 1-2 cm long, angular, winged; seeds < 1 mm long *C. aestuans*
- 1 Capsule 2.5-7 cm long, subterete, not winged; seeds ca. 1 mm long.
 - 2 Capsule with an attenuate beak; seeds separated by incomplete transverse partitions [*C. hirtus*]
 - 2 Capsule truncate with 4 toothlike projections; seeds no separated by partitions [*C. siliquosus*]

* *Corchorus aestuans* Linnaeus, Jute. Roadsides, other disturbed ground; native of Asia. Reported for Thomas County, GA (Carter, Baker, & Morris 2009). [= K2, WH3; ? *C. acutangulus* Lamarck – S]

* *Corchorus hirtus* Linnaeus, Hairy Jute. Disturbed areas; native of E. Indies. [= K2, WH3; > *C. orinocensis* Kunth – S]

* *Corchorus siliquosus* Linnaeus, Slippery Bur. Roadsides; native of West Indies, Mexico, Central America and perhaps s. FL. [= K2, S, WH3]

4. *Triumfetta* Linnaeus 1753

A genus of about 70-150 species, trees, shrubs, and herbs, of tropical regions. References: Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Capsule hispid; lower leaf surface not velutinous *T. pentandra*
- 1 Capsule glabrous; lower leaf surface velutinous *T. semitriloba*

* *Triumfetta pentandra* A. Richard. Disturbed areas; native of tropical America. [= K, WH3]

* *Triumfetta semitriloba* Jacquin, Mosote, Burweed. Disturbed areas; native of tropical America. In sw. GA (Jones & Coile 1988) and s. peninsular FL. [= K, S, WH3]

5. *Tilia* Linnaeus 1753 (Basswood, Whitewood, Linden, Linn)

A genus of about 25-45 species, trees, of temperate regions of North America, Europe and Asia. Hardin's (1990) treatment of American *Tilia* seems a practical and reasonable approach; it gives taxonomic status to the more distinctive (and geographically based) elements of variation, while recognizing the intergradational nature of the variation; McCarthy (2012) agreed with Hardin's entities and their ranks. Pigott (2012), however, differed in his interpretation (see synonymy). Further investigation of this complex group is, however, warranted. References: McCarthy (2012)=U; Pigott (2012)=V; Hardin (1990)=Z; Stace (2010)=Y; Haines (2011)=X; Bayer & Kubitzki in Kubitzki & Bayer (2003). Key adapted from Hardin (1990) and Stace (2010).

Identification notes: While the varieties treated below are broadly distinctive and have definite geographic distributions across e. North America, they are imperfectly distinct in geographic areas of overlap. In our area, their identification is particularly problematic in Virginia, where individuals in many parts of the state show intergradation between the northern var. *americana* and the Southern and Central Appalachian var. *heterophylla*.

- 1 Leaf blades 8-25 cm long; flowers with staminodes; [collectively common and widespread natives].
- 2 Lower leaf surfaces puberulent with bulbous glands, acicular trichomes, and (rarely) sparsely scattered stellate trichomes; fruiting peduncles and pedicels glabrous or sometimes puberulent; [generally northern, south to NC and TN] *T. americana* var. *americana*

- 2 Lower leaf surfaces usually tomentose or becoming puberulent, with bulbous glands, acicular trichomes, and a predominance of stellate or fasciculate trichomes; fruiting peduncles and pedicels stellate-tomentulose (becoming puberulent in age); [collectively widespread in our area].
- 3 Lower leaf surfaces grayish or brownish, loosely but densely tomentose with fasciculate and/or stipitate-stellate trichomes, either remaining tomentose or becoming puberulent, or puberulent from emergence and green beneath; lateral buds 3-5 mm long; pericarp 0.5-0.6 mm thick; [generally southern, Coastal Plain and Piedmont of NC, SC, GA and southward and westward] *T. americana* var. *caroliniana*
- 3 Lower leaf surfaces pale or whitish, densely stellate tomentose with appressed, sessile-stellate trichomes obscuring the surface (rarely becoming puberulent with age but with some stellate trichomes persisting along major veins, the margin, and/or the apex); lateral buds 5-8 mm long; pericarp 0.8-1.0 mm thick; [widespread in our area]..... *T. americana* var. *heterophylla*
- 1 Leaf blades 3-9 (-12) cm long; flowers lacking staminodes; [rare aliens, sparingly naturalized in suburban woodlands].
- 4 Leaves pubescent below; flowers 2-4 (-6) per cyme; fruit strongly ribbed..... [*T. platyphyllos*]
- 4 Leaves glabrous below except for tufts of hairs in the vein axils; flowers 4-15 per cyme; fruit not or slightly ribbed.
- 5 Cymes obliquely erect above the leaves; leaf blades mostly 3-6 cm long, the tertiary veins obscure as viewed from the upper side of the leaf [*T. cordata*]
- 5 Cymes pendent below the leaves; leaf blades mostly 6-9 cm long, the tertiary veins prominent as viewed from the upper side of the leaf [*T. ×europaea*]

Tilia americana Linnaeus var. *americana*, Northern Basswood. Rich coves, rocky slopes, metabasalt boulderfields, rich north-facing river bluffs, calcareous Coastal Plain ravines. May-Jul; Aug-Sep. NB and MB south to e. VA, w. NC, and OK. In VA, var. *americana* occurs throughout the northern half of the state, with scattered populations southward in the mountains. Pigott (2012) recognizes two varieties within what is here treated as var. *americana*: a more narrowly circumscribed var. *americana* and var. *neglecta*. [= C, K, Mo, Pa, Va, U, X, Z; = *T. americana* – G, RAB, W, WV; > *T. americana* – F; > *T. neglecta* Spach – F, S; > *T. glabra* Ventenat – S; > *T. truncata* Spach – S; > *T. americana* var. *americana* – V; > *T. americana* var. *neglecta* (Spach) Fosberg – V]

Tilia americana Linnaeus var. *caroliniana* (P. Miller) Castiglioni, Southern Basswood, Carolina Basswood. Mesic forests, in the outer Coastal Plain usually associated with shell deposits, Indian shell middens, or underlying coquina limestone ("marl"). Jun-Jul; Jul-Aug. NC south to c. peninsular FL and west to OK and c. TX. Pigott (2012) splits this entity into two taxa, each recognized at subspecific rank under *T. caroliniana*. [= K, U, WH3, Z; > *T. caroliniana* P. Miller – RAB, S; > *T. floridana* Small – F, RAB, S; > *T. georgiana* Sargent – S; > *T. littoralis* Sargent – S; > *T. caroliniana* ssp. *caroliniana* – V; > *T. caroliniana* ssp. *floridana* (Small) Murray – V]

Tilia americana Linnaeus var. *heterophylla* (Ventenat) Loudon, Mountain Basswood, White Basswood, Linn. Rich coves and mesic to dry slopes (the drier sites usually on limestone), often one of the most abundant trees in Southern Appalachian cove forests. May-Jul; Jul-Aug. Centered in the Southern Appalachians: sw. PA and WV south to c. NC, wc. GA, FL Panhandle, and westward as disjunct populations to the Ozarkian Highlands of s. MO and n. AR. In VA, var. *heterophylla* dominates in sw. VA and along southern Piedmont river bluffs, with disjunct populations in calcareous ravines in the upper Coastal Plain (Surry County); it also extends less commonly into the northern VA mountains and foothills, where var. *americana* is more prevalent, but seems to be absent (or very uncommon) in the Potomac valley east of the Blue Ridge. Pigott (2012) recognizes this entity at subspecific rank and treats it as one of three subspecies of *T. caroliniana*. [= C, K, Mo, Pa, U, Va, WH3, X, Z; = *T. heterophylla* Ventenat – F, RAB, W, WV; > *T. heterophylla* – G, S; > *T. monticola* Sargent – G; > *T. australis* Small – S; > *T. eburnea* W.W. Ashe – S; > *T. lasioclada* Sargent – S; > *T. michauxii* Nuttall – S; > *T. venulosa* Sargent; = *T. caroliniana* ssp. *heterophylla* (Ventenat) Pigott – V]

* *Tilia cordata* P. Miller, Small-leaved Linden, Small-leaved Lime. Suburban woodlands, uncommonly planted, rarely naturalizing; native of Europe. [= C, X, Y; = *T. cordata* ssp. *cordata* – V]

* *Tilia ×europaea* Linnaeus (pro sp.) [*Tilia cordata* × *platyphyllos*], Common European Linden, Lime. Suburban woodlands; uncommonly planted, rarely naturalizing, native of Europe. [= V, Y; = *T. ×vulgaris* Hayne – X]

* *Tilia platyphyllos* Scopoli, Large-leaved Linden, Large-leaved Lime. Uncommonly planted, uncertain if naturalizing in our area; native of Europe. [= C, X, Y; > *T. platyphyllos* ssp. various – V] {rejected as a component of our flora, but keyed because of likelihood of naturalization}

6. *Firmiana* Marsili 1786 (Chinese Parasol-tree, Phoenix Tree)

A genus of about 12 species, trees, of Africa and Asia. References: Whetstone (1983)=Z; Brizicky (1966)=Y; Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Firmiana simplex* (Linnaeus) W. Wight, Chinese Parasol-tree, Phoenix Tree. Planted and occasionally naturalized nearby; native of se. Asia, probably China. [= C, K, WH3, Y, Z; = *F. platanifolia* (Linnaeus f.) Schott & Endlicher – RAB, S]

7. *Hibiscus* Linnaeus 1753 (Hibiscus, Rose-mallow)

A genus of about 200-300 species, trees, shrubs, and herbs, of tropical to warm temperate areas. References: Blanchard in FNA (in prep.); Blanchard (2008)=Z; Wise & Menzel (1971); Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Woody shrub, the stems usually solitary from a creeping rhizome; [section *Hibiscus*] *H. syriacus*
- 1 Herb (sometimes robust and to as tall as 3.5 m), often several from ground level, from a crown or taproot.
 - 2 Annual from a taproot, to 0.5 m tall; calyx inflated at maturity; capsule 1.0-1.3 cm long; petals 1.5-3 (-4) cm long; leaves 2-6 cm long, deeply cleft; [section *Trionum*] *H. trionum*
 - 2 Perennial from a crown, usually 0.7-3.5 m tall; calyx not inflated at maturity; capsule 1.7-3.5 cm long; petals 4-14 cm long; leaves 4-25 cm long, deeply cleft, hastate-lobed, or not at all lobed or cleft.
 - 3 Leaves and stems harshly scabrous; calyx lobes each with an elongate purplish nectary on the back; [of pine savannas and dry sandy soils of maritime forest edges, from se. NC southward]; [section *Furcaria*] *H. aculeatus*
 - 3 Leaves and stems glabrous, softly pubescent, or slightly scabrous; calyx lobes lacking nectaries; [of marshes and swamps (sometimes cultivated in drier soils), collectively widespread in our area]; [section *Muenchhusia*].
 - 4 Stem glabrous; leaves glabrous; leaves either palmately 3-5-lobed, or prominently halberd-lobed at the base (uncommonly unlobed).
 - 5 Leaves either palmately 3-5-lobed; petals bright scarlet *H. coccineus*
 - 5 Leaves halberd-lobed at the base (uncommonly unlobed); petals pink or white with a purplish base *H. laevis*
 - 4 Stem pubescent at least when young; leaves pubescent on at least one surface; leaves unlobed or slightly lobed toward the tip (except *H. grandiflorus*).
 - 6 Staminal column 6.2-9.5 cm long, $> \frac{2}{3} \times$ as long as the petals; petals 8.5-14 cm long; [e. GA southward] *H. grandiflorus*
 - 6 Staminal column 1.2-5 cm long, $< \frac{1}{2} \times$ as long as the petals; petals 4-12 cm long; [widespread].
 - 7 Capsule pubescent (the dark surface largely or completely obscured); bracts of the involucre usually ciliate; upper leaf surface usually densely stellate-pubescent *H. lasiocarpus*
 - 7 Capsule glabrous and dark brown to black; bracts of involucre eciliate; upper leaf surface glabrous or nearly so *H. moscheutos*

Hibiscus aculeatus Walter, Savanna Hibiscus, Comfort-root. Pine savannas, dry sandy or loamy soils of maritime forest edges. Jun-Aug; Jul-Sep. Se. NC south to sc. peninsular FL, west to LA. [= FNA, GW, K, RAB, S, WH3]

Hibiscus coccineus Walter, Scarlet Hibiscus. Marshes, swamp forests, roadside swales, cultivated as an ornamental in yards, in much of our area presumably introduced from farther south, but sometimes appearing native. S. GA and s. AL south to s. FL. [= FNA, GW, K, S, Va, WH3]

Hibiscus grandiflorus Michaux, Large-flowered Hibiscus. Tidal marshes, lakeshores, wet flatwoods and savannas. E. GA (Chatham Co., adjacent to the SC border) (Jones & Coile 1988) south to s. FL, west to e. LA; e. Cuba. [= FNA, GW, K, S, WH3]

Hibiscus laevis Allioni, Smooth Rose-mallow, Halberd-leaved Marsh-mallow, Showy Hibiscus. Freshwater marshes, exposed riverbanks, sandbars. Jun-Aug; Aug-Oct. S. PA south to FL Panhandle, west to TX; north in the interior to around the Great Lakes. [= C, FNA, K, Mo, Pa, Va, W, WH3; = *H. militaris* Cavanilles - F, G, GW, RAB, S, WV]

Hibiscus lasiocarpus Cavanilles, Western Rose-mallow. Marshes, swamps. Jul-Oct. KY, IN, IL, MO, KS, and NM south to Panhandle FL, AL, MS, LA, and TX. [= F, GW, Mo, S; = *H. moscheutos* Linnaeus var. *occidentalis* Torrey - C; = *H. moscheutos* Linnaeus ssp. *lasiocarpus* (Cavanilles) O.J. Blanchard - FNA, K, Z; = *H. lasiocarpus* - G, orthographic variant; < *H. moscheutos* - WH3]

Hibiscus moscheutos Linnaeus, Eastern Rose-mallow. Marshes, swamps, river sandbars. Jun-Sep; Jul-Oct. E. MA west to MI, south to c. peninsular FL and e. TX. [= Pa, Va; > *H. moscheutos* Linnaeus ssp. *moscheutos* - RAB, GW, W; > *H. moscheutos* Linnaeus ssp. *incanus* (Wendland f.) H.E. Ahles - GW, RAB; > *H. moscheutos* Linnaeus ssp. *palustris* (Linnaeus) R.T. Clausen - RAB, GW, W; = *H. moscheutos* var. *moscheutos* - C; > *H. incanus* Wendland f. - G, S; = *H. moscheutos* ssp. *moscheutos* - FNA, K, Z; > *H. moscheutos* Linnaeus - F, G, W; > *H. oculiroseus* Britton - S; > *H. palustris* Linnaeus - F, G; > *H. moscheutos* - S; < *H. moscheutos* - WH3]

- * *Hibiscus syriacus* Linnaeus, Rose-of-Sharon, Althaea. Escaped or persistent after cultivation, often spreading by rhizomes; native of e. Asia. Jun-Sep; Aug-Oct. [= C, F, FNA, G, K, Mo, Pa, RAB, S, Va, W, WV]
- * *Hibiscus trionum* Linnaeus, Flower-of-an-hour, Venice Mallow. Fields, roadsides, railroad yards, disturbed areas; native of Europe. Jun-Sep. Reported for Ware County, GA (Carter, Baker, & Morris 2009). [= C, FNA, G, K, Mo, Pa, RAB, Va, W, WH3, WV; = *Trionum trionum* (Linnaeus) Wootton & Standley - S]

8. *Kosteletzkya* C. Presl 1835 (Seashore-mallow)

A genus of about 15-30 species, herbs, of North America, sub-Saharan Africa, and Madagascar. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Alexander (2010)=Y; Blanchard in FNA (in prep.); Blanchard (2008)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003).

Kosteletzkya pentacarpos (Linnaeus) Ledebour, Seashore-mallow, Saltmarsh-mallow, Fen-rose. Brackish to freshwater tidal marshes. Jul-Oct. NY (Long Island) south to s. FL, west to TX; West Indies. Several varieties have often been recognized on the basis of length of hairs and of parts of the flower and inflorescence (see synonymy). While geographic trends are readily apparent, the recognition of infraspecific taxa is made problematic by the non-correlation of various characters. In recent studies, neither Blanchard (2008) nor Alexander (2010) recognize varieties in our flora area. *K. smilacifolia* A. Gray, of peninsular FL, appears to warrant specific status, as treated by Small (1933). It also appears that the Eurasian *K. pentacarpos* represents an early introduction of North American *Kosteletzkya* to the Old World (probably via ship's ballast) and is conspecific; *K. pentacarpos* (based on European material) has nomenclatural priority over *K. virginica* (Blanchard 2008). [= Va; < WH3, Z; < *K. pentacarpa* – FNA, orthographic variant; = *Kosteletzkya virginica* – RAB, orthographic variant; > *Kosteletzkya virginica* var. *aquilonia* Fernald – C, F, G; > *Kosteletzkya virginica* var. *virginica* – C; > *Kosteletzkya virginica* var. *virginica* – F, G; > *Kosteletzkya virginica* var. *althaeifolia* Chapman – F, G; > *Kosteletzkya virginica* (Linnaeus) C. Presl ex A. Gray – GW, K; > *Kosteletzkya althaeifolia* (Chapman) Rusby – S; > *Kosteletzkya virginica* – S; = *Kosteletzkya pentacarpos* var. *pentacarpos* – Y; = *Hibiscus pentacarpos* Linnaeus]

9. *Abelmoschus* Medikus 1787 (Okra, Gumbo)

A genus of about 15 species, herbs, of the Old World tropics. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Bates in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Abelmoschus esculentus* (Linnaeus) Moench, Okra, Gumbo. Frequently cultivated in gardens, rarely persistent or self-seeding the year following; native of Africa. The young capsules are a famous component of southern cooking. [= FNA, K, S, WH3; = *Hibiscus esculentus* Linnaeus – F]

10. *Urena* Linnaeus 1753 (Caesarweed)

A genus of about 6 species, of tropical and subtropical regions. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Urena lobata* Linnaeus, Caesarweed, Bur Mallow, Congo Jute. Roadsides and vacant lots; native of se. Asia. Introduced to se. SC via landscaping plantings, spreading to vacant lots and roadsides (P. McMillan, pers. comm., 2005). [= FNA, GW, K, S, WH3]

11. *Pavonia* Cavanilles 1787

A genus of about 150 species, of tropical and subtropical areas. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Leaves hastate; calyx lobes broadly ovate; carpels unawned; petals white or pink, with a maroon blaze at the base; [introduced species of disturbed habitats] *P. hastata*
 1 Leaves ovate; calyx lobes lanceolate; carpels with 3 apical awns up to 10 mm long; petals yellow; [rare native] *P. spinifex*

* *Pavonia hastata* Cavanilles, Swampmallow. Mesic flatwoods, disturbed areas; native of tropical America. In se. GA (Jones & Coile 1988). [= K, S, WH3]

Pavonia spinifex (Linnaeus) Cavanilles, Gingerbush. Hammocks. E. SC; ne. FL and peninsular FL; Bermuda; Bahamas; West Indies; tropical America. Reported for the vicinity of Charleston, SC on the basis of a specimen collected by Bachman (Chapman 1878). Small (1933) considers this species as likely native, at least in FL. [= K, S, WH3]

12. *Malvaviscus* Fabricius 1759 (Wax-mallow)

A genus of 3-4 species, herbs, of tropical and subtropical areas. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Turner & Mendenhall (1993)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Leaves pubescent on the lower surface.....*M. drummondii*
- 1 Leaves glabrous or nearly so on the lower surface.....*M. penduliflorus*

* *Malvaviscus drummondii* Torrey & A. Gray, Wax-mallow, Turk's-cap Mallow. Cp (FL, GA, NC, SC): disturbed areas; rare, native of TX and n. Mexico. Jul-Oct. First reported for NC and SC by Leonard (1971b). Although Turner & Mendenhall (1993) cite Leonard's specimens as *M. arboreus* var. *arboreus*, they were correctly determined by Leonard as *M. drummondii*. Therefore the attribution of *M. arboreus* var. *arboreus* to NC by Kartesz (1999) is an error. [= S; = *M. arboreus* Dillenius ex Cavanilles var. *drummondii* (Torrey & A. Gray) Schery - K, WH3, Z; = *Hibiscus drummondii* (Torrey & A. Gray) M.J. Young]

Malvaviscus penduliflorus A.P. de Candolle, Turk's-cap Mallow, Mazapan. Cp (FL): disturbed areas; rare, native of tropical America. Apr-Nov. [= K, WH3; = *M. arboreus* Dillenius ex Cavanilles var. *penduliflorus* (A.P. de Candolle) Schery; *Hibiscus*]

13. *Gossypium* Linnaeus 1753 (Cotton)

A genus of about 40-50 species, herbs, shrubs, and trees, of warm temperate to tropical areas. References: Fryxell (1969, 1979)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003).

Identification notes: Agricultural cotton is now a complex set of cultivars, some involving cross-breeding between the two species treated below, and some plants may not be readily identifiable to species.

- 1 Capsule 3-6 cm long, narrowly ovoid to elongate, its surface deeply pitted with oil glands; leaves 3-7-lobed, the central lobe usually > 1.5x as long as wide; stipules 1-5 cm long; corolla deep yellow; long fibers of the seed completely separable from the seed; short fibers of the seed absent or present.....*G. barbadense*
- 1 Capsule 2-3 cm long, ovoid to subglobose, its surface smooth; leaves 3-5-lobed, the central lobe usually 1.0-1.5x as long as wide; stipules 0.5-1.5 (-2.0) cm long; corolla pale yellow; long fibers of the seed firmly attached to the seed; short fibers of the seed present.....*G. hirsutum*

* *Gossypium barbadense* Linnaeus, Sea-island Cotton, Egyptian Cotton, Pima Cotton, Extra-long-staple Cotton. Cp (GA, NC, SC): formerly cultivated, perhaps no longer present in our area; native of South America, Central America, and the West Indies. Probably first domesticated about 5000-5500 years b.p. in coastal Peru and Ecuador. [= K, S, Z]

* *Gossypium hirsutum* Linnaeus, Upland Cotton. Frequently cultivated crop, especially in sandy soils of the Coastal Plain, rarely adventive or a waif; native of Central America, South America, the West Indies, and s. FL. Jul-Sep. Probably first domesticated in the Yucatan Peninsula. [= C, G, Mo, WH3, Z; > *G. hirsutum* var. *hirsutum* - K; = *G. herbaceum* Linnaeus - F, misapplied; > *G. herbaceum* - S; > *G. hirsutum* - S, misapplied]

14. *Abutilon* P. Miller 1754 (Indian-mallow, Indian-hemp)

A genus of about 100-160 species, herbs, of tropical and warm temperate areas. References: Fryxell (2002)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Petals 20-25 mm long, pink to dark red.....*A. hulseanum*
- 1 Petals 10-16 mm long, yellow.....*A. theophrasti*

Abutilon hulseanum (Torrey & A. Gray) Torrey & A. Gray. Disturbed areas; pine flatwoods.. N. peninsular FL (Alachua County) south to s. FL; West Indies; South America. [= WH3; ? *A. pauciflorum* St. Hilaire - S]

* *Abutilon theophrasti* Medikus, Velvetleaf, Pie-marker, Butterprint. Crop fields, roadsides, disturbed areas; native of s. Asia. Jun-Oct. [= F, G, K, Mo, Va, W, WH3, Z; = *A. theophrasti* - Pa, RAB, orthographic variant; = *Abutilon abutilon* (Linnaeus) Rusby - S]

15. *Sida* Linnaeus 1753 (*Sida*)

A genus of about 100 species, shrubs and herbs, of tropical, subtropical, and warm temperate areas. References: Fryxell (1985)=Z; Fuertes, Fryxell, & Jansen (2003); Siedo (1999)=Y; Verdcourt (2004)=X; Bayer & Kubitzki in Kubitzki & Bayer (2003). Key adapted in part from Z.

- 1 Leaves deeply palmately lobed; plants 1-2 (-4) m tall; petals white; [section *Pseudonapaea*, to be removed from *Sida*].....*S. hermaphrodita*
- 1 Leaves unlobed; plants 0.2-1 m tall; petals yellow.
 - 2 Mericarps, styles, and stigmas 5; stem with a spine subtending each leaf; leaves usually truncate to subcordate at the base; [section *Spinosae*].....*S. spinosa*
 - 2 Mericarps, styles, and stigmas (6-) avg. 10 (-14); stem lacking spines subtending the leaves; leaves usually cuneate to rounded (cordate to subcordate in *S. cordata*) at the base.
 - 3 Leaves cordate to subcordate at the base; flowers clustered into a terminal panicle; [section *Cordifoliae*].....*S. cordifolia*
 - 3 Leaves cuneate to rounded at the base; flowers solitary in leaf axils.
 - 4 Leaves narrowly elliptic to linear, (3-) 4-20× as long as wide; [section *Ellipticifoliae*].
 - 5 Pedicels < 2 cm long*S. elliotii* var. *elliotii*
 - 5 Pedicels 2-6 cm long [*S. lindheimeri*]
 - 4 Leaves elliptic-rhombic, mostly 2-3× as long as wide; [section *Sidae*].
 - 6 Leaves and branches borne distichously; stipules usually falcate, several-veined*S. acuta*
 - 6 Leaves and branches borne spirally; stipules linear, 1 (-3)-veined*S. rhombifolia* var. *rhombifolia*

Sida acuta Burman f., Broomweed, Wireweed. Disturbed areas; native of the Tropics, the original northern limit uncertain. Jun-Oct. [= K1, Z; ? *S. carpinifolia* Linnaeus f. – RAB, S; = *S. ulmifolia* P. Miller – K2, WH3, a barely later name]

* *Sida cordifolia* Linnaeus, Malva Blanca. Disturbed sandhills, disturbed hammocks; native of tropical America. [= K, S, WH3, Z]

Sida elliotii Torrey & A. Gray var. *elliotii*, Coastal Plain Sida. Stream banks, sandy openings, pineland pond margins, limestone glades and barrens, mesic hammocks. Jul-Oct. Var. *elliotii* ranges from se. VA south to n. FL, west to LA and north in the interior to c. TN and se. MO. A second variety, var. *parviflora* Chapman, occurs in Peninsular FL, se. TX, and through montane e. Mexico to Guatemala. *S. inflexa*, of se. VA and ne. NC, is alleged to differ as follows: *S. inflexa* with calyx 7-10 mm long, leaves elliptic to narrowly elliptic, 4-20 mm wide, (3-) 4-10× as long as wide (vs. *S. elliotii* var. *elliotii* with calyx 5-7 mm long; leaves narrowly lanceolate to linear, 1.5-7 mm wide, 10-20× as long as wide). [= Mo, Va, Y; < *S. elliotii* – C, G, RAB, S, WH3; >> *S. elliotii* – F, K1, K2, S, Z; > *S. inflexa* Fernald – F, K1, K2, Z; > *S. rubromarginata* Nash – K1, K2, S]

Sida hermaphrodita (Linnaeus) Rusby, Virginia Sida, Virginia-mallow. Sandy or rocky areas along riverbanks. Jul-Aug. C. PA and MD west to s. OH, south to DC, WV, w. VA, and ne. TN; disjunct in nw. OH, ne. IN, and s. MI (where presumably native) and with additional collections from e. MA, NY (Long Island), and s. NJ (where probably adventive) (Spooner et al. 1985). Fryxell (1985) comments that this species is so different from the rest of the genus that "one might plausibly argue that it be elevated to generic rank." A molecular phylogenetic analysis suggests that its affinities are not with *Sida*, but with the South American *Sidasodes* (Fuertes, Fryxell, & Jansen 2003). Spooner et al. (1985) provide a detailed review of the species. [= C, F, G, K, Pa, S, Va, W, WV, Z]

* *Sida lindheimeri* Engelman & A. Gray, Showy Sida. Disturbed areas; native of TX south into Mexico. [= K2, Z]

Sida rhombifolia Linnaeus var. *rhombifolia*, Arrowleaf Sida. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, SC): roadsides, fields, gardens, disturbed areas; common. Apr-Oct. Southeastern North America west to TX, south through Mexico, Central America, and n. South America; West Indies; the original distribution of this species is uncertain. Verdcourt (2004) discusses variation in this taxon, and suggests that "studies throughout the entire range of the species will necessitate recognition of more than one species." He recognizes 6 varieties in e. Africa, aside from the Linnaean var. *rhombifolia* (with type in Jamaica). [= Va, X; < *S. rhombifolia* – C, F, G, K, RAB, S, W, WH3, Z]

* *Sida spinosa* Linnaeus, Prickly Sida, Prickly-mallow, False-mallow. Disturbed areas, wet fields; native of the Neotropics and Paleotropics. Jun-Nov. [= C, F, G, K, Mo, Pa, RAB, S, Va, W, WH3, WV, Z]

16. *Iliamna* Greene 1906 (Globe-mallow)

A genus of 7 species, perennial herbs, of North America. Some authors include *Iliamna* in *Sphaeralcea*. References: Bodo Slotta & Porter (2006)=Y; Porter & Wieboldt in Terwilliger (1991)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Leaves 5-7-lobed, the lobes narrowly triangular, the sinuses acute; flowers odorless; plant to ca. 1 m in height; [sandstone outcrops on ridgetop]..... ***I. corei***
- 1 Leaves 5-7-lobed, the lobes broadly triangular or deltoid, the sinuses obtuse; flowers fragrant; plant to ca. 2.5 m in height; [of river shores and along railroads]..... ***I. remota***

Iliamna corei Sherff, Peters Mountain Mallow. In shallow soil in crevices of outcroppings of Clinch sandstone, near the summit of Peters Mountain. Jun-Aug; Jul-Oct. Endemic to the summit of Peters Mountain, Giles County, VA. The validity of *I. corei* as a species distinct from *I. remota* is supported by Bodo Slotta & Porter (2006). [= F, Va, Y, Z; < *I. remota* – C, G, W; < *I. rivularis* (Douglas ex Hooker) Greene var. *rivularis* – K]

Iliamna remota Greene, Kankakee Globe-mallow. Shores and gravel bars along rivers, and along railroad embankments. Jun-Aug; Jul-Oct. W. VA; nw. IN and ne. IL. Considered by some to be introduced only in our area, however, the VA populations are genetically different than those in IN and IL (Bodo Slotta & Porter 2006). [= F, Va, Y, Z; < *I. remota* – C, G, W (also see *I. corei*); < *I. rivularis* (Douglas ex Hooker) Greene var. *rivularis* – K; = *Sphaeralcea remota* (Greene) Fernald]

17. *Malvastrum* A. Gray 1849 (False-mallow)

A genus of 14 species, herbs, of tropical and warm temperate areas. References: Hill in FNA (in prep.); Bates (1967); Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Leaves linear-lanceolate to lanceolate, 3.5-8× as long as wide; plant 1-5 (-8) dm tall; [of inland calcareous habitats]..... ***M. angustum***
- 1 Leaves broadly lanceolate to broadly ovate, 1.5-2.5× as long as wide; plant (5-) 10-20 dm tall; [of near coastal habitats, mainly FL, waifs elsewhere].
 - 2 Hairs of the stems stellate with 5-12 ascending rays; leaves often shallowly 3-lobed..... ***M. americanum***
 - 2 Hairs of the stems stellate with 2-5 appressed rays; leaves unlobed.
 - 3 Mericarps with minute cusps, none longer than 0.1-0.4 mm long..... ***M. corchorifolium***
 - 3 Mericarps with well-developed sharp cusps, the larger 1-2 mm long..... ***M. coromandelianum***

Malvastrum angustum A. Gray, Hairy False-mallow. Mt (VA): limestone barrens; rare (VA Rare). Jul-Aug; Aug-Oct. KY, w. VA (Lee Co.), and c. TN, west to IA, KS, and OK. Discovered in our area in 1994 by J.C. Ludwig (Fleming & Ludwig 1996). [= FNA, Va; = *Malvastrum hispidum* (Pursh) Hochreutiner – C, K, epithet misapplied; = *Malvastrum angustum* A. Gray – G, S; ? *Sphaeralcea angusta* (A. Gray) Fernald – F; = *Sidopsis hispidum* (Pursh) Rydberg, epithet misapplied; = *Sida hispida* Pursh, misapplied]

Malvastrum americanum (Linnaeus) Torrey. Disturbed areas. Jan-Dec. FL, TX south through Central America to South America; West Indies; also in the Old World tropics. [= FNA, K, WH3]

Malvastrum corchorifolium (Desrousseaux) Britton ex Small. Cp (FL): coastal hammocks; rare. Jan-Dec. FL and AL south to Central America; West Indies. [= FNA, K, WH3]

* ***Malvastrum coromandelianum*** (Linnaeus) Garcke. Cp (FL): coastal hammocks, waif on ballast; rare, native of tropical America (TX to Argentina). Jan-Dec. Northern occurrences, such as in PA (Rhoads & Klein 1993) and NJ (Kartesz 1999), represent old records of ballast waifs. [= FNA, K, WH3]

18. *Napaea* Linnaeus 1753 (Glade-mallow)

A monotypic genus, an herb, of temperate c. North America. References: Bayer & Kubitzki in Kubitzki & Bayer (2003).

Napaea dioica Linnaeus, Glade-mallow. Mt (VA): floodplains; rare. Jun-Aug. PA and IA south to sw. VA and s. IL. The original distribution of this scarce species is difficult to determine. See the interesting discussion of this species' occurrence in VA in Wieboldt et al. (1998). [= C, F, G, K, Va]

19. *Modiola* Moench 1794 (Bristly-mallow)

A monotypic genus, an herb, currently of North America, Central America, and South America (but likely not native in North and Central America). References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Modiola caroliniana* (Linnaeus) G. Don, Bristly-mallow. Lawns, roadsides, disturbed areas, pondshores; probably adventive in our area and originally native to South America. Late Mar-Jun (sometimes later). The original distribution unclear: sometimes considered as ranging as a native from SC south to FL, west to TX, south into the tropics, and adventive northward, but probably be wholly introduced in the southeastern United States. [= C, F, G, GW, K, RAB, S, Va, WH3]

20. *Anoda* Cavanilles 1785 (Anoda)

A genus of about 24 species, herbs, of sw. North America, Central America, and South America. References: Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Anoda cristata* (Linnaeus) Schlechtendal, Spurred Anoda. Disturbed areas; native of sw. United States, Central and South America. Jun-Oct. [= G, K, Mo, RAB, Va, WH3; = *A. crista* – C, orthographic variant; > *A. cristata* var. *cristata* – F; > *A. cristata* var. *brachyanthera* (Reichenbach) Hochreutiner – F]

21. *Alcea* Linnaeus 1753 (Hollyhock)

A genus of about 50-60 species, warm temperate Eurasian (Mediterranean Europe to c. Asia). References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Alcea rosea* Linnaeus, Hollyhock. Roadsides, dumps, frequently cultivated, less commonly escaped or persistent; native of Eurasia. May-Sep. [= FNA, K, Mo, Va; = *Althaea rosea* (Linnaeus) Cavanilles – C, F, G, RAB]

* *Alcea rugosa* Alefeld, Russian Hollyhock. Reported for MD. [= FNA] {not yet keyed}

22. *Althaea* Linnaeus 1753 (Marsh-mallow)

A genus of about 12 species, herbs, Eurasian. References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* *Althaea officinalis* Linnaeus, Marsh-mallow. Marshes; native of Europe. Jul-Sep. The roots of this plant were the original source of the mucilaginous paste used to make marshmallows (which are now made with a synthetic mucilage). [= C, F, FNA, G, K, Pa, Va]

23. *Malva* Linnaeus 1753 (Mallow)

A genus of about 40 species, herbs, of temperate Eurasia and montane Africa. References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003). Key based in part on FNA.

- 1 Upper leaves deeply 5-7-lobed, the sinuses cut over halfway to the middle; petals 20-35 mm long; erect perennial*M. moschata*
- 1 Upper leaves less deeply lobed, rarely to as deep as halfway to the middle; petals 5-30 (-45) mm long; prostrate to erect annual or biennial.
- 2 Epicalyx of 3 oblong-ovate bractlets; petals reddish purple, (12-) 16-30 (-45) mm long; biennial, erect, usually not branched at the base*M. sylvestris*

- 2 Epicalyx of 3 linear or linear to narrowly lanceolate bractlets; petals white or pink, 3-15 mm long; annual, sprawling, usually branched at the base (except *M. verticillata*).
- 3 Bractlets of the epicalyx linear; petals to 3-5 mm long, white to pale lilac *M. parviflora*
- 3 Bractlets of the epicalyx broadly linear to narrowly lanceolate; petals (3-) 5- mm long, pink or purple (rarely white).
- 4 Stems erect, usually > 5 dm long; leaf blades 3-8 (-17) cm long *M. verticillata*
- 4 Stems prostrate to ascending, to 5dm long; leaf blades 1.5-5 cm long.
- 5 Petals 6-13 mm long, about 2× as long as the sepals; mature mericarps slightly roughened or obscurely reticulate *M. neglecta*
- 5 Petals 3-6 mm long, about 1× as long as the sepals; mature mericarps strongly rugose-reticulate *M. pusilla*

* *Malva moschata* Linnaeus, Musk Mallow, Rose Mallow. Pastures, roadsides, barnyards; native of Europe. May-Oct. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WV]
 * *Malva neglecta* Wallroth, Common Mallow, Cheeses. Pastures, roadsides, barnyards; native of Europe. Apr-Nov. [= C, F, FNA, G, K, Mo, Pa, RAB, Va, W, WV; = *M. rotundifolia* – S, rejected because of uncertain application]
 * *Malva parviflora* Linnaeus, Little Mallow, Small-flowered Mallow. Disturbed areas; native of Mediterranean Europe. May-Oct. [= C, F, FNA, G, K, Mo, WH3]
 * *Malva pusilla* Smith, Small Mallow, Dwarf Mallow, Cheeses. Pastures, roadsides, barnyards; native of Europe. May-Sep. [= FNA; = *M. rotundifolia* Linnaeus – C, F, G, K, Pa, rejected because of uncertain application]
 * *Malva sylvestris* Linnaeus, Common Mallow, High Mallow, Cheeses. Pastures, roadsides, barnyards; native of Europe. May-Sep. [= C, FNA, K, Mo, Pa, RAB, S, Va, W; > *M. sylvestris* var. *sylvestris* – F, G; > *M. sylvestris* var. *mauritiana* (Linnaeus) Boissier – F, G]
 * *Malva verticillata* Linnaeus, Whorled Mallow. Disturbed areas; native of e. Asia. Jul-Sep. Reported as an introduction as far south as s. PA (Rhoads & Klein 1993; Rhoads & Block 2007), MD, WV (Strausbaugh & Core 1978), DE, and DC. [= K, Pa, WV; > *M. verticillata* var. *verticillata* – C, F, FNA, G; > *M. verticillata* var. *crispa* Linnaeus – C, F, FNA, G, Mo]

24. *Callirhoe* Nuttall 1821 (Poppy-mallow)

A genus of about 9 species, herbs, of North America. References: Dorr (1990)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003).

- 1 Calyx not subtended by an epicalyx.
- 2 Inflorescence racemose, corymbose, or nearly umbellate; petals white, pink, or mauve; plants ascending, 1.5-8.5 dm tall; mericarps pubescent with simple, appressed hairs *C. alcaeoides*
- 2 Inflorescence paniculate; petals deep red, with a white basal spot; plants erect, 5-20 dm tall; mericarps glabrous *C. pedata*
- 1 Calyx subtended by an epicalyx of 3 bractlets.
- 3 Calyx lobes distinct and divergent in bud; stems decumbent *C. involucrata* var. *involucrata*
- 3 Calyx lobes valvate in bud, forming a point; stems erect, ascending, or decumbent.
- 4 Bractlets of the epicalyx linear, 0.1-1.7 mm wide; peduncles 1-flowered; calyx lobes lanceolate, 7-15.4 mm long; mericarps indehiscent; leaves cordate or ovate in outline, palmately deeply divided into 5-7 lobes *C. papaver*
- 4 Bractlets of the epicalyx obovate, 2.5-4.6 mm wide; peduncles several-flowered; calyx lobes deltoid, 2-5 (-6.5) mm long; mericarps dehiscent; leaves triangular, not lobed or only slightly so *C. triangulata*

Callirhoe alcaeoides (Michaux) A. Gray, Pale Poppy-mallow. Calcareous prairies, glades, and other open habitats. May-Aug. E. NE south through e. and OK to c. TX; disjunct and scattered eastward in IA, MO, AR, nw. LA, IL, s. IN, c. KY, c. TN, and c. AL (Dorr 1990). [= C, F, G, K, Mo, Z; = *Callirrhoë alcaeoides* – S, orthographic variant]

* *Callirhoe involucrata* (Torrey & A. Gray) A. Gray var. *involucrata*, Purple Poppy-mallow. Disturbed areas; adventive from its native range in the midwestern United States. May-Aug. [= C, G, K, Mo, Z; < *C. involucrata* var. *involucrata* – F]

Callirhoe papaver (Cavanilles) A. Gray, Woods Poppy-mallow. Longleaf pine woodlands, dry hammocks, glades, barrens, prairies, forest openings. May-Jul. N. peninsular FL, Panhandle FL, and sw. GA (Carter, Baker, & Morris 2009) west to e. TX and s. AR (Dorr 1990). [= F, G, K, WH3, Z; = *Callirrhoë papaver* – S, orthographic variant]

* *Callirhoe pedata* (Nuttall ex Hooker) A. Gray, Palmleaf Poppy-mallow. Occasionally mowed roadside and adjacent powerline right-of-way, with other species of calcareous prairie habitats, one occurrence recorded to date; plausibly native, but perhaps only adventive from a native range in prairies and glades of the sc. United States (w. AR and e. OK, south to c. TX). Previously misidentified as *C. digitata* Nuttall. [= K, Z]

Callirhoe triangulata (Leavenworth) A. Gray, Sand Poppy-mallow, Clustered Poppy-mallow. Sandhills, sandy scrub, and other dry, open habitats. Jul-Aug. Sc. NC south to GA and n. FL, and west to ec. MS; also sw. WI and ne. IA south to s. IN, s. IL, and se. MO. [= C, F, G, K, Mo, WH3, Z; = *Callirrhoë triangulata* – S, orthographic variant]

252. THYMELAEACEAE A.L. de Jussieu 1789 (Mezereum Family) [in MALVALES]

A family of about 45-53 genera and 500-800 species, mostly trees and shrubs, of cosmopolitan distribution, but especially diverse in Africa (Van der Bank, Fay, & Chase 2002). *Dirca*, *Edgeworthia*, and *Thymelaea* are all in subfamily Thymelaeoideae (Van der Bank, Fay, & Chase 2002). References: Van der Bank, Fay, & Chase (2002); Herber in Kubitzki & Bayer (2003).

- 1 Annual herb, annual; leaf blades < 2 cm long; fruits capsular, indehiscent[*Thymelaea*]
- 1 Perennial shrub; leaf blades > 2 cm long; fruits drupaceous or berrylike.
 - 2 Stems jointed; leaves scattered; stamens exserted*Dirca*
 - 2 Stems not jointed; leaves clustered toward apex of stems; stamens included[*Edgeworthia*]

Dirca Linnaeus 1753 (Leatherwood, Leatherbark)

A genus of 4 species, shrubs, of North America (including Mexico). Our species is most closely related to *D. mexicana* G.L. Nesom & Mayfield (of the Sierra Madre Oriental, Tamaulipas, Mexico) and *D. decipiens* Floden (of e. MS, nw. AR, and sw. MO); the other species is *D. occidentalis* A. Gray of California (Schrader & Graves 2004; Floden, Mayfield, & Ferguson 2009). References: Nevling (1962)=Z; Floden, Mayfield, & Ferguson (2009)=Y.

Dirca palustris Linnaeus, Leatherwood, Leatherbark, Wicopee, Rope-bark. Very rich forests, on slopes or bottomlands, limited to calcareous or mafic rocks such as limestone, calcareous siltstone, calcareous shale, gabbro, or amphibolite, in marl ravine bottoms in the Coastal Plain of VA, in Ashe County NC ascending to 1500 meters elevation. Mar-Apr; Jun-Jul. Widespread in e. North America, from NS and s. QC, south to Panhandle FL, AL, and OK. The curiously flexible twigs and swollen nodes are distinctive. The common names refer to the extraordinary toughness of the tan-brown bark, which was used by native Americans for cordage. [= C, F, G, K, Mo, Pa, RAB, S, Va, W, WH3, WV, Y, Z]

Edgeworthia Meisner 1841 (Paperbush)

A genus of 3 species, shrubs, of e. Asia. References:

* *Edgeworthia papyrifera* Siebold & Zuccarini, Paperbush. Reported for Rabun County, GA by Jones & Coile (1988). [= K; = *E. chrysantha* Lindley]

Thymelaea P. Miller 1754 (Mezereon)

A genus of ca. 30 species, mainly of Mediterranean Europe. References: Nevling & Barringer in FNA (in prep.).

* *Thymelaea passerina* (Linnaeus) Lange, Mezereon. Disturbed areas; native of Europe. AL and MS. [= K]

255. CISTACEAE A.L. de Jussieu 1789 (Rockrose Family) [in MALVALES]

A family of about 8 genera and 180 species, shrubs and herbs, of warm temperate and subtropical areas, centered in Mediterranean Europe. References: Arrington & Kubitzki in Kubitzki & Bayer (2003).

- 1 Shrub, usually much branched from the lower stem; flowers solitary, terminal on the branches; leaves 1-3 mm long and scalelike, or 3-7 mm long and acicular; capsule cylindrical, > 2x as long as wide*Hudsonia*

- 1 Suffrutescent herb, usually little branched from the lower stem (often much branched above, and in *Lechea* with specialized short basal shoots at ground level); flowers axillary or terminal in branching inflorescences; leaves 4-50 mm long, mostly linear, lanceolate, oblong, or elliptic; capsule globose, subglobose, ellipsoid, ovoid, or obovoid, < 2× as long as wide.
- 2 Flowers of 2 types, the chasmogamous with 5 showy yellow petals, the cleistogamous lacking petals; pubescence of the stem stellate; leaves 10-50 mm long, alternate; plants with shoots of one type only, not producing short basal shoots; capsules 1.3-12.5 mm long, the larger capsules of chasmogamous flowers at least 2.0 mm long *Crocanthemum*
- 2 Flowers of 1 type, with 3 inconspicuous, dark red petals; pubescence of the stem simple; leaves 4-15 mm long (to 30 mm long in *L. pulchella* and *L. mucronata*), linear to linear-elliptic, 0.5-4 mm wide (to 13 mm wide in *L. mucronata*), alternate, opposite, or whorled; plants with shoots of two types, the short, prostrate to ascending basal shoots produced late in the season and overwintering; capsules 0.9-1.7 mm long *Lechea*

Crocanthemum Spach 1836 (Frostweed, Rockrose)

A genus of about 24 species, of eastern North America, California, Mexico, and s. South America. The eastern North American species previously attributed to *Helianthemum* are in a clade distinct from the Old World *Helianthemum*, and should be recognized as *Crocanthemum*. References: Sorrie in FNA (in prep.); Daoud & Wilbur (1965)=Z; Wilbur & Daoud (1964)=Y; Arrington & Kubitzki in Kubitzki & Bayer (2003).

Identification notes: The identification of most of our species of *Crocanthemum* requires an understanding of the 2 types of flowers produced. Chasmogamous flowers have showy yellow petals and larger sepals, the distinct portion of the 2 linear outer sepals usually linear, (0.7-) 1.3-5.5 mm long, the distinct portion of the 3 broader inner sepals 2.5-12 (-14) mm long. Cleistogamous flowers lack petals and have smaller sepals, the distinct portion of the 2 linear outer sepals 0.2-3 mm long, the distinct portion of the 3 broader inner sepals 1.5-4.8 mm long. In some species (*C. canadense*, *C. bicknellii*, *C. propinquum*) the chasmogamous flowers open earlier (Apr-Jul) than the cleistogamous (Jun-Sep). In others (*C. corymbosum*, *C. georgianum*, *C. nashii*, *C. rosmarinifolium*), the two types of flowers open at the same time (Mar-Jun) or cleistogamous flowers are nearly always absent (*C. carolinianum*). Capsules from chasmogamous flowers are larger and contain more seeds than those from cleistogamous flowers.

- 1 Leaves 1-4 (-7) mm wide, (5-) 7-15× as long as wide; capsules from chasmogamous flowers 2-3 mm long, with 1-3 (-6) seeds; capsules from cleistogamous flowers 1.3-1.7 mm long, with 1 (-2) seeds *C. rosmarinifolium*
- 1 Leaves 2-20 mm wide, 2-6 (-8)× as long as wide; capsules from chasmogamous flowers (2.4-) 3-9 (-10.5) mm long, with 6-92 (-135) seeds; capsules from cleistogamous flowers 1.5-4.2 mm long, with 1-20 seeds.
 - 2 Leaves basally disposed, the largest and most prominent leaves in a basal rosette; stem leaves 2-5 below those subtending flowers or fruits; stem with spreading trichomes to 2.5 mm long; lower surface of leaves sparsely pubescent, the surface readily visible; cleistogamous flowers usually never produced; capsules 6-9 (-10.5) mm long, with 80-92 (-135) papillate seeds *C. carolinianum*
 - 2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; stem glabrate to densely puberulent (the pubescence not long and spreading); lower surface of leaves densely pubescent, hiding the surface; cleistogamous flowers regularly produced, either intermixed with the chasmogamous or in separate inflorescences; capsules 1.3-7 (-8.5) mm long, with 1-46 papillate, reticulate, or smooth seeds (pebbled to somewhat papillate in *H. nashii*).
 - 3 Ovary and capsule densely stellate pubescent
 - 4 Inflorescence a terminal umbellate cluster; fruit 2-valved *C. arenicola*
 - 4 Inflorescence a thyrsse, the flowers borne in clusters the axils of leaves; fruit 3-valved *C. nashii*
 - 3 Ovary and capsule glabrous.
 - 5 Chasmogamous flowers usually solitary, terminal or subterminal, later overtopped by lateral branches; seeds papillate, 35-46 per chasmogamous capsule, 5-9 (-12) per cleistogamous capsule; chasmogamous capsules (4-) 6-7 (-8.5) mm long, cleistogamous capsules (2-) 2.3-3.0 (-3.8) mm long; upper surface of cauline leaves with some long simple trichomes mixed with the shorter stellate trichomes *C. canadense*
 - 5 Chasmogamous flowers usually (1-) 2-18, rarely overtopped by lateral branches (often 1-3 in cymes in *H. georgianum*); seeds smooth or reticulate, 12-35 per chasmogamous capsule, 1-20 per cleistogamous capsule; chasmogamous capsules (2.4-) 3.5-5.7 mm long, cleistogamous capsules 1.5-4.2 mm long; upper surface of cauline leaves with the shorter stellate trichomes only.
 - 6 Chasmogamous and cleistogamous flowers borne together, the two types of flowers open at the same time (Mar-Jun); seeds smooth, 15-35 per chasmogamous capsule, 4-20 per cleistogamous capsule; outer sepals of the cleistogamous flowers 1.4-3.0 mm long; inner sepals of the cleistogamous flowers 2.0-4.8 mm long; [of the outer Coastal Plain (primarily barrier islands) of NC and SC].
 - 7 Flowers borne in dense many-flowered flat-topped cymes terminating the stem and sometimes also the main branches; capsules of the cleistogamous flowers 1.6-3.8 mm long, with 4-8 (-10) seeds; pedicels and calyx with 0.5-1.5 mm long simple trichomes mixed with the shorter stellate trichomes; outer sepals of both chasmogamous and cleistogamous flowers with an expanded, obtuse, spatulate tip, 0.3-1.2 mm wide *C. corymbosum*
 - 7 Flowers borne in loose 1-7-flowered cymes or racemes at the ends of the main branches; capsules of the cleistogamous flowers 3.0-4.2 mm long, with 12-20 seeds; pedicels and calyx with short stellate pubescence only; outer sepals of both chasmogamous and cleistogamous flowers linear, 0.2-0.5 mm wide *C. georgianum*
 - 6 Chasmogamous and cleistogamous flowers borne in separate inflorescences, the chasmogamous flowers opening earlier (Apr-Jul) than the cleistogamous flowers (Jun-Sep); seeds reticulate, 12-26 per chasmogamous capsule, 1-2 (-3) per cleistogamous capsule; outer sepals of the cleistogamous flowers 0.2-1.2 (-1.8) mm long; inner sepals of the cleistogamous flowers 1.7-2.5 (-3.0) mm long; [of the Mountains and less commonly the Piedmont of NC and VA, and very rarely the Coastal Plain of VA].
 - 8 Stems mostly 20-50 cm tall, clustered, arising from an upright caudex; distinct portion of the outer sepals of the cleistogamous flowers linear, (0.3-) 0.6-1.2 (-1.8) mm long, about 3-5× as long as wide; distinct portion of calyx of the chasmogamous flowers (2.4-) 3.5-4.5 (-8) mm long; cleistogamous capsules sharply 3-angled in cross-section; leaf with broadly cuneate base ...
..... *C. bicknellii*

- 8 Stems mostly 10-30 cm tall, scattered, arising from horizontal elongate rootstocks; distinct portion of the outer sepals of the cleistogamous flowers rudimentary, knob-like, 0.2-0.5 mm long, 1-2× as long as wide; distinct portion of calyx of the chasmogamous flowers (0.7-) 1.5-3.0 (-4.0) mm long; cleistogamous capsules somewhat rounded in cross-section; leaf with narrowly cuneate to attenuate base..... **C. propinquum**

Crocanthemum arenicola (Chapman) Barnhart, Gulf Coast Frostweed. Sandhills, dunes, scrub. Panhandle FL west to s. MS. [= FNA, S; = *Helianthemum arenicola* Chapman – K, WH3, Y, Z]

Crocanthemum bicknellii (Fernald) Janchen, Hoary Frostweed, Plains Frostweed, Plains Sunrose, Bicknell's Hoary Rockrose. Woodlands, glades, barrens, rock outcrops, and grassy balds, to at least 1500m in elevation. Jun-Jul (chasm.), Jul-Sep (cleist.); Aug-Oct. ME and s. ON west to MN and s. MB, south to ne. GA, e. TN, AR, KS, and CO. [= FNA, S, Va; = *Helianthemum bicknellii* Fernald – C, F, G, K, Pa, RAB, W, Y, Z]

Crocanthemum canadense (Linnaeus) Britton, Canada Frostweed, Canada Sunrose. Fields, woodlands, forest edges, roadsides, disturbed areas. Apr-May (chasm.), May-Aug (cleist.); Jun-Oct. NS and ME west to MI and MN, south to e. GA, e. AL, e. TN, KY, and MO. [= FNA, S, Va; = *Helianthemum canadense* (Linnaeus) Michaux – C, F, G, K, Pa, RAB, W, WV, Y, Z; > *Helianthemum canadense* var. *canadense* – F; > *Helianthemum canadense* var. *sabulonum* Fernald – F]

Crocanthemum carolinianum (Walter) Spach, Carolina Sunrose. Fields, savannas, dry pine flatwoods. Apr-May; Jul-Aug. Ne. NC (Dare County) south to s. FL, west to AR and e. TX. [= FNA, S; = *Helianthemum carolinianum* (Walter) Michaux – K, RAB, WH3, Y, Z]

Crocanthemum corymbosum (Michaux) Britton, Pinebarren Sunrose. Openings in maritime forests, dry hammocks. Apr-May; Jul-Oct. E. NC south to s. FL, east to s. MS. [= FNA, S; = *Helianthemum corymbosum* Michaux – K, RAB, WH3, Y, Z]

Crocanthemum georgianum (Chapman) Barnhart, Georgia Sunrose, Georgia Frostweed. Openings in maritime forests, sandy disturbed areas. Apr-May; May-Oct. E. NC south to n. FL, west to c. TX and AR. [= FNA, S; = *Helianthemum georgianum* Chapman – K, RAB, WH3, Y, Z]

Crocanthemum nashii (Britton) Barnhart, Florida Scrub Sunrose, Nash's Sunrose. Xeric sandhills. Endemic to peninsular FL; disjunct in se. NC (New Hanover County). May-Jun; Jul-Sep. [= FNA, S; = *Helianthemum nashii* Britton – K, WH3, Y, Z]

Crocanthemum propinquum (E.P. Bicknell) E.P. Bicknell, Low Frostweed, Creeping Sunrose. Woodlands, rock outcrops, sandy barrens and fields. Jun-Jul (chasm.), Jul-Sep (cleist.); Aug-Oct. Se. MA and se. NH south to w. NC and e. and c. TN. [= FNA, Va; = *Helianthemum propinquum* E.P. Bicknell – C, F, G, K, Pa, RAB, W, Y, Z]

Crocanthemum rosmarinifolium (Pursh) Janchen, Rosemary Sunrose. Sandy roadsides, fields. May-Jun; Jul-Oct. S. NC south to Panhandle FL, west to c. TX; also disjunct in the West Indies. [= FNA, S; = *Helianthemum rosmarinifolium* Pursh – K, RAB, WH3, Y, Z]

Hudsonia Linnaeus 1767 (Sand-heather, Golden-heather, Beach-heather)

A genus of 3 species, dwarf shrubs, of ne. North America. Molecular systematics suggests that *H. tomentosa* may warrant generic status separate from *H. ericoides* and *H. montana*. References: Morse (1979)=Z; Skog & Nickerson (1972)=Y; Arrington & Kubitzki in Kubitzki & Bayer (2003). Key based in part on Morse (1979).

- 1 Pedicels 0-1 (-3) mm long; leaves 1-3 mm long, ovate, densely tomentose, appressed to the stem and overlapping; stamens 8-20; [of the Coastal Plain of VA and ne. NC northward, and Mountains of WV northward]..... **H. tomentosa**
- 1 Pedicels 4-10 mm long; leaves 3-7 mm long, subulate, slightly pubescent, spreading; stamens 10-30; [collectively of the Mountains of NC and Coastal Plain of SC, MD, DE, and NJ].
 - 2 Sepals obtuse to acute, lacking long-acuminate apices; stamens 10-20; leaves 3-4.5 (-6) mm long, sparsely villous; fruits cylindrical; [of the Coastal Plain of SC, MD, DE, and NJ] **H. ericoides**
 - 2 Sepals acuminate, with attenuate apices 1-2 mm long; stamens 20-30; leaves 5-7 mm long, glabrate to sparsely villous; fruits urceolate to campanulate; [of the Mountains of NC] **H. montana**

Hudsonia ericoides Linnaeus, Northern Golden-heather. Sandy flats in longleaf pine sandhills (SC) or Coastal Plain pitch pine barrens (DE). May; Aug. NL (Newfoundland) south to ME, NH, MD (Sipple 2002), and DE; disjunct in nc. SC. The disjunct occurrence in SC has every appearance of being native; it is discussed by Bozeman & Logue (1968). [= C, F, G, K, RAB, S, Z; = *H. ericoides* Linnaeus ssp. *ericoides* – Y]

Hudsonia montana Nuttall, Mountain Golden-heather. Shallow sandy soils on ledges of quartzite or other felsic rocks in the Blue Ridge Escarpment, at various sites along the eastern side of Linville Gorge, Burke County, NC, and disjunct farther south in McDowell County, NC. Jun-early Jul; mid-Jul-Sep. This species is endemic to w. NC; it is almost certainly a southern sibling of the more northern *H. ericoides*. As well as being a very narrowly distributed endemic, *H. montana* is endangered by fire suppression in its habitat. [= K, S, RAB, W, Z; = *H. ericoides* Linnaeus ssp. *montana* (Nuttall) Nickerson & J. Skog – Y]

Hudsonia tomentosa Nuttall, Woolly Beach-heather. Dunes, sand flats, blowouts (in DE, NC, VA), high elevation quartzitic sandstone outcrops (in WV). May-Jul; Aug-Sep. NL (Labrador) west to MB and NT, south to WV (Panther Knob), WI, and MN, and south along the Atlantic Coast from ME to VA and ne. NC (where it reaches its southern limit in Dare County). [= C, F, G, RAB, S, Va, WV, Z; > *H. tomentosa* var. *intermedia* Peck – K2; > *H. tomentosa* var. *tomentosa* – K2; = *H. ericoides* Linnaeus ssp. *tomentosa* (Nuttall) Nickerson & J. Skog – Y]

Lechea Linnaeus 1753 (Pinweed)
[contributed by Bruce A. Sorrie]

A genus of about 18 species, herbs, of North America, the West Indies, and Central America. References: Hodgdon (1938)=Z; Wilbur & Daoud (1961)=Y; Spaulding (2013)=X; Sorrie & Weakley (2007b, c); Lemke (2014)=Q; Arrington & Kubitzki in Kubitzki & Bayer (2003). Key based on X, Y, Z.

Identification notes: *Lechea* is recognizable by its production of numerous basal shoots (usually prostrate) in the late summer and fall. These are evergreen and overwinter, and the fertile stems (usually erect or ascending) are produced from renewed growth of the basal shoots in the spring and summer.

- 1 Flowers and fruits mostly borne in clusters of 2s and 3s (occasionally solitary), usually on bent, reflexed pedicels; [of peninsular FL].....*L. cernua*
- 1 Flowers and fruits borne singly (separate, not fascicled), usually on straight pedicels; [collectively widespread].
 - 2 Pubescence of the stems strongly spreading, not at all appressed; inner sepals carinate (U- or V-shaped in cross-section).
 - 3 Sepals uniformly pubescent; main stem leaves all < 1 cm long; inner broad sepals not bowed or only slightly so; capsule ellipsoid, indehiscent and distinctly exserted from calyx (obviously longer than the sepals); fruit usually 1-seeded; [of peninsular FL] [*L. divaricata*]
 - 3 Sepals sparsely pubescent to glabrous; main stem leaves usually > 1.5 cm long; inner broad sepals distinctly bowed (U or V-shaped in cross-section); capsule subglobose, splitting to 3 valves at maturity and about equal to the calyx in length or slightly exserted; fruit usually with 2-4 seeds; [widespread] *L. mucronata*
 - 2 Pubescence of the stems more or less appressed, usually strongly so; inner sepals shallowly curved in cross section, not carinate.
 - 4 Outer (slender) sepals equaling or exceeding the inner (broad) sepals.
 - 5 Base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx; pedicels averaging 1.5-3.5 mm long *L. racemulosa*
 - 5 Base of the fruiting calyx not conspicuously differentiated in texture and color; pedicels averaging < 1.5 (-2) mm long.
 - 6 Capsule completely enclosed by the sepals, subglobose; leaves averaging > 10× as long as wide; plant short and usually densely bushy, < 3 dm tall *L. tenuifolia*
 - 6 Capsule exserted, usually conspicuously so, the sepals not enclosing the summit of the fruit, ellipsoid to ovate; leaves < 8× (usually < 6×) as long as wide; plant usually taller, 1-7 dm tall.
 - 7 Outer sepals distinctly longer than the inner sepals, usually also longer than the capsule; stem leaves usually whorled, 2 mm wide; plant erect, with short, ascending branches *L. minor*
 - 7 Outer sepals shorter than to barely longer than the inner sepals, shorter than the capsule; stem leaves alternate, rarely wider than 1.5 mm wide; plant ascending (sometimes erect or spreading, branches spreading) *L. sessiflora*
 - 4 Outer (slender) sepals shorter than the inner (broad) sepals.
 - 8 Calyx very sparingly short-pubescent to glabrous; sepals spreading when in fruit; capsule globose and strongly exserted (1/3–1/2 of length); stems clearly woody at base with many wiry, woody branches; [of FL and s. GA] *L. deckertii*
 - 8 Calyx sparsely to densely pubescent; sepals not spreading in fruit or only slightly so; mature capsule either ellipsoid and strongly exserted or oval to globose and included to slightly exserted; stems herbaceous (but can appear woody), dying to the base each year; [collectively widespread].
 - 9 Capsules ellipsoid to narrowly pyriform, normally about 2× as long as wide (or even longer in *L. racemulosa*).
 - 10 Stigmas not persistent; pedicels averaging about 2 mm long; base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx *L. racemulosa*
 - 10 Stigmas persistent, reddish-brown, conspicuous on the summit of the capsule; base of the fruiting calyx not conspicuously differentiated in texture and color *L. sessiflora*
 - 9 Capsules of a broader shape, ovoid, broadly ellipsoid, or subglobose, normally < 1.5× as long as wide.
 - 11 Capsules obviously longer than the sepals.
 - 12 Seeds 3 (-4), relatively narrow and 3-sided, like the sections of an orange; fruiting stems 2.5-5.5 dm tall; panicle ovoid to subcylindric, the principal branches subequal and relatively short; capsules clustered at branch tips, or in a dense row *L. pulchella* var. *pulchella*
 - 12 Seeds 2 (-3), broad and compressed, or obscurely 3-sided; fruiting stems 3.5-8.5 dm tall; panicle subcylindric to subglobose, the principal branches diminishing upward, relatively long; capsules in a sparse row (rarely more dense) *L. pulchella* var. *ramosissima*
 - 11 Capsules almost completely enveloped by the sepals.

- 13 Leaves sparsely pubescent on the midrib and margin only beneath; branches and stems sparsely subappressed-pilose; seeds 4-6..... *L. intermedia* var. *intermedia*
- 13 Leaves appressed pubescent on the surface beneath; branches and stems moderately to densely gray-canescens; seeds 2-3.
- 14 Leaves 1.5-3.0 (-4.0) mm wide; seeds 2-4 (-5); [of coastal dunes, from ne. NC northward].
- 15 Seeds 3-4 (-5), obscurely 3-sided and more-or-less resembling sections of an orange, or 2-sided and convex ventrally; main stems 1.0-2.5 mm diameter, strongly ascending-erect to subprocumbent; sepals strongly tinged maroon, occasionally dull brown; [of s. ME and c. NH south to DE] *L. maritima* var. *maritima*
- 15 Seeds 2 (-3), 2-sided and flattish, concave ventrally; main stems 2.0-4.0 mm diameter, procumbent to ascending; sepals dull brown, occasionally tinged maroon; [of se. DE south to ne. NC] *L. maritima* var. *virginica*
- 14 Leaves 0.5-1.0 mm wide; seeds either 3 or 4-6; [of sandhills and flatwoods, of se. NC southward].
- 16 Seeds 3; fruiting stems 2-4 dm tall; panicles densely congested; mature calyx lobes strongly rusty-colored; [of se. NC south to s. FL and west to s. MS]..... *L. torreyi* var. *congesta*
- 16 Seeds 4-6; fruiting stems 3-5 dm tall; panicles open and loose; mature calyx dark brown; [of ne. FL and Panhandle FL south to s. FL] *L. torreyi* var. *torreyi*

Lechea cernua Small, Scrub Pinweed, Nodding Pinweed. Xeric sands of scrub. N. FL peninsula (Flagler, Lake, and Hernando counties) south to s. FL. [= K1, K2, S, WH3, X, Y, Z]

Lechea deckertii Small, Deckert's Pinweed. Xeric sands of scrub. Sc. GA (Jones & Coile 1988) south to s. FL and e. Panhandle FL. [= K1, K2, S, WH3, X, Y, Z]

Lechea divaricata Shuttleworth ex Britton, Spreading Pinweed. Dry sands of scrub and scrubby flatwoods. May-Oct. N. peninsular FL, just south of our area (Volusia and Citrus counties) south to s. FL. [= K1, K2, S, WH3, X, Y, Z]

Lechea intermedia Leggett ex Britton var. *intermedia*, Pinweed. Dry areas. Jul-Aug; Aug-Oct. *L. intermedia* ranges from NB west to ON, MN, and SK, south to VA, n. OH, n. IL, and nw. NE. Only var. *intermedia* ranges south of New England; 3 other varieties occur in New England and Canada. [= F, K1, K2, Va; < *L. intermedia* - C, G, Pa, W; = *L. intermedia* var. *typica* - Z]

Lechea maritima Leggett ex Britton, Sterns, & Poggenburg var. *maritima*. Coastal dunes. S. ME and c. NH south to DE, and disjunct in n. NB (reports of this species south to GA are apparently based on misidentifications). [= C, F, G, K1, K2, Z]

Lechea maritima Leggett ex Britton, Sterns, & Poggenburg var. *virginica* Hodgdon. Sandy dunes, flats, and blowouts, often associated with *Hudsonia tomentosa*. Jun-Aug; Aug-Sep. var. *virginica* is endemic from se. DE, e. MD, e. VA, and ne. NC. [= C, F, G, K1, K2, Va, Z; < *L. maritima* - S]

Lechea minor Linnaeus, Thymeleaf Pinweed. Savannas, sandhills, pine-oak woodlands, sandy disturbed places. Jul-Aug; Aug-Oct. MA and VT west to s. ON and n. IN, south to c. peninsular FL and LA (primarily Coastal Plain and around the Great Lakes). [= C, F, G, K1, K2, Pa, RAB, S, Va, W, WH3, X, Y, Z; = *L. thymifolia* Michaux]

Lechea mucronata Rafinesque, Hairy Pinweed. Open dry habitats, sandhills, dunes, dry hammocks, woodlands. Jun-Aug; Jul-Oct. NH west to MI and OK, south to c. peninsular FL, TX, and n. Mexico. [= C, K1, K2, Va, W, WH3, X; = *L. villosa* Elliott - RAB, F, G, Pa, S, Y; > *L. villosa* var. *typica* - Z]

Lechea pulchella Rafinesque var. *moniliformis* (E.P. Bicknell) Seymour. Dry sandy soils. Coastal Plain from Nantucket Island, MA south to s. NJ, and disjunct along the Great Lakes (a common phytogeographic pattern, lending credence to the validity of the variety). [= K1, K2; < *L. leggettii* Britton & Hollick - C; = *L. leggettii* var. *moniliformis* (E.P. Bicknell) Hodgdon - F, G, Y, Z] {not yet keyed}

Lechea pulchella Rafinesque var. *pulchella*, Leggett's Pinweed. Dry woodlands, disturbed places. Jun-Aug; Aug-Oct. Var. *pulchella* ranges from e. MA west to ne. OH, south to c. VA. [= K2, Va, X; < *L. leggettii* Britton & Hollick - RAB, C; = *L. leggettii* var. *leggettii* - F, G, Y; < *L. pulchella* var. *pulchella* - K1; < *L. pulchella* - Pa, W; = *L. leggettii* var. *typica* - Z]

Lechea pulchella Rafinesque var. *ramosissima* (Hodgdon) Sorrie & Weakley. Pine-oak woodlands, savannas, flatwoods, sandhills, openings in maritime forests, sometimes in wet, almost peaty soils. Jun-Aug; Aug-Oct. Se. VA south to n. FL and west to e. LA; disjunct in sc. TN (Coffee County). [= K2, Va, WH3, X; < *L. leggettii* Britton & Hollick - RAB, C, G, S; = *L. leggettii* Britton & Hollick var. *ramosissima* Hodgdon - F, G, Y, Z; < *L. pulchella* var. *pulchella* - K1]

Lechea racemulosa Michaux. Dry pine woodlands, other woodlands, forest edges, old fields. Jun-Aug; Jul-Oct. Se. NY west to s. OH and s. IL, south to se. VA, NC, c. GA, and AL, with a few disjunct occurrences west to MO; the range is centered on the Appalachian Mountains. [= C, F, G, K1, K2, Pa, RAB, S, Va, W, WV, Y, Z]

Lechea sessiliflora Rafinesque, Pineland Pinweed. Sandhills and dry flatwoods. Jul-Aug; Aug-Oct. A Southeastern Coastal Plain endemic: s. NC south to s. FL and west to s. MS. [= K1, K2, WH3; = *L. patula* Leggett - RAB, Y, Z; > *L. exserta* Small - S; > *L. patula* - S; > *L. prismatica* Small - S]

Lechea tenuifolia Michaux. Dry oak-pine forests and openings. Jun-Aug; Aug-Oct. S. ME south to SC (mostly inner Coastal Plain and Piedmont), and from s. IN n. IL, s. MN, and NE south to e. LA and c. TX. [= K1, K2, RAB, S, Va, W, WV, X, Y; > *L. tenuifolia* var. *tenuifolia* – C, F, G; > *L. tenuifolia* var. *occidentalis* Hodgdon – Z; > *L. tenuifolia* var. *typica* – Z]

Lechea torreyi Leggett ex Britton var. ***congesta*** Hodgdon ex Lemke. Sandhills and pine flatwoods. Jun-Jul; Aug-Oct. As interpreted by Hodgdon, *L. torreyi* consists of two varieties, the more widespread var. *congesta* ranging from se. NC south to s. FL and west to s. MS (disjunct in Belize), and the more restricted var. *torreyi* restricted to FL. Wilbur & Daoud (1961) express doubt about the validity of the two varieties, but present little evidence for or against their recognition. Lemke (2014) supports varietal status and validates the name. [= Q, Z; < *L. torreyi* – K1, K2, RAB, S, WH3, X, Y]

Lechea torreyi Leggett ex Britton var. ***torreyi***. Sandhills and pine flatwoods. Jun-Jul; Aug-Oct. Ne. FL and Panhandle FL south to s. peninsular FL. [= Q, Z; < *L. torreyi* – K1, K2, S, WH3, X, Y]

258. TROPAEOLACEAE A.L. de Jussieu ex A.P. de Candolle 1824 (Nasturtium Family) [in BRASSICALES]

A family of 1-3 genera and about 90 species, herbs, of Central and South America. References: Tucker in FNA (2010); Sparre & Andersson (1991)=Z; Bayer & Appel in Kubitzki & Bayer (2003).

Tropaeolum Linnaeus 1753 (Nasturtium)

A genus of about 85-90 species, herbs, of tropical Central America and South America (s. Mexico to Peru). References: Tucker in FNA (2010); Sparre & Andersson (1991)=Z.

* ***Tropaeolum majus*** Linnaeus, Nasturtium. Disturbed areas, cultivated and rarely persistent or present around refuse areas; native of tropical America. Weakly persistent in widely scattered areas, as in se. PA (Rhoads & Klein 1993). *T. majus* is considered by Sparre & Andersson (1991) to be a taxon of hybrid origin, not known from wild populations. It is probably not truly established in our area. [= FNA, K, Z] {not keyed}

261. LIMNANTHACEAE R. Brown 1838 (False-mermaid Family, Meadow-foam Family) [in BRASSICALES]

A family of 2 genera and 8 species, herbs, of temperate North America. References: Tucker in FNA (2010); Bayer & Appel in Kubitzki & Bayer (2003).

Floerkea Willdenow 1801 (False-mermaid)

A peculiar and monotypic genus, an annual herb, endemic to North America. References: Tucker in FNA (2010).

Floerkea proserpinacoides Willdenow, False-mermaid. Moist, rich floodplain forests and adjacent rich lower slopes. Apr-Jun. NS and QC west to BC, south to n. VA, TN, and CA. [= C, F, FNA, G, K, Mo, Pa, S, Va, W, WV]

264. **BATACEAE** Martius ex Meisner 1842 (Batis Family) [in BRASSICALES]

A monogeneric family, of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. References: Thorne in FNA (2010); Rogers (1982b); Bayer & Appel in Kubitzki & Bayer (2003).

Batis P. Browne 1756 (Saltwort, Beachwort, Batis)

A genus of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. The only other member of the family and genus is *B. argillicola*, of New Guinea and Australia. References: Thorne in FNA (2010); Rogers (1982b)=Z; Goldblatt (1976); Bayer & Appel in Kubitzki & Bayer (2003).

Batis maritima Linnaeus, Saltwort, Beachwort, Batis, Turtleweed, Vidrillos. Brackish marshes. Jun-Jul; Oct. Se. SC south to s. FL, west to TX, and in Central and South America; West Indies; HI (where apparently introduced). *B. maritima* is alleged (as by FNA and S) to occur as far north as NC, but the documentation is unknown; there is no twentieth century evidence to place *Batis* in NC. [= FNA, GW, K, RAB, S, WH3, Z]

270. **RESEDACEAE** A.P. de Candolle ex Gray 1821 (Mignonette Family) [in BRASSICALES]

A family of about 6 genera and 75-85 species, herbs and shrubs, of the northern hemisphere. References: Martín-Bravo, Tucker, & Daniel in FNA (2010); Kubitzki in Kubitzki & Bayer (2003).

Reseda Linnaeus 1754 (Mignonette)

A genus of about 55-60 species, herbs, of Europe, Mediterranean region, and c. Asia. References: Martín-Bravo, Tucker, & Daniel in FNA (2010).

- 1 Upper and middle leaves deeply pinnately lobed.
 - 2 Carpels 4; petals white; seeds tuberculate [R. alba]
 - 2 Carpels 3; petals yellowish; seeds smooth R. lutea
- 1 Upper and middle leaves entire or finely toothed (sometimes with 1-2 lateral lobes).
 - 3 Sepals and petals 4; seeds smooth; fruits < 7 mm long, crowded, erect to ascending [R. luteola]
 - 3 Sepals and petals 6; seeds rugose; fruits > 7 mm long, well-spaced, pendent.
 - 4 Capsules 7-11 mm long; sepals (in fruit) < 5mm long [R. odorata]
 - 4 Capsules (well-developed) 11-15 mm long; sepals (in fruit > 5 mm long) [R. phyteuma]

* *Reseda alba* Linnaeus, White Mignonette. Disturbed areas, native of the Mediterranean region. Jun-Jul. Naturalized in ne. North America, south to DE and se. PA (Rhoads & Block 2007). [= C, F, FNA, G, K, Pa]

* *Reseda lutea* Linnaeus, Yellow Mignonette, Wild Mignonette. Disturbed areas; native of Europe. Jun-Jul. Naturalized south to DE, se. PA, and sc PA (Rhoads & Block 2007). [= C, F, FNA, G, K, Pa, WV; > *R. lutea* ssp. *lutea* – Mo]

* *Reseda luteola* Linnaeus, Weld, Dyer's Rocket, Yellow-weed. Disturbed areas, formerly cultivated as a dye plant; native of Eurasia. Jun-Jul. Reported from se. and sc. PA (Rhoads & Block 2007) and elsewhere mainly north of our area. [= C, F, FNA, G, K, Pa; > *R. luteola* ssp. *luteola* – Mo]

* *Reseda odorata* Linnaeus, Garden Mignonette. Gardens, garden borders, and disturbed areas, doubtfully established; native of Mediterranean Europe. Jun-Jul. Reported for scattered locations in eastern North America (Kartesz 1999). [= C, FNA, G, K, Pa]

* *Reseda phyteuma* Linnaeus, Corn Mignonette. Disturbed areas; native of Europe. Reported from se. PA (Rhoads & Klein 1993). [= K] {no definite report for our area; not mapped; rejected as a component of our flora}

272. CLEOMACEAE Horaninow 1834 (Cleome Family) [in BRASSICALES]

A family of ca. 18 genera and ca. 175 species, herbs, of mainly tropical and subtropical areas. The Cleomaceae is here circumscribed to include the members of the Capparaceae, subfamily Cleomoideae, following phylogenetic analyses which show this group to be a monophyletic clade more closely related to Brassicaceae than to the rest of Capparidaceae (Hall, Sytsma, & Iltis 2002). The generic classification is still uncertain and in flux (Patchell, Roalson, & Hall 2014). References: Tucker & Vanderpool in FNA (2010); Patchell, Roalson, & Hall (2014); Hall, Sytsma, & Iltis (2002); Judd, Sanders, & Donoghue (1994); Sanders & Judd (2000). Key based on FNA.

- 1 Stamens (8-) 10-27; petals notched or irregularly lacerate at the apex; gynophore (stipe of the pistil, above the calyx) 2-6 mm long; leaflets (1-) 3 *Polanisia*
- 1 Stamens 6 (except 14-25 in *Corynandra*); petals obtuse or acute at the apex; gynophore (stipe of the pistil, above the calyx) 1-80 mm long; leaflets 5-7.
 - 2 Plants with nodal spines (and sometimes with prickles on petioles and leaf veins).
 - 3 Petals 5-10 mm long; gynophore 1-4 mm long; petioles and leaf blades unarmored *Hemiscola*
 - 3 Petals 10-30 mm; gynophore 45-80 mm; petioles and sometimes leaf blades prickly *Tarenaya*
 - 2 Plants lacking nodal spines and lacking prickles on petioles and leaf veins.
 - 4 Filaments fused to lower half of gynophore (evident from scars near the midpoint of the gynophore of fruiting specimens) *Gynandropsis*
 - 4 Filaments free from gynophore
 - 5 Bracts subtending the pedicels minute *Cleoserrata*
 - 5 Bracts subtending the pedicels with expanded blades, sometimes even trifoliolate.
 - 6 Style 0.2-0.8 mm long; gynophore 3-12 mm; stamens 6; sepals fused ¼-½ their length *Cleome*
 - 6 Style 1-1.2 mm long; gynophore obsolete; stamens 14-25; sepals free *Corynandra*

Cleome Linnaeus 1753 (Cleome, Spiderflower)

A genus of about 20 species, annual herbs, of the Old World. References: Tucker in FNA (2010); Iltis (1960)=Z; Kers in Kubitzki & Bayer (2003). [also see *Arivela*, *Cleoserrata*, *Gynandropsis*, *Hemiscola*, and *Tarenaya*]

- 1 Fruits (12-)15-25 mm long; bracts unifoliate; leaflets linear to elliptic *[C. ornithopodioides]*
- 1 Fruits 40-70 mm long; bracts trifoliate; leaflets oblanceolate to rhomboid-elliptic *[C. rutidosperma]*
- * *Cleome ornithopodioides* Linnaeus, Bird Spiderflower. Reported for KY, MD, PA, OH. [= FNA, K2; > *C. iberica* A.P. de Candolle] {add to synonymy}
- * *Cleome rutidosperma* A.P. de Candolle. Disturbed areas; native of tropical Asia and Africa. Reported for SC by FNA. [= FNA, K2, WH3, Z]

Cleoserrata H.H. Iltis 2007

A genus of 5 species, annual herbs, of tropical America. References: Tucker in FNA (2010).

- 1 Petals white, tinged with pink or red; bracts at most 1 mm long, subulate; gynophore 1-2 mm long *[C. serrata]*
- 1 Petals brilliant pink to purple, fading to pink or white (rarely initially white); bracts 3-18 mm long, ovate-cordate; gynophore 30-85 mm long *[C. speciosa]*
- * *Cleoserrata serrata* (Jacquin) H.H. Iltis. Disturbed areas; rare, native of tropical America. Reported as introduced in GA (Kartesz 1999). [= FNA; = *Cleome serrata* Jacquin – K; = *Neocleome serrata* (Jacquin) Small – S]
- * *Cleoserrata speciosa* (Rafinesque) H.H. Iltis. Vacant lots, disturbed areas; native of Mexico. [= FNA; = *Cleome speciosa* Rafinesque – K, WH3]

Corynandra Schrader ex Sprengel 1827

A genus of about 10 species, annual herbs, of Asia and Africa. References: Cochrane & Iltis (2014)=Y; Tucker in FNA (2010); Iltis (1960)=Z.

- * *Corynandra viscosa* (Linnaeus) Cochrane & Iltis *ssp. viscosa*, Wild Caia, Yellow Cleome. Disturbed areas; native of Asia (now pantropical). Reported for sc. GA (Carter, Baker, & Morris 2009; Jones & Coile 1988), se. PA (Rhoads & Klein 1993), and recently from Beaufort County, SC (J. Nelson, pers.comm. 2006). Reported from chrome ore piles in Newport News (Reed 1959); presumably a waif. Our material is the widely weedy *C. viscosa ssp. viscosa*. [= Y; = *Arivela viscosa* (Linnaeus) Rafinesque – FNA; = *Cleome viscosa* Linnaeus – K1, K2, WH3, Z]

Gynandropsis A.P. de Candolle 1824

A genus of 2 species, annual or short-lived perennial herbs, pantropical. References: Tucker in FNA (2010).

* ***Gynandropsis gynandra*** (Linnaeus) Briquet, Spiderwisp, Cat's-whiskers. Fields, disturbed areas; native of Africa. Jun-Oct. [= FNA; = *Cleome gynandra* Linnaeus – K1, K2, RAB, S, WH3, Z]

Hemiscola Rafinesque 1838

A genus of 6 species, annuals, of tropical America. Probably better subsumed within *Tarenaya* (Patchell, Roalson, & Hall 2014).
References: Tucker & Iltis in FNA (2010).

- 1 Leaflets ovate to rhomboidal; sepals lanceolate; anthers 0.9-1.0 mm long; silique 20-40 (-60) mm long.....[*H. aculeata* var. *aculeata*]
- 1 Leaflets obovate; sepals ovate; anthers 0.3-0.5 mm long; silique 15-20 mm long.....[*H. diffusa*]

* ***Hemiscola aculeata*** (Linnaeus) Rafinesque var. *aculeata*, Prickly Spiderflower. Disturbed areas; native of tropical America. Reported for AL. [= FNA; < *Cleome aculeata* Linnaeus – K1, K2' = *Tarenaya species 1*]

* ***Hemiscola diffusa*** (Banks ex A.P. de Candolle) H.H. Iltis. On ballast (Mobile, AL); native of South America. [= FNA; = *Cleome diffusa* Banks ex A.P. de Candolle – K1, K2; = *Tarenaya species 2*]

Polanisia Rafinesque 1819 (Clammy-weed)

A genus of about 6 species, of North America. References: Tucker in FNA (2010).

Identification notes: *Polanisia* has some resemblance to *Warea* (in the Brassicaceae).

- 1 Petals broadest toward the base, barely or not at all clawed; capsule valvate; [of xeric longleaf pine sandhills].....*P. tenuifolia*
- 1 Petals broadest toward the tip, narrowed to a long, distinct claw; capsule opening near the tip; [of floodplains and disturbed soils].
 - 2 Larger petals 3.5-6.5 (-8) mm long; longest stamens 4-10 (-14) mm long..... *P. dodecandra* var. *dodecandra*
 - 2 Larger petals (7-) 8-13 (-16) mm long; longest stamens (9-) 12-30 mm long..... [*P. dodecandra* var. *trachysperma*]

Polanisia dodecandra (Linnaeus) A.P. de Candolle var. *dodecandra*, Clammy-weed, Spider-weed. Sandy or gravelly floodplains along the James River in VA, also introduced on railroad ballast. Jun-Sep. VT west to MB, south to MD, w. VA, TN, AR, and OK. Apparently both native and introduced in our area. [= C, Va; = *P. dodecandra* ssp. *dodecandra* – FNA, K, Pa; = *P. graveolens* Rafinesque – F, S, WV; = *P. dodecandra* – G; < *P. dodecandra* – W; = *Cleome dodecandra* Linnaeus; = *Cleome graveolens* (Rafinesque) Schultes f.]

* ***Polanisia dodecandra*** (Linnaeus) A.P. de Candolle var. *trachysperma* (Torrey & A. Gray) Iltis. Disturbed areas; apparently adventive from w. North America. Jun-Sep. [= C; = *P. dodecandra* ssp. *trachysperma* (Torrey & A. Gray) Iltis – FNA, K, Pa; = *P. trachysperma* Torrey & A. Gray – F, G, S, WV]

Polanisia tenuifolia Torrey & A. Gray, Slenderleaf Clammy-weed, Pineland Catchfly. Sandhills. E. GA (several counties from the SC border) (Jones & Coile 1988) south to s. FL, west to s. MS. [= FNA, K, WH3; = *Aldenella tenuifolia* (Torrey & A. Gray) Greene – S]

Tarenaya Rafinesque 1838

A genus of about 33 species, annual herbs, of South America. *Hemiscola* should perhaps be merged (Patchell, Roalson, & Hall (2014). References: Tucker & Iltis in FNA (2010). Key based on FNA.

- 1 Sepals, ovary, and fruit glabrous; fruit about as long as gynophore; petals deep pink or purple (infrequently white)..... *T. hassleriana*
- 1 Sepals, ovary, and fruit glandular-pubescent; fruit longer than gynophore; petals white or greenish-white [*T. spinosa*]

- * **Tarenaya hassleriana** (Chodat) H.H. Iltis, Cleome, Spiderflower, Pinkqueen. Gardens, disturbed areas, sandbars, riverbanks, persistent and self-seeding from cultivation as an ornamental; native of South America. Jun-Nov. The petals in bud are a pale pink to nearly white, they turn a deep pink upon opening late in the day; by morning the petals have once again faded to a pale pink or white. [= FNA, Va; = *Cleome hassleriana* Chodat – C, K, WH3; ? *C. houtteana* Schlechtendal – RAB, misapplied; < *C. spinosa* Jacquin – F, G, misapplied; = *C. hasslerana* – Pa, orthographic variant; < *Neocleome spinosa* (Jacquin) Small – S]
- * **Tarenaya spinosa** (Jacquin) Rafinesque. Disturbed areas; native of South America. [= FNA; < *Neocleome spinosa* (Jacquin) Small – S; = *Cleome spinosa* Jacquin – WH3]

273. BRASSICACEAE Burnett 1835 or **CRUCIFERAE** A.L. de Jussieu 1789 (Mustard Family) [in BRASSICALES]

A family of about 340 genera and 3400 species, annuals, perennials, shrubs, and rarely trees and vines, of cosmopolitan distribution (but most diverse in the temperate Northern Hemisphere). References: Al-Shehbaz in FNA (2010); Rollins (1993); Al-Shehbaz (1984, 1985a, 1985b, 1986, 1987, 1988a, 1988b); Appel & Al-Shehbaz in Kubitzki & Bayer (2003).

- Tribe a. Alyseae: *Alyssum*, Berteroa
- Tribe aa. Anastaticae: Lobularia
- Tribe b. Anchonieae: Matthiola

- 1 Plants in flower
 - 2 Trichomes of plant absent or, if present, unbranched **Key A**
 - 2 Trichomes of plant present with some or most or all branched **Key B**
- 1 Plants in fruit.
 - 3 Trichomes of plant absent or, if present, unbranched **Key C**
 - 3 Trichomes of plant present with some or most or all branched **Key D**

Key A – plants in flower, trichomes of plant absent or, if present, unbranched

- 1 Flowers yellow.
 - 2 Leaves auriculate, sagittate, or amplexicaul at base.
 - 3 Upper stems glaucous.
 - 4 Petals 6-30mm, clawed; [tribe *Brassicaceae*] **Brassica**
 - 4 Petals 2-4mm, not clawed; [tribe *Isatideae*] **Isatis**
 - 3 Upper stems green; [tribe *Cardamineae*].

- 5 Stems angular distally; blooming Apr to early Jun *Barbarea*
 5 Stems not angular distally; blooming Apr to Oct *Rorippa*
- 2 Leaves not clasping at base.
 6 Petals with contrasting dark veins; [tribe *Brassicaceae*] *Raphanus*
 6 Petals mostly uniform in color.
 7 Ovaries and young fruits 2-segmented; petals 6-30 mm; [tribe *Brassicaceae*] *Brassica*
 7 Ovaries and young fruits unsegmented; petals 1-8 mm.
 8 Stigmas distinctly 2-lobed; [tribe *Sisymbrieae*] *Sisymbrium*
 8 Stigmas entire, rarely indistinctly 2-lobed; [tribe *Cardamineae*] *Rorippa*
- 1 Flowers white, pinkish, lavender, or blue.
 9 Leaves strictly basal or basal and cauline and auriculate.
 10 Plants with only basal leaves or cauline leaves much reduced.
 11 Plants annual; flowers zygomorphic; petals 0.5-2.5 mm long; [tribe *Iberideae*] *Teesdalia*
 11 Plants annual or perennial; flowers actinomorphic; petals absent, rudimentary, or to 16 mm long; [tribe *Cardamineae*] *Cardamine*
- 10 Plants with some well-developed cauline leaves.
 12 Ovaries and young fruits ovate, orbicular or cordate.
 13 Ovules 1 per ovary; [tribe *Calepineae*] *Calepina*
 13 Ovules >1 per ovary.
 14 Ovules 2 (rarely 4) per ovary; [tribe *Lepidieae*] *Lepidium*
 14 Ovules 6-16 per ovary.
 15 Leaves mostly entire; plants not fetid; [tribe *Noccaeeae*] *Noccaea*
 15 Leaves often toothed; plants fetid; [tribe *Thlaspidiae*] *Thlaspi*
- 12 Ovaries and young fruits linear.
 16 Plants aquatic or semi-aquatic; rooting at nodes; [tribe *Cardamineae*] *Nasturtium*
 16 Plants terrestrial, though sometimes growing partially submerged; not rooting at nodes.
 17 Flowers blue, rarely pink or white; petals 12-32 mm; [tribe *Brassicaceae*] [*Orychophragmus*]
 17 Flowers white, sometimes pink; petals <16 mm.
 18 Cauline leaves sessile; [tribe *Boechereae*] *Boechera*
 18 Cauline leaves usually petiolate; [tribe *Cardamineae*] *Cardamine*
- 9 Leaves basal and cauline but not auriculate.
 19 Plants aquatic, rooting at nodes; [tribe *Cardamineae*].
 20 Submersed leaves dissected into filiform segments *Rorippa*
 20 Leaves not dissected into filiform segments *Nasturtium*
- 19 Plants terrestrial, though sometimes growing partially submerged; not rooting at nodes.
 21 Stamens 2 or 4.
 22 Ovaries and young fruits linear; [tribe *Cardamineae*] *Cardamine*
 22 Ovaries and young fruits ovate, orbicular or cordate.
 23 Flowers actinomorphic; filaments not appendaged; [tribe *Lepidieae*] *Lepidium*
 23 Flowers zygomorphic; filaments appendaged; [tribe *Iberideae*] *Teesdalia*
- 21 Stamens 6.
 24 Petals 15-30 mm long; [tribe *Lunarieae*] *Lunaria*
 24 Petals rarely to 20 mm long.
 25 Ovaries and young fruits 2-segmented; [tribe *Brassicaceae*] *Cakile*
 25 Ovaries and young fruits unsegmented.
 26 Ovaries and young fruits ovate, orbicular or cordate; [tribe *Lepidieae*] *Lepidium*
 26 Ovaries and young fruits linear.
 27 Petals with contrasting dark veins; [tribe *Brassicaceae*] *Raphanus*
 27 Petals mostly uniform in color.
 28 Leaves smelling of garlic when crushed, reniform or cordate, dentate; [tribe *Thlaspidiae*] *Alliaria*
 28 Leaves not smelling of garlic, rarely reniform or cordate, with margins various.
 29 Cauline leaves sessile; [tribe *Boechereae*] *Boechera*
 29 Cauline leaves usually petiolate; [tribe *Cardamineae*].
 30 Base of plant usually glabrous; seeds not winged *Cardamine*
 30 Base of plant pubescent; seeds winged *Planodes*

Key B – plants in flower, trichomes of plant present with some or most or all branched

- 1 Flowers yellow.
 2 Trichomes sessile, medafixed; [tribe *Erysimeae*] *Erysimum*
 2 Trichomes not sessile and medafixed.
 3 Leaves 2-3× pinnately dissected; [tribe *Descurainieae*] *Descurainia*
 3 Leaves not pinnately dissected.
 4 Cauline leaves not auricled; [tribe *Alysseae*] *Alyssum*
 4 Cauline leaves auricled; [tribe *Camelineae*].
 5 Annual; petals yellow to pale yellow, fading whitish *Camelina*
 5 Perennial or biennial; petals creamy or pale yellow *Turritis*
- 1 Flowers white, pinkish, lavender, or blue.
 6 Leaves only basal; [tribe *Arabideae*] *Draba*
 6 Leaves cauline (and often basal as well).
 7 Ovaries and young fruits not linear.

- 8 Cauline leaves sessile and auriculate; [tribe *Camelineae*].
 9 Petals pale yellow, fading to whitish *Camelina*
 9 Petals wholly white *Capsella*
 8 Cauline leaves petiolate or sessile and not auriculate.
 10 Petal apices strongly bifid; [tribe *Alysseae*] *Berteroa*
 10 Petal apices rounded, retuse, or emarginate.
 11 Leaves 2-3× pinnately dissected; [tribe *Descurainieae*] *Descurainia*
 11 Leaves not pinnately dissected.
 12 Ovules 1-2 per ovary; [tribe *Alysseae*] *Alyssum*
 12 Ovules 4 or more per ovary; [tribe *Arabideae*] *Draba*
 7 Ovaries and young fruits linear.
 13 Cauline leaves sessile and auriculate.
 14 Young fruits ascending to descending; [tribe *Boechereae*] *Boechera*
 14 Young fruits ascending to erect or appressed to rachis.
 15 Stems pubescent or less commonly glabrous above, not glaucous; [tribe *Arabideae*] *Arabis*
 15 Stems glabrous and glaucous above; [tribe *Camelineae*] *Turritis*
 13 Cauline leaves usually petiolate and if sessile, not auriculate.
 16 Stigmas 2-lobed, petals > 15 mm long; [tribe *Hesperideae*] *Hesperis*
 16 Stigmas entire, petals < 6 mm long.
 17 Leaves pinnately divided or lobed.
 18 Leaves lyrate pinnatifid; [tribe *Camelineae*] *Arabidopsis*
 18 Leaves 2-3× pinnately dissected; [tribe *Descurainieae*] *Descurainia*
 17 Leaves entire or toothed.
 19 Sepals 1-2.5 mm; of disturbed habitats; seeds uniseriate; [tribe *Camelineae*] *Arabidopsis*
 19 Sepals 0.7-1.2 mm or >2.5 mm; of disturbed and natural habitats; seeds biseriata; [tribe *Arabideae*] *Draba*

Key C – plants in fruit, trichomes of plant absent or, if present, unbranched

- 1 Fruits silicles (< 3× as long as wide).
 2 Fruits 2-segmented *Cakile*
 2 Fruits unsegmented.
 3 Fruits 2 cm or more wide *Lunaria*
 3 Fruits < 2 cm wide.
 4 Fruits with 20 or more seeds *Rorippa*
 4 Fruits with 16 or fewer seeds.
 5 Fruits with 1 seed.
 6 Plants 5 dm or more tall *Isatis*
 6 Plants < 5 dm tall *Calepina*
 5 Fruits with 2-16 seeds.
 7 Fruits with 2 seeds *Lepidium*
 7 Fruits with more than 2 seeds.
 8 Leaves pinnately lobed *Teesdalia*
 8 Leaves not lobed.
 9 Plants not fetid; seeds usually smooth, yellowish to medium brown *Noccaea*
 9 Plants fetid; seeds striate or aveolate, dark gray to dark brown or black *Thlaspi*
 1 Fruits siliques (> 3× as long as wide).
 10 Fruits indehiscent or breaking into 1-seeded segments.
 11 Fruits not segmented, 1-seeded *Isatis*
 11 Fruits segmented, usually more than 1-seeded.
 12 Styles obsolete; plants glabrous; of beaches *Cakile*
 12 Styles 1-5 mm; plants pubescent; inland *Raphanus*
 10 Fruits dehiscent, more than 1-seeded.
 13 Fruits segmented *Brassica*
 13 Fruits unsegmented.
 14 Fruits latiseptate (flattened parallel to the septum).
 15 Replums strongly flattened; fruit valves dehiscing elastically, coiled *Cardamine*
 15 Replums terete; fruit valves not dehiscing elastically or coiled.
 16 Seeds not winged *Barbarea*
 16 Seeds winged at least distally.
 17 Cauline leaves pinnatifid or pinnatisect *Planodes*
 17 Cauline leaves entire or dentate *Boechera*
 14 Fruits terete or 4-angled.
 18 Plants aquatic or semi-aquatic; rooting at nodes *Nasturtium*
 18 Plants terrestrial, though rarely growing partially submersed; not rooting at nodes.
 19 Leaves smelling of garlic when crushed, reniform or cordate, dentate *Alliaria*
 19 Leaves not smelling of garlic when crush, rarely reniform or cordate, dentate or not.
 20 Seeds biseriata *Rorippa*
 20 Seeds uniseriate.
 21 Stigma lobes obviously decurrent *[Orychophragmus]*
 21 Stigma lobes sometimes distinct but not decurrent.

- 22 Lower cauline leaves entire or dentate *Boechea*
- 22 Lower cauline leaves pinnatifid or pinnatisect.
 - 23 Terminal leaflet lobes nearly entire to crenate or undulate..... *Barbarea*
 - 23 Terminal leaflet lobes sharply toothed or cut *Sisymbrium*

Key D – plants in fruit, trichomes of plant present with some or most or all branched

- 1 Fruits siliques (<3× as long as wide).
 - 2 Leaves basal only *Draba*
 - 2 Plant with some cauline leaves.
 - 3 Cauline leaves sessile; blade bases auriculate, sagittate, or amplexicaule.
 - 4 Fruits obdeltoid *Capsella*
 - 4 Fruits narrowly pyriform to pyriform or broadly obovoid *Camelina*
 - 3 Cauline leaves petiolate or sessile and not auriculate.
 - 5 Leaves 2-3× pinnately dissected *Descurainia*
 - 5 Leaves not pinnately dissected..
 - 6 Fruits with 1-2 seeds *Alyssum*
 - 6 Fruits with 4 or more seeds.
 - 7 Seeds winged or margined *Berteroa*
 - 7 Seeds without differentiated margin *Draba*
 - 1 Fruits siliques (>3× as long as wide).
 - 8 Leaves basal only *Draba*
 - 8 Plant with some cauline leaves.
 - 9 Cauline leaves sessile; blade bases auriculate, sagittate, or amplexicaule.
 - 10 Seeds biseriate *Turritis*
 - 10 Seeds uniseriate.
 - 11 Siliques straight, slightly ascending to strictly erect or appressed; seeds 0.6-1.7 mm long; basal leaves <8 cm long *Arabis*
 - 11 Siliques curved or straight, ascending to descending, seeds either <1mm long or <2.5 mm long, basal leaves 2.5-20 cm long *Boechea*
 - 9 Cauline leaves petiolate or sessile and not auriculate.
 - 12 Trichomes sessile, medafixed *Erysimum*
 - 12 Trichomes not sessile and medafixed.
 - 13 Leaves 2-3× pinnately dissected *Descurainia*
 - 13 Leaves not 2-3× pinnately dissected..
 - 14 Stigmas 2-lobed with lobes connivent and decurrent to erect *Hesperis*
 - 14 Stigmas entire and capitate, rarely slightly 2-lobed.
 - 15 Seeds biseriate *Draba*
 - 15 Seeds uniseriate *Arabidopsis*

***Abdra* E.L. Greene 1900 (Draba)**

A genus of about 2 species, annual herbs, of se. North America. This genus has been segregated from *Draba* on molecular and morphological grounds (Jordon-Thaden et al. 2010; Al-Shehbaz 2012). References: Al-Shehbaz, Windham, & Elven in FNA (2010); Al-Shehbaz (2012)=X; Rollins (1993)=Z; Al-Shehbaz (1987)=Y; Koch & Al-Shehbaz (2002).

- 1 Pubescence of the lower leaves of stalked cruciform trichomes; siliques densely pubescent; fruiting branches congested, mostly < 1 cm long and appearing almost glomerate; seeds 4-8 per silique, each 1.0-1.5 mm long *A. aprica*
- 1 Pubescence of the lower leaves of sessile cruciform trichomes; siliques glabrous; fruiting branches elongate; seeds 8-15 per silique, each 0.5-0.8 mm long *A. brachycarpa*

Abdra aprica (Beadle) Al-Shehbaz, M. Koch, & Jordon-Thaden, Flatrock Draba, Open-ground Whitlow-grass, Sun-loving Draba, Granite Whitlow-wort. Shallow soils around and under *Juniperus virginiana* on granitic flatrocks and amphibolite outcrops. Mar-Apr; Apr-May. Ozark highlands of AR, MO, and OK; disjunct on granitic flatrocks in SC and GA. [= X; = *Draba aprica* Beadle – RAB, FNA, G, K, S, W, Y, Z]

Abdra brachycarpa (Nuttall ex Torrey & A. Gray) E.L. Greene, Short-fruited Draba. Granitic flatrocks, open places (fields, roadsides, woodland margins, disturbed areas). Feb-Apr; Mar-May. VA west to IN and KS, south to FL and TX. [= X; = *Draba brachycarpa* Nuttall ex Torrey & A. Gray – RAB, C, F, FNA, G, K, S, Va, W, WH3, Y, Z]

Alliaria Heister ex Fabricius 1759 (Garlic Mustard)

A genus of 2 species, annual or biennial herbs, of Eurasia and n. Africa. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1988b)=Y.

* *Alliaria petiolata* (Bieberstein) Cavara & Grande, Garlic Mustard, Hedge Garlic. Moist forests in bottomlands and on slopes; native of Europe. Apr-Jun; May-Jun. This species has become a noxious weed in ne. United States, invading undisturbed moist forests. Dhillon & Anderson (1999) report on physiological characteristics that make *Alliaria* a successful invader in shaded situations. [= C, FNA, Il, K, Pa, RAB, Va, W, Y, Z; = *Alliaria officinalis* Andrzejowski ex Bieberstein – F, G]

Alyssum Linnaeus 1753 (Alyssum, Madwort)

A genus of 170-190 species, herbs, of Eurasia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1987)=Y.

* *Alyssum alyssoides* (Linnaeus) Linnaeus, Yellow Alyssum. Roadsides, disturbed areas, especially in dry, barren soil; native of Europe. May-Sep. [= C, F, FNA, G, Il, K, Pa, Va, W, Z; > *A. alyssoides* var. *alyssoides* – Y]

Arabidopsis Heynhold (Mouse-ear Cress)

A genus of about 9 species, annual and perennial herbs, circumboreal and most diverse in Eurasia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z, Al-Shehbaz (1988a)=Y; O'Kane & Al-Shehbaz (1997)=X; O'Kane & Al-Shehbaz (2003); Koch, Bishop, & Mitchell-Olds (1999); Koch & Al-Shehbaz (2002). Key based in part on O'Kane & Al-Shehbaz (1997).

- 1 Fruit strongly flattened; petals 6-10 mm long; [native perennial, of calcareous and mafic rock outcrops] *A. lyrata* ssp. *lyrata*
- 1 Fruit terete; petals 2-4 mm long; [alien annual, of disturbed, weedy sites] *A. thaliana*

Arabidopsis lyrata (Linnaeus) O'Kane & Al-Shehbaz ssp. *lyrata*, Lyreleaf Rockcress, Dwarf Rockcress. Rock crevices in or thin soil around calcareous or mafic rock outcrops. Mar-Jun; Apr-Sep. The species is widespread in n. North America and e. Asia, south in e. North America to NC, e. TN, and n. GA; ssp. *lyrata* is strictly North American, from NY west to AK, south to NC, GA (?), TN, MS, MB, SK, AB, and BC. The GA record is an old and indefinite collection ("northern Georgia") by Vasey. [= FNA, Il, Va, X; < *Arabis lyrata* Linnaeus – C, F, G, K, Pa, RAB, S, W, X; = *A. lyrata* var. *lyrata* – Y, Z]

* *Arabidopsis thaliana* (Linnaeus) Heynhold, Mouse-ear Cress. Disturbed areas, fields, roadsides, lawns; native of Eurasia. Mar-May. *Arabidopsis thaliana* has sometimes been referred to as the white mouse of the vascular plant world, having been very extensively used as an experimental plant. [= C, F, FNA, G, Il, K, Pa, RAB, S, Va, W, X, Y, Z]

Arabis Linnaeus 1753 (Rockcress)

The circumscription of *Arabis* is in flux; there is increasing evidence that the broad circumscription traditionally employed in most North American floras includes discordant elements. Based on molecular phylogenetic studies and morphology, the members of *Arabis* (as circumscribed most broadly) in our area should be divided into at least 4 genera, as follows: *Arabidopsis*, *Arabis* sensu stricto, *Boechea*, and *Turritis*. References: Al-Shehbaz in FNA (2010); Hopkins (1937)=Z; Rollins (1993)=Y; Al-Shehbaz (1988a)=X; Al-Shehbaz (2003)=Q; Koch, Bishop, & Mitchell-Olds (1999); Koch & Al-Shehbaz (2002). [also see *Arabidopsis*, *Boechea*, *Turritis*]

- 1 Plants matted from a branching caudex, perennial; [cultivated and rarely persistent or escaped] [*A. caucasica*]
- 1 Plants unbranched, biennial; [native to our area].
 - 2 Petals 6-9 mm long; siliques 2.5-7 cm long.
 - 3 Siliques (4.5-) 5-7 cm long; [endemic to w. GA and c. AL] *A. georgiana*
 - 3 Siliques 2.5-4 cm long; [of se. PA, c. PA, and IN south to NC, e. TN, and AL] *A. patens*
 - 2 Petals 3-5 mm long; siliques 3-6 cm long; [collectively known from NC, TN, VA, and northward and westward from those states].
 - 4 Stem pubescence primarily appressed and of 2-armed or dolabriform hairs *A. pycnocarpa* var. *adpressipilis*
 - 4 Stem pubescence primarily spreading and of simple hairs *A. pycnocarpa* var. *pycnocarpa*

* *Arabis caucasica* Willdenow, Wall Rockcress, Gray Rockcress. Cultivated, possibly persistent (not definitely documented for our area and rejected as a component of the flora). May-Jun. Introduced in KY and TN (Kartesz 1999, 2010) and IL (Mohlenbrock 2014). [= FNA, II, K1, Y; ? *A. alpina* - K2; ? *A. alpina* Linnaeus var. *albida* (Steven ex Jacquin) Paoletti] {not definitely documented as naturalized in our area}

Arabis georgiana R.M. Harper, Georgia Rockcress. Nutrient-rich streambanks and rock outcrops. Apr-May; May-early Jul. Endemic to n. and sw. GA and c. AL. It differs from our other species by the following combination of characters: fruits 5-7 cm long, borne appressed to ascending, leaves with bifurcate, trifurcate, or stellate hairs. See Patrick, Allison, & Krakow (1995). [= FNA, K1, K2, Y, Z]

Arabis patens Sullivant, Spreading Rockcress. Thin soils around calcareous or dolomitic outcrops, very rarely in nutrient-rich seepage from mafic rocks. May-Jun; Jun-Aug. Irregularly distributed, primarily in the sedimentary rock Appalachians, from se. PA, c. PA, and IN south to NC, e. TN, and AL. In NC, this species occurs over marble at Blowing Spring, Nantahala River Gorge, Swain County, at various sites over calcareous sedimentary rocks in the Hot Springs Window, near Hot Springs, Madison County, and in nutrient-rich seepage from amphibolite at Chimney Rock, Rutherford County. [= C, F, FNA, G, K1, Pa, RAB, S, Va, W, X, Y, Z; = *Boechea patens* (Sullivant) Al-Shehbaz - K2, Q]

Arabis pycnocarpa M. Hopkins var. *adpressipilis* M. Hopkins, Slender Rockcress, Hairy Rockcress. Thin soils near outcrops of mafic or other rock weathering to nutrient-rich soils. Apr-May; May-Jun. Var. *adpressipilis* ranges from OH to IL, south to c. TN and AR; disjunct east of the mountains in NC. *A. pycnocarpa* is related to but clearly specifically distinct from *A. hirsuta* (Linnaeus) Scopoli of Europe and *A. eschscholtziana* Andrzejowski of w. North America. [= FNA, II, Va, Z; = *A. hirsuta* (Linnaeus) Scopoli var. *adpressipilis* (M. Hopkins) Rollins - C, F, G, Pa, X, Y; < *A. hirsuta* var. *pycnocarpa* (M. Hopkins) Rollins - K1, K2; > *A. ovata* Michaux - S, misapplied]

Arabis pycnocarpa M. Hopkins var. *pycnocarpa*, Slender Rockcress. Thin soils near outcrops of calcareous soils. May-Jun. QC west to AK, south to e. and sw. PA (Rhoads & Block 2007), AR, and AZ, primarily west of the Blue Ridge. Reports of this taxon from GA (Fernald 1950, Kartesz 1999, Hopkins 1937) are based on material collected by A.W. Chapman near Rome, and later described as *Arabis georgiana*. See discussion under *A. pycnocarpa* var. *adpressipilis*. [= FNA, II; = *A. hirsuta* (Linnaeus) Scopoli var. *pycnocarpa* (M. Hopkins) Rollins - C, F, G, Pa, X, Y; < *A. hirsuta* (Linnaeus) Scopoli var. *pycnocarpa* - K1, K2; = *A. pycnocarpa* M. Hopkins var. *typica* - Z]

Armoracia Gaertner, B. Meyer, & Scherbius 1800 (Horseradish)

A genus of 3 species, perennial herbs, of Eurasia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Y; Al-Shehbaz (1988a)=X.

- 1 Plant aquatic; stem submersed or prostrate; fruit unilocular [see *Rorippa aquatica*]
- 1 Plant terrestrial; stem erect; fruit bilocular *A. rusticana*

* *Armoracia rusticana* P. Gaertner, B. Meyer, & Scherbius, Horseradish. Persistent after cultivation, sometimes spreading (generally only very locally, but sometimes greater distances, probably by water transport of rhizomes); native of Europe. Apr-Jul. The root is grated to provide the condiment. [= C, G, II, K1, K2, Pa, RAB, X, Y, Z; =? *A. lapathifolia* Gilibert - F; = *A. armoracia* (Linnaeus) Britton - S]

Armoracia rusticana

Barbarea R. Brown 1812 (Winter-cress, Creasy Greens)

A genus of about 20 species, biennial and perennial herbs, semicosmopolitan. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

- 1 Basal leaves with 4-10 pairs of lateral lobes; siliques 4.5-7 cm long; pedicels 1.2-1.8 mm thick..... ***B. verna***
- 1 Basal leaves with 1-4 pairs of lateral lobes; siliques 1.5-3 cm long; pedicels 0.5-1.0 mm thick..... ***B. vulgaris***

* ***Barbarea verna*** (P. Miller) Ascherson, Early Winter-cress. Fields, disturbed areas; native of Eurasia. Mar-Jun. Formerly a commonly used winter and spring green in rural parts of our area, still available canned as “Dry Land Cress”. [= C, F, FNA, G, II, K1, K2, Pa, RAB, Va, W, Y, Z; = *Campe verna* (P. Miller) Heller – S]

* ***Barbarea vulgaris*** W. Aiton, Common Winter-cress, Yellow Rocket. Fields, disturbed areas; native of Eurasia. Apr-Jun. Additional study is needed of the various infraspecific or specific taxa recognized by some authors (particularly Europeans) in what is here considered a variable species; see Stace (2010), for instance. [= C, FNA, K1, K2, Pa, Va, W, Y, Z; > *B. vulgaris* var. *vulgaris* – F, G, II, RAB; > *B. vulgaris* var. *arcuata* (Opiz ex J. & C. Presl) Fries – F, G, II, RAB; > *Campe barbarea* (Linnaeus) W. Wight ex Piper – S; > *Campe stricta* (Andrzejowski) W. Wight ex Piper – S, misapplied; > *B. vulgaris* var. *sylvestris* Fries]

Barbarea verna

Barbarea vulgaris

Berteroa A.P. de Candolle 1821 (Hoary Alyssum)

A genus of about 5 species, annual or perennial herbs, of Europe and the Middle East. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1987)=Y.

* ***Berteroa incana*** (Linnaeus) A.P. de Candolle, Hoary Alyssum. Disturbed areas; native of Europe. May-Aug. [= C, F, FNA, G, II, K1, K2, Pa, Va, Y, Z]

Berteroa incana

Boechera Löve & Löve 1975 (Rockcress)

A genus of ca. 110 species, primarily in w. and n. North America, most diverse in CA, with a few species in e. North America and e. Asia. References: Al-Shehbaz & Windham in FNA (2010); Alexander et al. (2013)=V; Windham & Al-Shehbaz (2007); Hopkins (1937)=Z; Rollins (1993)=Y; Wieboldt (1987); Al-Shehbaz (1988a)=X; Al-Shehbaz (2003)=Q; Koch, Bishop, & Mitchell-Olds (1999); Koch & Al-Shehbaz (2002).

- 1 Pedicels of flowers or fruits deflexed..... ***B. canadensis***
- 1 Pedicels of flowers or fruits erect, ascending, or spreading.
 - 2 Mature fruits < 4 cm long; stems branched or simple at the base.
 - 3 Stem leaves (most of them) < 5 mm wide; stems branched at the base [see *Arabidopsis lyrata* ssp. *lyrata*]
 - 3 Stem leaves (most of them) > 8 mm wide; stems simple at the base.
 - 4 Lower cauline leaves glabrous or sparsely pubescent on the upper surface; fruits erect and appressed, 3-5 cm long [see *Arabis*]

- 4 Lower cauline leaves hirsute or strigose on the upper surface; fruits widely ascending or spreading. 1.5-4 cm long.
- 5 Petals 6-9 mm long; fruiting pedicels 10-16 mm long; mature fruits 2.5-4 cm long; pubescence of the lower leaf surface simple; seeds winged [see *Arabis patens*]
- 5 Petals 2-5 mm long; fruiting pedicels 2-10 (-13) mm long; mature fruits 1.5-3 cm long; pubescence of the leaf surface stellate; seeds wingless.
- 6 Petals 2-3 mm long, white to cream; fruiting pedicels 2-3.5 mm long; siliques 1.5-3 cm long; pubescence of the upper leaf surface simple *B. dentata*
- 6 Petals 3-5 mm long, pink or purplish; fruiting pedicels 5-10 (-13) mm long; siliques 1.5-2 cm long; pubescence of the upper leaf surface stellate *B. perstellata*
- 2 Mature fruits > 4 cm long; stems generally simple at the base.
- 7 Fruits erect, appressed against the stem, the fruiting inflorescence < 2 cm in diameter.
- 8 Mature fruits terete, (4-) 7-9.5 cm long; basal leaves 5-12 cm long, stellate pubescent; cauline leaves 4-12 cm long; pubescence of the stem mostly of spreading, simple hairs [see *Turritis*]
- 8 Mature fruits flat, 1.5-10 cm long; basal leaves 2-8 cm long, nearly glabrous; cauline leaves 1-4 cm long; pubescence of the stem mostly of appressed, forked hairs.
- 9 Mature fruits 4-10 cm long, 1.5-2.5 mm wide, with 2 rows of seeds in each locule *B. stricta*
- 9 Mature fruits 1.5-7 cm long, 0.7-1.1 mm wide, with 1 row of seeds in each locule [see *Arabis*]
- 7 Fruits ascending to spreading (not erect and appressed to the stem), the fruiting inflorescence > 4 cm in diameter.
- 10 Cauline leaves not at all auricled or sagittate-clasping at the base.
- 11 Calyx 2.9-4.8 mm long; flowering Apr-May; plant unbranched or with 1-3 branches (sometimes more if the main stem damaged), the inflorescence thus a raceme or slightly paniculate; mature fruits 5.2-9.8 cm long; seeds 64-80 per silique; seeds with wing 0.2-0.5 mm wide *B. burkii*
- 11 Calyx 2.0-3.3 mm long; flowering mid Jul-Sep; plant with numerous branches (well-developed plants usually with at least 10), the inflorescence thus a diffuse panicle; mature fruits 4.3-8.0 cm long; seeds 30-42 per silique; seeds with wing 0.1-0.2 mm wide *B. serotina*
- 10 Cauline leaves auricled or sagittate-clasping at the base.
- 12 Basal leaves subentire to serrate or sinuate-serrate; petals white, to 5 mm long, equaling or slightly surpassing the sepals; longest cauline leaves usually 8-18 cm long; plant glaucous *B. laevigata*
- 12 Basal leaves sharply serrate-dentate to strongly lacinate or lyrate-pinnatifid; petals creamy-white, to 8 mm long, about 2× the length of the sepals; longest cauline leaves usually 3-5 cm long; plant green or red-tinged *B. missouriensis*

Boechea burkii (Porter) Windham & Al-Shehbaz, Burk's Smooth Rockcress. Limestone barrens, shale barrens, and other dry, rocky habitats. Apr-May. E. and c. PA south to e. WV, ne. TN, and w. NC in the sedimentary rock Appalachians. RAB assigns this plant (as *Arabis laevigata* var. *burkii*) to NC based on somewhat aberrant specimens from high elevation cove forests; these are better assigned to *B. laevigata*. Hopkins (1937), however, cites a specimen from Hot Springs, Madison County, NC, an area with plausible habitats (dry sedimentary rock woodlands, shale barrens). [= FNA, K2, Va; = *Arabis laevigata* (Muhlenberg ex Willdenow) Poiret var. *burkii* Porter – C, K1, Pa, W, X, Y; < *Arabis laevigata* var. *burkii* – F, G, Z; < *Arabis burkii* (Porter) Small – S, misapplied in part; < *Boechea laevigata* – Q; = *Borodinia burkii* (Porter) P.J. Alexander & Windham – V]

Boechea canadensis (Linnaeus) Al-Shehbaz, Sicklepod, Canada Rockcress. Thin soils around rock outcrops, especially mafic or calcareous, and in dry to mesic, nutrient-rich, often rocky woodlands over mafic or calcareous rocks. May-Jul; Jun-Aug. QC and ND south to Panhandle FL and TX. [= FNA, II, K2, Q, Va, WH3; = *Arabis canadensis* Linnaeus – C, F, G, K1, Pa, RAB, S, W, X, Y, Z; = *Borodinia canadensis* (Linnaeus) P.J. Alexander & Windham – V]

Boechea dentata (Rafinesque) Al-Shehbaz & Zarucchi. Nutrient-rich alluvial and river bluff forests. Apr-May. NY west to MN, south to n. VA (along the Potomac River), nc. TN (Chester, Wofford, & Kral 1997), and AR. [= FNA, K2, Q, Va; = *Borodinia dentata* (Rafinesque) P.J. Alexander & Windham – V; = *Arabis shortii* (Fernald) Gleason – C, G, K1, Pa, X, Y; = *Arabis perstellata* E.L. Braun var. *shortii* Fernald – F; = *Arabis dentata* (Torrey) Torrey & A. Gray – S, Z (name preoccupied); > *Arabis shortii* var. *phalacrocarpa* (M. Hopkins) Steyermark; > “*B. dentata* var. *dentata*” – II; > “*B. dentata* var. *phalacrocarpa* (M. Hopkins) Steyermark” – II, not validly published]

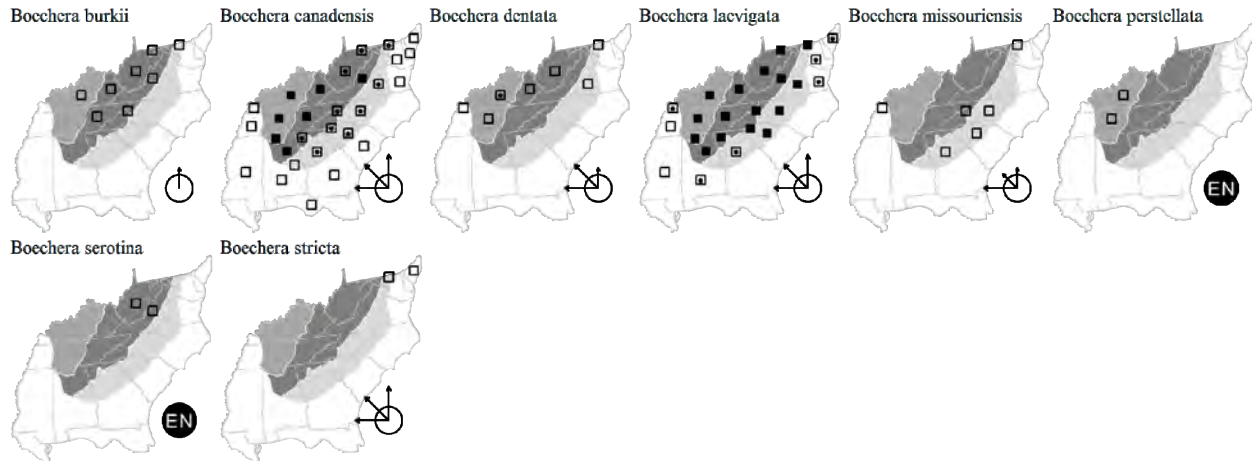

Boechea laevigata (Muhlenberg ex Willdenow) Al-Shehbaz, Common Smooth Rockcress. Rocky woodlands and forests, rock outcrops, especially mafic or calcareous, but also on more acidic substrates, rarely also in bottomlands. Apr-May; May-Jun. ME west to MN and SD, south to GA, AL, MS, AR, OK, and CO. Of our *Boechea B. laevigata* is the most common, being the least limited to calcareous substrates. [= FNA, II, K2, Va; = *Arabis laevigata* (Muhlenberg ex Willdenow) Poiret var. *laevigata* – C, F, G, K1, Pa, W, X, Y, Z; > *Arabis laevigata* var. *laevigata* – RAB; > *Arabis laevigata* var. *burkii* – RAB, misapplied; >> *Arabis burkii* (Porter) Small – S, misapplied in part; > *Arabis laevigata* – S; < *Boechea laevigata* – Q; = *Borodinia laevigata* (Muhlenberg ex Willdenow) P.J. Alexander & Windham – V]

Boechea missouriensis (Greene) Al-Shehbaz, Missouri Rockcress. Thin soil around outcrops of metamudstone, diabase, or granite (generally on mafic or rich granitic substrates). Apr-May; May-Jun. ME to WI, south to KY, AR, and OK; disjunct eastward in NC, SC, and GA. [= FNA, II, K2, Q; = *Arabis missouriensis* Greene – C, K1, Pa, X, Y; = *Arabis laevigata* var. *missouriensis* – RAB; > *Arabis missouriensis* var. *missouriensis* – F; > *Arabis viridis* Harger var. *viridis* – G, Z; = *Borodinia missouriensis* (Greene) P.J. Alexander & Windham – V]

Boechea perstellata (E.L. Braun) Al-Shehbaz. Calcareous bluffs. Apr-May. Apparently endemic to KY and c. TN (Chester, Wofford, & Kral 1997). [= FNA, K2, Q; = *Arabis perstellata* – K1, Y; = *Borodinia perstellata* (E.L. Braun) P.J. Alexander & Windham – V; > *Arabis perstellata* E.L. Braun var. *perstellata* – X; > *Arabis perstellata* E.L. Braun var. *ampla* Rollins – X]

Boechea serotina (Steele) Windham & Al-Shehbaz, Shale Barren Rockcress. Shale barrens. Mid-Jul-Sep. Endemic to Devonian and Ordovician shales of w. VA and e. WV. Wieboldt (1987) has clarified the taxonomy of this species and *A. laevigata* var. *burkii*; also see Porter & Wieboldt (1991) for further discussion. [= FNA, Va; = *Arabis serotina* Steele – C, K, X, Y; < *Arabis laevigata* var. *burkii* – F, G, Z; < *Boechea laevigata* – Q; = *Borodinia serotina* (Steele) P.J. Alexander & Windham – V]

Boechera stricta (Graham) Al-Shehbaz. {habitat}. Apr-Jun. NL (Labrador) and AK south to NJ, DE, OH, IL, NM, AZ, and CA. [= FNA, II, Q; = *Arabis drummondii* A. Gray – C, F, G, K, Y; > *A. drummondii* A. Gray var. *typica* – Z; = *Boechera drummondii* (A. Gray) Löve & Löve, illegitimate name]

Brassica Linnaeus 1753 (Mustard, Turnip, Rape, Cabbage, Collard Greens, Kale, Broccoli, Cauliflower, Kohlrabi, Rutabaga, Bok-Choy, Chinese Cabbage, Brussels Sprouts)

A genus of about 40 species, herbs, of the Old World. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z. [also see *Erucastrum*, *Sinapis*]

- 1 Upper cauline leaves petiolate, or sessile and cuneate.
 - 2 Pedicels and siliques widely spreading to divaricately ascending; siliques 2-4 cm long, terete or nearly so; [section *Rapa*] ***B. juncea***
 - 2 Pedicels and siliques erect and appressed to the rachis; siliques 1-2 cm long, more-or-less 4-angled; [section *Melanosinapis*] ***B. nigra***
- 1 Upper cauline leaves auriculate, slightly to strongly clasping the stem; [section *Rapa*].
 - 3 Petals mostly 18-25 mm long; beak of the silique (3-) 4-11 mm long [***B. oleracea***]
 - 3 Petals mostly 6-16 mm long; beak of the silique (5-) 7-15 (-22) mm long.
 - 4 Petals 10-18 mm long, pale yellow; beak of the silique usually (5-) 7-10 (-16) mm long; plant usually glaucous; siliques 5-10 cm long ***B. napus***
 - 4 Petals 6-10 (-11) mm long, deep yellow; beaks of the silique usually (8-) 10-15 (-22) mm long; plant usually green; siliques 3-7 cm long ***B. rapa* var. *rapa***

* ***Brassica juncea*** (Linnaeus) Czernajew, Leaf Mustard, Brown Mustard, Indian Mustard, Mustard Greens, Chinese Mustard. Fields, disturbed areas; native of Eurasia. Apr-Jun. This species is apparently a recently derived polyploid ($n=18$) of *B. nigra* ($n=8$) and *B. rapa* ($n=10$). The seeds of this species are one source of table mustard; other components include *Brassica nigra* and *Sinapis alba*. [= C, G, II, K, Pa, RAB, Va, W, WH3, Y, Z; > *B. juncea* – S; > *B. japonica* (Thunberg) Siebold ex Miquel – S]

* ***Brassica napus*** Linnaeus, Rutabaga, Rape, Canola, Colza, Swede. Fields, disturbed areas; native of Eurasia. May-Jul. This species is apparently a recently derived polyploid ($n=19$) of *B. oleracea* ($n=9$) and *B. rapa* ($n=10$). The seeds of this species are the source of 'canola' oil, the name coined by marketers from 'Canadian' + 'oil' + 'low' + 'acid' to avoid the negative connotation of the ancient name 'rape'. [= II, K, W, WH3, Y, Z; < *B. napus* – RAB (also see *B. rapa*)]

* ***Brassica nigra*** (Linnaeus) W.D.J. Koch, Black Mustard, Charlock. Fields, disturbed areas; native of Eurasia. May-Aug. The seeds of this species are one source of table mustard; other species used include *B. juncea* and *Sinapis alba*. [= C, F, G, II, K, Pa, S, Va, WH3, Y, Z; = *Sinapis nigra* Linnaeus]

* ***Brassica oleracea*** Linnaeus. Fields, gardens, disturbed areas, sometimes weakly persistent from cultivation; native of Eurasia. Commonly cultivated in our area in fields and gardens in a variety of forms, including *B. oleracea* var. *acephala* A.P. de Candolle (Collard Greens, Kale), *B. oleracea* var. *capitata* Linnaeus (Cabbage), *B. oleracea* var. *italica* Plenck (Broccoli), *B. oleracea* var. *botrytis* Linnaeus (Cauliflower), *B. oleracea* var. *gemmifera* Zenk (Brussels Sprouts), and *B. oleracea* var. *gongylodes* Linnaeus (Kohlrabi). [= FNA, II, K]

* ***Brassica rapa*** Linnaeus var. *rapa*, Turnip, Bird's-rape, Field Rape, Field Mustard, Bok-choy, Chinese Cabbage. Fields, disturbed areas; native of Europe. Mar-Jun. *B. rapa* is cultivated in a variety of forms, *B. rapa* var. *chinensis* (Linnaeus) Kitam. (Bok-choy or Pak-choi) and *B. rapa* var. *amplexicaulis* Tanaka & Ono (Chinese Cabbage). [= K, Va, WH3; < *B. rapa* – C, II, Pa, Y, Z; < *B. napus* – RAB; > *B. rapa* – G; > *B. campestris* Linnaeus – G, S]

Braya Sternberg & Hoppe 1815

A genus of about 24 species, perennial (rarely annual) herbs, of alpine and arctic Eurasia and North America. References: Al-Shehbaz & German (2014)=Z; Harris in FNA (2010); Rollins (1993)=Z.

* **Braya humilis** (C.A. Meyer) B.L. Robinson *ssp. humilis*. Pasture; native of boreal and arctic North America and Asia. [= FNA, Z; < *B. humilis* – C, K1, Z; < *B. humilis* var. *leiocarpa* (Trautvetter) Fernald – F, G; < *Neotorularia humilis* (C.A. Meyer) Hedge & J. Léonard]

Bunias Linnaeus 1753 (Warty-cabbage)

A genus of 3 species, herbs, of Eurasia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

- 1 Plant an annual; cauline leaves < 5 cm long; siliques 10-12 mm long, more-or-less straight, 4-winged, spiny; seeds 3-4 per silique..... [B. erucago]
- 1 Plant a perennial; cauline leaves > 10 cm long; siliques 5-10 mm long, usually curved, not winged, verrucose; seeds 1-2 per silique..... [B. orientalis]

* **Bunias erucago** Linnaeus, Southern Warty-cabbage. Disturbed areas; native of Europe. Apr-Jun. [= C, FNA, K2, Z]
 * **Bunias orientalis** Linnaeus, Warty-cabbage, Turkish Rocket. Disturbed areas; native of Europe. May-Jul. [= C, F, FNA, G, K2, Pa, Z]

Cakile P. Miller 1754 (Sea Rocket)

A genus of about 7-8 species, annual herbs, primarily of coastal North America, Europe, and North Africa. References: Rodman in FNA (2010); Rollins (1993)=Z; Rodman (1974)=Y; Al-Shehbaz (1985b)=X.

Identification notes: The siliques of *Cakile* are divided near their middle by an abscission zone into two halves, each with a single seed: the upper abscises and disperses by water or wind, the lower remains attached to the parent plant. The size of the two segments and the contour of the abscised surface remaining on the lower segment are important taxonomic characters.

- 1 Lower silique segment with 2 opposite lateral horns or wings on the sides prolonged upward into sharp triangular wedges, concave in between; petals lavender (rarely white), 8-14 mm long, 3-6 mm wide; most of the leaves deeply pinnatifid into 6-9 lobes..... *C. maritima* *ssp. maritima*
- 1 Lower silique segment without lateral horns, triangular wedges absent to 1.5 mm high; petals white (rarely lavender), 4-10 mm long, 1.4-3 mm wide; most of the leaves with a few to many irregular teeth (or pinnatifid in *C. lanceolata* *ssp. pseudoconstricta*).
 - 2 Infructescences usually >20 cm long; [of the Gulf Coast]..... *C. lanceolata* *ssp. pseudoconstricta*
 - 2 Infructescences 10-20 cm long; [collectively widespread].
 - 3 Siliques 3-4 mm wide, the beak conical and acute at the apex; [of the Gulf Coast]..... *C. constricta*
 - 3 Siliques 5-9 mm wide, the beak somewhat flattened and typically rather blunt; [of the Atlantic Coast].

- 4 Upper fruit segment 7-15 mm long, 4-angled (to weakly 8-ribbed); articulating surface of lower fruit segment flat to concave and with 2 (-6) small teeth projecting upward or the sides prolonged upward into 2 opposite triangular wedges; [of NC northward to NL (Labrador)]..... *C. edentula*
- 4 Upper fruit segment 12-20 mm long, 8-ribbed; articulating surface of lower fruit segment flat (to slightly convex or concave) and without teeth; [of NC southward to St. Lucie County, FL]..... *C. harperi*

Cakile constricta Rodman, Gulf Coast Sea Rocket. Beaches, coastal sands. Feb-Oct. Panhandle FL west to TX. [= FNA, GW, K1, K2, X, Y, Z; < *C. lanceolata* (Willdenow) O.E. Schulz – S, WH3]

Cakile edentula (Bigelow) Hooker, Northeastern Sea Rocket. Beaches, at or near the wrack line. May-Jun (-Oct). NL (Labrador) south to NC; introduced in various other shores around the world, including w. North America and Australia. See *C. harperi* for discussion of the relation between these taxa. [= Pa, RAB, S, Va; = *C. edentula* var. *edentula* – C, F, G; = *C. edentula* ssp. *edentula* – GW; = *C. edentula* ssp. *edentula* var. *edentula* – FNA, K1, K2, X, Y, Z]

Cakile geniculata (B.L. Robinson) Millspaugh, Gulf Coast Sea Rocket. Beaches. [= K2] {add to synonymy; not yet keyed}

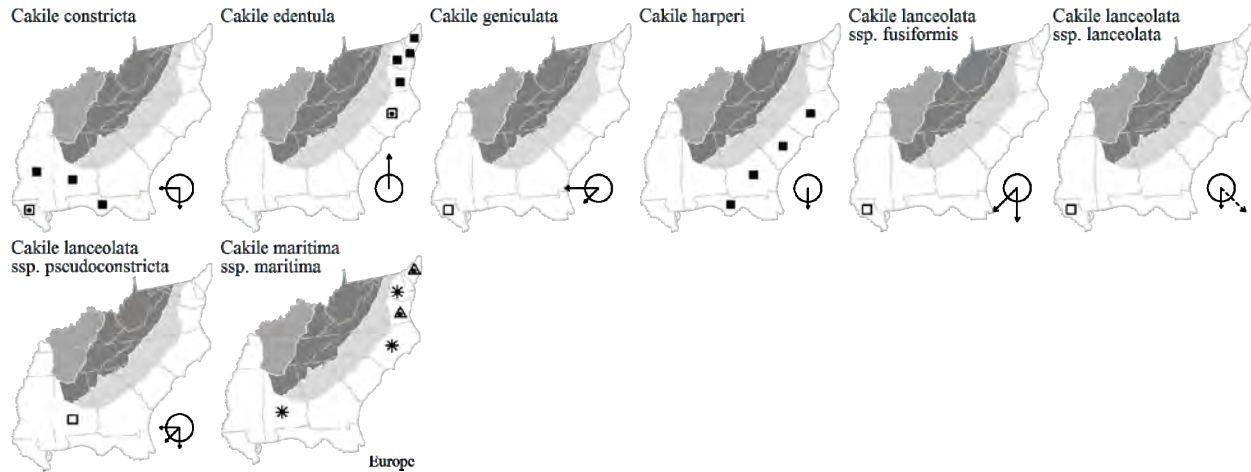

Cakile harperi Small, Southeastern Sea Rocket. Beaches, at or near the wrack line. May-Jun (-Oct). A Southeastern Coastal Plain endemic: e. NC south to the east coast of c. peninsular FL. Rodman (1974) and most authors since have treated *C. harperi* as *C. edentula* ssp. *harperi* (Small) Rodman. Rodman further treats the Great Lakes and ne. United States coastal populations (respectively) as *C. edentula* ssp. *edentula* var. *lacustris* Fernald and *C. edentula* ssp. *edentula* var. *edentula*. Rodman points out the morphologic distinctions between the three taxa, the chemical differences between "edentula" and "harperi," and the rarity or absence of intermediates in areas of pairwise overlap between the 3 entities. The geographic / morphologic pattern is not clinal, but is rather a sharp step function, with an overlap in the distribution of (and rare hybridization between) two largely distinct taxa. The few intermediates can be interpreted as hybrids or very limited and local introgression between otherwise distinct (though related) taxa. *C. harperi* shows greater chemical similarity to *C. constricta* Rodman and *C. lanceolata* (Willdenow) O.E. Schultz than to *C. edentula*, and also shows some morphologic affinities with these more southern taxa. For these reasons I prefer the simplicity of treating the three taxa as binomial species. [= RAB, S; = *C. edentula* (Bigelow) Hooker ssp. *harperi* (Small) Rodman – FNA, GW, K1, K2, WH3, X, Y, Z]

Cakile lanceolata (Willdenow) O.E. Schulz ssp. *fusiformis* (Greene) Rodman. {not yet keyed}

Cakile lanceolata (Willdenow) O.E. Schulz ssp. *lanceolata*. {not yet keyed}

Cakile lanceolata (Willdenow) O.E. Schulz ssp. *pseudoconstricta* Rodman. Beaches, coastal sands. Jan-Dec. FL, AL, LA, TX, Tamaulipas. [= FNA, K1, K2, X, Y, Z; < *C. lanceolata* – GW, S, WH3]

* *Cakile maritima* Scopoli ssp. *maritima*, European Sea Rocket. Beaches, at or near the wrack line; native of Europe. The other subspecies are also European but are apparently not introduced in our area. The NC location was on ballast at Wilmington, and is apparently not persistent. VA locations are, however, well-established. [= FNA, Va, X, Y; < *C. maritima* – C, F, G, K1, K2, Z; = *C. cakile* (Linnaeus) Karstens – S]

Calepina Adanson 1763 (Ball Mustard)

A genus of 2 species, annual herbs, of c. and sw. Asia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* *Calepina irregularis* (Asso) Thellung, White Ball Mustard. Fields, disturbed areas; native of Eurasia. Apr. Reported for e. MD by Knapp et al. (2011). [= C, FNA, K1, K2, RAB, Va, Y, Z]

Calepina irregularis

***Camelina* Crantz 1762 (Gold-of-pleasure, False-flax)**

A genus of 6-8 species, herbs, of se. Europe and the Middle East. References: Al-Shehbaz & Beilstein in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1987)=Y.

- 1 Siliques 4-7 mm long; leaves and stem rough-hairy, the stellate trichomes exceeded by simple trichomes (which are 1-2 mm long)..... *C. microcarpa*
- 1 Siliques 7-12 mm long; leaves and stem glabrate to sparsely hairy, the stellate trichomes as long as the few simple trichomes..... *C. sativa*

* ***Camelina microcarpa*** Andrzejowski ex A.P. de Candolle, Lesser Gold-of-pleasure. Fields, disturbed areas; native of Eurasia. Apr-May. [= C, F, FNA, G, K1, K2, Pa, RAB, S, Va, W, Y, Z]

* ***Camelina sativa*** (Linnaeus) Crantz, Gold-of-pleasure, False-flax. Fields, disturbed areas; native of Eurasia. Apr-May. [= C, F, FNA, G, Pa, RAB, S, Va, WV, Y, Z; > *C. sativa* ssp. *sativa* – K1, K2]

***Capsella* Medikus 1792 (Shepherd's Purse)**

A genus of 1-4 species, annual or biennial herbs, of Europe. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1986)=Y; Stace (2010)=X.

* ***Capsella bursa-pastoris*** (Linnaeus) Medikus, Common Shepherd's Purse. Fields, roadsides, gardens, disturbed areas; native of Europe. Mar-Jun. *C. rubella* Reuter, Pink Shepherd's Purse, is sometimes distinguished (as by F, G, Stace 2010), and occurs in our area. It is alleged to be diploid (vs. tetraploid), to have pink petals 1-2 mm long (vs. white, 2-3 mm long), and lateral margins of the fruit concave (vs. straight to convex). Al-Shehbaz (1986) considered the character correlations to be poor, not warranting taxonomic recognition. [= C, FNA, K1, K2, Pa, RAB, Va, W, WH3, Y, Z; > *C. bursa-pastoris* – F, G, X; > *C. rubella* Reuter – F, G, X; > *C. gracilis* Gren. – F; = *Bursa bursa-pastoris* (Linnaeus) Britton – S]

***Cardamine* Linnaeus 1753 (Bittercress, Toothwort)**

A genus of about 200 species, herbs, cosmopolitan. *Dentaria* should apparently be included (Sweeney & Price 2000). References: Al-Shehbaz, Marhold, & Lihová in FNA (2010); Rollins (1993)=Z; Sweeney & Price (2001)=Y; Al-Shehbaz (1988a)=X; Sweeney & Price (2000); Franzke et al. (1998). Key based in part on Turrill, Evans, & Gilliam (1994) and Y.

- 1 Leaves palmately divided (if 1-ternate, then palmately so, the terminal leaflets on a petiolule the same length as the those of the lateral leaflets); ["*Dentaria*"].
 - 2 Plants entirely glabrous (including on the leaf margins); leaflets highly dissected with linear to filiform segments *C. dissecta*
 - 2 Plants with marginal leaf trichomes, and often also pubescent on the stem, inflorescence, and petioles; leaflets entire, toothed, or deeply lobed.

- 3 Trichomes of leaf margins appressed and ca. 0.1 mm long; stem leaves 2 (-3), opposite; lateral leaflets of stem leaves very rarely incised, the leaf being (and appearing merely 3-foliolate, though teeth may be prominent and lacerate); basal leaves usually present at flowering.
- 4 Rhizome with 2-3 cm long segments, each separated by a narrow and fragile connecting portion (which typically is broken on herbarium specimens), and lacking "teeth" (actually prominent reduced leaves); leaflets of the stem leaves (2.5×-) avg. 5× (-7×) as long as wide (thus proportionately much narrower than the leaflets of the basal leaves); central leaflet of stem leaves (2.5-) avg. 3.25 (-4) cm long × (0.5-) avg. 0.75 (-1.0) cm wide; taste of fresh plant relatively mildly mustardy *C. angustata*
- 4 Rhizome elongate and of uniform diameter, lacking definite segments, but with periodic "teeth" (prominent reduced leaves) along it; leaflets of the stem leaves (2×-) avg. 3× (-4×) as long as wide (thus proportionately similar to the leaflets of the basal leaves); central leaflet of stem leaves (4-) avg. 6 (-8) cm long × (1.5-) avg. 2 (-2.5) cm wide; taste of fresh plant strong, like horseradish or wasabi..... *C. diphylla*
- 3 Trichomes of leaf margins erect and 0.2-0.3 mm long; stem leaves 3, whorled; lateral leaflets of stem leaves usually incised into 2 main lobes, giving the leaf a superficially somewhat 5-parted appearance; basal leaves usually absent (or often present in *C. maxima*) at flowering.
- 5 Rhizome with 2-3 cm long segments, each separated by a narrow and fragile connecting portion (which typically is broken on herbarium specimens); upper stem pubescent..... *C. concatenata*
- 5 Rhizome elongate, with alternating thicker and thinner portions (but not fragile and easily separating); upper stem glabrous..... *C. maxima*
- 1 Leaves simple, pinnately lobed, or pinnately divided (if 1-ternate, then pinnately so, the terminal leaflet on a longer petiole than those of the lateral leaflets); [*Cardamine* in the narrow sense].
- 6 Cauline leaves simple, sometimes the lower to middle cauline leaves with 1-2 pairs of very small lateral lobes.
- 7 Plant from a tuberous or bulbous base, erect and generally unbranched, not stoloniferous or rooting down from upper nodes after flowering; petals 7-20 mm long.
- 8 Stem glabrous, or with hairs < 0.1 mm long; corolla white, rarely pink; stem leaves 4-12; silique 1.5-3 cm long, plus a 3-7 mm beak..... *C. bulbosa*
- 8 Stem cinereous-pubescent with hairs (0.2-) 0.3-0.6 (-0.8) mm long; corolla pink to lavender, rarely white; stem leaves 2-5; silique 1-2 cm long, plus a 2-4 mm beak..... *C. douglassii*
- 7 Plant from a fibrous root system, frequently much branched from the base, some of the branches becoming stoloniferous and rooting down at the upper nodes after flowering; petals 2-10 mm long or absent.
- 9 Petals absent or present, if present 0.7-2 mm long; silique 5-10 (-15) mm long, plus a 0.5-1.0 mm beak, on thick pedicels 1-3 (-6) mm long..... *C. longii*
- 9 Petals present, 2-10 mm long; silique 8-21 mm long, plus a 1-3 mm beak, on slender pedicels 10-20 mm long.
- 10 Petals 3-5 mm long, the tips ascending or erect; anthers orbicular, ca. 0.3 mm across; stylar beak of the silique 1-1.5 mm; mid-cauline and upper cauline leaves cuneate, rounded, or truncate (rarely the mid-cauline leaves subcordate, but not clasping); basal leaves with 1-3 pairs of lateral leaflets *C. micranthera*
- 10 Petals 5-10 mm long, the tips spreading or ascending; anthers oblong, about 1 mm long; stylar beak of the silique 2-3 mm; mid-cauline and upper cauline leaves cordate, often clasping around the stem or branch; basal leaves with 0-1 pairs of lateral leaflets..... *C. rotundifolia*
- 6 Cauline leaves 1-ternate or pinnatifid (if 1-ternate, the lateral leaflets about as large as the terminal leaflet).
- 11 Cauline leaves with 3-5 leaflets; petals 4-10 mm long; plant a perennial.
- 12 Stem glabrous at base; lower leaves green underneath; petioles auriculate at the base, the auricles 1-5 mm long, acute to acuminate; leaves 3 (-5)-foliolate; siliques 22-40 mm long *C. clematidis*
- 12 Stem pubescent at base; lower leaves purple underneath; petioles not auriculate at the base; leaves 3-5-foliolate; siliques 10-25 mm long.
- 13 Petals 6-9 mm long; stamens shorter than the petals by 1 mm or more; sepals 3-4 mm long; filaments obviously flattened..... *C. flagellifera* var. *flagellifera*
- 13 Petals 4-6 mm long; stamens equaling to slightly exceeding the petals; sepals 2.5-3.5 mm long; filaments terete to somewhat flattened..... *C. flagellifera* var. *hugeri*
- 11 Cauline leaves with 7-10 leaflets; petals 1-4 mm long or absent (8-15 mm long in *C. pratensis* var. *palustris*); plant an annual, biennial, or perennial.
- 14 Petals 8-15 mm long..... *C. pratensis* var. *palustris*
- 14 Petals 1-4 mm long or absent.
- 15 Cauline leaves with prolonged sagittate-auriculate bases, the 13-19 leaflets acuminate..... *C. impatiens*
- 15 Cauline leaves without basal auricles, the 5-15 (-17) leaflets mostly obtuse.
- 16 Plant with many, persistent basal leaves forming a rosette; stem bases and petioles hirsute..... *C. hirsuta*
- 16 Plant with few or no basal leaves, not forming a rosette; stem bases and petioles glabrous (or sparsely hirsute).
- 17 Cauline leaves 2-4 cm long; terminal leaflet similar to the lateral leaflets in size and shape; leaflets neither decurrent along the rachis nor petiolulate; stem glabrous throughout..... *C. parviflora* var. *arenicola*
- 17 Cauline leaves 4-10 cm long; terminal leaflet broader than the lateral leaflets; leaflets either decurrent along the rachis or petiolulate; stem pubescent at base.
- 18 Leaflets petiolulate; stems flexuous; [alien weed]..... [*C. flexuosa*]
- 18 Leaflets decurrent on the rachis; stems typically erect; [native]..... *C. pensylvanica*

Cardamine angustata O.E. Schulz, Eastern Slender Toothwort. Rich, mesic forests. Mar-May; Apr-Jun. NJ and IN south to n. GA, c. TN, and ne. MS. Material sometimes considered merely disjunct in the Ouachita Mountains of AR, or named as a variety, var. *ouachitana* E.B. Smith, is apparently specifically distinct and not closely related (C.T. Witsell, pers. comm., 2013). [= *C. Pa*, *Va*, *X*, *Y*; < *C. angustata* – FNA, K2, Z; = *C. angustata* var. *angustata* – RAB; = *Dentaria heterophylla* Nuttall – F, G, S, W]

Cardamine bulbosa (Schreber ex Muhlenberg) Britton, Sterns, & Poggenburg, Bulbous Bittercress. Swampy forests and bogs, primarily (but not strictly) in circumneutral soils over limestone or mafic rocks. Mar-May; Apr-May. ME west to MB, south to FL, LA, and TX. [= F, FNA, G, GW, K, Pa, RAB, S, Va, W, WH3, Z; = *C. rhomboidea* (Persoon) A.P. de Candolle – C, X]

Cardamine clematitidis Shuttleworth ex A. Gray, Mountain Bittercress. Shaded brookbanks, rock outcrops with seepage, at high elevations (1200m and above). Apr-May; Jun-Jul. Endemic to the high elevation Southern Appalachians of w. NC, e. TN, sw. VA, and ne. GA (Brasstown Bald). A report for SC (Gaddy et al. 1984) is erroneous, based on material of *C. flagellifera* (Gaddy 2014). [= C, FNA, K, S, Va, W, X, Z; < *C. clematitidis* Shuttleworth ex Gray – F, G, GW, RAB (also see *C. flagellifera*)]

Cardamine concatenata (Michaux) O. Schwarz, Cutleaf Toothwort. Rich, mesic forests. (Jan-) Mar-May; Apr-May. ME, QC and MN south to FL Panhandle, LA, OK, and TX. [= C, FNA, K, Pa, RAB, Va, WH3, X, Y, Z; = *Dentaria laciniata* Muhlenberg ex Willdenow – G, GW, S, W; > *Dentaria laciniata* var. *laciniata* – F; > *D. laciniata* var. *coalescens* Fernald – F]

Cardamine diphylla (Michaux) Alph. Wood, Crinkleroot, Toothwort. Rich, mesic forests. Apr-May; May-Jun. NB west to MN, south to n. GA, SC, and AL. [= C, K, Pa, RAB, Va, X, Y, Z; = *Dentaria diphylla* Michaux – F, G, W; > *Dentaria diphylla* – S; > *Dentaria incisa* Small – S]

Cardamine dissecta (Leavenworth) Al-Shehbaz, Dissected Toothwort. Rich, mesic forests. Mar-Apr; Apr-May. Al-Shehbaz (1988c) describes the range as separated into four areas: c. AL (3 counties); c. NC and sc. VA (6 counties); nw. GA, c. TN, and s. KY (18 counties); and se. IN, ne. KY, and s. OH (6 counties). He states that *C. dissecta* is easily distinguished from its relatives "by its glabrous leaves that are divided into filiform to narrowly linear segments." See Al-Shehbaz (1988c) for additional discussion of the systematics, nomenclature, ecology, and distribution of this species. First reported for VA by Wieboldt et al. (1998). [= C, FNA, K, Va, X, Y, Z; = *Dentaria multifida* Muhlenberg ex Elliott – F, G, W; = *Cardamine angustata* var. *multifida* (Muhlenberg ex Elliott) H.E. Ahles – RAB; > *Dentaria multifida* – S; > *Dentaria furcata* Small – S; = *Cardamine multifida* (Muhlenberg ex Elliott) Wood]

Cardamine douglassii Britton, Limestone Bittercress, Douglass's Bittercress, Purple Cress, Pink Spring-cress. Nutrient-rich, mesic forests, especially alluvial bottomlands, and in nutrient-rich seepages, in NC in the drainages of the Neuse, Meherrin, and (rarely) Cape Fear rivers. Mid Mar-early Apr; Apr-May. NY, ON, and MN south to c. NC, sc. TN, AL, and MO. [= C, F, FNA, G, K, GW, Pa, RAB, Va, X, Z]

Cardamine flagellifera O.E. Schulz var. *flagellifera*, Large-flowered Blue Ridge Bittercress. In seepages, on streambanks, and in moist cove or bottomland forests, mainly at moderate to low elevations. Mar-May; Jun-Jul. *C. flagellifera* is endemic to the Southern Appalachians of w. NC, SC, e. TN, GA, VA, and WV, and is quite distinct from *C. clematitidis*, as pointed out by Dudley (1974). Rollins's division of this species into two varieties (following Small's recognition of two species) needs further evaluation. [= K, Z; < *C. flagellifera* – C, FNA, Va, W, X; < *C. clematitidis* – GW, RAB; = *C. flagellifera* – S]

Cardamine flagellifera O.E. Schulz var. *hugeri* (Small) Rollins, Small-flowered Blue Ridge Bittercress. In seepages, on streambanks, and in moist cove or bottomland forests, mainly at moderate to low elevations. Mar-Apr; Jun-Jul. Endemic to the Southern Appalachians of NC and TN. [= K, Z; < *C. flagellifera* – C, FNA, W, Va, X; < *C. clematitidis* – GW, RAB; = *C. hugeri* Small – S]

* *Cardamine flexuosa* Withering, Woodland Bittercress. Disturbed sites; native of Eurasia. Feb-May. Lihová et al. (2006) show that Asiatic "*C. flexuosa*" is a distinct taxon from European *C. flexuosa* and will need a new name; at least some of our material is the Asiatic species, whose proper name is unclear (Lihová et al. 2006). Both the European and Asiatic taxa are allotetraploids of unclear parentage. [< *C. flexuosa* Withering – F, FNA, Pa, RAB, Va, X; > *C. debilis* D. Don – K, Z; > *C. flexuosa* – K, Z]

* *Cardamine hirsuta* Linnaeus, Hairy Bittercress. Disturbed areas, including fields and gardens; native of Europe. Feb-May (or irregularly earlier in response to mild winter weather). [= C, F, FNA, G, GW, K, Pa, RAB, S, Va, W, WH3, X, Z]

* *Cardamine impatiens* Linnaeus, Narrowleaf Bittercress. Alluvial floodplains (in the New River drainage in NC and VA); native of Europe. Jun-Jul. See Poindexter (2006). Reported for MD (Knapp et al. 2011). [= C, F, K, Pa, Va, X, Z]

Cardamine longii Fernald, Long's Bittercress. Tidal freshwater marshes and cypress-gum swamps. Jun-Sep. Coastal in distribution, irregularly from ME south to SC (or FL). Difficult to distinguish from depauperate or submerged forms of *C. pennsylvanica* with few leaflets; the short style (capsule beak) and short and thick pedicels appear to be the most reliable characteristics. [= C, F, FNA, K, X, Z]

Cardamine maxima (Nuttall) Wood, Large Toothwort. Moist forests. Apr-May. NB, ON, and MI south to NJ, PA, OH, WV (?), and KY (?). [= FNA, K, Pa, Y, Z; = *C. ×maxima* – C; = *Dentaria maxima* Nuttall – F, G]

Cardamine micranthera Rollins, Streambank Bittercress, Small-anthered Bittercress. Sand and gravel bars in creeks, swampy floodplain woods, seepage over rocks. Apr-May; May-Jun. A narrow endemic, known only from Stokes County, NC

and Patrick County, VA; apparently extirpated from Forsyth County, NC. The description and key in RAB are partly in error, being based on the inadequate and unrepresentative material available at the time. *C. micranthera* is most closely related to *C. rotundifolia*, but also shows some affinities to *C. pensylvanica*. It can be distinguished from *C. rotundifolia* by the characters in the key; additionally, *C. micranthera* does not form proliferative branches from the upper nodes, generally branching from the base in vigorous plants, or unbranched in smaller plants. It can be distinguished from *C. pensylvanica* by its predominately simple leaves, especially those on the upper stem, the larger flowers, the petals 3-5 mm long (vs. 1.5-3 mm long), the fruiting pedicels thin, 10-20 mm long, spreading to ascending (vs. thick, 4-10 mm long, ascending). Wieboldt (1992) reasonably speculates that *C. micranthera* may be an in-breeding relative derived from *C. rotundifolia* in the Piedmont/Mountain interface. [= FNA, K, RAB, Va, X, Z]

***Cardamine parviflora* Linnaeus var. *arenicola* (Britton) O.E. Schulz, Sand Bittercress.** Various habitats, primarily seasonally wet areas with shallow soil or sand, also on mafic outcrop glades, as on greenstone, diabase, and nutrient-rich granites. Mar-May. The typic variety is Eurasian; our variety is widespread in e. North America, also occurring in the Pacific Northwest. Our plant may warrant specific status. [= C, F, K, RAB, Va, X, Z; < *C. parviflora* – FNA, G, GW, Pa, S, W, WH3; = *C. arenicola* Britton – S]

***Cardamine pensylvanica* Muhlenberg ex Willdenow, Quaker Bittercress.** Various wet habitats, especially swampy depressions, streambanks, small woodland seeps. Mar-May. NL (Newfoundland), NL (Labrador), NT, and AK south to FL, TX, and CA. [= C, FNA, G, GW, K, Pa, RAB, S, Va, W, WH3, X, Z; > *C. pensylvanica* var. *pensylvanica* – F; > *C. pensylvanica* var. *brittoniana* Farwell – F]

***Cardamine pratensis* Linnaeus var. *palustris* Wimmer & Graebner, American Cuckoo-flower, Lady's-smock.** Seeps, bogs, and swamps. Apr-Jul. Var. *palustris* ranges from Canada south to NJ, VA, OH, IN, MN, and BC. The Eurasian var. *pratensis*, with pink (vs. white) flowers, is introduced in ne. North America and may occur in our area. These two varieties may not be distinguishable; Rollins combines var. *palustris* into var. *pratensis*. [= C, F, G; < *C. pratensis* – FNA, Pa, Va; < *C. pratensis* var. *pratensis* – K, Z]

***Cardamine rotundifolia* Michaux, American Bittercress, Mountain Watercress.** Seeps, streambanks, swampy depressions, sand and gravel bars in creeks. Apr-May; Jun-Jul. Characteristically, *C. rotundifolia* branches from the upper nodes while in flower, the branches rooting down and proliferating vegetatively. A Central/Southern Appalachian endemic: n. DE, PA, and w. NY, west to OH and KY, south to w. NC and n. GA. [= C, F, G, GW, K, Pa, RAB, S, Va, W, X, Z]

***Chorispora* R. Brown ex A.P. de Candolle 1821 (Chorispora)**

A genus of 11 species, herbs, of Central Asia and the Middle East. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1988d)=Y.

* ***Chorispora tenella* (Pallas) A.P. de Candolle, Chorispora, Blue Mustard.** Disturbed areas; native of w. Asia. Well established in the w. United States, and occurs at scattered locations eastward, as in c. and w. TN (Chester, Wofford, & Kral 1997) and s. PA (Rhoads & Block 2007). [= C, FNA, K, Pa, Y, Z]

***Coincya* Porta & Rigo ex Rouy 1891 (Wallflower-cabbage, Coincya)**

A genus of 6 species, of c. and s. Europe and n. Africa. References: Warwick in FNA (2010); Rollins (1993)=Z; Leadlay & Heywood (1990)=Y; Al-Shehbaz (1985b)=X; Naczi & Thieret (1996)=Q.

* ***Coincya monensis* (Linnaeus) Greuter & Burdet ssp. *recurvata* (Allioni) Leadlay, Wallflower-cabbage, Coincya.** Mt (NC, VA, WV), Cp (DE): roadsides; uncommon (rare in NC and WV), native of Eurasia. May-Jul. Rollins (1961) discusses the occurrence of this species in w. NC. Poindexter & Murrell (2011) report the first occurrence for VA. See Naczi & Thieret (1996) for an excellent discussion of this species' occurrence in North America. [= FNA, K, Q; < *C. monensis* – Pa; ? *Brassica erucastrum* – RAB, misidentified; ? *Hutera cheiranthos* (Villars) Gomez-Campo – X; = *C. monensis* ssp. *recurvata* var. *recurvata* – Y, Z; ? *Rhynchosinapis cheiranthos* (Villars) Dandy; ? *C. cheiranthos* (Villars) Greuter & Burdet]

Conringia Adanson 1763 (Hare's-ear Mustard)

A genus of 6 species, herbs, of Europe and the Middle East. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* **Conringia orientalis** (Linnaeus) Andrzejowski, Hare's-ear Mustard, Treacle Mustard. Disturbed areas; native of Eurasia. Apr-Jun. [= C, F, FNA, G, K, Pa, RAB, S, WH3, WV, Y, Z]

Descurainia Webb & Berthelot 1836 (Tansy-mustard, Flixweed)

A genus of ca. 40 species, primarily of North and South America. References: Goodson & Al-Shehbaz in FNA (2010); Rollins (1993)=Z, Al-Shehbaz (1988b)=Y; Detling (1939)=X.

- 1 Siliques 10-25 (-30) mm long, acute to acuminate, the seeds mostly in 1 row **D. sophia**
- 1 Siliques 5-10 (-13) mm long, obtuse or clavate, the seeds mostly in 2 rows.
- 2 Leaves densely gray-canescens; angle between fruiting pedicels and rachis ca. 75 degrees; pedicels glandular-puberulent, 6-12 mm long; plants 2-5 dm tall; [primarily of the Coastal Plain] **D. pinnata** var. **pinnata**
- 2 Leaves glabrous or glabrescent; angle between fruiting pedicels and rachis ca. 45 degrees; pedicels glabrous, 6-16 mm long; plants 3-7 dm tall; [primarily of the Mountains and Piedmont, rarely weedy in the Coastal Plain].
- 3 Stems moderately to densely glandular and pubescent (but not canescens); siliques 5-10 (-12) mm long; pedicels 8-16 mm long **D. pinnata** var. **brachycarpa**
- 3 Stems sparsely pubescent to glabrous; siliques 8-12 mm long; pedicels 6-12 mm long [**D. pinnata** var. **intermedia**]

Descurainia pinnata (Walter) Britton var. **brachycarpa** (Richardson) Fernald, Northeastern Tansy-mustard. Dry rocky openings and woodlands. Apr-Aug. QC west to NT, south to VA, TN, and TX; introduced in the Coastal Plain of NC. [= C, F, G, Pa, Va; = *D. brachycarpa* (Richardson) O.E. Schulz - RAB; = *D. pinnata* ssp. *brachycarpa* (Richardson) Detling - K, X, Y, Z; = *Sophia millefolia* Rydberg - S; < *D. pinnata* - W; > *D. pinnata* var. *brachycarpa* - WV; > *D. pinnata* var. *pinnata* - WV, misidentified; < *D. pinnata* ssp. *brachycarpa* - FNA]

* **Descurainia pinnata** (Walter) Britton var. **intermedia** (Rydberg) C.L. Hitchcock. Waste areas near wool-combing mills; native of w. North America. Also reported for WV (Kartesz 1999). [= *Descurainia pinnata* ssp. *intermedia* (Rydberg) Detling - K, X, Y, Z; = *Sophia intermedia* Rydberg - S; < *D. pinnata* ssp. *brachycarpa* - FNA]

Descurainia pinnata (Walter) Britton var. **pinnata**, Southeastern Tansy-mustard. Open sandy areas, especially roadsides. Feb-May. E. NC south to FL, west to TX and OK. [= C, F, G; = *D. pinnata* - RAB, WH3; = *D. pinnata* ssp. *pinnata* - FNA, K, X, Y, Z; = *Sophia pinnata* (Walter) T.J. Howell - S]

* **Descurainia sophia** (Linnaeus) Webb ex Prantl, Herb Sophia. Disturbed areas; native of Eurasia. Apr-Aug. [= C, F, FNA, G, K, Pa, RAB, Va, WV, X, Y, Z; = *Sophia sophia* (Linnaeus) Britton - S]

Diplotaxis A.P. de Candolle 1821 (Wall-rocket)

A genus of ca. 30 species, herbs, of Eurasia and Africa. References: Martínez-Laborde in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

- 1 Leaves mostly basal or very low-cauline; plant annual or biennial; siliques lacking a gynophore (stipe) between the sepal scars and the base of the valves; [section *Anocarpum*] **D. muralis**
- 1 Leaves mostly cauline; plant perennial, becoming somewhat woody at the base; siliques with a 0.5-2 mm gynophore (stipe) between the sepal scars and the base of the valves; [section *Diplotaxis*] **D. tenuifolia**

* *Diplotaxis muralis* (Linnaeus) A.P. de Candolle, Annual Wall-rocket, Sand-rocket, Stinking Wall-rocket. Disturbed areas; native of Europe. Jun-Sep. The report of this species for NC by Ahles & Radford (1959) was based on a misidentification of *Coincya muralis* (Naczi & Thieret 1996). [= C, F, FNA, G, K, Pa, S, WH3, Y, Z]

* *Diplotaxis tenuifolia* (Linnaeus) A.P. de Candolle, Perennial Wall-rocket, Flixweed. Disturbed areas, ballast; native of Europe. Jul-Oct. [= C, F, FNA, G, K, Pa, S, WH3, Y, Z]

Draba Linnaeus 1753 (Draba, Whitlow-grass)

A genus of about 330 species, perennial and annual herbs, of Northern Hemisphere and Andean South America, particularly in arctic and alpine habitats. Molecular phylogenetic studies show that *Erophila* should be included in *Draba*, but that other elements are discordant and should be segregated as *Abdra* and *Tomostima* (Koch & Al-Shehbaz 2002; Al-Shehbaz 2012; Jordon-Thaden et al. 2010). References: Al-Shehbaz, Windham, & Elven in FNA (2010); Al-Shehbaz (2012)=X; Rollins (1993)=Z; Al-Shehbaz (1987)=Y; Koch & Al-Shehbaz (2002).

- 1 Leaves all basal; petals deeply bifid (about 1/2 way to base).....*D. verna*
- 1 Leaves basal and cauline (the basal sometimes withering by fruiting); petals merely emarginate.
 - 2 Silique twisted; petals 5-6 mm long; styles conspicuous, 1.5-3 mm long; perennial from a caudex; flowers all chasmogamous, with anthers 0.5-0.6 mm long, and with petals; [on calcareous rock outcrops]*D. ramosissima*
 - 2 Silique not twisted; petals 0-5 mm long; styles absent to inconspicuous, 0-0.25 mm long; winter-annuals; flowers of two types, the early ones chasmogamous, with anthers 0.2-0.4 mm long, and with petals, the later ones cleistogamous, with anthers ca. 0.05 mm long, and lacking petals; [mostly in open situations in sandy or clayey soils, sometimes on rocks, including limestone].
 - 3 Silique 1-6 mm long; leaves extending upward into the lower branches of the inflorescence; trichomes exclusively cruciform..... [see *Abdra*]
 - 3 Silique 8-14 mm long; leaves low-cauline, not extending upward into the lower branches of the inflorescence; trichomes of 2 types, simple and 2-7-rayed..... [see *Tomostima*]

Draba ramosissima Desvaux, Rocktwist, Appalachian Draba. In crevices of rock outcrops, or in dry talus slopes, over a variety of rock types (including limestone, dolostone, schist, gneiss, shale). Apr-May; May-Jul. W. MD and e. WV south through w. VA and e. KY south to w. NC and e. TN. [= FNA, K, RAB, S, Va, W, WV, X, Y, Z]

* *Draba verna* Linnaeus, Whitlow-grass. Disturbed areas, especially in dry, barren soils, including granitic flatrocks; native of Europe. Feb-Apr; Mar-May. [= C, FNA, K, Pa, RAB, S, Va, W, WV, X, Y, Z; > *D. verna* var. *verna* - F, G; > *D. verna* var. *boerhaavii* van Hall - F, G; = *Erophila verna* (Linnaeus) Besser]

Eruca P. Miller 1754 (Rocket-salad, Arugula)

A monotypic genus, an annual herb, native to Mediterranean Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* *Eruca vesicaria* (Linnaeus) Cavanilles ssp. *sativa* (P. Miller) Thellung, Garden Rocket, Rocket-salad, Arugula. Cultivated as a salad green, persistent around gardens or occurring as a waif; native of Mediterranean Europe. May-Jun. [= FNA, K1, Y, Z; = *E. sativa* P. Miller - C, F, K2, Pa, WV; < *E. vesicaria* - G; < *E. eruca* (Linnaeus) Ascherson & Graebner - S]

Erucastrum C. Presl 1826 (Dog-mustard)

A genus of ca. 22 species, herbs, of Africa, Europe, and Arabia. References: Warwick in FNA (2010); Rollins (1993)=Z; Luken, Thieret, & Kartesz (1993); Al-Shehbaz (1985b)=Y.

* *Erucastrum gallicum* (Willdenow) O.E. Schulz, Dog-mustard, Rocket-weed, French Rocket. Disturbed areas; native of Europe. Apr-Sep. Luken, Thieret, and Kartesz (1993) discuss the introduction and spread of *E. gallicum* in North America. While only weakly naturalized in our area, *E. gallicum* seems likely to increase in abundance. The report of *Brassica erucastrum* for NC in RAB is apparently based on material of *Coincya muralis* (Naczi & Thieret (1996). [= C, F, FNA, G, K, Pa, WH3, Y, Z; = *Brassica erucastrum* Linnaeus]

Erysimum Linnaeus 1753 (Wallflower, Treacle Mustard)

A genus of ca. 150-180 species, of the Northern Hemisphere. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988d)=Y; Rollins (1993)=Z.

- 1 Petals 13-25 (-30) mm long, 4-11 (-13) mm wide; seeds 2-3 mm long; biennial or perennial; [native, usually in thin rocky soil]..... *E. capitatum* var. *capitatum*
- 1 Petals 3.5-10 mm long, 1.5-3 mm wide; seeds ca. 1 mm long; annual or biennial; [introduced, usually in disturbed situations].
- 2 Sepals 1.8-3.5 mm long; petals 3.5-5.5 mm long; fruits (1-) 1.5-2.5 (-4) cm long; pedicels slender (much narrower than the fruit), 5-13 (-16) mm long..... *E. cheiranthoides*
- 2 Sepals 4.5-6 mm long; petals 6-9 (-11) mm long; fruits (2-) 3-8 (-10) cm long; pedicels thick (as wide as the fruit or nearly so), 2-9 (-15) mm long.
- 3 Biennial or perennial; fruit 3-5.8 (-7) cm long; fruiting pedicel somewhat narrower than the fruit..... [*E. inconspicuum*]
- 3 Annual; fruit (2-) 3-8 (-10) cm long; fruiting pedicel as wide as the fruit..... *E. repandum*

Erysimum capitatum (Douglas ex Hooker) E.L. Greene var. *capitatum*, Western Wallflower. Shale barrens and shale woodlands, limestone bluffs and calcareous rocky woodlands. Apr-Jul; Jun-Aug. Rollins (1993) interprets *E. capitatum* as including five varieties, all but the typical restricted to the Great Plains and west. Though most floras (including C, F, and G) give the impression that *Erysimum* is not native east of IL, MO, and AR ("rarely adventive farther east along railroads"), this taxon is native and relictual in w. VA (Alleghany and Bath counties), e. WV (Grant and Pendleton counties), ec. TN (Chester, Wofford, & Kral 1997), and c. KY (Campbell 2013). [= FNA, K1, K2, Va, Z; = *E. asperum* var. *asperum* - C, misapplied; > *E. arkansanum* Nuttall - F; < *E. asperum* - G, misapplied; < *Cheirinia aspera* (Nuttall) Britton - S, misapplied; = *Erysimum capitatum* ssp. *capitatum* - Y]

* *Erysimum cheiranthoides* Linnaeus, Wormseed Mustard. Fields, gardens, roadsides, along railroads, other disturbed areas; native of Eurasia. Jun-Jul; Jul-Aug. [= C, F, FNA, G, K1, K2, Pa, RAB, Va, W, WH3, WV, Y, Z; = *Cheirinia cheiranthoides* (Linnaeus) Link - S]

* *Erysimum inconspicuum* (S. Watson) MacMillan, Shy Wallflower. Disturbed soils, especially over calcareous rocks; native of w. North America. Jun. NS, QC, YT, and AK, south to PA, AR, OK, CO, UT, NV, and OR. [= F, FNA, G; = *E. inconspicuum* var. *inconspicuum* - K1, K2, Z; < *E. inconspicuum* - C, Y; = *E. inconspicuum* - F, FNA, G] {not mapped; no known records from our area; rejected}

* *Erysimum repandum* Linnaeus, Treacle Mustard, Bushy Wallflower. Disturbed areas; native of Eurasia. Apr-May; May-Jul. [= C, F, FNA, G, K1, K2, Pa, RAB, Va, WV, Y, Z; = *Cheirinia repanda* (Linnaeus) Link - S]

Hesperis Linnaeus 1753 (Dame's Rocket)

A genus of ca. 25 species, herbs, of Eurasia and n. Africa. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988d)=Y; Rollins (1993)=Z.

* *Hesperis matronalis* Linnaeus, Dame's Rocket. Bottomlands, roadsides, moist forests; native of Europe. Apr-Aug. The flowers are white or pink. [= C, F, FNA, G, K1, K2, Pa, RAB, S, Va, W, WV, Y, Z]

Iberis Linnaeus 1753 (Candytuft)

A genus of ca. 40 species, herbs, of Eurasia and n. Africa. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

* *Iberis amara* Linnaeus, Annual Candytuft. Disturbed areas; native of Europe. Jun-Aug. Reported from PA, WV, and KY (Kartesz 1999). [= C, FNA, K1, K2, Z]

* *Iberis sempervirens* Linnaeus, Evergreen Candytuft. Reported for NC and TN by Kartesz (1999), but the specimens he cites are from cultivated material. [= FNA, K1, K2] {rejected; not keyed}

Iodanthus Torrey & A. Gray 1840 (Purple Rocket)

A monotypic genus, a perennial herb, of e. North America. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

Identification notes: *Iodanthus pinnatifidus* somewhat resembles *Hesperis matronalis* in overall appearance, but differs in the following ways: petals 10-13 mm long (vs. 20-25 mm long), siliques 2-4 cm long (vs. 5-10 cm long), pubescence of the lower stem of simple trichomes (vs. branched trichomes).

Iodanthus pinnatifidus (Michaux) Steudel, Purple Rocket. Rich forests of bottomlands and lower slopes. May-Jun. W. PA west to MN and IA, south through WV and e. and c. TN to AL and TX. [= C, F, FNA, G, K1, K2, Pa, S, WV, Y, Z]

Isatis Linnaeus 1753 (Woad)

A genus of about 50 species, herbs, of Eurasia and n. Africa. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

* **Isatis tinctoria** Linnaeus, Woad. Fields, roadsides, other disturbed areas; native of Eurasia. Apr-Jun. Formerly cultivated as an important source of a blue dye. [= C, F, FNA, G, K1, K2, Va, W, WV, Z]

Leavenworthia Torrey 1837 (Glade Cress)

A genus of 8 species, annual herbs, endemic to e. North America. References: Al-Shehbaz & Beck in FNA (2010: Al-Shehbaz (1988a)=Y; Rollins (1993)=Z. Key adapted from Rollins (1993).

- 1 Petals entire, white, < 7 mm long; leaf lobes deeply dentate, the terminal lobe only slightly larger than the larger lateral lobes **L. uniflora**
- 1 Petals deeply to shallowly emarginate (notched at the tip), yellow, white, or lavender, 7-15 mm long; leaf lobes entire to shallowly dentate, the terminal lobe markedly larger than the largest lateral lobes.
- 2 Siliques conspicuously torulose (constricted between the seeds), even when young **L. torulosa**
- 2 Siliques not torulose (constricted between the seeds) (or slightly so in *L. stylosa*).
- 3 Petals 7-10 mm long, shallowly emarginate; style 1-3 mm long; siliques flat; [of AL, GA, KY, and TN].
- 4 Petals yellow; [of AL and TN] **L. exigua var. lutea**
- 4 Petals white to pale lavender; [of KY, TN, and nw. GA].
- 5 Styles 1-2 mm long; sepals pale lavender; [of TN and nw. GA] **L. exigua var. exigua**
- 5 Styles 2-3 mm long; sepals green; [of KY] **L. exigua var. laciniata**
- 3 Petals 10-16 mm long, deeply emarginate; styles 2.5-7 mm long; siliques thick or flat; [of AL and TN].
- 6 Siliques thin, flat; styles 1.5-5.5 mm long; petals white to lavender; [of n. AL].
- 7 Styles 2-5.5 mm long; mature siliques cuneate at the base and acute at the tip; [of Colbert, Franklin, and Lawrence counties, AL] .. **L. alabamica var. alabamica**
- 7 Styles 1.5-2 (-3) mm long; mature siliques rounded at the base and at the tip; [of Morgan County, AL] **L. alabamica var. brachystyla**
- 6 Siliques thick, fleshy; styles 2.5-7 mm long; petals yellow, white, or lavender; [of n. AL and c. TN].
- 8 Siliques 12-15 mm long, 3-4 mm wide; seeds slightly elongate, cleft at one side of the long axis; [of Sumner, Smith, Wilson, Davidson, Rutherford, Bedford, and Maury counties, TN] **L. stylosa**
- 8 Siliques 6-12 mm long, 4-5 mm wide; seeds orbicular, cleft at the basal end; [of Lawrence and Morgan counties, AL].
- 9 Siliques 6-10 mm long; styles 3-6 mm long; petals white to yellow, 10-13 mm long; [of Lawrence and Morgan counties, AL] ... **L. crassa var. crassa**
- 9 Siliques 8-12 mm long; styles 1.5-3.5 mm long; petals yellow, 9-11 mm long; [of Morgan County, AL] **L. crassa var. elongata**

Leavenworthia alabamica Rollins var. **alabamica**. Limestone glades. Mar-Apr. Endemic to n. AL (Colbert, Franklin, and Lawrence counties). [= K1, K2, Y, Z; < *L. alabamica* – FNA]

Leavenworthia alabamica Rollins var. **brachystyla** Rollins. Limestone glades, other calcareous sites. Mar-May. Endemic to n. AL (Morgan County). [= K1, K2, Y, Z; < *L. alabamica* – FNA]

Leavenworthia crassa Rollins var. **crassa**. Limestone glades, disturbed calcareous soils nearby. Mar-May. Endemic to n. AL (Lawrence and Morgan counties). [= K1, K2, Y, Z; < *L. crassa* – FNA]

Leavenworthia crassa Rollins var. **elongata** Rollins. Limestone glades, disturbed calcareous soils nearby. Mar-Apr. Endemic to n. AL (Morgan County). [= K1, K2, Y, Z; < *L. crassa* – FNA]

Leavenworthia exigua Rollins var. *exigua*. Limestone glades, disturbed calcareous sites nearby. Endemic to the Central Basin of c. TN (8 counties) (Chester, Wofford, & Kral 1997), western Highland Rim (Decatur and Perry counties), and the Ridge and Valley of nw. GA (Walker and Catoosa counties). [= K1, K2, Y, Z; < *L. exigua* – FNA]

Leavenworthia exigua Rollins var. *laciniata* Rollins. Limestone glades, disturbed calcareous sites nearby. Apr. Endemic to the Western Highland Rim and w. Knobs of c. KY (Bullitt and Jefferson counties). [= C, K1, K2, Y, Z; < *L. exigua* – FNA]

Leavenworthia exigua Rollins var. *lutea* Rollins. Limestone glades, disturbed calcareous sites nearby. Mar-Apr. Endemic to the Central Basin of n. AL (Jefferson County) and c. TN (Bedford and Maury counties) (Chester, Wofford, & Kral 1997). [= K1, K2, Y, Z; < *L. exigua* – FNA]

Leavenworthia stylosa A. Gray. Limestone glades, disturbed calcareous sites nearby. Mar-Apr. Endemic to the Central Basin of c. TN (Sumner, Smith, Wilson, Davidson, Rutherford, Bedford, and Maury counties) (Chester, Wofford, & Kral 1997). [= FNA, K1, K2, S, Y, Z]

Leavenworthia torulosa A. Gray. Limestone glades, disturbed calcareous sites nearby. Mar-Apr. Endemic to the Central Basin of c. TN (10 counties), the Ridge and Valley of e. TN (Bradley and Meigs counties), and the Western Highland Rim of KY (Logan, Simpson, Todd, and Warren counties). [= C, F, FNA, G, K1, K2, S, Y, Z]

Leavenworthia uniflora (Michaux) Britton. Limestone glades, disturbed calcareous sites nearby. Endemic to the Central Basin of c. TN (8 counties), the Ridge and Valley of e. TN (Hamilton, Meigs, Bledsoe, and Knox counties), nw. GA (Walker and Murray counties), and c. KY (15 counties). [= C, F, FNA, G, K1, K2, S, Y, Z]

Lepidium Linnaeus 1753 (Pepperwort, Peppergrass, Pepperweed)

A genus of ca. 220 species, herbs, cosmopolitan. Al-Shehbaz, Mummenhof, & Appel (2002) discuss the inclusion of *Cardaria* and *Coronopus* in *Lepidium*. References: Al-Shehbaz & Gaskin in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1986a, 1986b)=Y; Al-Shehbaz, Mummenhof, & Appel (2002)=X.

section *Lepidium*: perfoliatum, graminifolium

section *Cardamon*: sativum

section *Lepia*: campestre

section *Dileptium*: austrinum, densiflorum, oblongum, virginicum ssp. virginicum

?: didymum, draba, ruderale, africanum, bonariense, lasiocarpum, schinzii, coronopus

- 1 Upper cauline leaves sessile, and also perfoliate, sagittate, or auriculate at the base.
 - 2 Upper cauline leaves cordate-amplexicaul; basal leaves 2-3-pinnatifid; petals yellow [*L. perfoliatum*]
 - 2 Upper cauline leaves sagittate or auriculate; basal leaves entire, dentate, or sinuate (1-2-pinnatifid in *L. oblongum*); petals white or absent.
 - 3 Stamens 2; petals absent (or minute); basal leaves 1-2-pinnatifid; [wool-alien waif, probably not established in our area] [*L. oblongum*]
 - 3 Stamens 6; petals present; basal leaves entire, dentate, sinuate (rarely 1-pinnatifid); [collectively common and widespread in our area].
 - 4 Plants annual, not rhizomatous; fruits dehiscent, apically broadly winged, notched at the apex; fruiting racemes elongated, much longer than broad *L. campestre*
 - 4 Plants perennial, rhizomatous; fruits indehiscent, apically not winged, not notched at the apex; fruiting racemes corymbose *L. draba*
- 1 Upper cauline leaves petiolate, not perfoliate, sagittate, or auriculate at the base.
 - 5 Valves of the silicles rugose-verrucose; some inflorescences (at least) borne opposite a leaf.
 - 6 Silicles reniform to ovate-cordate, 2.3-3.4 mm long, strongly ridged, not notched at the apex, indehiscent [*L. coronopus*]
 - 6 Silicles bilobed, 1.3-1.7 mm long, reticulate, strongly notched at the apex; splitting into two halves *L. didymum*
 - 5 Valves of the silicles smooth; inflorescences not leaf-opposed.
 - 7 Silicles 5-6 mm long; stamens 6 [*L. sativum*]
 - 7 Silicles 1.5-3.5 (-4) mm long; stamens 2.
 - 8 Fruiting pedicels erect-appressed; nectar glands filiform, 0.3-0.6 mm long; stems with flattened, retrorse, scale-like trichomes; [wool-alien waif, probably not established in our area] [*L. schinzii*]
 - 8 Fruiting pedicels ascending to spreading; nectar glands broader in shape, < 0.2 mm long; [collectively common and widespread in our area].
 - 9 Silicles pubescent or only ciliate at the margin.
 - 10 Silicles pubescent with subappressed hairs; lower surfaces of pedicels glabrous [*L. austrinum*]
 - 10 Silicles pubescent with spreading hairs; lower surfaces of pedicels pubescent [*L. lasiocarpum* ssp. *lasiocarpum*]
 - 9 Silicles glabrous.
 - 11 Petals 1-2× as long as the sepals *L. virginicum* ssp. *virginicum*
 - 11 Petals 0-0.8× as long as the sepals.
 - 12 Upper cauline leaves laciniate to pinnatifid; inflorescence rachis with hairs to 0.8 mm long.

- 13 Fruiting pedicels (2.0-) 3.0-4.5 mm long; stems usually erect or ascending.....[*L. bonariense*]
- 13 Fruiting pedicels 1.5-2.0 (-2.5) mm long; stems usually prostrate.....[*L. oblongum*]
- 12 Upper cauline leaves entire, serrate, or dentate; inflorescence axis glabrous, papillose, or with hairs < 0.1 mm long.
- 14 Basal leaves 2-3-pinnatifid; seeds marginless; fresh plants fetid.....*L. ruderale*
- 14 Basal leaves undivided or to 1-pinnatifid; seeds narrowly winged (marginless in *L. africanum*); fresh plants not fetid.
- 15 Silicles oblong; seeds marginless.....[*L. africanum*]
- 15 Silicles orbicular or broadly ovate or obovate; seeds with a narrow wing.
- 16 Inflorescence rachis with straight, usually subclavate papillae; silicles widest above the middle.....*L. densiflorum*
- 16 Inflorescence rachis with minute trichomes, these usually subappressed; silicles widest at or below the middle.....*L. virginicum* ssp. *virginicum*

- * *Lepidium africanum* (Burm. f.) A.P. de Candolle, African Pepperwort. Waif around wool-combing mills in Coastal Plain of SC, with little evidence that it is established in our area; native of s. Africa. For further information, see Rollins (1993) and Al-Shehbaz (1986). [= K, Y, Z]
- * *Lepidium austrinum* Small, Southern Pepperwort. Disturbed areas, waif around wool-combing mills in Coastal Plain of SC; native of sc. and sw. North America southwards. Mar-Jun. Also reported from MS (Bryson 1991, FNA). For further information, see Rollins (1993) and Al-Shehbaz (1986). [= FNA, K, Y, Z]
- * *Lepidium bonariense* Linnaeus, Argentinian Pepperwort. Waif around wool-combing mills in Coastal Plain of SC, with little evidence that it is established in our area; native of South America. For further information, see Rollins (1993) and Al-Shehbaz (1986). [= K, Y, Z]
- * *Lepidium campestre* (Linnaeus) R. Brown, Field Pepperwort, Cow Cress, Field Cress. Disturbed areas; native of Europe. Mar-Jun. [= C, F, FNA, G, K, Pa, RAB, Va, W, WH3, WV, S, Y, Z; = *Neolepia campestre* (Linnaeus) W.A. Weber]
- * *Lepidium coronopus* (Linnaeus) Al-Shehbaz. Disturbed areas; native of Europe. [= FNA; > *Lepidium squamatum* Forsskål - X; > *Coronopus squamatus* (Forsskål) Ascherson - C, K1, K2, Pa; > *Coronopus procumbens* Gilibert - F, G; = *Carara coronopus* (Linnaeus) Medikus - S]
- * *Lepidium densiflorum* Schrader, Prairie Pepperweed, Green-flowered Peppergrass. Disturbed areas; native of w. North America. May-Jun. [= C, F, FNA, G, K2, Pa, S, Va, WH3, WV; > *L. densiflorum* var. *densiflorum* - K1, Y, Z]

- * *Lepidium didymum* Linnaeus, Wart-cress, Lesser Swine-cress. Fields, roadsides, disturbed areas; native of South America. [= FNA, Va, WH3, X; = *Coronopus didymus* (Linnaeus) Smith - C, F, G, K, Pa, RAB, Y, Z; = *Carara didyma* (Linnaeus) Britton - S]
- * *Lepidium draba* Linnaeus, Hoary Cress. Disturbed areas; native of Eurasia. Apr-Aug. Reported for VA by Harvill et al. (1992). Al-Shehbaz (1986) discusses 2 subspecies of *L. draba* (as *Cardaria draba*). [= FNA; = *L. draba* ssp. *draba* - X; = *Cardaria draba* (Linnaeus) Desvoux - C, F, G, Pa, Z; = *Cardaria draba* ssp. *draba* - K, Y]
- * *Lepidium graminifolium* Linnaeus, Grassleaf Pepperwort. Disturbed areas, especially on ballast; native of Mediterranean Europe. Apr-Jun. [= K, Y, Z] {not yet keyed}
- * *Lepidium lasiocarpum* Nuttall ssp. *lasiocarpum*. Waif around wool-combing mills in Coastal Plain of SC, with little evidence that it is established in our area; native of sc. and sw. North America southwards. Mar-Jun. For further information, see Rollins (1993) and Al-Shehbaz (1986). [= FNA; = *L. lasiocarpum* var. *lasiocarpum* - K, Z; < *L. lasiocarpum* - Y]
- * *Lepidium oblongum* Small. Waif around wool-combing mills in Coastal Plain of SC, with little evidence that it is established in our area; native of sc and sw. North America south through Mexico to Central America. For further information, see Rollins (1993) and Al-Shehbaz (1986). [= FNA, Y; > *L. oblongum* var. *oblongum* - K, Z]
- * *Lepidium perfoliatum* Linnaeus, Perfoliate Pepperwort, Clasping Pepperweed, Shieldcress. Disturbed areas; native of Europe. Apr-May. [= C, F, FNA, G, K, Pa, RAB, Y, Z]

- * *Lepidium ruderale* Linnaeus, Narrowleaf Pepperwort, Stinking Pepperweed. Disturbed areas; native of Europe. Apr-Jun. [= C, F, FNA, G, K, RAB, S, Y, Z]
- * *Lepidium sativum* Linnaeus, Garden Cress. Disturbed areas. Reported for scattered locations in sc. and se. PA (Rhoads & Block 2007) and VA (K, based on Massey 1961). May-Aug. [= C, F, FNA, G, K, Pa, Z]
- * *Lepidium schinzii* Thellung. Waif around wool-combing mills in Coastal Plain of SC, with little evidence of establishment; native of South Africa. For further information, see Rollins (1993) and Al-Shehbaz (1986). [= Y, Z]
- Lepidium virginicum* Linnaeus ssp. *virginicum*, Poor Man's Pepper. Disturbed areas. Apr-Jun (and sporadically later). *L. virginicum* var. *virginicum* is widespread in e. and c. North America; also introduced in various places elsewhere in the world.

Rollins (1993) interprets *L. virginicum* as having seven additional varieties, all in western North America and Central America. For North America, FNA recognizes two subspecies, a course followed here. [= FNA; = *L. virginicum* var. *virginicum* – C, G, K, Y, Z; < *L. virginicum* – F, Pa, S, RAB, Va, W, WH3, WV]

***Lobularia* Desvaux 1815 (Sweet Alyssum)**

A genus of 4 species, herbs, of Eurasia and Macaronesia. References: Borgen in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1987)=Y.

* ***Lobularia maritima*** (Linnaeus) Desvaux, Sweet Alyssum. Disturbed areas, lawns; native of Europe. Jun-Nov. The NC occurrences are doubtfully established, from gardens and a "lawn." [= C, F, FNA, G, K, Pa, WH3, Y, Z]

***Lunaria* Linnaeus 1753 (Honesty)**

A genus of 3 species, biennial herbs, of Europe. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1987)=Y. Key based on Z.

- 1 Upper cauline leaves coarsely and irregularly dentate, the teeth acute to obtuse, sometimes with a mucro or short linear tip < 0.5 mm long; siliques broadly rounded at both ends (when mature – young siliques may be cuneate and acute); plant annual or biennial.....***L. annua***
- 1 Upper cauline leaves spinulose-dentate, the teeth acuminate and usually with a linear tip > 0.5 mm long; siliques cuneate at the base, acute at the tip; plant perennial.....**[*L. rediviva*]**

* ***Lunaria annua*** Linnaeus, Annual Honesty, Silver-dollar. Escaped from cultivation around gardens, not usually persistent; native of se. Europe. Apr-Jun. [= C, F, FNA, G, K, Pa, Va, Z]

* ***Lunaria rediviva*** Linnaeus, Perennial Honesty. Cultivated ornamental, perhaps persistent around gardens; native of Europe. Apr-Jun. Reported for VA by Kartesz (1999), incorrectly (Weakley, Ludwig, & Townsend 2012). [= C, F, FNA, G, K, Pa, Z]

***Matthiola* W.T. Aiton 1812 (Stock)**

A genus of about 50 species, herbs, mainly of Eurasia and Africa. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

* ***Matthiola incana*** (Linnaeus) R. Brown, Stock. Disturbed dunes, sandy fields, vacant lots; native of Europe. Reported for the Buxton area, Dare County, NC, by Burk (1961). [= FNA, K, Z]

***Myagrurn* Linnaeus 1753**

A genus of 1 species, an annual herb, native of s. Europe and sw. Asia. References: Al-Shehbaz in FNA (2010).

* ***Myagrurn perfoliatum*** Linnaeus. Disturbed areas; native of Mediterranean Europe and w. Asia. Apr-Jun. Reported for VA (FNA); the basis of this report is unknown. [= FNA] {rejected as a component of our flora; not keyed; not mapped}

Nasturtium R. Brown 1812 (Watercress)

A genus of 5 species, perennial herbs, of Eurasia, n. Africa, and North America. Al-Shehbaz & Price (1998) summarize the reasons for separating *Nasturtium* from *Rorippa*; Franzke et al. (1998) provide corroboration based on molecular analysis. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Stuckey (1972)=Y; Green (1962)=X; Al-Shehbaz & Price (1998)=V; Al-Shehbaz (1988a)=Q; Franzke et al. (1998).

- 1 Petioles of emergent leaves lacking auricles toward the base; seeds yellowish-brown, finely reticulate, with 400-500 polygonal depressions on each side *N. floridanum*
- 1 Petioles of emergent leaves auriculate toward the base; seeds reddish-brown, rather coarsely reticulate, with 25-150 (-175) polygonal depressions on each side.
- 2 Mature siliques 1-1.5 mm wide, terete or subterete; seeds in 1 row in each locule of the silique; seeds with (75-) 100-150 (-175) polygonal depressions on each side [*N. microphyllum*]
- 2 Mature siliques (1.8-) 2-3 mm wide, flattened; seeds in 2 rows in each locule of the silique; seeds with 25-50 (-60) polygonal depressions on each side *N. officinale*

Nasturtium floridanum (Al-Shehbaz & Rollins) Al-Shehbaz & R.A. Price, Florida Watercress. Spring runs, blackwater bottomlands. Mar-May. Ne. FL and e. Panhandle FL south to s. FL; endemic to FL, but north to counties adjacent to se. GA. [= FNA, V, WH3; = *Rorippa floridana* Al-Shehbaz & Rollins – K, Z; < *Nasturtium microphyllum* Boenninghausen ex Reichenbach – GW, misapplied; *Nasturtium stylosum* Shuttleworth ex O.E. Schulz] {synonymy incomplete}

* *Nasturtium microphyllum* Boenninghausen ex Reichenbach, Narrow-fruited Watercress. Streams, springs; native of Europe. See Green (1962) for additional information. [= FNA, Pa, V; = *Rorippa microphylla* (Boenninghausen ex Reichenbach) Hylander ex Löve & Löve – C, K, Q, X, Z; < *Nasturtium officinale* – RAB, G, W; = *Nasturtium officinale* W.T. Aiton var. *microphyllum* (Boenninghausen ex Reichenbach) Thellung – F]

* *Nasturtium officinale* W.T. Aiton, Watercress. Streams, springs, seepages; native of Eurasia. Apr-Jul. [= FNA, GW, Pa, V, Va, WH3, WV; = *Rorippa nasturtium-aquaticum* (Linnaeus) Hayek – C, K, Q, X, Z; < *Nasturtium officinale* – G, RAB, W (also see *N. microphyllum*); > *Nasturtium officinale* var. *officinale* – F; > *Nasturtium officinale* var. *siifolium* (Reichenbach) W.D.J. Koch – F; = *Sisymbrium nasturtium-aquaticum* Linnaeus – S]

Noccaea Moench 1802

A genus of ca. 128 species, perennial, biennial, and annual herbs, almost entirely of Europe, Asia, and n. Africa. Mummenhoff & Koch (1994) and Meyer (1973, 1979) discussed the reasons for separating *Microthlaspi* from *Thlaspi*; Al-Shehbaz (2012) suggested that this and other segregates might ultimately be placed in *Noccaea*, a decision confirmed and followed in Al-Shehbaz (2014). References: Al-Shehbaz (2014)=U; Al-Shehbaz (2012); Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Thieret & Baird (1985)=Y; Mummenhoff & Koch (1994)=X; Al-Shehbaz (1986)=V.

* *Noccaea perfoliata* (Linnaeus) Al-Shehbaz, Perfoliate Penny-cress, Thoroughwort Penny-cress. Fields, disturbed areas; native of Europe. Mar-May; Apr-Jun. [= U; = *Microthlaspi perfoliatum* (Linnaeus) F.K. Meyer – FNA, K, Va, X; = *Thlaspi perfoliatum* Linnaeus – C, F, G, Pa, RAB, V, W, WV, Y, Z]

Orychophragmus Bunge 1833 (Purple-mistress)

A genus of 7 species, herbs, of s. Europe and n. Africa. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

* *Orychophragmus violaceus* (Linnaeus) O.E. Schulz, Purple-mistress. Railroad rights-of-way, other disturbed areas; native of Mediterranean Europe. Mar-May. Introduced and apparently well established in and around Richmond, VA; originally reported as *Moricandia arvensis* (Rollins 1993), a misidentification. [= FNA, Va; >> *Moricandia arvensis* (Linnaeus) A.P. de Candolle – K, Z, misidentification]

Paysonia O’Kane & Al-Shehbaz 2002 (Bladderpod)

A genus of 8-9 species, herbs, endemic to southeastern United States. O’Kane & Al-Shehbaz (2002) clearly show that *Paysonia* is not a part of *Lesquerella*, which itself is included within *Physaria*. References: O’Kane in FNA (2010); Rollins (1993)=Z; Rollins & Shaw (1973)=Y; O’Kane & Al-Shehbaz (2002)=X; Al-Shehbaz (1987)=V. Key adapted from X and Z.

- 1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow [see *Physaria*]

- 1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white.
- 2 Siliques strongly compressed parallel to the plane of the septum, orbicular; valves pubescent with a mixture of large, simple, bulbous-based trichomes and smaller branched trichomes; flowers yellow *Paysonia lescurii*
- 2 Siliques not compressed, nearly globose, subglobose, pyriform, or slightly bilobed; valves glabrous or pubescent with only a single type of trichome; flowers white or yellow.
- 3 Flowers white; siliques pyriform, depressed globose, or slightly bilobed; septum (of the silique) perforate or nearly absent.
- 4 Siliques glabrous or very sparsely pubescent, subpyriform; valves (of the silique) papery, densely pubescent on the interior; styles glabrous..... *Paysonia perforata*
- 4 Siliques densely pubescent, depressed globose or slightly bilobed; valves (of the silique) glabrous on the interior; styles hirsute..... *Paysonia stonensis*
- 3 Flowers yellow; siliques globose to subglobose; septum (of the silique) complete.
- 5 Siliques densely pubescent; styles pubescent (at least near base) *Paysonia densipila*
- 5 Siliques glabrous; styles glabrous *Paysonia lyrata*

Paysonia densipila (Rollins) O’Kane & Al-Shehbaz, Duck River Bladderpod. Calcareous glades, sometimes in fields and bottomlands. Endemic to an area from c. TN south to n. AL. [= FNA, X; = *Lesquerella densipila* Rollins – K, V, Y, Z]

Paysonia lescurii (A. Gray) O’Kane & Al-Shehbaz, Lesquereux’s Bladderpod. Calcareous glades, fields, bottomlands. Endemic to an area from sc. KY south through c. TN to n. AL. [= FNA, X; = *Lesquerella lescurii* (A. Gray) S. Watson – K, S, V, Y, Z]

Paysonia lyrata (Rollins) O’Kane & Al-Shehbaz, Lyreleaf Bladderpod. Calcareous glades. Endemic to Colbert, Franklin, and Lawrence counties, AL. [= FNA, X; = *Lesquerella lyrata* Rollins – K, V, Y, Z]

Paysonia perforata (Rollins) O’Kane & Al-Shehbaz, Spring Creek Bladderpod. Calcareous glades, fields, pastures. Endemic to Rutherford and Wilson counties, TN (Chester, Wofford, & Kral 1997). [= FNA, X; = *Lesquerella perforata* Rollins – K, V, Y, Z]

Paysonia stonensis (Rollins) O’Kane & Al-Shehbaz, Stones River Bladderpod. Floodplains, fields, pastures. Endemic to Rutherford County, TN (Chester, Wofford, & Kral 1997). [= FNA, X; = *Lesquerella stonensis* Rollins – K, V, Y, Z]

Physaria (Nuttall ex Torrey & A. Gray) A. Gray

A genus of about 98 herbs, of temperate North America and South America (Al-Shehbaz & O’Kane 2002). The genus is most diverse in sw. North America. References: O’Kane in FNA (2010); Rollins (1993)=Z; Rollins & Shaw (1973)=Y; Al-Shehbaz & O’Kane (2002)=X; Al-Shehbaz (1987)=V. Key adapted from Rollins (1993).

- 1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white.....[see *Paysonia*]
- 1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow.
- 2 Fruits (1-) 2-3 mm long, slightly pubescent on the exterior; petals 3.5-6.5 (-7.5) mm long, bright yellow; biennial or perennial from branched, woody caudex..... *P. globosa*
- 2 Fruits 3-8 mm long, glabrous on the exterior; petals 5-11 mm long, either pale yellow or bright yellow to orange; annual, biennial, or short-lived perennial from a fine taproot.
- 3 Stems to 2.5 dm long; basal leaves 1-2.4 cm long, entire or sinuate; petals pale yellow [*P. filiformis*]
- 3 Stems 1-7 dm long; basal leaves 1.5-5 (-8) cm long, lyrate-pinnatifid (rarely merely dentate or entire); petals bright yellow to orange.
- 4 Fruiting pedicels sigmoid, 5-15 (-25) mm long; gynophore 0.5-1 mm long [*P. gordonii*]
- 4 Fruiting pedicels straight or slightly curved, (7-) 10-20 (-25) mm long; gynophore 1-2 mm long *P. gracilis* ssp. *gracilis*

Physaria filiformis (Rollins) O’Kane & Al-Shehbaz, Missouri Bladderpod. Reported for AL (FNA), apparently erroneously (Yatskievich, 2010, pers. comm.); Ozark endemic, in sw. MO and n. AR. [= FNA, X; = *Lesquerella filiformis* Rollins – K, V, Y, Z] {rejected}

Physaria globosa (Desvaux) O’Kane & Al-Shehbaz, Globe Bladderpod. Calcareous glades, ledges, shaly areas. Mar-May. Endemic to an area from Posey County, IN and allegedly also s. OH south through c. KY to c. TN. [= X; = *Lesquerella globosa* (Desvaux) S. Watson – C, F, G, K, S, V, Y, Z]

* *Physaria gordonii* (A. Gray) O’Kane & Al-Shehbaz, Gordon’s Bladderpod. Shaly roadside; native of sc. and sw. US and n. Mexico. Rollins (1993) reports this species (identification unconfirmed) as a waif along the Blue Ridge Parkway, VA; it may not be established. [= FNA; > *P. gordonii* ssp. *gordonii* – X; > *Lesquerella gordonii* (A. Gray) S. Watson var. *gordonii* – Z; = *Lesquerella gordonii* – K, Y]

Physaria gracilis (Hooker) S. Watson ssp. *gracilis*, Spreading Bladderpod. Prairies, roadsides, old fields. Mar-May. TN, IL, MO, and OK south to AL, MS, LA, and TX. [= X; < *Lesquerella gracilis* – F, G; = *Lesquerella gracilis* (Hooker) S. Watson ssp. *gracilis* – K, V, Z]

Planodes E.L. Greene 1912 (Virginia-cress)

A genus of 2 species, of North America and Mexico. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (2010)=Z; Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

Planodes virginicum (Linnaeus) E.L. Greene, Virginia-cress, Sibara. Disturbed areas, fields, roadsides. Feb-Jun. VA west to IL, IA, and KS, south to FL and TX. A native weed, presumably much more common now than formerly. [= FNA, Va, Z; = *Sibara virginica* (Linnaeus) Rollins – C, F, G, K, RAB, W, WH3, WV, Y, Z; = *Arabis virginica* (Linnaeus) Poiret – S]

Raphanus Linnaeus 1753 (Radish)

A genus of 3 species, herbs, of the Old World. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y; Stace (2010)=X.

- 1 Siliques moniliform (constricted between the seeds), the silique body about the same diameter for most of its length, longitudinally grooved; petals usually yellow, fading white (rarely purple); seeds 4-12 per silique *R. raphanistrum* ssp. *raphanistrum*
- 1 Siliques not moniliform, the silique body tapered from its widest point below the middle to the apex, smooth or slightly longitudinally grooved; petals usually purple (rarely white); seeds 1-3 (-5) per silique *R. sativus*

* *Raphanus raphanistrum* Linnaeus ssp. *raphanistrum*, Wild Radish, Jointed Charlock, White Charlock. Fields, roadsides, disturbed areas; native of Mediterranean Europe. Mar-Jun (and sporadically later). European authors (such as Stace 2010) recognize several infraspecific taxa in *R. raphanistrum*; North American material represents ssp. *raphanistrum*. [= FNA, X; < *R. raphanistrum* – C, F, G, K, Pa, RAB, Va, W, WH3, WV, Y, Z]

* *Raphanus sativus* Linnaeus, Radish, Garden Radish. Persistent after cultivation or as a "throwout"; native of Mediterranean Europe. Apr-Jun. Cultivated for at least 5000 years. [= C, F, FNA, G, K, Pa, RAB, S, W, WH3, WV, X, Y, Z]

Rapistrum Crantz 1769 (Bastard-cabbage)

A genus of 2 species, herbs, of Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* *Rapistrum rugosum* (Linnaeus) Allioni, Annual Bastard-cabbage. Waste areas around wool-combing mills, other disturbed ground; native of Mediterranean Europe. Also naturalized at scattered sites in e. TN (Chester, Wofford, & Kral 1997), PA (Rhoads & Klein 1993), and elsewhere. [= C, F, FNA, Z; > *R. rugosum* var. *rugosum* – G; > *R. rugosum* ssp. *rugosum* – K, Y]

Rorippa Scopoli (Yellow Cress, Marshcress)

A genus of about 75 species, herbs, cosmopolitan. The separation of *Nasturtium* from *Rorippa* is warranted (Al-Shehbaz & Price 1998); Franzke et al. (1998) provide corroboration based on molecular analysis. The species treated here as *R. aquatica* has been placed in several genera in recent years. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=X; Rollins (1993)=Z; Stuckey (1972)=Y; Al-Shehbaz & Bates (1987)=V; Les, Anderson, & Cleland (1995)=U; Al-Shehbaz (1988a)=Q. Key modified from FNA.

- 1 Plant a submerged aquatic, rooting from lower nodes; leaves of two forms, the submerged pectinately divided, the emergent simple, sometimes lobed; fruit <2.5× as long as wide; petals white *R. aquatica*
- 1 Plant terrestrial or of wet places, not rooting from lower nodes; leaves of one form, pinnately lobed or simple; fruit >2.5× as long as wide; petals yellow or pale yellow (or absent).
- 2 Plant a rhizomatous, colony-forming perennial; petals (2.0-) 2.8-6.0 mm long; siliques 3-15× as long as wide.
 - 3 Stems branched at the base, decumbent to ascending; leaf sinuses not reaching the midrib, the lateral segments entire to weakly toothed; siliques 3-6× as long as wide *R. sinuata*
 - 3 Stems branched in the upper portions, erect; leaf sinuses reaching the midrib, the lateral segments often sharply toothed; siliques 6-15× as long as wide *R. sylvestris*
- 2 Plant a taprooted annual or biennial; petals 0-3.5 mm long; siliques either 2-9 (-10)× or 15-50× as long as wide.
 - 4 Flowers nearly sessile; petals absent; lower fruiting pedicels 0.5-1.5 mm long; siliques (3-) 5.4-8.5 (-10.2) mm long, (1.4-) 1.8-2.6 (-3.3) mm wide, mostly 3-5× as long as wide *R. sessiliflora*
 - 4 Flowers clearly pedicellate; petals present (or absent in *R. dubia*); lower fruiting pedicels > 4 mm long; siliques 4-20 mm long, either 2-9 (-10)× or 15-50× as long as wide.
 - 5 Siliques (7-) 10-40 mm long, 15-50× as long as wide.

- 6 Siliques straight, (15-) 25-40 mm long, 0.7-0.9 (-1.0) mm wide; seeds uniseriate.....*R. dubia*
- 6 Siliques curved, (7-) 10-24 (-30) mm long, 1-1.5 (-2) mm wide; seeds biseriata.....[*R. indica*]
- 5 Siliques 2.5-12.5 (-20.4) mm long, 2-9 (-10)× as long as wide.
- 7 Siliques (5.2-) 8.5-12.5 (-20.4) mm long, (4-) 6-9 (-10)× as long as wide; leaves deeply pinnatifid, the pinnae themselves toothed, lobed or dissected; seeds 0.4-0.5 mm long, 100-150 per silique.....*R. teres*
- 7 Siliques 2.5-9 mm long, 2-5× as long as wide; leaves serrate, lobed, or pinnately dissected, the pinnae (when present) merely toothed; seeds 0.5-0.9 mm long, 20-80 per silique.
- 8 Leaves hirsute on the lower surface; stems hirsute usually up to the terminal raceme.....*R. palustris* ssp. *hispida*
- 8 Leaves glabrous on the lower surface; stems glabrous or sparsely hirsute.....*R. palustris* ssp. *palustris*

Rorippa aquatica (Eaton) E.J. Palmer & Steyermark, Lake Cress. Shallow water of swamps and lake margins. VT west to MN, south to s. GA, FL, and e. TX, widely scattered and probably dispersed by waterfowl. See Al-Shehbaz & Bates (1987) and Les, Anderson, & Cleland (1995) for additional information on this interesting plant. Apparently most closely related to *Rorippa*, and here included there. [= FNA, Va; = *Neobeckia aquatica* (Eaton) Greene – K, S, U, WH3; = *Armoracia lacustris* (A. Gray) Al-Shehbaz & V. Bates – C, Q, V, Z; = *Armoracia aquatica* (Eaton) Wiegand – F, G, GW; = *Rorippa americana* (A. Gray) Britton]

* **Rorippa dubia** (Persoon) H. Hara. Disturbed wet places; native of se. Asia. [= FNA; = *R. indica* (Linnaeus) Hiern var. *apetala* Hochreutiner – K1, K2, Z] {add X, Y to synonymy}

* **Rorippa indica** (Linnaeus) Hiern, Indian Yellow-cress. River banks and bars; native of se. Asia. Reported for VA (VBA, G. Fleming, pers. comm. 2009). [= C, Va, Y; = *R. indica* var. *indica* – K1, K2, Z] {add X to synonymy}

Rorippa palustris (Linnaeus) Besser ssp. *hispida* (Desvaux) Jonsell. Moist soils. NL (Labrador) to AK, south to c. VA (Amelia County), IL, NE, NM, and n. CA. Al-Shehbaz (1988a) considers reports of this taxon in the Southeast to be misidentifications of var. *fernaldiana*. [= FNA, K; = *Rorippa palustris* var. *hispida* (desvaux) Rydberg – C, Z; = *Rorippa islandica* (Oeder) Bolbás var. *hispida* (Desvaux) Butters & Abbe – F, G; < *Rorippa palustris* – Pa; = *Radicula hispida* (Desvaux) Heller – S; = *Rorippa palustris* ssp. *hispida* (Desvaux) Jonsell var. *hispida* – Y]

Rorippa palustris (Linnaeus) Besser ssp. *palustris*, Marshcress. Marshes, bogs, seeps. May-Oct. ME and NB west to SK, south to FL, TX, ID, and n. South America. [= Va; > *Rorippa palustris* var. *palustris* – C, Z; > *Rorippa islandica* var. *islandica* – F, G, misapplied; = *Rorippa palustris* ssp. *palustris* – K, X; > *Rorippa palustris* var. *fernaldiana* (Butters & Abbe) R. Stuckey – C, Z; > *Rorippa islandica* var. *fernaldiana* Butters & Abbe – F, G, WV, misapplied; < *Rorippa palustris* – GW, W, WH3; > *Rorippa palustris* ssp. *fernaldiana* (Butters & Abbe) Jonsell – K, X; < *Rorippa palustris* – Pa; = *Rorippa islandica* (Oeder) Bolbás – RAB, misapplied; = *Radicula palustris* (Linnaeus) Moench – S; > *Rorippa palustris* ssp. *glabra* (O.E. Schulz) R. Stuckey var. *fernaldiana* (Butters & Abbe) R. Stuckey – Y; > *Rorippa palustris* ssp. *palustris* var. *palustris* – Y]

Rorippa sessiliflora (Nuttall ex Torrey & A. Gray) A.S. Hitchcock, Stalkless Marshcress. Wet places, marshes, swamps. Apr-Jul. MD, WV (Cusick 1994), OH, IN, IL, MN, and NE south to Panhandle FL, s. AL, LA, and c. TX. [= C, F, FNA, G, GW, K, RAB, W, WH3, Va, X, Y, Z; = *Radicula sessiliflora* (Nuttall ex Torrey & A. Gray) E.L. Greene – S]

Rorippa sinuata (Nuttall) A.S. Hitchcock. Riverbanks, pond margins. C. and w. North America, east to ON, MN, WI, IL, w. KY, TN, AR, and LA. [= C, F, FNA, G, GW, K, X, Y, Z]

* **Rorippa sylvestris** (Linnaeus) Besser, Creeping Yellow Cress. Lawns, disturbed moist to wet soils; native of Eurasia. May-Aug. [= C, F, FNA, G, GW, K, Pa, RAB, Va, W, WV, X, Y, Z; = *Radicula sylvestris* (Linnaeus) Druce – S]

Rorippa teres (Michaux) R. Stuckey. Cypress-gum ponds, marshes, swamps, ditches, disturbed wet areas. Mar-May. Se. NC south to s. FL, west to se. OK, sw. TX, and s. and w. Mexico (Sinaloa). [= C, FNA, K, WH3; > *Rorippa teres* var. *teres* – GW, X, Y, Z; = *Rorippa walteri* – RAB; = *Radicula walteri* (Elliott) E.L. Greene – S]

Sinapis Linnaeus 1753 (Mustard)

A genus of 7 species, herbs, of s. Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z and C.

- 1 Beak of silique strongly compressed; silique densely covered with long, stiff trichomes, ca. 4 mm in diameter; pedicels slender, mostly at right angles to the rachis; seeds 4-8 per silique; [section *Sinapis*].....*S. alba*
- 1 Beak of silique conical; silique glabrous or nearly so, ca. 2 mm in diameter; pedicels thick, erect to spreading; seeds 7-13 per silique; [section *Ceratosinapis*].....*S. arvensis*

* **Sinapis alba** Linnaeus, White Mustard, Yellow Mustard. Disturbed areas; native of Mediterranean Europe. Apr-Jun. The seeds of this species are one source of table mustard; other species used include *Brassica juncea* and *B. nigra*. [= C, K, Pa, S, Y, Z; ? *Brassica hirta* – F, G, RAB, WV]

* ***Sinapis arvensis*** Linnaeus, Charlock, Crunchweed, Wild Mustard. Disturbed areas; native of Mediterranean Europe. Apr-Jul. [= C, K, Pa, S, WH3, Y, Z; ? *Brassica kaber* (A.P. de Candolle) L.C. Wheeler – G, RAB; > *Brassica kaber* var. *pinnatifida* (Stokes) L.C. Wheeler – F, WV]

Sisymbrium Linnaeus (Jim Hill Mustard)

A genus of about 41 species, herbs, mainly northern hemisphere. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1986b, 1988)=Y.

- 1 Siliques linear, 5-10 cm long; spreading from the rachis; pedicels 5-20 mm long; petals 6-8 mm long ***S. altissimum***
- 1 Siliques subulate, 0.8-1.5 cm long, appressed to the rachis; pedicels 1-3 mm long; petals 3-4 mm long ***S. officinale***

- * ***Sisymbrium altissimum*** Linnaeus, Tumble Mustard, Jim Hill Mustard. Fields, disturbed areas; native of Eurasia. May-Jun. [= C, F, FNA, G, Pa, RAB, Va, W, WH3, WV, Y, Z; = *Norta altissima* (Linnaeus) Britton – S]
- * ***Sisymbrium irio*** Linnaeus, London-rocket. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area; native of Europe. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= C, F, FNA, G, K, WH3, Y, Z] {not yet keyed}
- * ***Sisymbrium loeselii*** Linnaeus. Disturbed areas, waif around wool-combing mills; native of e. Europe and w. Asia. [= C, F, FNA, G, K, Y, Z] {not yet keyed}
- * ***Sisymbrium officinale*** (Linnaeus) Scopoli, Hedge Mustard. Fields, pastures, barnyards, disturbed areas; native of Europe. [= C, FNA, K, Pa, Va, WH3, Y, Z; > *S. officinale* var. *leiocarpum* A.P. de Candolle – RAB, F, G, W, WV; > *S. officinale* var. *officinale* – F, G, RAB, W, WV; = *Erysimum officinale* Linnaeus – S]
- * ***Sisymbrium turczaninowii*** Sonderegger, Russian Rocket. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= K, Y, Z] {not yet keyed}

Teesdalia W.T. Aiton 1812 (Shepherd's Cress)

A genus of 3 species, herbs, of Europe, n. Africa, and the Middle East. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Appel (1998); Al-Shehbaz (1986)=Y.

- * ***Teesdalia nudicaulis*** (Linnaeus) W.T. Aiton, Shepherd's Cress, Hedge Mustard, Bank Cress. Lawns, fields, roadsides, disturbed areas; native of Europe. Mar-Apr; Apr-Jun. [= C, F, FNA, G, K, RAB, Va, Y, Z]

Thlaspi Linnaeus 1753 (Pennycress)

A genus of about 6 species, as much more narrowly circumscribed, annual herbs, native to Eurasia and n. Africa. Mummenhoff & Koch (1994), Meyer (1973, 1979), Koch & Al-Shehbaz (2004), and Al-Shehbaz (2014) discuss the reasons for separating *Noccaea* from *Thlaspi*; they are now additionally treated in separate tribes. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1986)=Y. [also see *Microthlaspi*]

- 1 Siliques 5-8 mm long, 2-4 mm wide; seeds brown, alveolate; lower stem with scattered long hairs; fresh plant smelling of garlic when crushed; [section *Pterotropis*] ***T. alliaceum***
- 1 Siliques (8-) 10-17 mm long, 7-12 mm wide; seeds brown, concentrically ridged; lower stem glabrous; fresh plant not smelling of garlic when crushed; [section *Thlaspi*] ***T. arvense***

* *Thlaspi alliaceum* Linnaeus, Garlic Pennycress, Roadside Pennycress. Fields, disturbed areas, roadsides; native of Europe. Mar-Apr; Apr-May. This alien is spreading very aggressively along roadsides and into fields in some parts of our area (Cusick 2015; Thompson et al. 2013). [= FNA, K, Pa, RAB, Va, Y, Z]

* *Thlaspi arvense* Linnaeus, Field Pennycress, Frenchweed. Fields, disturbed areas; native of Europe. Mar-Jun; Apr-Jul. [= C, F, FNA, G, K, Pa, RAB, S, Va, W, WH3, WV, Y, Z]

Tomostima Rafinesque 1825 (Draba)

A genus of 6 species, annual herbs, of North America south into Mexico and disjunct in South America. This genus has been segregated from *Draba* on molecular and morphological grounds (Jordon-Thaden et al. 2010; Al-Shehbaz 2012). References: Al-Shehbaz, Windham, & Elven in FNA (2010); Jordon-Thaden et al. (2010); Al-Shehbaz (2012)=X; Rollins (1993)=Z; Al-Shehbaz (1987)=Y; Koch & Al-Shehbaz (2002).

- 1 Inflorescence congested, the fruiting portion ca. 1.5 cm long; trichomes of the upper leaf surface simple or once-forked; pedicels glabrous (rarely with a few scattered trichomes)..... *T. reptans*
- 1 Inflorescence not congested, the fruiting portion mostly > 2.5 cm long; trichomes of the upper leaf surface dendritic; pedicels densely pubescent.
 - 2 Silique ca. 3-6× as long as wide, 5-15 mm long, 1.2-2.2 (-2.8) mm wide, pubescent with simple or branched trichomes *T. cuneifolia*
 - 2 Silique ca. 2× as long as wide, 5-8 mm long, 2.5-3.7 mm wide, pubescent with simple trichomes *T. platycarpa*

Tomostima cuneifolia (Nuttall ex Torrey & A. Gray) Al-Shehbaz, M. Koch, & Jordon-Thaden. Open blackland prairies, preferring rocky, bare soil, limestone outcrops, also waste areas around wool-combing mills, possibly other habitats. Feb-Mar; Mar-Apr. IL south to LA, west to UT, NV, CA, and nw. Mexico; scattered eastwards as apparently native disjuncts in OH, KY, TN, GA, AL, MS, and FL, and also as an occasional weed in NC and SC and perhaps other states. The species extends as a native at least as far east as c. GA (Houston County) (Echols 2007) and AL, where it occurs in prairies and on limestone outcrops (Diamond & Woods 2009). Taxa previously treated as additional varieties are now considered to be separate species. [= X; < D. *cuneifolia* – C, F, G, RAB, S, WH3; = *Draba cuneifolia* Nuttall ex Torrey & A. Gray var. *cuneifolia* – FNA, K, Y, Z]

* *Tomostima platycarpa* (Torrey & A. Gray) Al-Shehbaz, M. Koch, & Jordon-Thaden. Waste areas around wool-combing mill, perhaps not established; native of sw. North America. [= X; = *Draba platycarpa* Torrey & A. Gray – FNA, K, Y, Z]

Tomostima reptans (Lamarck) Al-Shehbaz, M. Koch, & Jordon-Thaden. Dry soil. Feb-Mar; Mar-Apr. MA and ON west to WA, south to NC, GA, TX and CA. The few occurrences in our area seem to make little ecological or phytogeographic sense; they may represent introductions. The first collection in our area was, however, by Walter. [= X; > D. *reptans* var. *reptans* – C, F, G; = *Draba reptans* (Lamarck) Fernald – FNA, K, Pa, RAB, Y, Z; > D. *caroliniana* Walter – S]

Turritis Linnaeus 1753 (Tower Mustard)

A genus of 2 species, annual or biennial herbs, circumboreal. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1988a)=Y; Koch, Bishop, & Mitchell-Olds (1999); Koch & Al-Shehbaz (2002).

Turritis glabra Linnaeus, Tower Mustard. Open disturbed areas, forest edges. May-Jun; Jul-Aug. Circumboreal, south in North America to NC, sc. TN (Chester, Wofford, & Kral 1997), AR, KS, NM, and CA. Possibly only an introduction in our area. [= FNA, Va; = *Arabis glabra* (Linnaeus) Bernhardt – C, F, G, RAB, W; > *A. glabra* var. *glabra* – Y, Z]

Warea Nuttall 1834 (Warea, Pineland-cress)

A genus of 4 species, annual herbs, of se. North America. The genus is endemic to se. United States Coastal Plain. This is the only genus of tribe *Thelypodieae* in our area. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985a)=Y; Channell & James (1964).

Identification notes: *Warea* (Brassicaceae) and *Polanisia* (Cleomaceae) are superficially similar. The genus is quite showy and conspicuous, reminiscent of a small *Cleome* because of its white to pink, clawed petals and silique borne on a long gynophore.

- 1 Leaves cuneate at the base.
- 2 Claws of the petals conspicuously coarsely papillate or pubescent, the margins crisped; gynophore 3-6 (-7) mm long, shorter than the pedicel; [FL peninsula] [*W. carteri*]

- 2 Claws of the petals smooth or papillose; gynophore (5-) 7-11 mm long, longer than the pedicel; [sc. NC south through SC and GA to AL and FL] *W. cuneifolia*
- 1 Leaves rounded, slightly auriculate, or auriculate-clasping at the base.
 - 3 Leaves conspicuously auriculate at the base, the auricles clasping and adnate to the stem; [FL peninsula] [*W. amplexifolia*]
 - 3 Leaves rounded to slightly auriculate at the base, not clasping the stem; [FL Panhandle, sw. GA and s. AL] *W. sessilifolia*

Warea amplexifolia (Nuttall) Nuttall, Wide-leaf Pineland-cress, Clasping Warea. Sandhills and Florida scrub. Aug-Sep. Endemic to the FL peninsula, north to Orange and Lake counties, FL, just south of our area. [= FNA, K2, S, WH3, Y, Z]

Warea carteri Small, Carter's Warea, Carter's Pineland-cress. Sandhills and Florida scrub. Late Sep-Jan. Endemic to the FL peninsula, north to Orange and Lake counties, FL, just south of our area. [= FNA, K2, S, WH3, Y, Z]

Warea cuneifolia (Muhlenberg ex Nuttall) Nuttall, Carolina Warea, Carolina Pineland-cress. Xeric white sands of sandhills, primarily in Sandhill Region. Jul-Sep; Aug-Sep. Sc. NC south to Panhandle FL and se. AL. [= FNA, K, RAB, S, WH3, Y, Z]

Warea sessilifolia Nash, Sessile-leaf Warea, Sessile-leaf Pineland-cress. Sandhills. Aug-Sep. Panhandle FL and adjacent AL (Pike County) and wc. GA (Stewart County) (Sorrie 1998b). [= FNA, K, S, WH3, Y, Z]

277. OLACACEAE A.L. de Jussieu ex R. Brown in Tuckey 1818 (Olax Family) [in SANTALALES]

A family of about 14 genera and 100 species, trees, shrubs, and woody vines, pantropical in distribution. Sometimes further divided, as by Nickrent et al. (2010), in which case *Ximenia* is placed in Ximeniaceae. References: Nickrent et al. (2010).

Ximenia Linnaeus 1753 (Tallow-wood)

A genus of about 8 species, hemiparasitic shrubs, tropical. *Ximenia* is placed in the segregate family Ximeniaceae by Nickrent et al. (2010).

Ximenia americana Linnaeus, Tallow-wood, Hog-plum. Hammocks, pine flatwoods, scrub. FL peninsula, north to Duval County, FL; Bahamas; West Indies; neotropics; paleotropics. [= K, S, WH3]

279. SANTALACEAE R. Brown 1820 (Sandalwood Family) [in SANTALALES]

A family of about 41 genera and 930 species, trees, shrubs, and herbs, primarily of tropical and warm temperate regions of the Old World and New World. All members of the family are hemiparasitic, attaching to the stems or roots of other plants. Viscaceae are closely related to and should either be included in the Santalaceae (Angiosperm Phylogeny Group 2003, 2009), as done here, or the contrasting approach should be taken, involving the segregation of smaller, monophyletic families (Nickrent et al. 2010). In our area, this would mean Santalaceae s.s. (*Nestronia*), Cervantesiaceae (*Pyrularia*), Thesiaceae (*Buckleya*), Comandraceae (*Comandra*), and Viscaceae (*Phoradendron*) (Nickrent et al. 2010). References: Nickrent et al. (2010); Nickrent & Malécot (2001).

- 1 Leaves alternate; monoecious herb or shrub.
 - 2 Herb, < 2 (-3) dm tall; leaves 1-4 cm long, glabrous; inflorescence a terminal panicle of cymes; [tribe *Comandreae* or family *COMANDRACEAE*] *Comandra*
 - 2 Shrub, > 4 dm tall; leaves 5-15 cm long, pubescent; inflorescence a terminal raceme; [tribe *Pyrularieae* or family *CERVANTESIACEAE*]... *Pyrularia*
- 1 Leaves opposite; dioecious shrubs.
 - 3 Aerial shrubs, parasitic on treetrunks and branches; leaves coriaceous, brittle when live; [tribe *Visceae* or family *VISCACEAE*] *Phoradendron*
 - 3 Terrestrial shrubs, parasitic via root connections; leaves herbaceous, flexible when live.
 - 4 Staminate flowers in terminal umbel-like dichasia; pistillate flowers (and fruits) solitary, terminal; clumped shrub to 4 m tall; [tribe *Thesiae* or family *THESIACEAE*] *Buckleya*
 - 4 Staminate flowers in axillary umbels; pistillate flowers (and fruits) solitary, axillary; rhizomatous shrub to 1 m tall; [tribe *Santalaeae* or family *SANTALACEAE*] *Nestronia*

***Buckleya* Torrey (Piratebush)**

A genus of 5 species, hemiparasitic shrubs, of temperate e. North America and e. Asia; the 3 species other than our own are *B. lanceolata* of Japan, and *B. henryi*, *B. graebneriana*, and *B. angulosa* of China. *Buckleya* is placed in the segregate family Thesiaceae by Nickrent et al. (2010). References: Carvell & Eshbaugh 1982=Z; Massey et al. (1983).

Buckleya distichophylla (Nuttall) Torrey, Piratebush. Dry or rocky bluffs and slopes, usually with pines or hemlock, and most common in scrubby pine-oak/heath woodlands. Apr-May; Jun-Oct. A Southern Appalachian endemic: sw. VA south through ne. TN to sw. NC, in the western edge of the Blue Ridge and to the west in the Ridge and Valley. It is apparently parasitic on a variety of hosts – not limited to *Tsuga*, as has sometimes been reported. The branches, with their neat and distichous array of simple leaves, are often mistaken for a compound leaf. Huish, Manow, & McMullen (2015) discuss its reproductive biology. [= C, F, G, K, RAB, S, Va, W, Z]

***Comandra* Nuttall (Bastard-toadflax)**

A genus of 2 species, hemiparasitic perennial herbs, of North America and Europe. *Comandra* is placed in the segregate family Comandraceae by Nickrent et al. (2010).

Comandra umbellata (Linnaeus) Nuttall var. ***umbellata***, Eastern Bastard-toadflax. Dry forests and woodlands, woodland borders, usually in acidic soils and most common in oak/heath forests. Apr-Jul; Jul-Aug. Var. *umbellata* ranges from ME to MI, south to n. GA and AL; other varieties are western or Eurasian. [= C, Va; < *C. umbellata* – Pa, W, WV; = *C. umbellata* ssp. *umbellata* – K, Mo; ? *C. umbellata* – RAB, S; > *C. umbellata* – F, G; > *C. richardsiana* – F, G]

***Nestronia* Rafinesque (Nestronia)**

A monotypic genus, a hemiparasitic shrub, endemic to se. United States. *Nestronia* is placed in a much more narrowly circumscribed Santalaceae by Nickrent et al. (2010). References: Libby & Bloom (1998).

Identification notes: In its clonal, usually knee-high growth, *Nestronia* has something of the aspect of an opposite-leaved lowbush blueberry.

Nestronia umbellata Rafinesque, Nestronia, Conjuror's-nut, Leechbrush. Relatively mesic sites in sandhills in the upper Coastal Plain, mesic to dry Piedmont oak forests. Apr-May; Jul. Sc. VA south and west to sc. GA, se. AL, nc. AL, and sc. TN; disjunct in sc. KY. See Libby & Bloom (1998) for an interesting discussion and county distribution map. It sometimes forms colonies (presumably clones) several hectares in size. [= C, F, G, K, RAB, S, Va, W]

***Phoradendron* Nuttall 1848 (Mistletoe)**

A genus of about 235 species, epiphytic hemiparasites, of tropical and rarely temperate America. *Phoradendron* is placed in the segregate family Viscaceae by Nickrent et al. (2010). References: Abbott & Thompson (2011)=X; Kuijt (2003)=Y; Kuijt (1982)=Z.

Phoradendron leucarpum (Rafinesque) Reveal & M.C. Johnston ssp. ***leucarpum***, American Mistletoe, Christmas Mistletoe. Parasitic on various species of trees, especially abundant in swamp forests (perhaps because they are less frequently cut and have older, more mature hardwoods). Oct-Nov (-Mar); Nov-Jan (-May). Kuijt (2003) interprets this as a species with four subspecies; ssp. *serotinum* is the eastern component, ranging from NJ west to s. OH, s. IN, and s. MO, south to s. FL and s. TX; this interpretation is supported by genetic studies currently underway (Hawkins et al., in prep.). The other three subspecies are distributed in sw. United States and n. Mexico. The same four subspecies are recognized by Abbott & Thompson, under what has now been ruled to be the correct species name: *P. leucarpum* (Appelquist 2012). The lengthy and arcane debates about the correct nomenclature are summarized by Abbott & Thompson (2011), and references cited therein. *Phoradendron* is, of course, the mistletoe familiar (at least traditionally) in e. United States as a Christmas decoration. Kuijt (1982) comments that "the superficial likeness of *Phoradendron serotinum* to the European *Viscum album* has made the transfer of the latter's folklore to North America easy;" *Viscum album* was a sacred plant of Celtic and druidical pre-Christian European societies. The white berries of *P. leucarpum* are extremely poisonous. Their sticky flesh promotes the dispersal of the seeds by birds from tree to tree. [= Mo, Va, X; < *P. serotinum* (Rafinesque) M.C. Johnston – C, RAB, W, Z; < *P. flavescens* (Pursh) Nuttall – F, G, S, WV; < *P. leucarpum* (Rafinesque) Reveal & M.C. Johnston – K, Pa, WH3; = *P. serotinum* (Rafinesque) M.C. Johnston ssp. *serotinum* – Y]

***Pyrularia* Michaux (Buffalo-nut)**

A genus of 4 species, hemiparasitic shrubs, of e. North America and e. Asia (the other 3 species are of e. Asia). *Pyrularia* is placed in the segregate family Cervantesiaceae by Nickrent et al. (2010).

Pyrularia pubera Michaux, Buffalo-nut, Oil-nut. Mesic to dry forests, over a wide range of substrates. Apr-May; Jul-Oct. A Southern and Central Appalachian endemic, *P. pubera* ranges from sw. PA (Rhoads & Block 2007), e. WV, and w. VA south

and west to e. KY, w. NC, e. TN, and n. and wc. GA. The oil in the fruits is very poisonous. *Pyrolaria pubera* forms parasitic root connections with numerous trees, shrubs, and herbs with which it grows. [= C, F, G, K, Pa, RAB, S, Va, W, WV]

284. TAMARICACEAE Link 1821 (Tamarisk Family) [in CARYOPHYLLALES]

A family of about 4 genera and 78 species, shrubs and trees, of Eurasia and Africa (especially from the Mediterranean to c. Asia).
References: Crins (1989b); Gaskin in Kubitzki & Bayer (2003); Gaskin et al. (2004).

Tamarix Linnaeus 1753 (Tamarisk, Salt-cedar)

A genus of about 54 species, trees and shrubs, native of Eurasia and Africa. References: Baum (1978)=Z; Crins (1989b)=Y.

Identification notes: An important character is the staminal disk; three terms are used. In **hololophic** disks, the lobe between each stamen is obvious and separate from the stamens on either side, and each is usually 2-lobed. In **paralophic** disks, each lobe is deeply bipartite, and each half-lobe is fused to the base of the adjacent stamen, but is still somewhat distinct from it. In **synlophic** disks, the lobes are also deeply bipartite, but each half-lobe is fused confluent with the stamen base, giving the appearance that the filament has swollen base.

- 1 Flowers 4-merous; [section *Oligadenia*].
 - 2 Petals 1.5-2.5 mm long; bracts subtending the pedicels diaphanous; young growth completely glabrous; [section *Oligadenia*; series *Arbusculae*] *T. parviflora*
 - 2 Petals 3.5-5 mm long; bracts subtending the pedicels herbaceous; young growth (especially the bracts and the raceme axis) papillose; [section *Oligadenia*; series *Anisandrae*] *T. tetragyna*
- 1 Flowers 5-merous.
 - 3 Racemes 5-10 mm wide; [section *Oligadenia*].
 - 4 Bracts of the raceme linear to linear oblong, about equaling the pedicel; disk hololophic; young growth glabrous; [section *Oligadenia*; series *Laxae*] *T. chinensis*
 - 4 Bracts of the raceme lanceolate to ovate, exceeding the pedicel; disk synlophic, paralophic, or hololophic; young growth glabrous or papillose; [section *Oligadenia*; series *Anisandrae*].
 - 5 Young growth glabrous (except sometimes papillose on the raceme axis); disk synlophic; flowers with 5 antepetalous stamens and 0 antepetalous stamens *T. africana*
 - 5 Young growth papillose; disk hololophic to paralophic; flowers with 4-5 antepetalous stamens and 0-4 antepetalous stamens *T. tetragyna*
 - 3 Racemes 3-5 mm wide; [section *Tamarix*].
 - 6 Young growth papillose; disk synlophic; [section *Tamarix*; series *Canariensis*] *T. canariensis*
 - 6 Young growth glabrous; disk synlophic or hololophic; [section *Tamarix*; section *Gallicae*].
 - 7 Petals caducous; disk synlophic *T. gallica*
 - 7 Petals persistent; disk hololophic *T. ramosissima*

* *Tamarix africana* Poiret, African Tamarisk. Cp (SC): brackish marshes, coastal sands; rare, native of sw. Mediterranean Europe, ne. Africa, and the Canary Islands. [= K, Y; > *T. africana* var. *africana* - Z]

* *Tamarix aralensis* Bunge, Russian Tamarisk. Reported for NC (Kartesz 1999), but the specimen on which the report is based is of a plant in cultivation as an ornamental. Not keyed. [= K, Y, Z]

* *Tamarix canariensis* Willdenow, Canary Island Tamarisk. Brackish marshes, coastal hammocks, coastal sands; native of sw. Europe, ne. Africa, and the Canary Islands. [= K, WH3, Y, Z; < *T. gallica* Linnaeus - RAB, S]

* *Tamarix chinensis* Loureiro, Chinese Tamarisk. Coastal sands; native of China, Korea, and Japan. [= C, K, Y, Z; = *T. pentandra* Pallas - G, an illegitimate name]

* *Tamarix gallica* Linnaeus, French Tamarisk. Cp (GA, NC, VA?): brackish marshes; rare, native of the w. Mediterranean region of Europe. Apr-Jul. Most reports of this taxon from the Southeast represent misidentifications or a very broad interpretation of the species. [= F, G, K, Y, Z; < *T. gallica* - RAB, S]

* *Tamarix parviflora* A.P. de Candolle, Small-flower Tamarisk. Cp (NC, VA): coastal sands; rare, native of ne. Europe (Italy, Greece, Cyprus, Turkey). [= C, G, K, Y, Z; < *T. gallica* Linnaeus - RAB, S]

* *Tamarix ramosissima* Ledebour, Salt-cedar. Cp (GA, NC, SC, VA): brackish marshes, coastal hammocks, dunes and coastal sands, sand and gravel bars along rivers, disturbed areas; common, native of w. to e. Asia. [= K, Mo, Y, Z; < *T. gallica* Linnaeus - RAB, S]

* *Tamarix tetragyna* C. Ehrenberg. Cp (GA): coastal sands; rare, native of the Middle East. Established on Cumberland Island, Camden County, GA (Crins 1989b). [= K, Y, Z]

285. PLUMBAGINACEAE A.L. de Jussieu 1789 (Leadwort Family) [in CARYOPHYLLALES]

A family of about 24-27 genera and 650-775 species, shrubs, vines, and herbs, of cosmopolitan distribution. Lledó et al. (1998) and other authors suggest that the portion of the Plumbaginaceae often recognized as tribe Staticeae or subfamily Statioideae (which includes *Limonium*) would be better treated as a distinct family. References: Morin in FNA (2005); Lledó et al. (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Principal leaves basal; corolla 5-9 mm long; [subfamily *Statioideae*] *Limonium*
- 1 Principal leaves cauline; corolla 17-40 mm long; [subfamily *Plumbagoideae*] *Plumbago*

Limonium P. Miller 1754 (Sea-lavender)

A genus of about 350 species, dwarf shrubs, perennial and annual herbs, of cosmopolitan distribution. References: Luteyn (1976)=Z; Smith in FNA (2005); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Limonium carolinianum (Walter) Britton, Carolina Sea-lavender. Tidal marshes, especially in hypersaline flats. Aug-Oct. Along the coast from NL (Labrador) south to s. FL, west to TX and ne. Mexico. Various treatments recognize from 1 to 4 taxa in our area. The most recent monographer, Luteyn (1976), recognizes only a polymorphic *L. carolinianum* – a treatment followed by most flora authors since. Godfrey & Wooten (1981) follow Luteyn's treatment, but state "we are not at all confident that Luteyn's treatment is a reasonable one." [= C, FNA, GW, K, Va, WH3, Z; > *L. carolinianum* – F, S; > *L. nashii* Small – F, S; > *L. carolinianum* var. *carolinianum* – G, RAB; > *L. nashii* Small var. *nashii* – G, RAB; > *L. carolinianum* var. *angustatum* (A. Gray) Blake – G; > *L. carolinianum* var. *obtusilobum* (Blake) H.E. Ahles – RAB; > *L. nashii* Small var. *angustatum* (A. Gray) H.E. Ahles – RAB; > *L. angustatum* (A. Gray) Small – S; > *L. obtusilobum* Blake – S]

Plumbago Linnaeus 1753 (Leadwort)

A genus of 12 species, shrubs and suffrutescent herbs, pantropical and -subtropical. References: Smith in FNA (2005); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Corolla pale blue, the tube 28-40 mm long; inflorescences 2.5-3 (-5) cm long *P. auriculata*
- 1 Corolla white, the tube 17-33 mm long; inflorescences 3-15 (-30) cm long *P. zeylanica*

* *Plumbago auriculata* Lamarck, Cape Leadwort. Disturbed areas; native of s. Africa. [= FNA, K2, WH3; ? *P. capensis* Thunberg – S]

Plumbago zeylanica Linnaeus, Doctorbush. Coastal hammocks. FL, TX, and AZ south through Mexico and Central America to South America; West Indies; Africa and tropical Asia. Formerly *P. scandens* was recognized as a neotropical species and *P. zeylanica* as a paleotropical species; Smith in FNA (2005) states that they appear to be indistinguishable. [= FNA, K2, WH3; > *P. scandens* Linnaeus – S]

286. POLYGONACEAE A.L. de Jussieu 1789 (Smartweed Family) [in CARYOPHYLLALES]

A family of about 43-48 genera and 1100-1200 species, trees, shrubs, vines, and herbs, cosmopolitan, but especially north temperate. Recent changes in the circumscription of various genera (including *Polygonum*, *Persicaria*, *Fallopia*, etc.) have received strong support from molecular phylogenetic studies (Kim & Donoghue 2008; Lamb Frye & Kron 2003; Schuster,

Reveal, & Kron 2011). References: Freeman & Reveal in FNA (2005); Horton (1972)=Z; Mitchell & Dean (1978)=Y; Ronsse Decraene & Akeroyd (1988); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Lamb Frye & Kron (2003); Kim & Donoghue 2008).

- 1 Woody vine, climbing by tendrils; [subfamily *Polygonoideae*, tribe *Coccolobae*].
 - 2 Leaf base deeply cordate *Antigonon*
 - 2 Leaf base truncate to broadly cuneate *Brunnichia*
- 1 Herb (sometimes very robust and rather woody), herbaceous vine, tree or shrub (*Coccoloba*), or (*Fallopia baldschuanica*) a somewhat woody vine lacking tendrils.
 - 3 Tree or shrub; stube of pistillate flowers becoming fleshy in fruit [*Coccoloba*]
 - 3 Herbs, herbaceous vines, or a somewhat woody vine; tubes of pistillate flowers not generally becoming fleshy in fruit.
 - 4 Stem leaves (in our species) whorled; flowers in involucrate heads; ocreae absent; stamens 9; leaves densely white-tomentose on the lower surface; [of xeric situations of shale barrens and sandhills]; [subfamily *Eriogonoideae*, tribe *Eriogoneae*] *Eriogonum*
 - 4 Stem leaves alternate; flowers in various inflorescences (not involucrate); ocreae present; stamens (3-) 5-8 (-9); leaves glabrous or variously pubescent, but not densely white-tomentose; [of various habitats, including xeric ones]; [subfamily *Polygonoideae*].
 - 5 Tepals 6, in 2 series of 3 each; plants with leaves basally disposed, the largest basal (these withering in some species later in the season); [tribe *Rumiceae*].
 - 6 Tepals (the outer series) spinose [*Emex*]
 - 6 Tepals foliose.
 - 7 Fruit 3-winged; basal leaves very large, 20-40 cm wide; inner and outer tepals similar; [plant cultivated, rarely persistent or escaped] *Rheum*
 - 7 Fruit 3-angled; basal leaves small to medium in size, 0.5-15 cm wide; inner tepals wider than the outer tepals; [plants common, mostly weedy] *Rumex*
 - 5 Tepals mostly 5 in a single whorl; plants with leaves along the stem, lacking well-developed basal leaves.
 - 8 Flowers in small clusters or very reduced racemes of 1-5 flowers, borne in the axils of normally sized or reduced leaves; plants erect or sprawling herbs with stems < 1 m long, from taproots; leaves jointed at base; [tribe *Polygonae*] *Polygonum*
 - 8 Flowers in diffuse axillary panicles, or in terminal or long-peduncled axillary racemes, corymbs, or heads; plants various, either erect or sprawling herbs, or erect, robust, and suffrutescent herbs, or climbing herbaceous or suffrutescent vines, or suffrutescent bushy herbs; leaves not jointed at base (except *Polygonum*).
 - 9 Leaves cuneate at the base, either linear, spatular, or oblanceolate, mostly < 4 cm long and < 5 mm wide; leaves jointed at the base; pedicels jointed at the base; [tribe *Polygonae*] *Polygonum*
 - 9 Leaves cuneate, cordate, or hastate at the base, either lanceolate or ovate, mostly > 5 cm long and > 8 mm wide; leaves not jointed at the base; pedicels not jointed at the base.
 - 10 Inflorescence corymbiform, terminal; achenes strongly exerted at maturity; tepals almost free, horizontally spreading, white, 3-4 mm long; [erect annual, uncommonly cultivated and rarely persistent or escaped]; [tribe *Persicarieae*] *Fagopyrum*
 - 10 Inflorescence paniculate, racemiform, or headlike, terminal and axillary; achenes enclosed in the perianth at maturity; tepals fused for much of their length, ascending, pink, green, or white.
 - 11 Outer tepals neither keeled nor winged at maturity; inflorescence of spikelike racemes, heads, or sparse, interrupted racemes; [tribe *Persicarieae*] *Persicaria*
 - 11 Outer tepals keeled or winged at maturity; inflorescence a compound panicle of racemes; [tribe *Polygonae*].
 - 12 Plants climbing or sprawling, herbaceous to somewhat woody, the stems slender; perianth usually not enlarging in fruit; stigma capitate or peltate *Fallopia*
 - 12 Plants erect, robust (1-4 m tall), woody, the stems generally over 1 cm in diameter, hollow; perianth enlarging in fruit; stigma fimbriate *Reynoutria*

Antigonon Endlicher 1837 (Love-chain, Coralvine, Corallita)

A genus of about 6 species, vines, of tropical America. References: Freeman in FNA (2005).

* *Antigonon leptopus* Hooker & Arnott, Love-chain, Queen's-jewels, Confederate-vine, Corallita. Cultivated and persisting; commonly cultivated, rarely persisting or escaping, native of tropical America. [= FNA, K, WH3; = *Corculum leptopus* (Hooker & Arnott) Stuntz]

Brunnichia Banks ex Gaertner 1788 (Buckwheat-vine)

A genus of 3-4 species, vines, of e. North America and w. Africa. References: Holmes in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993).
