The **International Plant Genetic Resources Institute** (IPGRI) is an autonomous international scientific organization operating under the aegis of the Consultative Group on International Agricultural Research (CGIAR). IPGRI's mandate is to advance the conservation and use of plant genetic resources for the benefit of present and future generations. IPGRI works in partnership with other organizations, undertaking research, training and the provision of scientific and technical advice and information.

Financial support for the core programme of IPGRI was provided in 1994 by the Governments of: Australia, Austria, Belgium, Canada, China, Denmark, France, Germany, India, Italy, Japan, the Republic of Korea, the Netherlands, Norway, Spain, Sweden, Switzerland, the UK, the USA and the World Bank.

The designations employed and the presentation of material in this publication, and in its maps, do not imply the expression of any opinion whatsoever on the part of IPGRI or the CGIAR, concerning the legal status of any country, territory, city or area or its authorities, or concerning the delimitation of its frontiers or boundaries.

## SUMMARY

An ecogeographic study of *Vicia* subgenus *Vicia* is presented. This group contains the cultivated vetches and their wild relatives. The subgenus contains nine sections, nine series, 38 species and 36 sub-specific taxa. Ecogeographic data were recorded for each taxon throughout the geographical range of the subgenus. Representative herbarium specimens held in 18 major international herbaria were selected and these data were entered directly into an ecogeographic database. The herbarium specimen passport data were supplemented by observing the taxa during field trips.

The ecogeographic database, constructed using dBASE IV, contained information on the phytogeography, ecology and taxonomy of subgenus *Vicia*. These data are summarised in the ecogeographic conspectus. It includes data concerning accepted names of taxa, author(s), date of publication, where published; reference to full description and iconography; botanical illustrations; sectional descriptions; phenology; chromosome number; geographical distribution; distribution maps; ecological details, including altitude, soil and habitat preferences; interpretative notes on subgenus *Vicia* phytogeography, ecology and taxonomy.

The discussion focuses on previous and present ecogeographic studies, then draws generalised conclusions about the ecogeography of the subgenus. Future collection and conservation priorities are discussed and specific targets for *ex situ* and *in situ* are identified.

## 1. INTRODUCTION

### 1.1 General background

A revision of *Vicia* L. subgenus *Vicia* (Leguminosae, Vicieae) was recently completed by Maxted (1991a, 1993a). This involved the preparation of a revised database of systematic and more general information for the subgenus worldwide, from which the revised conspectus was synthesized. This conspectus contained detailed ecogeographical as well as systematic information. The ecogeographic element of the database and the conspectus form the basis of this study.

*Vicia* subgenus *Vicia* contains several economically important food and forage legume species which have a centre of distribution in the Eastern Mediterranean. Notably, subgenus *Vicia* contains the extensively cultivated fababean (broad bean), *Vicia faba* L., and the minor forages, *V. narbonensis* (narbon vetch) and *V. sativa* L. subsp. *sativa* (common vetch). The subgenus also contains taxa that have a high potential as forages of the future: *V. hyaeniscyamus* Mout., *V. noeana* (Reuter in Boiss.) Boiss. and *V. sativa* subsp. *amphicarpa* (L.) Batt. (Maxted *et al.* 1990).

Due to their current economic value and potential for future utilisation, *Vicia* was ascribed a high priority by the IBPGR forage working group for collection, conservation and forage development (IBPGR 1985a). To facilitate the conservation of high-priority groups, it was decided to commission a series of ecogeographic surveys of herbarium collections (IBPGR 1988). *Vicia* was included as a priority group that would benefit from an ecogeographic study.

Practically, the study necessitated the loan and observation of a large number of herbarium specimens, representing the taxa of *Vicia* subgenus *Vicia*, from international herbaria to the University of Southampton, where the study was based. However, this material did not fully represent the distribution of *Vicia* subgenus *Vicia* species within the Soviet Union. Soviet specimens have rarely been incorporated into Western herbaria. The centre of diversity and possibly origin for subgenus *Vicia* is the northeastern Mediterranean. This area includes Syria, Turkey, Iraq, Iran and the southwest republics of the former Soviet Union. Material from the first four countries is well represented in international herbaria and specimens from these herbaria were loaned to Southampton. The lack of Soviet material in Western herbaria necessitated the collection and survey of *Vicia* material in the former Soviet Union. Three collecting missions were undertaken in the former Soviet Union (Caucasus in 1989, and Central Asia in 1990 and 1991), as well as three survey missions to Crimean, Caucasian and Central Asian herbaria. Data gathered from both the visits to herbaria and the collecting missions (Auricht *et*

*al.* 1988; Maxted 1988, 1989a, 1990, 1991b; Maxted & Bisby 1986, 1987; Maxted & Sperling 1991; Maxted *et al.* 1989a) are incorporated into the ecogeographic database and conspectus.

## 1.2 Taxonomy of *Vicia* subgenus *Vicia*

### 1.2.1 Taxonomic History

The taxonomic history of subgenus *Vicia* is extensive, 20 major classifications of the group having been produced since the work of Linnaeus (Maxted 1991a). The overall similarity between these classifications of subgenus *Vicia* should be emphasized, though the position of some species has always been controversial. Certain species groupings are met with throughout the taxonomic history of the genus, e.g. the close linking of *V. sativa*, *V. barbazitae* Ten. & Guss., *V. pyrenaica* Pourret, *V. qatmensis* Gomb. and *V. grandiflora* Scop. (sect. *Vicia sensu*, Maxted 1993a), which may be taken to indicate a natural grouping. Specifically, the '*Faba*' group is a less cohesive unit than *Vicia* and as a result '*Faba*' has had a more disputed history. Opinions about the placement of *V. faba* have been particularly erratic, some authors believing it should be regarded as a separate genus (Seringe 1825; Alefeld 1861b; Stankevich 1970, 1978a, 1982), a separate subgenus (Fedtschenko 1948; Bueno Perez 1979), a separate section (Ascherson & Graebner 1909; Ball 1968; Chrtkova-Zertova 1979), a separate subsection (Koch 1836; Godron 1849; Taubert 1894; Radzhi 1971), a separate subseries (Plitmann 1967) or on a level with certain other *Vicia* species (Linnaeus 1753; Visiani 1842; Kupicha 1976).

It is perhaps not surprising that a crop plant like *V. faba*, without any obvious close progenitor, should have such a chequered taxonomic history, but another species in the '*Faba*' group, *V. bithynica* L., has also proved problematic to place. Most commonly it is allied with the other '*Faba*' group species but it was originally placed in *Lathyrus* by Linnaeus (1753) and was placed with the *Cracca* group (by Visiani 1842 and Boissier 1872) due to its extended peduncle. The taxonomic background of *V. narbonensis* has not proved so problematic, for when not linked to *V. faba* and *V. bithynica*, it has been allied to the perennial species of sect. *Atossa sensu* Kupicha (1976).

Within the '*Vicia*' group of species, Kupicha (1976) places the perennial species (except for *V. pyrenaica*, the close ally of *V. sativa*) in one section, *Atossa* (Alef.) Asch. & Graebner. Boissier (1872) originally grouped these four species by placing them in one subsection. Similarly, other authors link two or three of these species, but as few authors include all four species in their classification, it is difficult to judge the naturalness of their relationship.

Another subgroup often linked within the '*Vicia*' group is composed of *V. peregrina*, *V. aintabensis*, and *V. michauxii*. These three species are the only ones

to lack a peduncle and are obviously closely related. This led Ponert (1973) to regard the latter two taxa as subspecies of *V. peregrina*. Kupicha, like Boissier (1872) and Bouloumoy (1930), links *V. mollis* with these species in sect. *Peregrinae* Kupicha, but more recently this species has only occasionally been allied to the *V. peregrina* complex. *V. mollis* has been linked to sect. *Hypechusa* (Alef.) Asch. & Graebner, specifically to *V. sericarpa* (Plitmann 1967), *V. assyriaca* Chrtkova-Zertova (1979) and *V. anatolica* (Maxted 1993c).

The remaining species of the "Vicia" grouping come from the cohesive sect. *Hypechusa sensu* (Maxted 1993a). The taxonomic history shows that the species cluster together rather than form links with other sections. However, rather than the whole of the section being commonly united, subgroups of species are more commonly seen, e.g. *V. hybrida*, *V. pannonica* and *V. anatolica* or *V. hyrcanica*, *V. galeata* and *V. noeana*. There is a particular problem in trying to interpret the history of this section as most of the species included are relatively rare and of restricted distribution.

### 1.2.2 Delimitation of the taxon

The vetches and peas are included in the legume tribe Vicieae, which has historically included numerous genera with relatively small numbers of species in each, but in recent years the number of genera has decreased and the number of species per genus has increased. The generic classification of the Vicieae has now stabilized into a generally accepted grouping of five genera (Kupicha 1981): *Vicia* L., *Lathyrus* L., *Lens* Mill., *Pisum* L. and *Vavilovia* A. Fedorov.

Kupicha (1981) considers *Vicia* L. (Leguminosae, Vicieae) to comprise approximately 140 species, chiefly located in Europe, Asia and North America, extending to temperate South America and tropical East Africa. The genus is, however, primarily distributed through the Mediterranean and Irano-Turanian regions. Allkin *et al.* (1986) have increased the estimated number of accepted species to 166, which possibly errs on the conservative side. Kupicha (1976) provides the following description for the genus:

#### *Vicia* L., Sp. Pl. 734 (1753).

"Perennial and annual herbs with erect or more usually climbing or sprawling habit; plants never tuberous. Stems angled but not winged, usually with complete replacement of cortical vascular bundles at the nodes, occasionally with partial replacement. Leaves hypostomatic to epistomatic, paripinnate and tendrillous or mucronate or very rarely imparipinnate, usually with several to many pairs of leaflets, very rarely unijugate; stipules semisagittate or simple, sometimes toothed or laciniate, occasionally dimorphic, sometimes with a nectary on

abaxial side; vernation of leaflets conduplicate (supervolute in *V. biennis*); venation pinnate, brochidodrome. *Inflorescence* racemose, 1 - many-flowered, occasionally branched. *Calyx* usually with oblique mouth and teeth of unequal length ('irregular'), sometimes actinomorphic ('regular'). *Vexillum* oblong, stenonychioid or platonychioid, very rarely bossed or pouched at the fold, rarely pubescent on inner-face. *Alae* usually with 'pleat' in upper edge of limb. *Staminal tube* oblique at apex. *Style* linear, not contorted, dorsally or laterally compressed or occasionally terete, always hairy; distribution of pubescence various but style never hairy on adaxial side only (except in some specimens of *V. ervilia*). *Legume* compressed or occasionally sub-torulose, often stipitate, sometimes hairy but hairs rarely tuberculate; pod sometimes occasionally 'woolly' parenchymatous tissue between the seeds. *Seeds* with short to long hilum; testa smooth or very rarely rough; lens near hilum or occasionally on opposite side of seed; free amino acid canavanine sometimes present."

Kupicha (1976) comments that historically *Vicia* species have been grouped into three or four major species clusters: 'Cracca', 'Vicia', 'Ervum' and sometimes 'Faba'. Kupicha (1974, 1976) argues convincingly that this division of the species is artificial. She believes that correlated characters divide the species into two natural subgenera, *Vicia* and *Vicilla* (Schur) Rouy. Using her circumscription, the number of species in subgenus *Vicia* is smaller and more internally coherent than subgenus *Vicilla*. The former is therefore easier to circumscribe. Her two subgenera can be distinguished using the following characters:

<b>Character</b>	<b>Subgenus <i>Vicilla</i></b>	<b>Subgenus <i>Vicia</i></b>
Stipule nectary	absent	present on abaxial stipule face
Peduncle length	= or > leaf	< leaf or absent
Style type	terete, dorsally compressed, pubescent or tufted, laterally compressed	dorsally compressed, tufted
Keel shape	edge curved round and above style	apical part encircled style and anthers
Legume	stipitate, subtorulose	never stipitate
Canavanine	present	absent

The characters she used to distinguish her groupings are those used throughout the taxonomic history of *Vicia*. The 'Vicia' and 'Faba' groups are contained in her subgenus *Vicia*. It is now generally accepted that the subgenus is a distinctive, natural grouping (Tzvelev 1980; Hanelt & Mettin 1989; Maxted 1991a), although there is still some debate over the appropriate rank for *Vicia faba* itself (Maxted *et al.* 1991; Maxted 1991a, 1993a). In her conspectus, Kupicha (1976) provided brief descriptions and circumscriptions for the five sections of subgenus *Vicia* she recognized (see Table 1.1).

**Table 1.1. Descriptions and circumscriptions for the sections of subgenus *Vicia* (Kupicha 1976)**

**Section 18. *Atossa* (Alef.) Aschers. & Graebner**

(Perennial; calyx mouth oblique; inflorescence several-flowered, standard oblong; suture of legume not parallel; lens of seed close to hilum)

<i>V. oroboides</i> Wulfen	<i>V. sepium</i> L.
<i>V. balansae</i> Boiss.	<i>V. truncatula</i> Fisch. ex Bieb.

**Section 19. *Vicia***

(Leaves usually with more than three pairs of leaflets [if fewer, then leaflets less than 1 cm long], lateral veins of leaflets prominent and straight; calyx mouth sub-truncate; sutures of legume parallel)

<i>V. pyrenaica</i> Pourret	<i>V. sativa</i> L. agg.
<i>V. grandiflora</i> Scop.	<i>V. barbazitae</i> Ten. & Guss.
<i>V. lathyroides</i> L.	<i>V. cuspidata</i> Boiss.

**Section 20. *Faba* (Miller) Ledeb.**

(Leaves with 1-3 pairs of leaflets which are more than 2 cm long, lateral veins of leaflets not prominent, curved toward apex; calyx sub-truncate, sutures of legume parallel)

<i>V. faba</i> L.	<i>V. narbonensis</i> L.
<i>V. galilaea</i> Plitm. & Zoh.	<i>V. hyaeniscyamus</i> Mouterde
<i>V. johannis</i> Tamamschjan	<i>V. bithynica</i> L.

**Section 21. *Hypechusa* (Alef.) Aschers. & Graebner**

(Annual; Calyx mouth oblique; inflorescence 1-many-flowered, standard oblong or stenonychioid [i.e. limb wider than the claw]; suture of legume not parallel; lens of seed opposite hilum)

<i>V. anatolica</i> Turrill	<i>V. assyriaca</i> Boiss.
<i>V. ciliatula</i> Lipsky	<i>V. esraelonensis</i> O. Warb.
<i>V. galeata</i> Boiss.	<i>V. hybrida</i> L.
<i>V. hyrcanica</i> Fischer & Meyer	<i>V. lutea</i> L.
<i>V. melanops</i> Sibth. & Smith	<i>V. noeana</i> Reuter ex Boiss.
<i>V. pannonica</i> Crantz	<i>V. sericocarpa</i> Fenzl

**Section 22. *Peregrinae* Kupicha**

(Calyx mouth oblique; inflorescence 1-2-flowered, standard stenonychoid, flowers purplish; suture of legume not parallel; lens of seed close to hilum)

*V. aintabensis* Boiss. & Hausskn.

*V. mollis* Boiss. & Hausskn. ex Boiss.

*V. michauxii* Sprengel

*V. peregrina* L.

### 1.2.3 Classification of *Vicia* subgenus *Vicia*

The *Vicia* classification historically most generally used is that produced by Kupicha (1976), but this is a broad classification and she comments that it requires further refinement. Specifically, the set of species she circumscribed is incomplete, some 'good' species that are endemic to Syria are not included and strict use of her diagnosis for the subgenus would exclude *V. bithynica* and *V. sativa* subsp. *devia* J.G. Costa. The latter taxa have peduncles longer than the subtending leaf, which would place them in subgenus *Vicilla*, but they are linked by the presence of a nectary on the stipule and other characteristics to subgenus *Vicia*.

Acting on Kupicha's comments, Maxted (1991a) commenced the process of taxonomic refinement by publishing a revision of *Vicia* subgenus *Vicia*. Maxted (1993a) presents a revised classification of the subgenus that can be read as a development of Kupicha's concept and is an attempt at a better approximation of the abstract 'natural' classification of the group than previous classifications.

Maxted's classification of subgenus *Vicia* contains nine sections, nine series, 38 species, 14 subspecies and 22 varieties (see Table 1.2). Interestingly, the sections *sensu* (Kupicha 1976), that are split into further sections and series are those she suggests require refinement: *Atossa*, *Vicia*, *Faba* and *Hypechusa*. The latter three sections each contain groups of closely related forms (e.g. the *V. sativa* agg., the *V. narbonensis* complex and the *V. noeana* complex), which suggests that they are currently undergoing a process of rapid speciation. The classification ordered the sections from the perennial species of sect. *Atossa*, through the few flowered, adventitious weeds of sect. *Hypechusa*, *Peregrinae* and *Vicia*, to the more robust, crop-like forms of the *V. narbonensis* complex and culminates in *V. faba*. Sectional revisions of *Peregrinae* Kupicha and *Atossa* series *Truncatulae* (B. Fedtsch. ex Radzhi) Maxted have recently been published by Maxted (1993c, 1993d).

### 1.2.4 Key to *Vicia* subgenus *Vicia* sections, series and species

#### Key to *Vicia* subgenus *Vicia* sections and series

- 1(0). Calyx mouth truncate ..... 2  
       Calyx mouth oblique ..... 6

- 4(1) Calyx mouth truncate ..... 5
- 4(1) Calyx mouth oblique ..... 12
- 5(4) Keel slightly shorter or approximately equal to wings; lens positioned near hilum ..... 6
- 5(4) Keel markedly shorter than wings; lens positioned opposite hilum ..... 5 *V. dionysiensis*
- 6(5) Annual, stolons absent; standard cream, yellow, or purple ..... 7
- 7(6) Perennial, stoloniferous; standard purple ..... 25 *V. pyrenaica*
- 7(6) Stipules sub-entire, 2-4 mm long; flowers 6-14mm; seeds sculptured (test surface with protrusions); tendrils mostly simple ..... 8
- 7(6) At least the lower stipules distinctly toothed, usually larger; flowers (10-)14-36 mm; seeds smooth; tendrils simple or branched .... 9
- 8(7) Flowers 5-12 mm; legume falcate (curved); legume distal end strongly beaked; seed surface ruminant-reticulate.. 23 *V. cuspidata*
- 8(7) Flowers 9-15 mm; legume not falcate; legume distal end slightly beaked; seed surface tuberculate ..... 24 *V. lathyroides*
- 9(7) Wings purple; legume rounded in cross-section; seed circumference to hilum length ratio 0.11 to 0.3 ..... 10
- 9(7) Wings cream or yellow; Legume distinctly laterally flattened in cross-section; Seed circumference to hilum length ratio of 0.61 or more ..... 11
- 10(9) Standard face purple (rarely cream); wings reddish purple (rarely cream) ..... 26 *V. sativa*
- 11(9) Standard face yellow; wings blueish purple ..... 27 *V. barbazitae*
- 11(9) Aril present and protruding (membranous attachment to hilum); flower (19-)24-36 mm; wings yellow ..... 29 *V. grandiflora*
- 11(9) Aril absent; flower 20-21 mm; wings cream ..... 28 *V. qatmensis*
- 12(4) Leaves with 1-3(-4)-pairs leaflets, large and usually asymmetric about midrib; legume sutures parallel; seeds with short hilum, lens near hilum ..... 13

- Leaves with 3-8-paired leaflets, smaller and symmetric; legume sutures not parallel; seeds with medium or short hilum, lens on opposite side of seed to the hilum ..... 21
- 13(12) Leaf rachis ending in a mucro (much reduced tendril); calyx glabrous (without hairs); flower white; legume hairs simple  
..... 38 *V. faba*  
Leaf rachis ending in a tendril; calyx pubescent (with hairs); flower cream, lilac or purple; legume hairs tuberculate (with swollen base)  
..... 14
- 14(13) Stipules ovate-semi-sagittate; leaflets narrowly ovate to linear; calyx teeth subequal; peduncle commonly longer than calyx  
..... 30 *V. bithynica*  
Stipules orbicular-semi-sagittate; leaflets broadly ovate or obovate; calyx teeth unequal; peduncle rarely longer than calyx ..... 15
- 15(14) Standard face cream, possibly tinged with purple; wing apex with distinct markings ..... 16  
Standard face purple, lilac or rarely cream; wing apex markings absent or, if standard purple and leaflet distinctly toothed, possibly present ..... 18
- 16(15) Erect, robust plant; stipules purple; 5-6 flowers per inflorescence; flower cream yellow; legumes with numerous long hairs  
..... 37 *V. hyaeniscyamus*  
Ascending semi-robust plant; stipules green; 1-3 flowers per inflorescence; flower cream; legume with few short hairs ..... 17
- 17(16) Exterior calyx teeth nectaries dark purple; less than 7 basal side shoots ..... 34 *V. galilaea*  
Exterior calyx teeth nectaries green; more than 7 basal side shoots  
..... 33 *V. johannis*
- 18(15) Standard face cream or pale lilac ..... 19  
Standard face purple ..... 20
- 19(18) Standard face lilac; legume rhomboid, hairs with long tubercles (base swollen) ..... 31 *V. eristaloides*  
Standard face cream; legume rectangular, hairs with short tubercles  
..... 32 *V. kalakhensis*
- 20(18) Leaflet margin (edge) with more than 6 serrations; wing apex markings present; 6-10 seeded; seeds 4-5(-6)mm ..... 35 *V. serratifolia*  
Leaflet margin with less than 7 serrations; wing apex markings absent; 4-7 seeded; seeds 4-10(-13)mm ..... 36 *V. narbonensis*
- 21(12) Annual; leaf rachis ending in a tendril; standard shape stenonychioid (limb broader than claw) or platonychioid (limb same

- width as claw); hilum less than half seed circumference; lens positioned opposite hilum ..... 22
- Perennial; leaf rachis ending in a tendril or mucro; standard shape platynychioid; hilum over half seed circumference; lens positioned near hilum ..... 35
- 22(21) Standard upper surface sub-adpressed pubescent; legume pubescent ..... 23
- Standard upper surface glabrous (without hairs); legume glabrous or pubescent ..... 25
- 23(22) Inflorescence with 2-4-flowers; flowers 15-23 mm, yellow or purple ..... 16 *V. pannonica*
- Inflorescence with 1(-2)-flowers; flowers 12-35 mm, yellow ..... 24
- 24(23) Flowers 18-35 mm, flowers sulphur yellow; standard stenonychioid, limb equalling claw ..... 17 *V. hybrida*
- Flowers 15-18 mm, standard yellow green, wing with dark brown apex; standard platynychioid, limb shorter than claw ..... 14 *V. anatolica*
- 25(22) Flowers violet ..... 7 *V. esdraelonensis*
- Flowers yellowish (or rarely purple in *V. lutea*) ..... 26
- 26(25) Legume (and ovary) with hairy valves (sides); peduncle much shorter than calyx tube ..... 27
- Legume (and ovary) with glabrous valves; peduncle equalling or longer than calyx tube ..... 29
- 27(26) Peduncle 1-2 mm; standard stenonychioid; legume with simple or tubercular hairs ..... 19 *V. lutea*
- Peduncle more than 2 mm; standard platynychioid; legume with simple hairs ..... 28
- 28(27) Plant +/- villous; tendrils simple; flowers 12-18 mm, 1-3 in axil; wing apex marking present; fruit densely villous ..... 15 *V. mollis*
- Plants adpressed-pilose; tendrils mostly branched; flowers (15)18-29 mm, mostly solitary; wing apex marking absent; fruit adpressed-sericeous ..... 18 *V. sericocarpa*
- 29(26) Sutures (valve joint) of legume tuberculate-short haired; limb of standard shorter than claw ..... 30
- Sutures of legume glabrous; limb of standard shorter to longer than claw ..... 31
- 30(31) Wing apex with distinct brown spot; peduncle 2-9 mm; flowers (1)-2-4, 17-22 mm ..... 12 *V. melanops*
- Wing apex with no apex spot; peduncle 2-3 mm; flowers 1-2 per inflorescence, 12-15 mm long ..... 13 *V. ciliatula*

- 31(29) Stem 10-35 cm; tendrils rarely branched; lower calyx tooth 2-35 mm; standard 15-20 mm, pale yellow ..... 6 *V. assyriaca*  
Stem taller; tendrils branched; lower calyx tooth 2-9 mm; standard 17-30 mm, yellow-pink or yellow-brown ..... 32
- 32(31) Peduncle 1-3 mm; corolla not concolorous (petals not the same colour); legume rhomboid ..... 8 *V. tigridis*  
Peduncle longer than 3 mm; corolla concolorous; legume oblong. .... 33
- 33(32) Peduncle 1-2-flowered; legume 8-12 mm broad; limb of standard slightly shorter than claw ..... 10 *V. hyrcanica*  
Peduncle (1-)2-5-flowered; legume 8-10 mm broad; limb of standard as long or slightly longer than claw ..... 34
- 34(33) Hilum 1/6 of seed's circumference; calyx slightly violet, green only if lowest tooth longer than tube; leaflets 2-5(-8) mm broad, never obovate ..... 9 *V. galeata*  
Hilum 1/2 to 2/3 of seed's circumference; calyx green, teeth shorter than tube; leaflets 3-14 mm broad, some obovate ..... 11 *V. noeana*
- 35(21) Leaf rachis ending in a mucro ..... 36  
Leaf rachis ending in a tendril ..... 37
- 36(35) Stem slender; leaves with 1-4 leaflet pairs; calyx teeth not reflexed (twisted back); legume rounded to flat in cross-section ..... 3 *V. abbreviata*  
Stem stout; leaves with 4-7 leaflet pairs; calyx teeth reflexed at maturity; legume laterally flat in cross-sectional ..... 1 *V. oroboides*
- 37(35) Stem stout; flower yellow; legume valve hairs absent ..... 2 *V. balansae*  
Stem slender; flower lilac; legume valve hairs scarce, but present ..... 4 *V. sepium*

### 1.2.5 Diagnostic characteristics of *Vicia* subgenus *Vicia*

Throughout the taxonomic history of *Vicia*, certain characters have repeatedly been used to define and distinguish subgeneric groupings. These characters may be divided into two kinds, those used to define major divisions (i.e. subgenera or sections) and those used to distinguish subdivisions within the previously established major divisions.

There are a few characters that are commonly used to distinguish the major subgeneric groupings within subgenus *Vicia* and these have been used consistently. These major diagnostic characters are: presence of peduncle and, if present, the length of the peduncle in relation to either the flower or subtending leaf length; the number of flowers per inflorescence; presence of stipular nectaries; and the positioning of hairs around the style. Once the major groups have been established, many more characters are used to distinguish subgroups. These minor diagnostic characters are: life span; plant stature; number of flowers per inflorescence; number of leaflets per leaf; size of leaflets; calyx mouth shape; flower colour; vexillum shape; vexillum pubescence; legume pubescence; legume protrusion; relative legume size; relative legume shape; legume suture curvature; legume hairs type; seed shape; relative hilum length; relative position of the seed hilum and lens; and seed surface type.

The characters used to distinguish major and minor groupings are illustrated in the generalized diagram of vetch vegetative, floral, fruit and seed characters drawn in Figure 1.1.

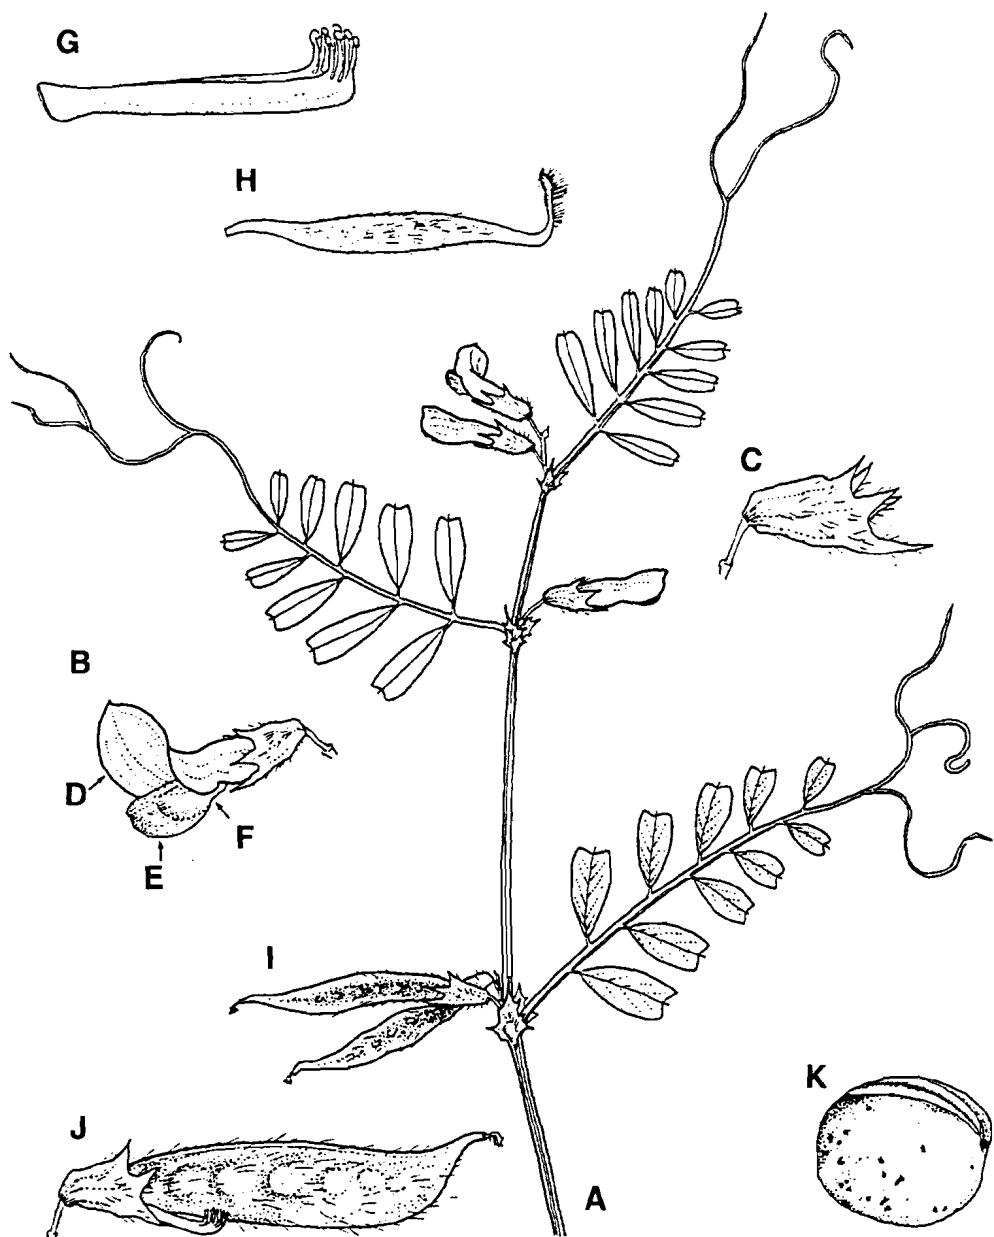

## 2. ECOGEOGRAPHIC MATERIAL AND METHOD

### 2.1 Selection of representative specimens

Seventy-four taxa were included within the scope of the project, and representative specimens of each of these taxa were seen during the course of it. Maxted *et al.* (1994) stress that it is important to gather information of herbarium material from as many herbaria as possible, so that a clear estimate of taxon ecology and geography can be made. In an attempt to obtain representative specimens, herbarium specimens were borrowed from the appropriate major international herbaria listed in Appendix I.

Collecting missions to the centre of diversity of the subgenus were also undertaken during the course of the project and 592 *Vicia* subgenus *Vicia* accessions were collected from Britain, France, Spain, Syria, Turkey, the former Soviet Union and Yugoslavia.

During the course of the project, over 6000 specimens of the target taxon were seen. Each specimen was identified and those with detailed

**Figure 1.1.** Generalized diagram of vetch, showing vegetative, floral, fruit and seed characters. A habit; B flower; C calyx; D standard petal; E wing petal; F keel petals; G stamens; H ovary, style and stigma; I fruit; J fruit; K seed.

ecogeographic passport data were selected for inclusion in the database. This meant that about a third of the specimens seen were selected to have data included in the ecogeographic database. A minimum level of passport data of at least the location data was required for a specimen to be included in the database. Specimens were, however, also selected if they were of particular interest, i.e. odd or rare forms.

The database contains information on 2008 specimens from 18 major international herbaria. These specimens represent collections from 113 countries of 38 species and 36 supra-specific taxa. When planning the visits to herbaria, an attempt was made to see specimens that represented the range of geographic and ecological conditions under which subgenus *Vicia* are found. It was considered desirable to collect detailed passport data from those representative specimens of each taxa, rather than collect data from larger numbers of specimens that duplicate data already included in the database from previous specimens of that taxon.

In practice, the specimens, whose data were incorporated in the database, were often those collected more recently. These specimens were commonly associated with more detailed, legible passport data that were more likely to have remained current. Extensive use of specimens collected several hundred years ago may provide details about historical distributions, but is likely to yield less useful information about contemporary extant populations.

## 2.2 The ecogeographic database

The building of an ecogeographic database necessitated the choice of a proprietary DBMS package. Freeston (1984) provides a review of the features that should be considered when choosing a DBMS, listing such considerations as: cost, portability, ease of use, ease of use of programming language, available applications, multi-user access, ease of data protection and security. Having considered these points, the decision was taken to use dBASE IV (Ashton-Tate 1989) as it is the widely used standard adopted by IPGRI. Details of the operating instructions for constructing and manipulating files are provided in the dBASE IV manual (Chou 1989).

The database was constructed using two personal computers: an Amstrad PC 1640 HD20 with a 20 megabyte hard disk, using MS-DOS and a Toshiba 1600E with a 20 megabyte hard disk, using MS-DOS. All the data collected were placed directly into the database using one of these computers.

The ecogeographic database was made up of seven files linked using the relational model. Details of the actual structures are discussed by Maxted (1990). The file structure was kept as simple as possible, incorporating all the available ecogeographic data. Initially, it was considered appropriate to record the vernacular names used for species but during the study, no ver-

nacular names were encountered and so the field was deleted from the database.

The relational model was used during the design of the database, in an attempt to avoid data duplication, so the eight database files were interlinked and so should not be considered as isolated data files. However, one file is central to the database and contains the bulk of the ecogeographic data. The other seven files should be seen as adjuncts to this file, each containing the explanation for the codes used in the central file.

The central file contained the following ecogeographic data: individual specimen accession codes, taxon name, collector's name and number, herbarium where the specimen is kept, whether it has flowers and or mature legumes, the collection date, ISO three-letter country code, region within country, detailed specimen provenance, latitude, longitude, altitude, soil type of collection site and the habitat of collection site. The bibliographic details of the nomenclature of *Vicia* subgenus *Vicia* taxa and related synonyms were contained in a separate file.

Though specimens whose data were included in the database were positively selected for detailed ecogeographic data there were still blank fields in the database. In general, it was much easier to record curatorial or geographic rather than ecological data from the herbarium specimens seen. The majority of specimens had a collector(s) name, collection number and locality details recorded, though the degree of detail recorded for the latter varies markedly between specimens. However, ecological details such as altitude, soil type, habitat and biotic interactions are less commonly recorded on herbarium specimen labels. This problem of missing ecological data results from plant collectors often failing to record any ecological site details for their specimens. It was noticeable that more recent and contemporary collections often have more detailed ecological data recorded. The lack of ecological herbarium label data would inhibit the drawing of conclusions on the ecological preference of the target taxon from a purely herbarium-based ecogeographic survey. During this study, however, the herbarium passport data were complemented by practical knowledge of taxon resulting from extensive field study and so ecological conclusions could be discussed.

### 3. ECOGEOGRAPHIC CONSPECTUS

#### 3.1 Introduction

The ecogeographic conspectus is intended to be a summary of the ecogeographic information available for *Vicia* subgenus *Vicia*. The subgenus,

as circumscribed by Maxted (1991a, 1993a), contains 92 taxa, with a distribution centring on Southern Europe and Northwest Asia. During the course of this study, field observations of all but the rarest taxa were made and this field knowledge has enhanced my understanding of their ecogeography. This knowledge has been incorporated into the ecogeographic conspectus.

Sections, series, species, subspecies and varieties follow the sequence proposed by Maxted (1991a, 1993a), from the primitive perennial species to the cultivated fababean. Where available the following information is provided for each taxon included in subgenus:

- a. accepted taxon name, author(s), date of publication, where published;
- b. reference to published descriptions and illustration;
- c. descriptions for each section (taken from Maxted 1991a);
- d. number of taxa in taxon;
- e. phenology, flowering duration;
- f. chromosome numbers, taken from the literature (taken from Maxted 1991a);
- g. geographical distribution, countries from which the taxon is recorded, which includes reliable records from the literature. Three-letter country ISO code units are used. An 'I' in brackets following the ISO code indicates the taxon is introduced in that country. To present a complete coverage of geographical details, extra distributional data were added from Allkin *et al.* (1983) and Greuter *et al.* (1989);
- h. distribution maps of specimens, produced using the program ATLAS (maps do not represent any endorsement of political boundaries on behalf of IPGRI);
- i. ecological details, including altitude, soil preference and habitat notes;
- j. geographical notes, discussion and interpretation of the taxon's distribution;
- k. ecological notes, discussion and interpretation of the taxon's ecological preferences;
- l. taxonomic notes, discussion and interpretation of the available taxonomic data.

The conspectus is a summary of the available data, but more detailed information on individual specimen ecogeography can be obtained by querying the database. A listing for the common synonyms associated with the taxa of the subgenus is provided in Appendix II and the full specimen citation for the specimens used during the ecogeographic study is provided in Appendix III.

As discussed above, the failure of the majority of collectors to record ecological data on specimen labels makes the drawing of ecological conclusions

from a herbarium survey hazardous. However, in this case the herbarium study was accompanied by a systematic collecting programme from the taxon's centre of diversity, which resulted in the majority of the taxa being seen in the field and so detailed ecological data could be incorporated into the conspectus.

To indicate individual taxon concentrations, a mapping program, ATLAS, was used to plot each specimen location onto a customized map of the taxon's region of distribution. ATLAS (Strategic Locations Planning 1987) was used to show the distribution of 37 species from the subgenus (*V. faba* was excluded as it is not known in the wild). The latitude and longitude data for each specimen were taken from the ecogeographic database, converted to ATLAS input format, imported to ATLAS and then plotted onto customized maps.

All the data included in the conspectus, except the ecological, geographic and taxonomic notes, were produced direct from the ecogeographic database for subgenus *Vicia* and a copy of this database can be obtained on request from IPGRI.

### 3.2 The ecogeographic conspectus

*Vicia* Subgenus *Vicia* L., Sp. Pl., 734 (1753). Kupicha, Notes Roy. Bot. Gard. Edinburgh., 34: 320 (1976).

Plants annual or perennial. Leaves hypostomatic to hypo-amphistomatic, paripinnate, usually tendrillous, occasionally mucronate; stipules monomorphic, always with a glandular nectariferous pit on the abaxial side. Inflorescence 1-several flowered, peduncle very rarely longer than subtending leaf, commonly shorter than the flower, flower sometimes sessile in leaf axil. Calyx regular or irregular. Vexillum platonychioid (limb and claw similar width) or stenonychioid (limb broader than claw), rarely pubescent on abaxial surface. Style with hairs all round apex or only on abaxial side, always tufted abaxially. Legume not stipitate, containing +/- well-developed "woolly" parenchymatous tissue between the seeds; pods oblong, rhomboid or linear. Seeds with long to short hilum; testa smooth or rarely rough; lens near hilum or on opposite side of seed.

**Number of taxa:** 92      **Chromosome numbers:**  $2n = 10, 12, 14, (16, 18)$

**Geographical distribution:** Europe, North Africa, Near and Middle East, Southwest Asia, Northern Asia.

**Geographical notes:** The thirty-eight species have a centre of diversity in Southern Europe and Western Asia. A few species, largely of sections *Vicia* and *Atossa*, have been introduced to other temperate areas of the world.

**Ecological notes:** The subgenus includes species with preferences for diverse habitats, ranging from the shaded woodland species of sect. *Atossa*, the marshy endemic of basaltic soils *V. dionysiensis*, the weeds of dry cultivation and to the crop, *Vicia faba*.

**Taxonomic notes:** The subgenus is divided into nine sections, nine series, 38 species, 14 subspecies and 22 varieties. The order of taxa follows that presented by Maxted (1993a) and was derived from a phenetic study of the subgenus. The classification is ordered from the primitive species of sect. *Atossa*, passes through the few flowered, adventitious weeds of sect. *Hypechusa*, *Peregrinae* and *Vicia* and culminates in the more robust, crop-like forms of the *V. narbonensis* complex, concluding with *V. faba*.

Within the subgenus the most distinct section is the monotypic sect. *Faba*. There has been much taxonomic controversy over the natural relationships between *V. faba* and the other *Vicia* species. Should the species be in a distinct series, section, subgenus or even genus? Maxted *et al.* (1991) and Maxted (1993a) concluded that the most natural placement is in a monotypic section.

### 3.2.1 Section *Atossa*

I. **Section Atossa** (Alef.) Asch. & Graebner, Syn. Mitteleur. Fl., 6, 2: 949 (1909).

Kupicha, Notes Roy. Bot. Gard. Edinburgh, 34: 320 (1976).

Perennial; erect or climbing; stem slender or stout. Stipules entire or semi-hastate; 2.5-9 x 1-5 mm; edge entire or with 1-6 teeth. Leaf 25-154 mm;

apex tendrillous or mucronate; 2-28 leaflets per leaf; leaflet 10-85 x 3-38 mm; symmetric; margins entire. Peduncle 7-32; with 1 to 8 flowers. Calyx mouth oblique; lower tooth longer than upper; base gibbous; pedicel 1-3 mm. Flowers 12-22 mm; all petals approximately equal length; standard yellow, blue or purple; shape platonychioid (limb and claw same width); claw bowing absent; upper standard surface glabrous. Wing marking absent; wing limb with slight basal folding. Legume 16-43 x 6-9 mm; oblong; laterally flattened; sutures straight or curved; valves glabrous (without hairs); septa absent; 2-7 seeds per legume. Seeds 2.5-4 x 3-5 mm; round or oblong; not laterally flattened; hilum over half seed circumference; lens positioned near hilum; testa surface smooth.

**Number of taxa:** six.

**Chromosome number:** 12, 14, 16, 18.

**Geographical distribution:** Europe, Near East and Asia eastward to the Pacific.

**Geographical notes:** This section is relatively widely distributed from Iceland to Japan, but the extent of the distribution is largely due to a single species, *V. sepium*. The other three species of the section are much more restricted. There are two centres of diversity, one concentrated in Northern Yugoslavia and the other in the Caucasus.

**Ecological notes:** All four species are encountered in similar habitats, stable semi-shaded woodland (coniferous, mixed or deciduous), woodland edges or hedgerows. They show no preference for a particular soil type, but are more commonly encountered at altitudes over 500 m (except *V. sepium*). The four species can be found in open or dense vegetation, under dry or moist conditions.

**Taxonomic notes:** The four species easily form three series. *V. balansae* and *V. abbreviata* are closely related.

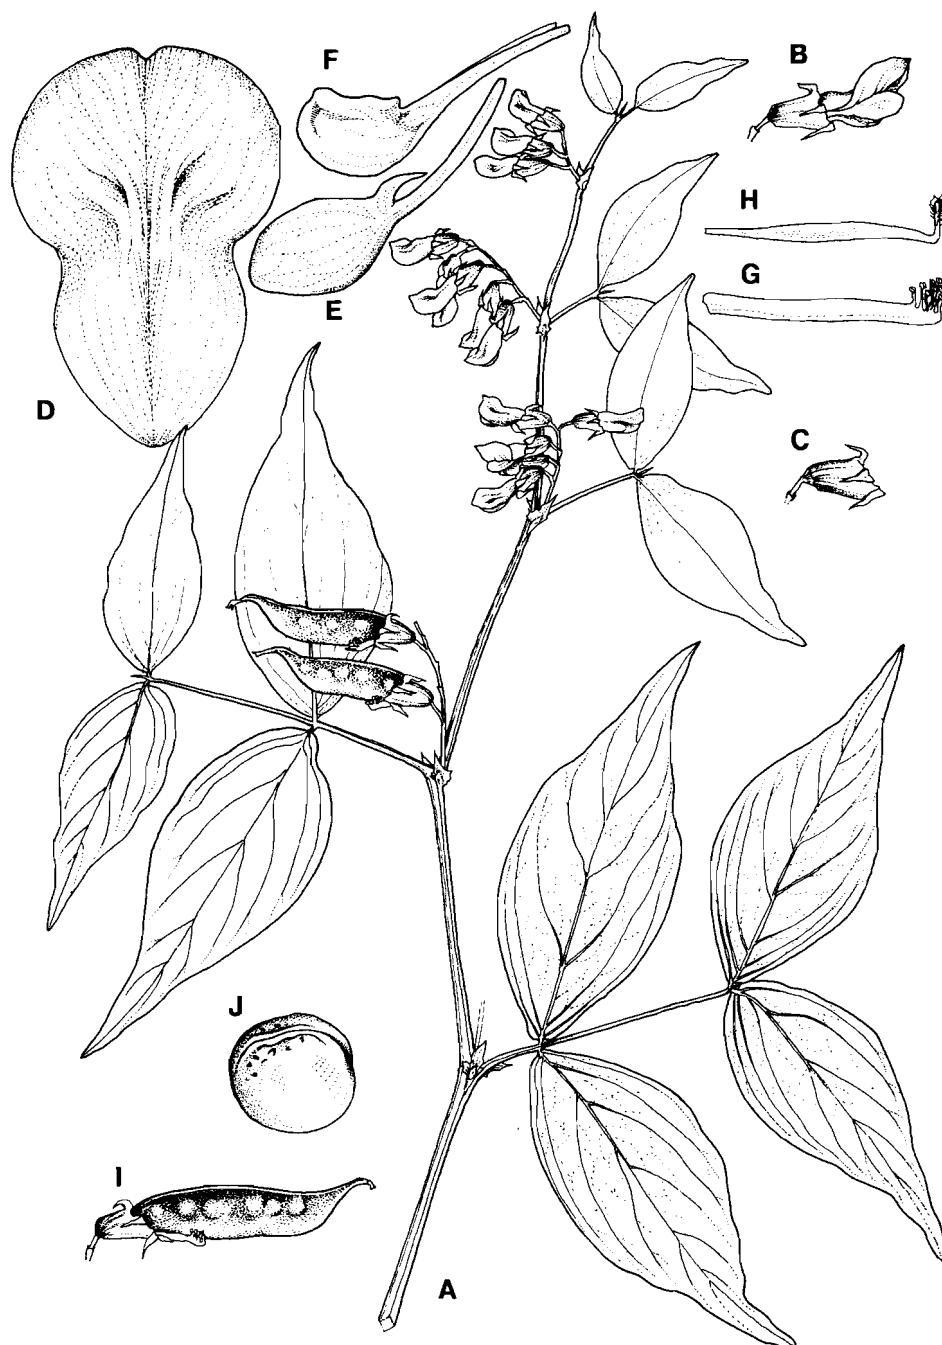

**A. Series *Pseudovicilla* Maxted, Kew Bull. 47(1): 129-130 (1991c).**

**Number of taxa:** one

**Chromosome number:** 14

**Geographical distribution:** Central Southeast Europe

**Taxonomic notes:** Linnaeus considered *V. oroboides* a member of the genus *Orobus* (*O. lathyroides*) and the resemblance with *Lathyrus* sect. *Orobus* and the oroboid *Vicia* is clear. However, Hanelt & Mettin (1970b), Bassler (1973) and Kupicha (1976) have each studied the morphological and cytotoxicological relationship between *V. oroboides* and other *Vicieae*. Each concluded that the species was a natural member of *Vicia* subg. *Vicia* and that it was quite distinct from the other oroboid *Vicia* in subg. *Vicilla* sect. *Vicilla*.

**Figure 3.1.** *Vicia oroboides*: A habit x 0.5; B flower x 1; C calyx x 1; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 1; J seed x 5. A - J from Maxted 1259 and 1000.

1. *V. oroboides* Wulfen in Jacq., Coll. Bot. Chem. Hist. Nat. Sp., 4: 323 (1790).

Fl. Eur., 2: 134. Figure 3.1.

**Phenology:** May - September

**Chromosome number:** 14.

**Geographical distribution:** AUT, HUN, ITA, YUG. Map 1.

**Ecology:** Alt. 150 - 1400 m; Hab. pasture and woodland on hill and mountainsides.

B. Series *Truncatulae* (B. Fedtsch. ex Radzhi) Maxted, Kew Bull. 47(1): 129-130 (1991c).

**Number of taxa:** two.

**Chromosome number:** 14

**Geographical distribution:** Southeast Europe and West Asia

**Geographical notes:** The two species of this series are commonly found in Northeast Turkey and the Caucasus, though *V. abbreviata* is also found further West in Southeast Europe.

**Map 1.** Distribution of *Vicia oroboides*.

**Taxonomic notes:** Stankevich (1988) considers the two taxa of this series to be subspecies of *V. abbreviata*. After studying natural populations in the Caucasus she concluded that the two taxa intergrade from one to the other. This, she considered, was especially apparent in the subalpine zone between Karmadon and Chmi in North Ossetia, Russia. She argues that two taxa have been able to remain morphologically distinct due to their preference for different ecological niches. While collecting in the Caucasus (Spring/Summer 1989), I located six populations of *V. balansae*. At five of these locations, *V. abbreviata* was equally abundant. Within the five sites, where both species were found, neither species showed a clear niche distinction and no putative hybrid forms were encountered. On the basis of morphological and ecological investigations of the complex Maxted (1993d) concluded that the specific distinction should be retained.

2. *V. balansae* Boiss., Fl. Orient. 2: 569 (1872). Fl. Tur., 3: 304; Fl. USSR., 13: 457.  
Figure 3.2.

**Phenology:** May - August

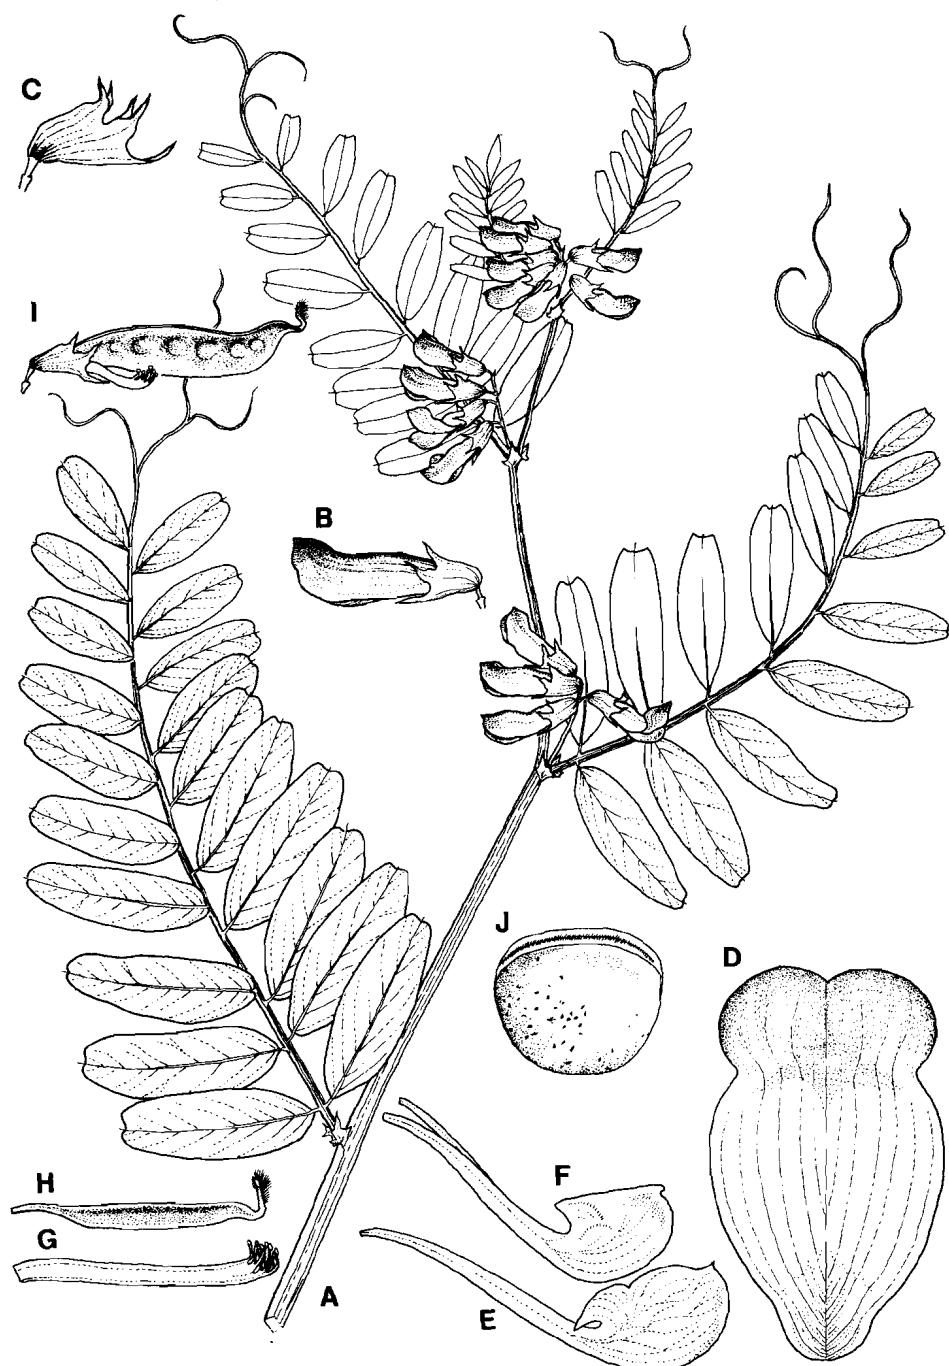

**Chromosome number:** 12, 14.

**Geographical distribution:** SUN, TUR. Map 2.

**Ecology:** Alt. 550 - 2700 m; Hab. moist alpine pastures and forests.

**Map 2.** Distribution of *Vicia balansae*.

**Figure 3.2.** *Vicia balansae*: A habit x 0.5; B flower x 1; C calyx x 1.5; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 1; J seed x 4. A - H and J from Maxted 6780 and 6894, I from Maxted 6964.

**Geographical distribution:** AUT, BGR, DEU, IRN, ROM, SUN, TUR, YUG.  
 Map 3.

**Ecology:** Alt. 100 - 2400 m; Hab. mountain forest and forest margins.

C. Series *Atossa* (Alef.) Aschers. & Graebner, Syn. Mitteleur. Fl., 6, 2: 949 (1909).

**Number of taxa:** three.                   **Chromosome number:** 14, 18

**Geographical distribution:** Europe and Northern Asia

**Geographical notes:** This monospecific section contains the most widespread species of the section, which is a common woodland herb of Northern Eurasia.

**Map 3.** Distribution of *Vicia abbreviata*.

4. *V. sepium* L., Sp. Pl., 2: 737 (1753). Fl. Eur., 2: 134; Fl. Tur., 3: 304; Fl. USSR., 13: 455-456; Illust. Draw. Brit. Pl., 3: 64.

**Phenology:** May - October      **Chromosome number:** (12), 14, (16), 18.

**Geographical distribution:** AUT, BGR, CAN(I), CSK, DEU, DNK, FIN, FRA, GBR, GRC, HUN, IRL, JPN, NOR, ROM, SWE, SUN, TUR, USA(I). Map 4.

**Map 4.** Distribution of *Vicia sepium*.

i. *V. sepium* var. *sepium* L., Sp. Pl. 2: 737 (1753).

**Phenology:** May - October

**Chromosome number:** 14

**Geographical distribution:** AUT, BGR, CAN(I), CZ, GBR, IRL, JPN, SUN, USA(I).

**Ecology:** Alt. 70 - 2200m; Hab. hedgerow and open woodland.

ii. *V. sepium* var. *eriocalyx* Celak, Prodr. Fl. Bohmen. 4: 910 (1881).

**Phenology:** May - September

**Chromosome number:** 14

**Geographical distribution:** AUT, CSK, DEU, DNK, FRA, GBR, IRL, NOR, SWE, USA(I).

**Ecology:** Alt. 2 - 1015m; Hab. open woodland and shaded disturbed land.

iii. *V. sepium* var. *montana* Koch, D.G.D.J., Syn. Fl. Germ. Helv., 1: 196 (1835).

**Phenology:** June - September

**Chromosome number:** 14

**Geographical distribution:** CSK, FIN, FRA, GBR, GRC, HUN, NOR, ROM, TUR.

**Ecology:** Alt. 75 - 1600m; Hab. hedgerow and open woodland.

### 3.2.2 Section *Microcarinae*

II. Section *Microcarinae* Maxted, Kew Bull. 47(1): 129-130 (1991c).

Annual; climbing or scrambling; stem slender. Stipules entire or semi-hastate; 1-3.5 x 1-1.5 mm; edge entire or with 1-6 teeth. Leaf 23- 35 mm; apex tendrillous; 2-6 leaflets per leaf; leaflet 8-13 x 2-3 mm; symmetric; margins entire. Peduncle 10-20 mm; with 22-4 flowers. Calyx mouth straight; teeth subequal; base not gibbous; pedicel 1-3 mm. Flowers 9-16 mm; keel distinctly shorter than wings; standard cream; shape stenonychioid (limb broader than claw); claw bowing absent; upper standard surface glabrous. Wing marking absent; wing limb with slight basal fold. Legume 17-23 x 6-7 mm; oblong; round in cross section; sutures curved; valves glabrous; septa absent; 3-5 seeds per legume. Seeds 3.5 to 6.0 mm; round; not laterally flattened; hilum less than quarter of seed circumference; lens positioned opposite to hilum; testa surface smooth.

**Number of taxa:** one.

**Chromosome number:**  $2n = 12$

**Geographical distribution:** SYR.

**Geographical notes:** The single species of this section is a very restricted endemic of the Djebel Druse in Southern Syria.

**Ecological notes:** Within the Djebel Druse this species is restricted to a small number of sites. Each site is located in a treeless valley bottom, with basaltic soil, at an altitude of about 1350 m. The sites are moist, but not waterlogged pastures. Mouterde (1961) described the species from sites in the Djebel Druse and in the area between Homs and Tartous. Both areas

have similar volcanic, basaltic soils. These soils are relatively uncommon in Syria and an obligate requirement for these soils may explain the species' limited distribution. The restriction of *V. dionysiensis* to these two areas suggests it is a relict species, dependent on these restricted edaphic enclaves for survival.

**Taxonomic notes:** Mouterde (1953) allies *V. dionysiensis* distantly to *V. cypria* Kotschy ex Unger & Kotschy and *V. singarensis* Boiss. & Hausskn., as they each are glabrescent, have few leaflets per leaf and individual leaflets are relatively long. The resemblance with these subgenus *Vicilla* sect. *Trigonellopsis* species is superficial. *V. dionysiensis* is a member of subgenus *Vicia* because it shows the diagnostic features of the subgenus: presence of the nectariferous gland on the abaxial stipule surface, peduncle shorter than the subtending leaf and one to few flowers per inflorescence. Within the subgenus, *V. dionysiensis* is distinguished by the marked reduction in size of the keel, stamen, ovary and stigma compared to the standard and wing lengths. These characters make it a distinct, peripheral member of the subgenus. The lens position, opposite the hilum on the seed circumference, links the species to section *Hypechusa*, which shares this characteristic. More particularly the stenonychioid standard suggests an allegiance with the species in the series *Hyrcanicae*, most specifically *V. assyriaca* Boiss.

5. *V. dionysiensis* Mout., Flore du Djebel Druze, 140 (1953). Fl. Syr., 2: 412-413. Figure 3.3.

**Phenology:** March - May

**Chromosome number:** 12.

**Geographical distribution:** SYR (endemic). Map 5.

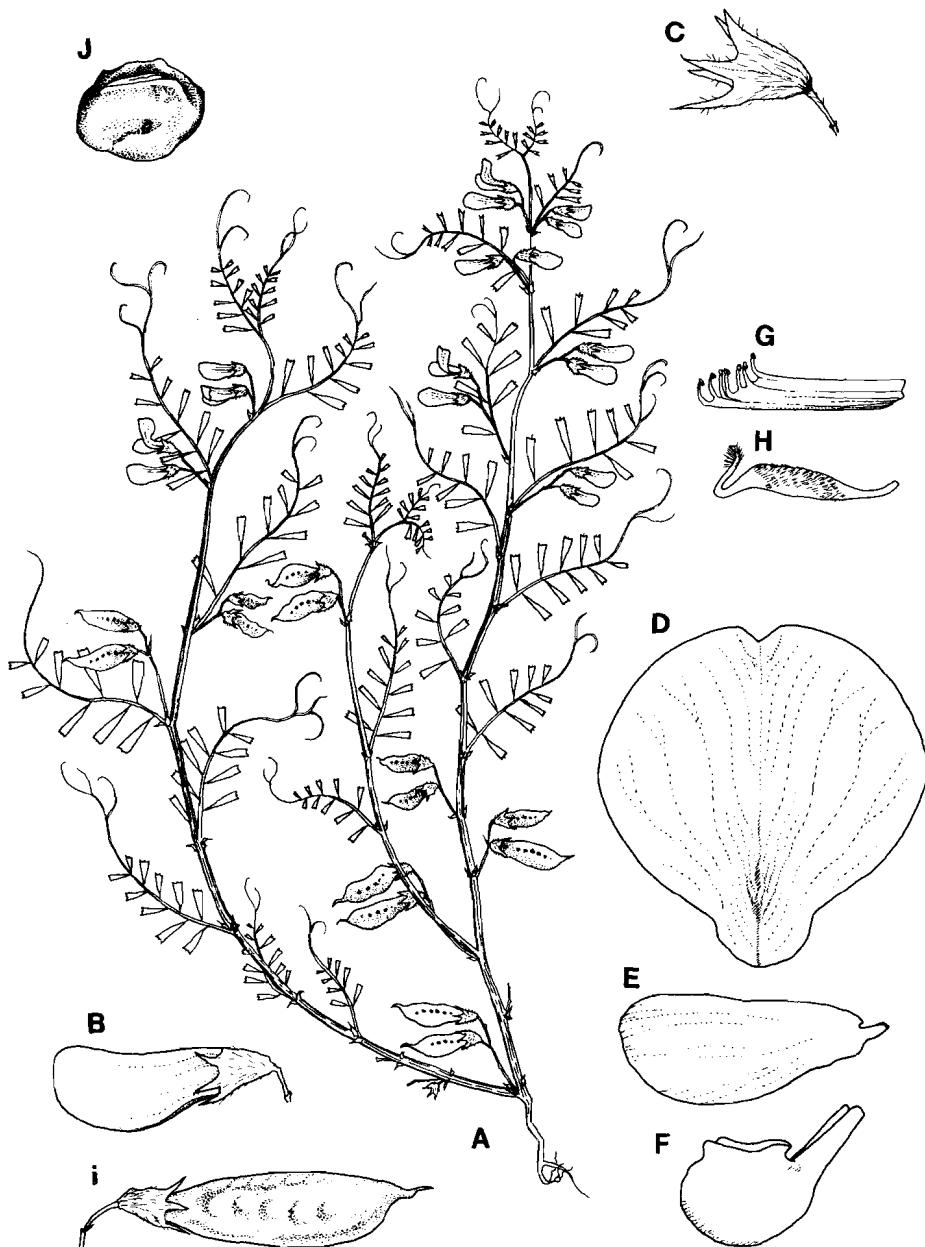

**Ecology:** Alt. 1320 - 1380 m; Soil basaltic heavy black; Hab. moist meadows.

**Geographical notes:** This species was initially described from the Jebel Druse, in Southern Syria, but Mouterde (1961) refers to the location of two populations between Homs and Tartous in Western Syria. I have located four populations in the Jebel Druse. During the Springs of 1986, 1989 and 1992, I searched extensively the area between Homs and Tartous, but was unable to locate any *V. dionysiensis* population in this area, which possibly indicates the species is now extinct in Tartous province.

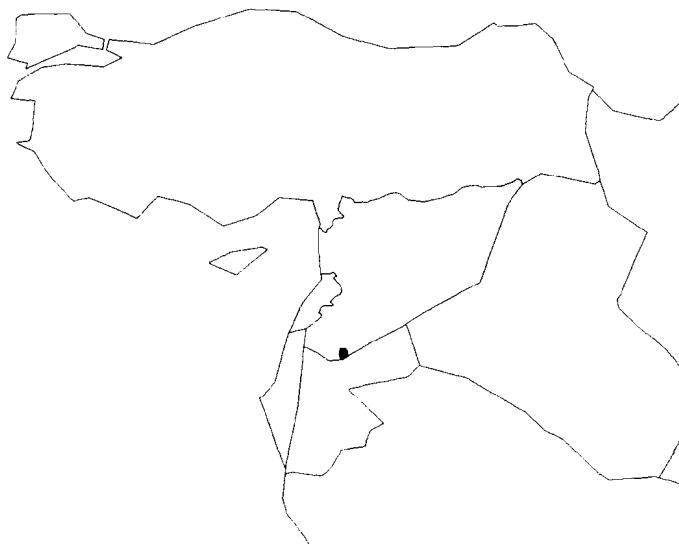

### 3.2.3 Section *Hypechusa*

III. **Section *Hypechusa* (Alef.) Aschers. & Graebner, Syn. Mitteleur. Fl., 6,2: 957 (1909).**

Annual; climbing; stem slender. Stipules entire or semi-hastate; 1-5.5 x 0.5-4 mm; edge entire or with 1-2 teeth. Leaf 14-105(-115) mm; apex tendrilous; 2-20 leaflets per leaf; leaflet 5-35(-40) x 1-15 mm; symmetric; mar-

**Figure 3.3.** *Vicia dionysiensis*: A habit x 0.5; B flower x 2; C calyx x 4; D standard petal x 4; E wing petal x 4; F keel petal x 4; G stamen x 4; H ovary, style and stigma x 4; I fruit x 2; J seed x 5. A - H and J from Maxted 2507, I from Maxted 2498.

**Map 5.** Distribution of *V. dionysiensis*.

gins entire. Peduncle 1-10(-28); with 1-4 flowers. Calyx mouth oblique; lower tooth longer than upper; base gibbous; pedicel 1-4. Flowers 12-35 mm; all petals approximately equal length; standard cream or yellow, rarely blue or purple; shape platonychioid or stenonychioid; claw bowing absent; upper standard surface glabrous or pubescent. Wing marking absent or present; wing limb with slight or strong basal fold. Legume 14-40 x 6-12 mm; oblong; round in cross section; sutures curved; valves glabrous or pubescent; hairs simple or tuberculate (with swollen base); septa absent; 1-6 seeds per legume. Seeds 2-5.5 x 2-6.5 mm; round or oblong; not laterally flattened; hilum less than quarter of seed circumference; lens positioned opposite to hilum; testa surface smooth.

**Number of taxa:** 18

**Chromosome number:** 10, 12, 14.

**Geographical distribution:** West, Central and Southern Europe, Mediterranean Basin and Transcaspia.

**Geographical notes:** The centre of diversity of sect. *Hypechusa* is focused on the fertile crescent countries of Southwest Asia. The distributional pattern of the two series within sect. *Hypechusa* is also centred on Southwest Asia, although ser. *Hypechusa* stretches further westerly to encompass Southern Europe.

**Ecological notes:** The species of this section are weeds of semi-arid areas, except for the rare species *V. esdraelonensis* which is reported to prefer moist areas. They are rarely found in shade, though I have collected *V. melanops* from shaded areas of Stone pine forest in Western Turkey. These species are most commonly found on the edges of cultivation through a broad range of soil types. The ser. *Hyrcanicae* species are in general larger plants and can stand more competition from surrounding plants than ser. *Hypechusa*.

**Taxonomic notes:** The current conception of sect. *Hypechusa* is similar to that used by Alefeld (1860) who first used the name for the genus *Hypechusa*. *V. mollis* was considered by Kupicha to belong to sect. *Peregrinae*. This grouping of *V. mollis* with *V. peregrina* and its allies was originally suggested by Boissier (1872). However, the fact that it possesses a short peduncle suggests that this species is more naturally allied to sect. *Hypechusa*, to which it has been transferred (Maxted 1993c). This position was adopted by Townsend (1967) and is supported by Plitmann (pers. comm.). The sect. *Hypechusa* taxa are split into two series, *Hyrcanicae* and *Hypechusa*, on the basis of peduncle length, corolla shape, corolla size and standard pubescence.

**A. Series *Hyrcanicae*** B. Fedtsch. ex Radzhi, Novosti Sist. Vyssh. Rast., 7: 238 (1971).

**Number of taxa:** seven.

**Chromosome number:** 12, 14.

**Geographical distribution:** West Asia.

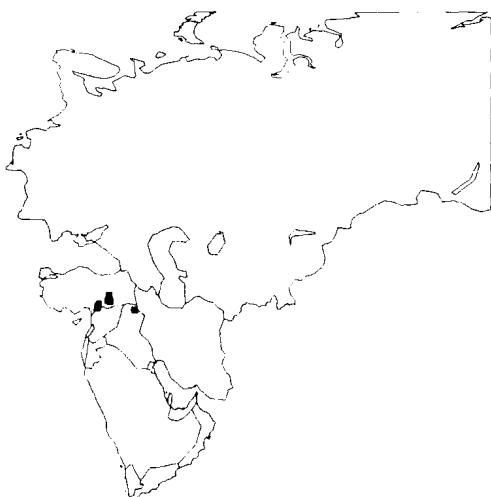

**Taxonomic notes:** The six species of ser. *Hyrcanicae* form a tight grouping and several authors (Townsend 1967, 1974; Ponert 1973; Meikle 1977) have suggested reducing some of the included species to subspecific rank. Plitmann (1967) notes the existence of intermediate forms between each of the ser. *Hyrcanicae* species, but ultimately retains their specific distinction. Ponert (1973) takes an extreme view and considers *V. assyriaca*, *V. noeana* subsp. *noeana* and subsp. *megalodonta* as subspecies of *V. hyrcanica*. Having noted these views, all the specimens seen during the course of this study have been easily attributed to one of these six species and specimens showing a degree of intermediacy remain very rare and so Maxted (in prep.) retains their specific identity.

**6. *V. assyriaca*** Boiss., Diagn. Pl. Or. Nov. ser. 1(9): 123 (1849). Fl. Iran., 46-47; Fl. Iraq, 3: 530-532; Fl. Syr., 2: 401; Fl. Tur., 3: 304-305; Illust. Fl. Iran., Tab. 33, fig. 3.

**Phenology:** April - June

**Chromosome number:** 12, 14.

**Geographical distribution:** CYP, IRQ, IRN, ISR, JOR, LBN, SYR, TUR. Map 6.

**Map 6.** Distribution of *V. assyriaca*.

**Ecology:** Alt. 600 - 2000 m; Hab. pasture, agricultural and disturbed land.

**Taxonomic notes:** Townsend (1967, 1974) and Meikle (1977), based on observations of herbarium material, consider *V. assyriaca* to be a synonym of *V. noeana*. Plitmann (1967), however, retained the two as distinct species, while noting the existence of intermediate forms. Having collected fresh material of both species I have found no introgressive specimens and am in no doubt that the specific distinction is warranted.

7. *V. esdraelonensis* Warb. & Eig, Repert. Sp. Nov. Reg. Veg. 25: 352 (1928). Fl. Pal., 2: 198; Fl. Syr., 2: 402; Fl. Tur., 3: 305-306; Illust. Fl. Pal., 2 (plates): 282.

**Phenology:** April - May

**Chromosome number:** 12.

**Geographical distribution:** ISR, JOR, SYR, TUR. Map 7.

**Ecology:** Marshland.

**Taxonomic notes:** This is a rare taxon with few herbarium specimens available.

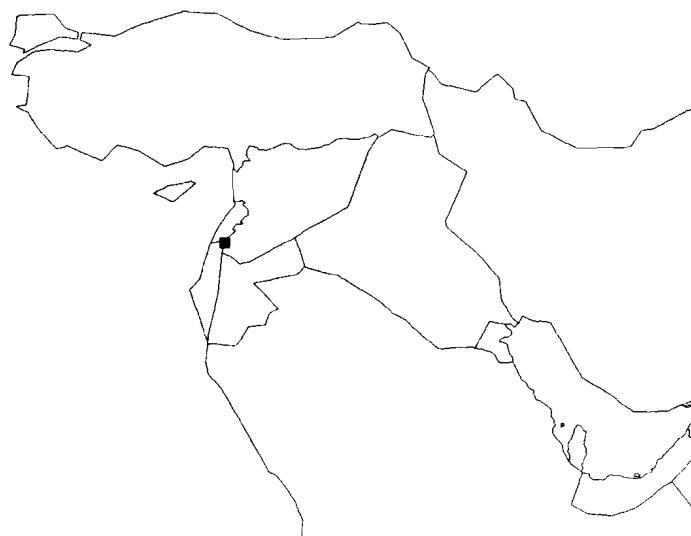

8. *V. tigridis* Mout., Nouv. Fl. Liban et Syrie, 2: 402 (1969). Fl. Syr., 2: 402.  
Figure 3.4.

**Phenology:** April - May

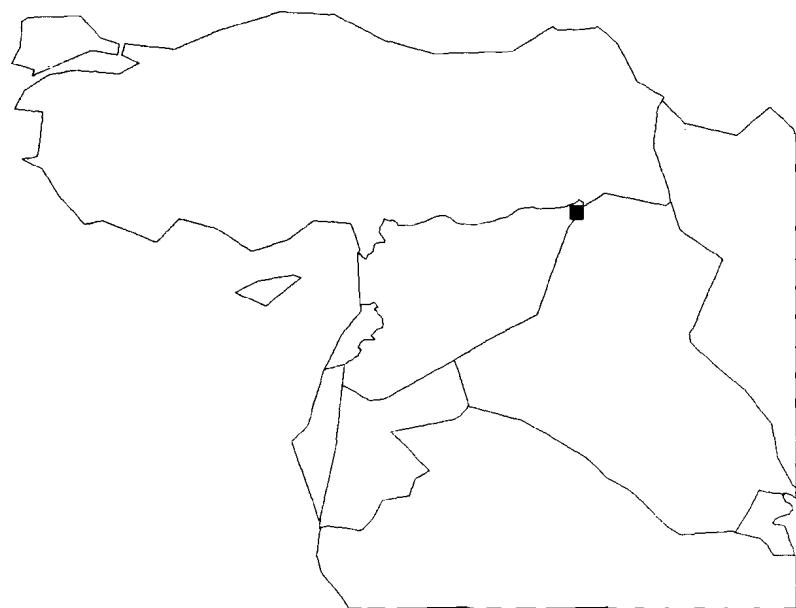

**Chromosome number:** 12.

**Geographical distribution:** SYR, (endemic to Ayn Diwar, Syria). Map 8.

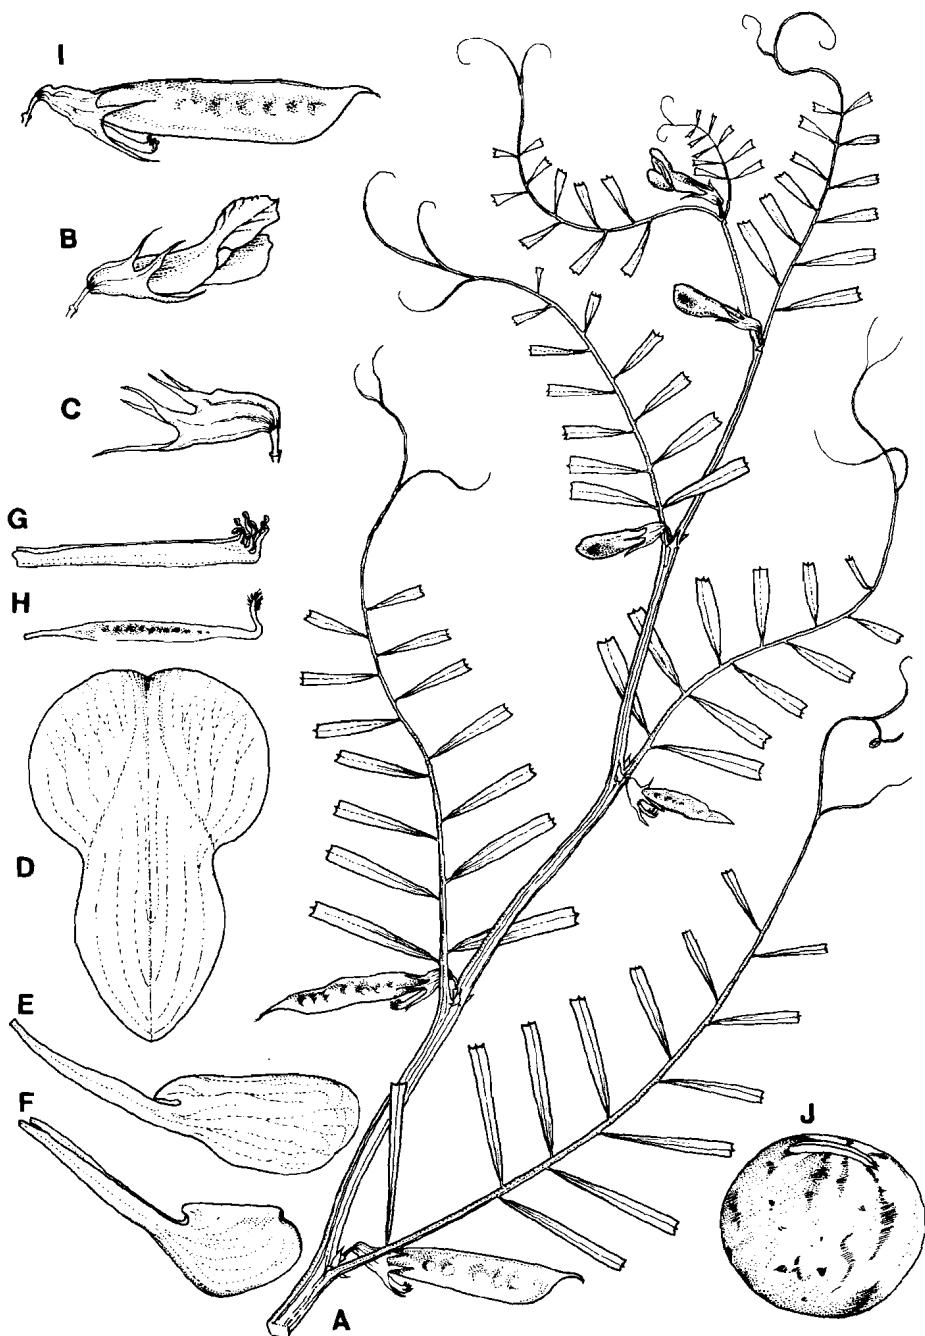

**Ecology:** Alt. 400 m; Soil, Alluvial; Hab. riverbank meadow.

Map 7. Distribution of *V. esdraelonensis*.

Map 8. Distribution of *V. tigridis*

**Figure 3.4.** *Vicia tigridis*: A habit x 0.5; B flower x 1.25; C calyx x 2; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 1; J seed x 5.5. A - J from Maxted 3287.

**Taxonomic notes:** A very rare taxon, restricted to a single population. The species is only known from the type collection and that made by Maxted, Ehrman & Khattab in 1986.

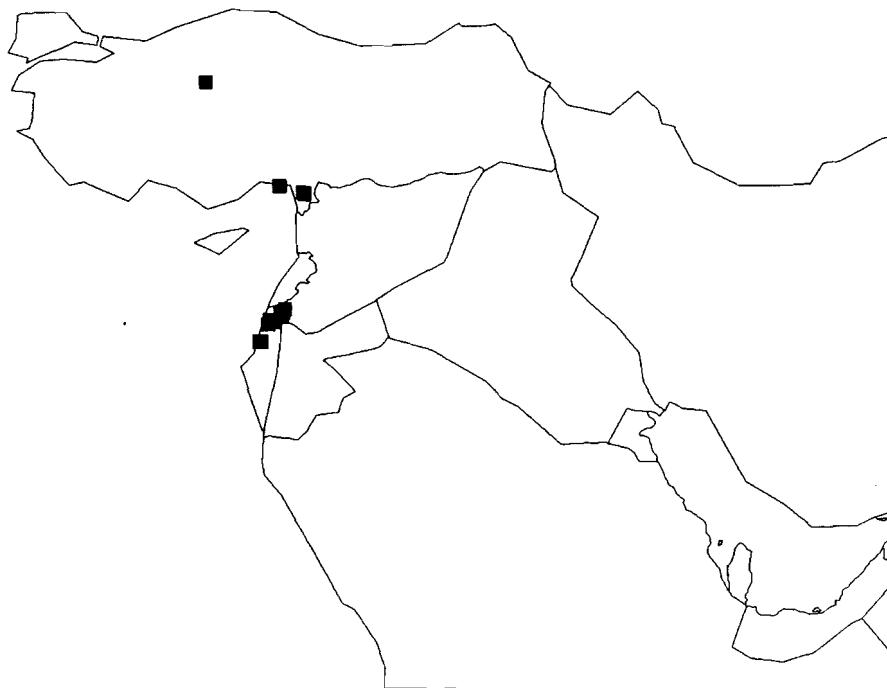

9. *V. galeata* Boiss., Diagn. ser. 1(2): 103 (1843). Fl. Pal., 2: 202; Fl. Syr., 2: 400-401; Fl. Tur., 3: 305; Illust., Fl. Pal., 2 (plates): 289.

**Phenology:** March - July **Chromosome number:** 12, 14.

**Geographical distribution:** ISR, IRQ, IRN, JOR, LBN, SYR, TUR. Map 9.

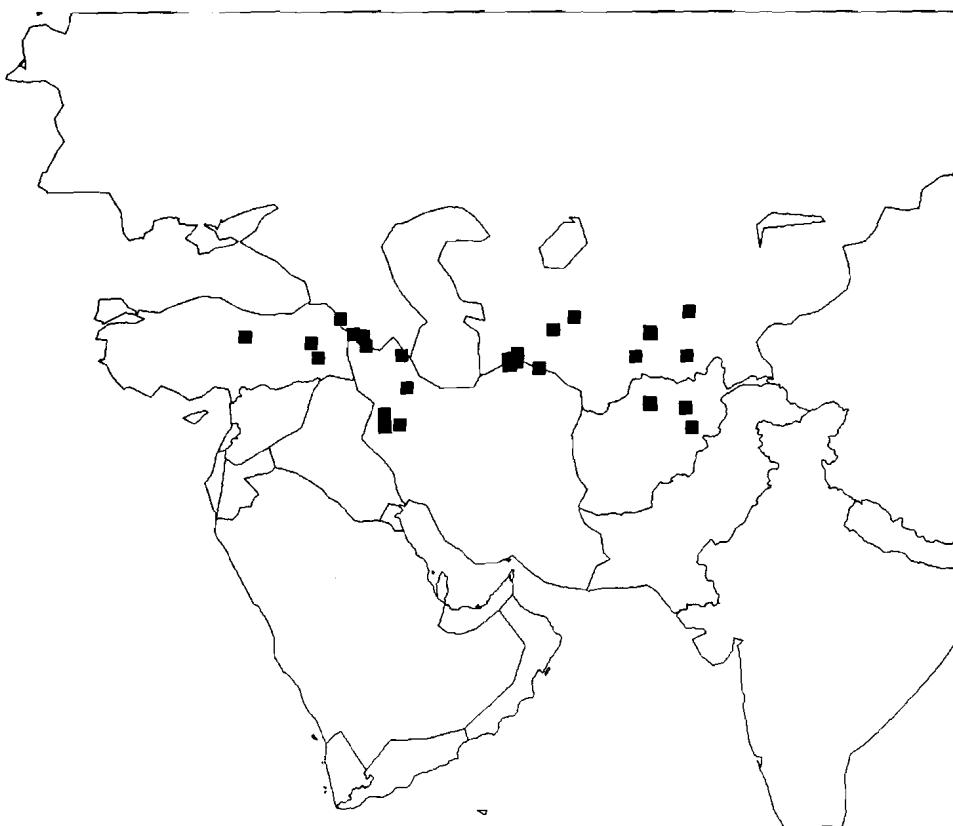

**Ecology:** Alt. 20 - 1400 m; Hab. moist roadside banks, disturbed or cultivated land.

**Taxonomic notes:** Plitmann (1967) notes the existence of transitional forms between *V. galeata* and other ser. *Hyrcanicae* taxa and between *V. hyrcanica* and *V. noeana* from Southeast Turkey from Southern Turkey, Eastern Iraq and Western Iran. However, field identification of populations from Syria, Turkey, the Caucasus and Central Asia has presented no problem and so the species are retained as a distinct entity.

Map 9. Distribution of *V. galeata*.

10. *V. hyrcanica* Fischer & C. Meyer, Ind. Sem. Hort. Petr. 2: 28 (1835). Fl. Iran., 44; Fl. Tur., 3: 306; Fl. USSR., 13: 465-466; Illust. Fl. Iran., 32, fig. 4.  
**Phenology:** May - August                    **Chromosome number:** 12, (14).  
**Geographical distribution:** AFG, IRN, SUN, TUR. Map 10.  
**Ecology:** Alt. 1150 - 1910 m; Hab. mountain pasture, agricultural and disturbed land.

**Map 10.** Distribution of *V. hyrcanica*.

**11. *V. noeana*** Reuter ex Boiss., Fl. Or. 2: 572 (1872). Fl. Syr., 2: 401; Fl. Tur., 3: 306-307.

**Phenology:** April - July

**Chromosome number:** 12.

**Geographical distribution:** CYP, IRQ, IRN, SYR, TUR. Map 11.

**Ecology:** Alt. 500 - 2000 m; Hab. localized minor cultivated crop in Turkey and Syria, weed of Disturbed and agricultural land.

i. ***V. noeana* subsp. *megalodonta*** Rech. f., Zur. Fl. Syr. Lib., Ark. Bot. 5(1): 262 (1959). Fl. Tur., 3: 307.

**Phenology:** May - June

**Chromosome number:** 12.

**Geographical distribution:** IRQ, TUR.

**Ecology:** Hab. disturbed and agricultural land.

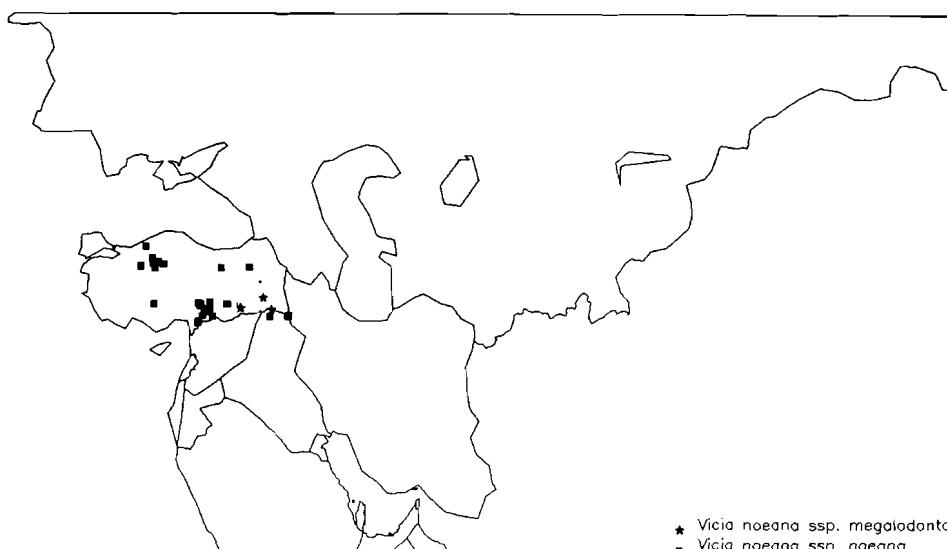

ii. ***V. noeana* subsp. *noeana*** (Reuter in Boiss.) Boiss., Fl. Or., 2: 572-573 (1872). Fl. Tur., 3: 306.

**Phenology:** April - July

**Chromosome number:** 12.

**Geographical distribution:** CYP, IRQ, (SUN?), SYR, TUR.

**Ecology:** Alt. 500 - 2000 m; Hab. localized minor cultivated crop in Turkey and Syria, weed of disturbed and agricultural land.

**Map 11.** Distribution of *V. noeana*.

**B. Series *Hypechusa* (Alef.) Aschers. & Graebner** Syn. Mitteleur. Fl., 6,2: 957 (1909).

**Number of taxa:** 11

**Chromosome number:** 10, 12, 14.

**Geographical distribution:** Europe, West Asia and North Africa.

**Taxonomic notes:** This series is more internally variable than ser. *Hyrcanicae* and following detailed study may warrant further subdivision.

**12. *V. melanops* Sibth. & Smith, Fl. Graec. Prodr., 2: 72 (1813). Fl. Eur., 2: 135; Fl. Tur., 3: 307.**

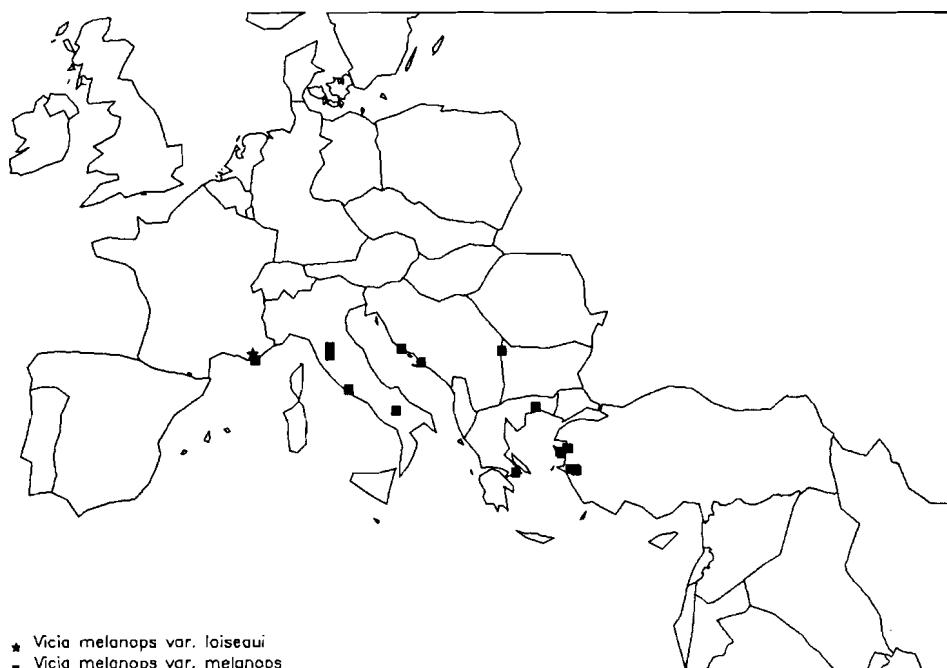

**Phenology:** April - June

**Chromosome number:** 10.

### 3.2.4 Section *Peregrinae*

IV. Section *Peregrinae* Kupicha, Notes R.B.G. Edinburgh., 34: 323 (1976).

Annual; climbing or scrambling; stem slender. Stipules entire or semi-hastate; 1-4 x 1-4 mm; edge entire or with 1-2 teeth. Leaf 22-80 mm; apex tendrillous; 4-16 leaflets; leaflet 6-40 x 1-6 mm; symmetric; margins entire. Peduncle absent; with 1 flower. Calyx mouth oblique; lower tooth longer than upper; base gibbous; pedicel 1-3 mm. Flowers 9-24 mm; all petals approximately equal length; standard cream, blue or purple; shape platonychoid or stenonychoid; claw bowing present; upper standard surface glabrous. Wing marking absent; wing limb with slight basal folding. Legume 12-40 x 4-15 mm; oblong; round in cross-section; sutures curved; valves pubescent; hairs simple; septa absent; 2-7 seeds per legume. Seeds 3.5-6.5 x 3.5-9.5; round or oblong; laterally flattened or not laterally flattened; hilum less than quarter of seed circumference; lens positioned near hilum; testa surface smooth.

**Number of taxa:** three.

**Chromosome number:** 12, 14

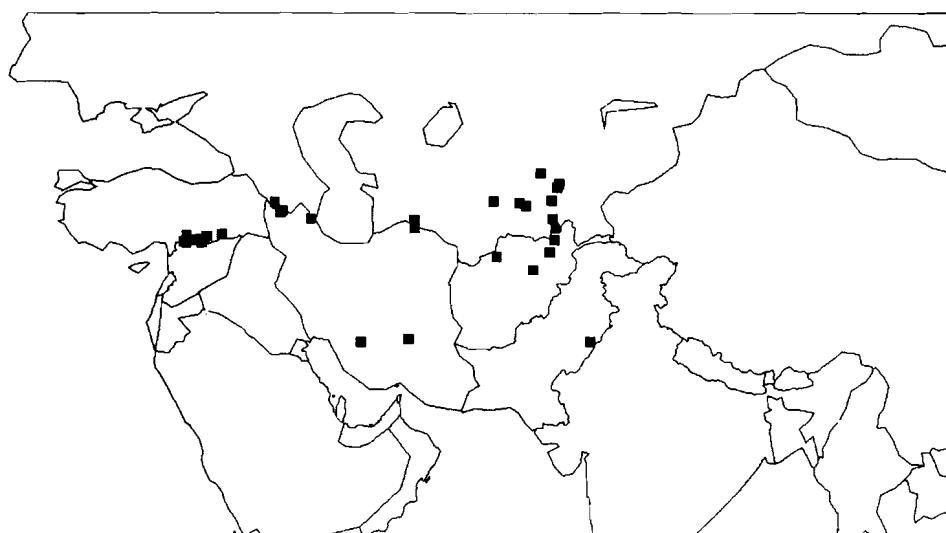

**Geographical distribution:** Mediterranean Basin, Crimea, Southwest Asia east to Afghanistan.

**Geographical notes:** The centre of diversity of sect. *Peregrinae* is focused on the fertile crescent countries of Southwest Asia. Two of the three species, *V. aintabensis* and *V. michauxii*, are restricted to this area, but *V. peregrina*

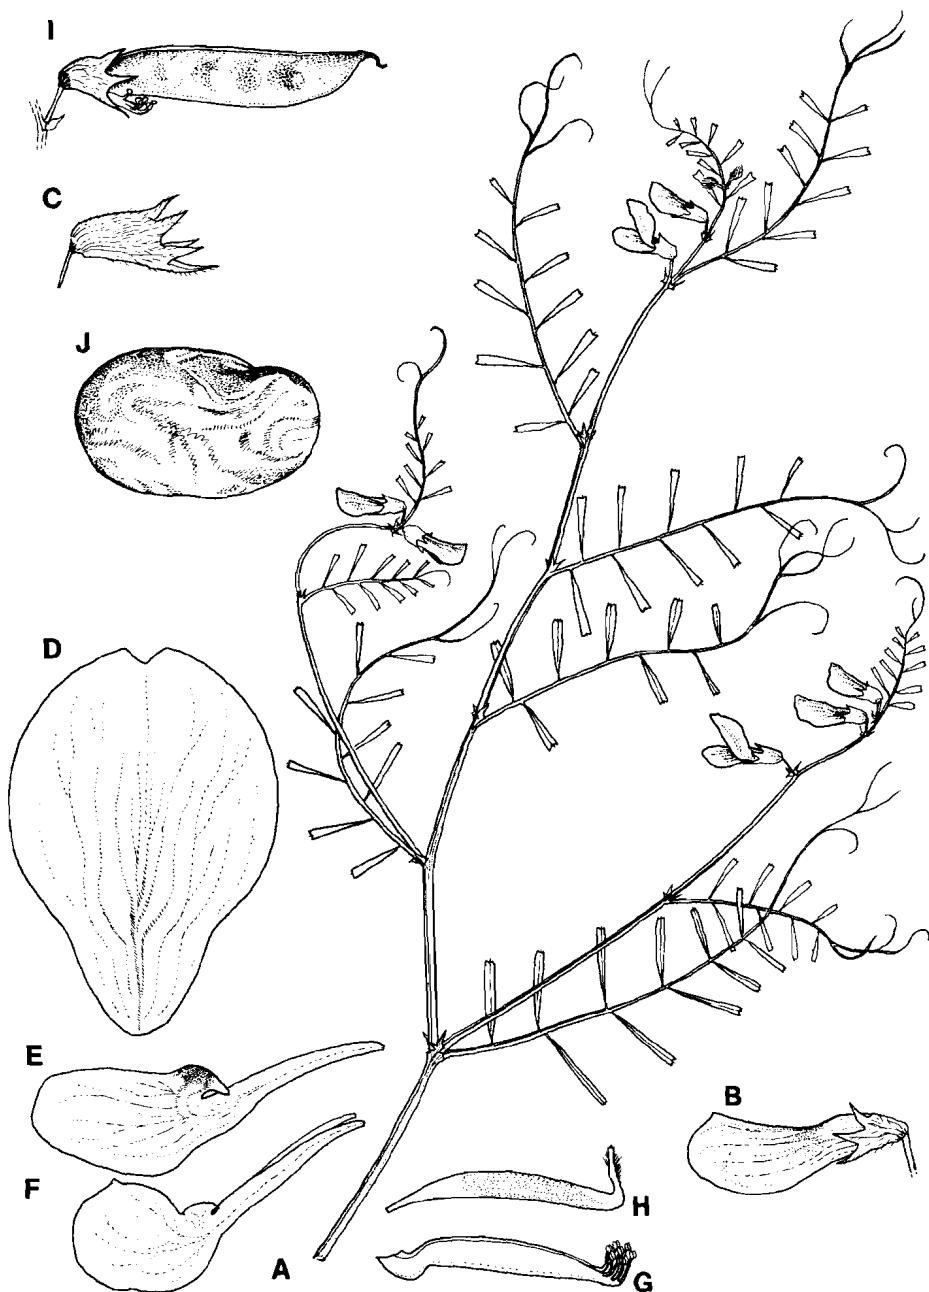

broadens the distribution of the section, as a whole, to Europe and North Africa.

**Ecological notes:** The three species are found in similar habitats, most commonly being found as weeds of cultivated annual crops of arid and semi-arid areas. The species do not show a preference for any particular soil types, they prefer open communities and cannot stand competition.

**Taxonomic notes:** Ponert (1973) used five subspecies to describe the variation seen in sect. *Peregrinae*. He included *V. aintabensis* and *V. michauxii* as subspecies of *V. peregrina* and resurrected two taxa commonly regarded as synonyms of these species. The three species are closely related and specific identification is difficult if the few good diagnostic characters are unrecordable. Plitmann (1967) states that intermediate forms between the three species are found in Northern Iraq and Southern Turkey. However, I have not seen specimens that show intermediacy and when the full data set is recordable I have had no problem in ascribing specimens to one of the three species recognized.

Map 20. Distribution of *V. michauxii*.

**Figure 3.7.** *Vicia michauxii*: A habit x 0.5; B flower x 1.5; C calyx x 2; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 1; J seed x 3.5. A-H and J from Maxted 5252, I from Maxted 8130.

**Ecology:** Alt. 10-1450 m; Hab. dry agricultural and disturbed land.

**Map 22.** Distribution of *V. peregrina*

### 3.2.5 Section *Wiggersia*

**V. Section *Wiggersia*** (Alef.) Maxted, Kew Bull. 47(1): 129-130 (1991c).

Annual; scrambling; stem slender. Stipules entire or semi-hastate; 2-6.5 x 1-4 mm; edge entire or with 1-2 teeth. Leaf 3-48 mm; apex tendrillous; 2-12 leaflets per leaf; leaflet 2-23 x 1-9 mm; symmetric; margins entire. Peduncle 1-2 mm; with 1 flower. Calyx mouth straight; teeth subequal; base not gibbous; pedicel 1-2 mm. Flowers 5-15 mm; all petals approximately equal length; standard cream, blue or purple; shape stenonychioid; claw bowing absent; upper standard surface glabrous. Wing marking absent; wing limb without basal folding. Legume 13-35 x 3-5 mm; linear; round in cross section or laterally flattened; sutures parallel or curved; valve glabrous or pubescent; hairs simple; septa absent; 4-8(-12) seeds per legume. Seeds 1.5-3.5 x 1-3 mm; round; not laterally flattened or laterally flattened; hilum less than quarter of seed circumference; lens positioned near hilum; testa surface rough.

**Number of taxa:** two.

**Chromosome number:** 10, 12.

**Geographical distribution:** Europe, West Asia and Algeria.

**Geographical notes:** The two species of sect. *Wiggersia* have a centre of diversity in Southwest Asia. *V. cuspidata* is restricted to Southeast Europe and Southwest Asia and *V. lathyroides* broadens the distribution of the section, as a whole, to include North Africa and Western Europe.

**Ecological notes:** The two species of this section are usually found in grazed grassland, among rocks or more rarely on the margins of cultivation. They are commonly found in semi-shaded areas of temperate or semi-arid regions. No particular soil preference has been noted. They do not respond well to competition from surrounding plants (probably due to their relatively small stature).

**Taxonomic notes:** These two species have been considered closely allied by numerous authors (Alefeld 1861a; Boissier 1872; Plitmann 1967; Ball 1968; Kupicha 1976; Chrtkova-Zertova 1979). They were included with *V. lutea*, *V. sepium* and *V. sylvatica* in the genus *Wiggersia* by Gaertner *et al.* (1801), but the name was not validly published. Alefeld (1861a) took up the name, but used a different conception that included *V. lathyroides* and *V. cuspidata* alone and thus the name is used here to encompass the same group. The two species are united by their small habit, much reduced peduncle, linear legume and their sculptured seed testa.

**23. *V. cuspidata*** Boiss., Diagn. Ser. 1(2): 104 (1843). Fl. Eur., 2: 135; Fl. Iran., 55; Fl. Pal., 2: 205; Fl. Syr., 2: 404; Fl. Tur., 3: 317; Illust. Fl. Iran., Tab. 35, fig. 5; Fl. Pal., 2 (plates): 294. Figure 3.8.

**Phenology:** April-June

**Chromosome number:** 12.

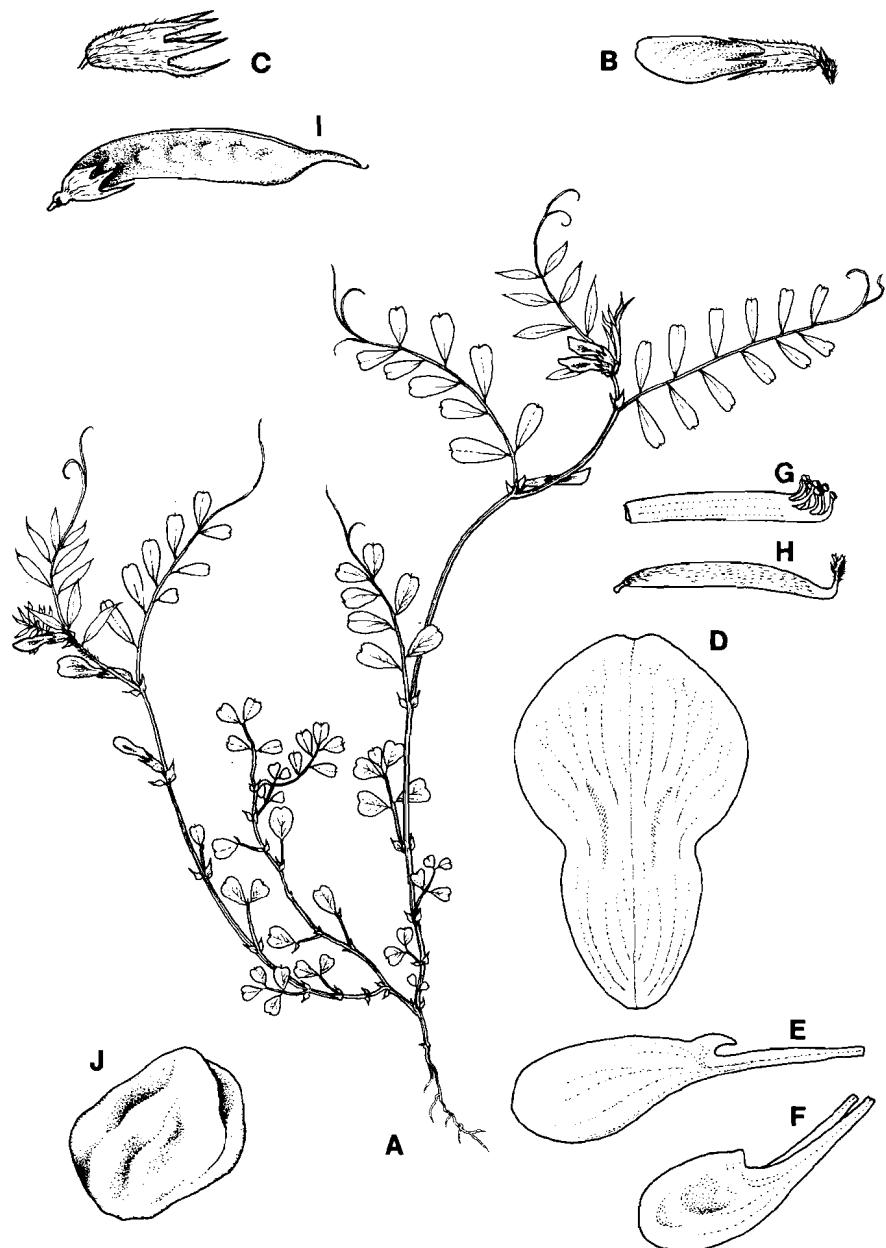

**Geographical distribution:** CYP, GRC, ISR, IRN, JOR, LBN, SYR, TUR. Map 23.

**Ecology:** Alt. 120-1550 m Hab. disturbed and undisturbed land, and open woodland.

**Taxonomic notes:** Plitmann (1967) notes that a few specimens of *V. cuspidata* from Turkey (Thracia and Lydia) show some degree of intermediacy with *V. lathyroides*. Having collected fresh material of both species and not having encountered any specimens showing intermediacy, I am in no doubt that the specific distinction should be retained.

**Map 23.** Distribution of *V. cuspidata*.

**Figure 3.8.** *Vicia cuspidata*: A habit x 0.5; B flower x 2; C calyx x 3; D standard petal x 4; E wing petal x 4; F keel petal x 4; G stamen x 4; H ovary, style and stigma x 4; I fruit x 1; J seed x 5. A-H and J from Maxted 2428, I from Maxted 2286 and 2380.

24. *V. lathyroides* L., Sp. Pl., 2: 736 (1753). Fl. Eur., 2: 135; Fl. Iran., 54-55; Fl. Iraq, 3: 538; Fl. Syr., 2: 404; Fl. Tur., 3: 317-318; Fl. USSR., 13: 457-458; Illust. Draw. Brit. Pl., 3: 67; Fl. Iran., Tab. 35, fig. 4.

**Phenology:** March-August

**Chromosome number:** (10), 12.

**Geographical distribution:** ALB, AUT, BEL, BGR, CAN(I), CHE, CSK, CYP, DEU, DEU, DNK, DZA, ESP, FIN, FRA, GBR, GRC, HUN, IRL, ISR, IRQ, IRN, ITA, JOR, LBN, MAR, NLD, NOR, POL, PRT, ROM, SWE, SUN, SYR, TUR, USA(I), YUG. Map 24.

**Ecology:** Alt. 10-1500 m; Hab. lawn and grazed pasture weed, open woodland and disturbed land.

**Map 24.** Distribution of *V. lathyroides*.

### 3.2.6 Section *Vicia*

**VI. Section *Vicia*** L., Sp. Pl. 736 (1753). Fl. Eur., 2: 134; Fl. Iran., 41; Fl. Iraq, 3: 528; Fl. Pal., 2: 202; Fl. Tur., 3: 303; Fl. USSR., 13: 453.

Annual or perennial; climbing; stem slender. Stipules entire or semi-hastate or semi-sagittate; 2.5-12 x 1-11 mm; edge entire or with 1-8 teeth. Leaf 12-84 mm; apex tendrillous; 4-18 leaflets per leaf; leaflets 7-38 x 1-15 mm; symmetric; margins entire, serrate or incised. Peduncle 1-13 mm; with 1-4 flowers. Calyx mouth straight; teeth subequal; base not gibbous; pedicel 1-4 mm. Flowers 10-33 mm; all petals approximately equal length; standard cream, yellow, blue or purple; shape stenonychoid; claw bowing absent; upper standard surface glabrous. Wing marking absent; wing limb with slight or strong basal folding. Legume 6-70 x 4-12 mm; linear or rectangular; round in cross section or laterally flattened; sutures straight; valves glabrous or pubescent; hairs simple; septa absent or present; 1-14 seeds per legume. Seeds 2-7 x 2-7 mm; round; laterally flattened or not laterally flattened; hilum less than quarter of seed circumference or over half of seed circumference; lens positioned near hilum; testa surface smooth.

**Number of taxa:** 12

**Chromosome number:** 10, 12, 14.

**Geographical distribution:** Europe, North Africa, and West and North Asia.

**Geographical notes:** Sect. *Vicia* is composed of five species, one of which is the pan-temperate and semi-tropical weed, *V. sativa*. The other four species of the section are geographically restricted. The centre of distribution of the section is Southeast Europe and Southwest Asia, with two restricted species (*V. pyrenaica* and *V. qatmensis*) forming isolated endemic distributions in the Iberian Peninsular and Syria respectively. The discontinuous distribution of these four species could suggest that they have each evolved separately from a *V. sativa*-like form.

**Ecological notes:** The section includes one of the most common temperate weeds, the common vetch, which can be found in numerous diverse habitats, though it is most commonly found in open, disturbed areas rather than closed, shaded communities. The other four species are more selective. *V. pyrenaica* is restricted to alpine meadows over 1000 m in the Pyrenees and Sierra Nevada ranges in France and Spain and the remaining three species prefer shaded areas of open woodland or are found along hedgerows. While *V. sativa* has some resistance to grazing, the other species are more susceptible. The species do not show an obvious preference for particular soils.

**Taxonomic notes:** Section *Vicia* is split into two series. *V. grandiflora* was first distinguished from the *V. sativa* aggregate by Alefeld (1861b), who created the monospecific genus *Cujunia*. The need for a discrete taxon for *V. grandiflora* was also seen by Fedtschenko (1948). He referred to the unit as ser. *Grandiflorae*, but he did not validly publish the name. Radzhi (1971) finally

published the taxon as ser. *Grandiflorae*. The two species of ser. *Grandiflorae* are distinguished from ser. *Vicia* by corolla colour, corolla size, legume shape, legume size and the relative lengths of the seed hilum to its circumference.

**A. Series *Vicia*** L., Sp. Pl. 736 (1753). Fl. Eur., 2: 134; Fl. Iran., 41; Fl. Iraq, 3: 528; Fl. Pal., 2: 202; Fl. Tur., 3: 303; Fl. USSR., 13: 453.

**Number of taxa:** nine.

**Chromosome number:** 10, 12, 14.

**Geographical distribution:** Europe, North Africa, and West and North Asia.

**Taxonomic notes:** The series contains the polymorphic, pan-temperate *V. sativa* and the other two species, *V. pyrenaica* and *V. barbazitae*, can be seen as extreme forms of *V. sativa*.

**25. *V. pyrenaica*** Pourret, Act. Tolouse Mem. 3: 333 (1788). Fl. Eur., 2: 134.

**Phenology:** June-August

**Chromosome number:** 14.

**Geographical distribution:** ESP, FRA. Map 25.

**Ecology:** Alt. 1100-2400 m; Hab. alpine pasture.

**Map 25.** Distribution of *V. pyrenaica*.

**26. *V. sativa* L., Sp. Pl. 2: 736 (1753). Fl. Eur., 2: 134; Fl. Iran., 50-51; Fl. Iraq, 3: 534-535; Fl. Pal., 2: 205; Fl. Syr., 2: 403; Fl. Tur., 3: 318-321; Fl. USSR., 13: 460-463.**

**Phenology:** February-November      **Chromosome number:** (10), 12, (14).

**Geographical distribution:** AFG, ALB, ARG(I), AUT, AUS(I), BEL, BGR, BRA(I), CAN(I), CHE, CHL(I), CHN, CSK, CYP, CUB(I), DEU, DNK, DZA, ECU, EGY, ESP, ETH, FIN, FRA, GBR, GRC, HUN, IRL, ISR, IND, IRQ, IRN, ITA, JPN, JOR, KEN(I), LBN, LE, LBY, MAR, MRT, MUS(I), MEX(I), NLD, NOR, NPL, NZL(I), POL, PAK, PRT, ROM, SAU, SWE, SOM, SUN, SYR, TUN, TUR, USA(I), YUG. Maps 26a, b, and c.

**Ecology:** Alt. 1-2900 m; Hab. common pan-temperate and semi-tropical weed, agricultural and disturbed land, margins of woodland.

**Taxonomic notes:** *V. sativa* is the most ubiquitous and polymorphic species of *Vicia*. Numerous recent workers, e.g. Hanelt & Mettin (1964, 1966), Plitmann (1967), Davis & Plitmann (1970), Hollings & Stace (1974, 1978), Stankevich (1978b) and Potokina (in prep.) have reported detailed morphological studies of the *V. sativa* aggregate and each has proposed a novel classification of the included supra-specific taxa. A detailed review of the existing knowledge, complemented by targeted research to fill existing knowledge gaps, is required to provide a clear statement about *V. sativa* infra-specific taxonomy.

**i. *V. sativa* subsp. *nigra* (L.) Ehrh., Hannover. Mag. 15: 229 (1780). Fl. Eur., 2: 134; Fl. Iran., 52-53; Fl. Iraq, 3: 536-537; Fl. Pal., 2: 206-207; Fl. Syr., 2: 403; Fl. Tur., 3: 319-320; Fl. USSR., 13: 464; Illust. Draw. Brit. Pl., 3: 66; Fl. Iran., Tab. 35, fig. 1.**

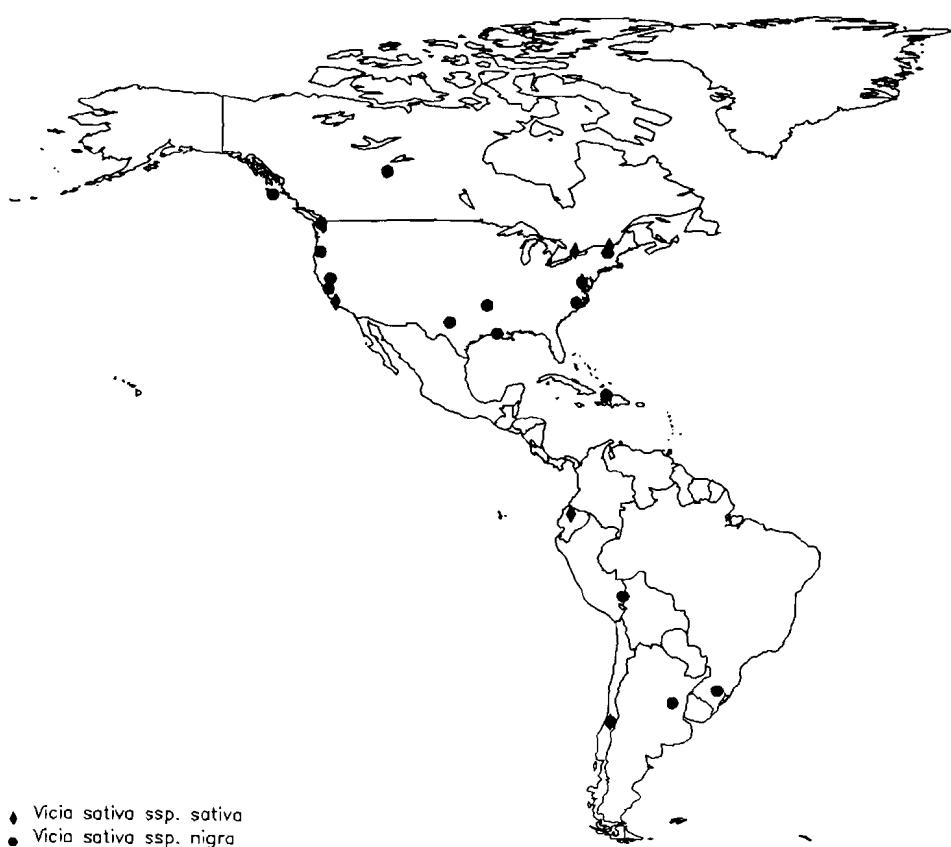

**Phenology:** February-November      **Chromosome number:** (10), 12, (14).

**Geographical distribution:** AFG, ALB, ARG(I), AUT, AUS(I), BEL, BGR, BRA(I), CAN(I), CHE, CHL(I), CHN, CSK, CYP, CUB(I), DEU, DNK, DZA, ECU, EGY, ESP, ETH, FIN, FRA, GBR, GRC, HUN, IRL, ISR, IND, IRQ, IRN, ITA, JPN, JOR, KEN(I), LBN, LE, LBY, MAR, MRT, MUS(I), MEX(I), NLD, NOR, NPL, NZL(I), POL, PAK, PRT, ROM, SAU, SWE, SOM, SUN, SYR, TUN, TUR, USA(I), YUG.

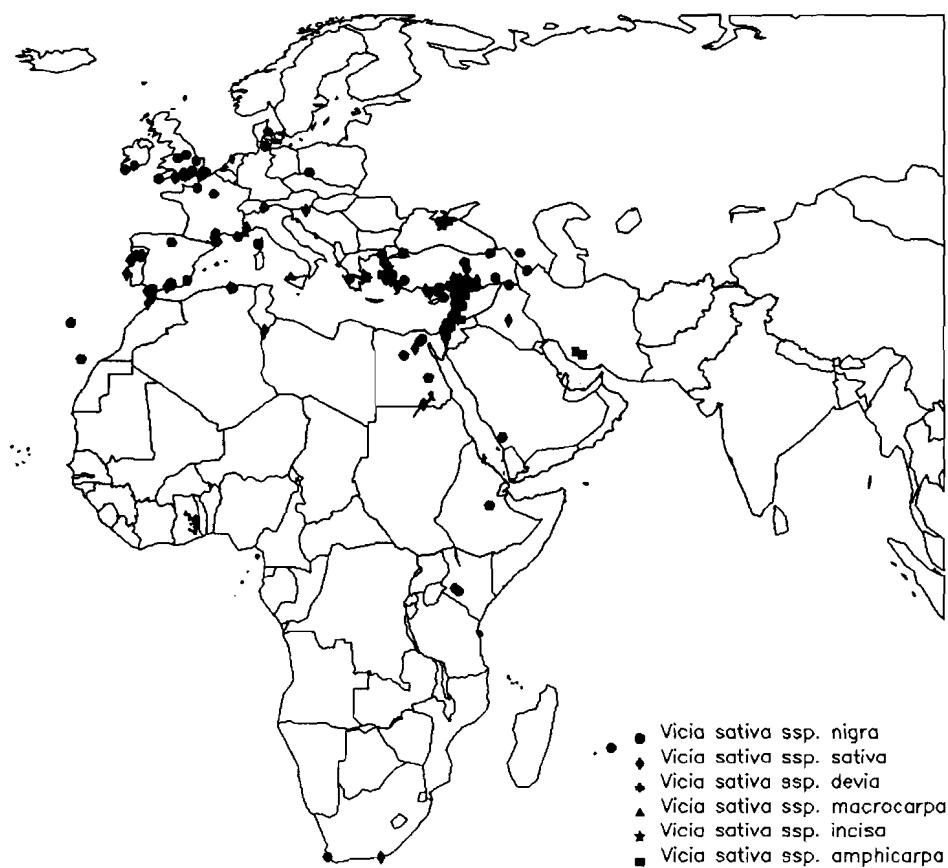

**Ecology:** Alt. 1-2900 m; Hab. common pan-temperate and semi-tropical weed, agricultural and disturbed land, margins of woodland.

**Taxonomic notes:** The most widespread of all the *V. sativa* subspecies, the common weedy vetch.

**ii. *V. sativa* subsp. *amphicarpa* (L.) Batt. in Batt. & Trabut, Fl. Algerie, 1: 268 (1889). Fl. Eur., 2: 134; Fl. Iran., 53-54; Fl. Iraq, 3: 537-538; Fl. Pal., 2: 207; Fl. Syr., 2: 403-404; Fl. Tur., 3: 321; Fl. USSR., 13: 465; Fl. Iran., Tab. 35, fig. 2.**

Map 26a. Distribution of *V. sativa* in the Americas.

Map 26b. Distribution of *V. sativa* in Europe, Africa and West Asia.

Map 26c. Distribution of *V. sativa* in East Asia and Australasia.

**Phenology:** March-August                           **Chromosome number:** 10, 12, 14.

**Geographical distribution:** AFG, ALB, AUS(I), BEL, CSK, CYP, ESP, FRA, GRC, ISR, IRQ, IRN, ITA, JOR, LBN, LBY, MRT, PRT, ROM, SUN, SYR, TUR, YUG.

**Ecology:** Alt. 20-2000 m; Soils, calcic brown, calcic brown & terra rossa, chalky calcic brown, chalky white, heavy black, terra rossa; Hab. dry disturbed or agricultural land.

**Taxonomic notes:** This subspecies has potential as a forage plant for dry areas. The amphicarpic pods are resistant to grazing and so regeneration of pasture following grazing is high (Fabre 1855; Ascherson 1884; Plitmann 1973; ICARDA 1987).

iii. *V. sativa* subsp. *incisa* (M. Bieb.) Arcang., Comp. Fl. Italiana, 201 (1882). Fl. Eur., 2: 135; Fl. Tur., 3: 320; Fl. USSR., 13: 463.

**Phenology:** April-June                           **Chromosome number:** 14.

**Geographical distribution:** BGR, DZA, GRC, LBY, MAR, PRT, SUN, TUR, YUG.

**Ecology:** Alt. 10-510 m; Hab. disturbed land associated with woodland.

iv. *V. sativa* subsp. *devia* J.G. da Costa, Boletim do Museu Municipal do Funchal, III(7): 62 (1948). Fl. Madeira (in press).

**Phenology:** N.A.                                   **Chromosome number:** N.A.

**Geographical distribution:** PRT (endemic to Madeira).

**Ecology:** N.A.

v. *V. sativa* L., Sp. Pl., 2: 736 (1753). subsp. *sativa*. Fl. Eur., 2: 135; Fl. Iran., 51; Fl. Iraq, 3: 535-536; Fl. Pal., 2: 206; Fl. Tur., 3: 319; Illust. Fl. Iran., Tab. 34, fig. 4; Fl. Pal., 2 (plates): 295.

**Phenology:** January-December                   **Chromosome number:** 10, 12.

**Geographical distribution:** AFG, ALB, AUS(I), BEL, BGR, CAN(I), CHE, CHL(I), CHN, CSK, CYP, CUB(I), DEU, DZA, ECU, EGY, ESP, ETH, FRA, GBR, GRC, HUN, IRL, ISR, IND, IRQ, IRN, ITA, JPN, JOR, KEN(I), LBN, LE, LBY, MAR, MRT, MUS(I), MEX(I), NLD, NZL(I), POL, PAK, PRT, ROM, SAU, SOM, SUN, SYR, TUN, TUR, USA(I), YUG.

**Ecology:** Alt. 10-2100 m; Hab. minor forage crop of the Middle East. Agricultural and disturbed land, margins of woodland.

**Taxonomic notes:** This subspecies is grown, both as a fodder and forage plant, in Europe, North Africa and West Asia. ICARDA are promoting the use of *V. sativa* subsp. *sativa* as a replacement for fallow in the traditional barley-fallow rotation (ICARDA 1988).

vi. *V. sativa* subsp. *macrocarpa* (Moris) Arcang., Comp. Fl. Italiana, 201 (1882). Fl. Eur., 2: 135; Fl. Tur., 3: 320-321.

**Phenology:** May-June                           **Chromosome number:** 10, 12.

**Geographical distribution:** ALB, BGR, DZA, ESP, FRA, GRC, ITA, LBY, MAR, PRT, TUR, YUG.

**Ecology:** Alt. 45-200 m; Hab. agricultural and woodland margins.

27. *V. barbazitae* Ten. & Guss., Mem. Sulle Peregr., 165 (1838). Fl. Eur., 2: 134; Fl. Tur., 3: 315. Figure 3.9.

**Phenology:** April-July                           **Chromosome number:** N.A.

**Geographical distribution:** BGR, FRA, DEU, GRC, ITA, TUR, YUG. Map 27.

**Ecology:** Alt. 340-2100 m; Hab. woodland and margins of cultivation.

i. *V. barbazitae* var. *barbazitae* Ten. & Guss., Mem. Sulle Peregr., 165 (1838).

**Phenology:** April-June                           **Chromosome number:** 14.

**Geographical distribution:** BGR, FRA, DEU, GRC, ITA, TUR, YUG.

**Ecology:** Alt. 340-2100 m; Hab. woodland and woodland margins.

ii. *V. barbazitae* var. *incisa* (Orph.) Boiss., Fl. Or., 2: 574 (1872).

**Phenology:** May-June                           **Chromosome number:** 14.

**Geographical distribution:** AUT, GRC, TUR.

**Ecology:** Alt. 550-1150 m; Hab. open woodland and meadows.

B. Series *Grandiflorae* B. Fedtsch. ex Radzhi, Novosti Sist. Vyssh. Rast., 7: 236 (1971). Fl. USSR., 13: 349.

**Number of taxa:** three.                           **Chromosome number:** 12, 14.

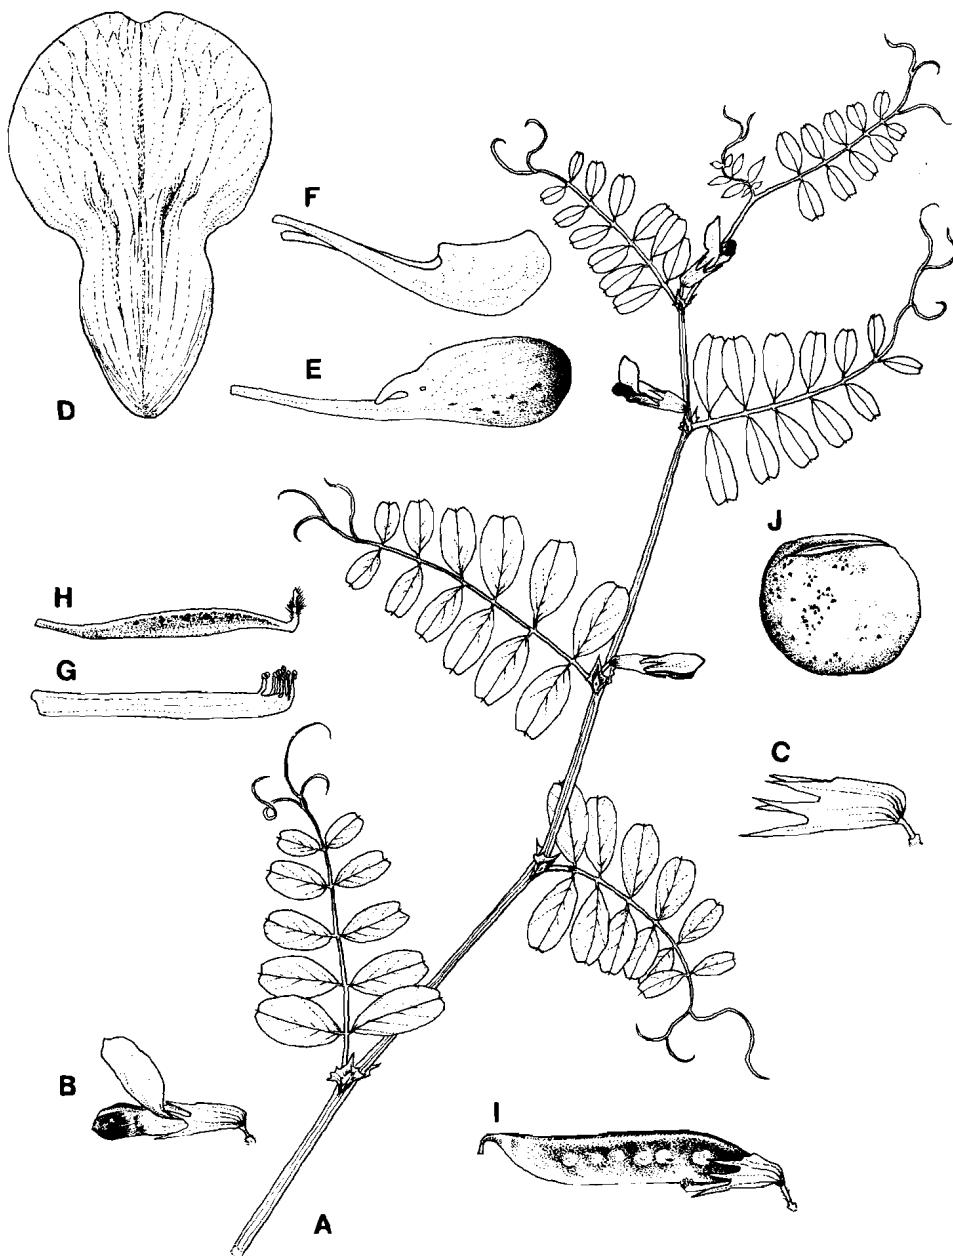

**Geographical distribution:** Southeast Europe and West Asia.

**Taxonomic notes:** Series *Grandiflorae* contains two closely allied species: *V. grandiflora* and *V. qatmensis*. The latter is an endemic of Western Syria and following its description was not incorporated into any of the major classifications of *Vicia*. However, having collected this species I consider the specific distinction from *V. grandiflora* is warranted. The two species are distinguished from *Vicia sensu stricto* by their yellow to cream coloured corolla, the corolla size, the laterally flattened but broader legume and the seed hilum being more than half the seed circumference.

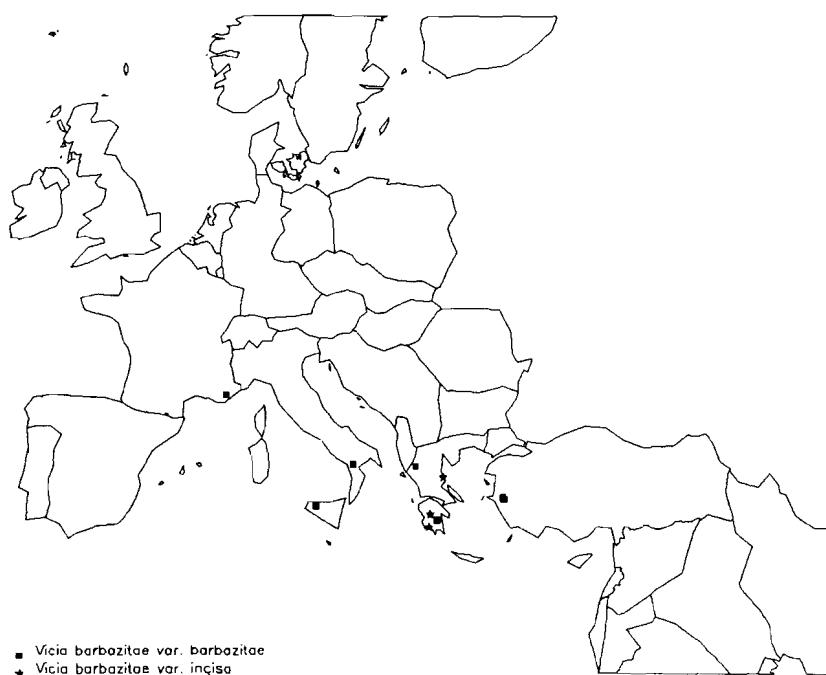

28. *V. qatmensis* Gomb., Notulae systematicae, 14(2): 109 (1951). Fl. Syr., 2: 401. Figure 3.10.

**Phenology:** March-May                           **Chromosome number:** 14.

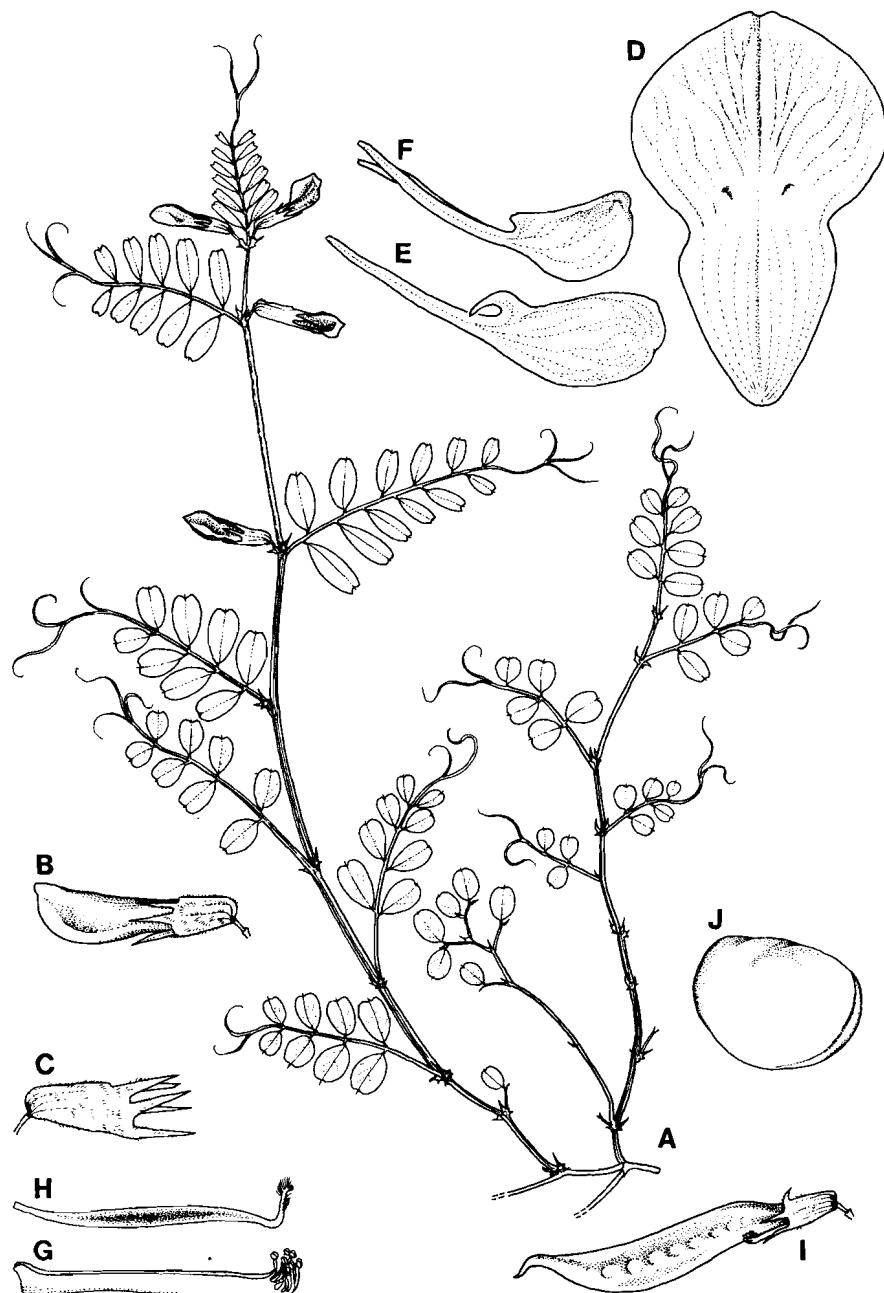

**Geographical distribution:** SYR (endemic), see Map 28.

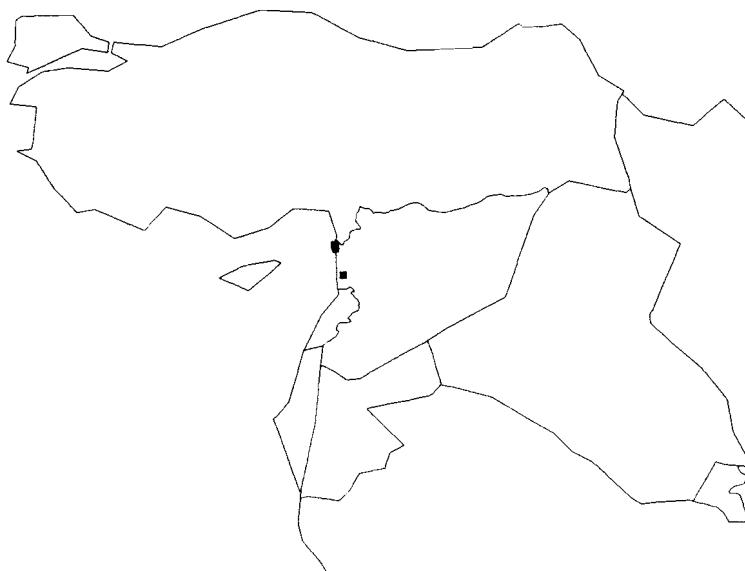

**Figure 3.9.** *Vicia barbazitae*: A habit x 0.5; B flower x 1; C calyx x 2; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 1; J seed x 5. A-H and J from Maxted 4317, I from Maxted 4429.

Map 27. Distribution of *Vicia barbazitae*.

**Figure 3.10.** *Vicia satmensis*: A habit x 0.5; B flower x 1; C calyx x 2; D standard petal x 1.5; E wing petal x 1.5; F keel petal x 1.5; G stamen x 1.5; H ovary, style and stigma x 1.5; I fruit x 1; J seed x 5. A-H and J from Maxted 2061, I from Maxted 2066.

**Map 28.** Distribution of *V. qatmensis*.

**Ecology:** Alt. 470-1040 m; Soil, Calcic brown & terra rossa, Woodland brown; Hab. woodland and coppice margins.

**Taxonomic notes:** This rare taxon has been located at two sites in Northwestern Syria; near the type location at Masiaf and in the gorge to the West of Kessab on the Turkish-Syrian border.

**29. *V. grandiflora*** Scop., Flora Carnolica, 2: 65 (1772). Fl. Eur., 2: 134; Fl. Iran., 54; Fl. Pal., 2: 205; Fl. Tur., 3: 315-316; Fl. USSR., 13: 459-460; Illust. Fl. Iran., Tab. 35, fig. 3.

**Phenology:** March-August

**Chromosome number:** (12), 14.

**Geographical distribution:** AFG, ALB, AUS(I), BGR, CAN(I), CSK, GRC, HUN, IRQ, IRN, ITA, POL, ROM, SUN, TUR, YUG, USA(I). Map 29.

**Ecology:** Alt. 340-1000 m; Hab. woodland and woodland margins.

### 3.2.7 Section *Bithynicae*

VII Section *Bithynicae* (B. Fedtsch. ex Radzhi) Maxted, Kew Bull. 47(1): 129-130 (1991c). Fl. USSR., 13: 472.

Annual; climbing; stem slender. Stipules semi-sagittate; 4-26 x 2-16 mm; edge with 3-8 teeth. Leaf 12-67 mm; apex tendrillous; 2-6 leaflets per leaf; leaflet 10-70 x 2-31 mm; symmetric; margins entire. Peduncle 1-69 mm; with 1-2 flowers. Calyx mouth straight; teeth subequal; base not gibbous; pedicel 1-5 mm. Flowers 11-22 mm; all petals approximately equal length; standard blue or purple; shape stenonychioid; claw bowing absent; upper standard surface glabrous. Wing marking absent; wing limb with slight basal folding. Legume 23-47 x 6-11 mm; rhomboid; laterally flattened; sutures parallel; valves pubescent; hairs tuberculate (with basal swelling); septa present; 2-7 seeds per legume. Seeds 2-4.5 x 2-4 mm; round; not laterally flattened; hilum less than quarter of seed circumference; lens positioned near hilum; testa surface smooth.

**Number of taxa:** one.

**Chromosome number:** 14.

**Geographical distribution:** Central, Southern Europe and the Mediterranean Basin.

**Ecological notes:** The single species of this section, *V. bithynica*, is most commonly associated with dry and open disturbed habitats. In Britain it is always found on sandy areas near the sea and this preference for sandy soils seems to hold throughout its range. In the Middle East it is more commonly found growing as a weed in cereals or vineyards. It does not appear to stand shading or strong competition from other plants.

**Taxonomic notes:** The distinct nature of *V. bithynica* within subgenus *Vicia* was noted as early as 1836 by Koch, who placed the species in a monospecific subsectional grouping. Subsequently, it has been included with the *V. narbonensis* complex species, with sect. *Vicia* species or placed with the *V. cracca*-related species. The radical difference of opinion between specialists on the placement of *V. bithynica* within *Vicia* seems likely to result from the relative importance given to peduncle length as a group-defining character

in the various classifications. *V. bithynica* has the overall features of *Vicia* subgenus *Vicia sensu* Kupicha (1976), but the peduncle is often longer than the flower which makes it the exception in a group where the flowers are otherwise sessile to subsessile. *V. bithynica* has historically most commonly been linked with the *V. narbonensis* complex, with which it shares the diagnostic large, serrate-edged stipule.

**30. *V. bithynica* (L.) L., Syst. Nat., ed. 10(2): 1166 (1759). Fl. Eur., 2: 135; Fl. Pal., 2: 207-208; Fl. Syr., 2: 410; Fl. Tur., 3: 321; Fl. USSR., 13: 472-473; Illust. Draw. Brit. Pl., 3: 68; Fl. Pal., 2 (plates): 296.**

**Phenology:** March-August

**Chromosome number:** 14.

**Geographical distribution:** AFG, ALB, AUT, BEL, BGR, CYP, DEU, DZA, ESP, FRA, GBR, GRC, ISR, IND, ISL, ITA, JOR, LBN, PHL(I), PAK, PRT, SUN, SYR, TUR, YUG. Map 30.

**Ecology:** Alt. 10-1250 m; Hab. agricultural and disturbed land, more rarely woodland edges.

**Taxonomic notes:** Plitmann (1967) comments that *V. bithynica* is both cultivated and wild, which may perhaps explains its wide distribution. I have been unable to trace any further record of its cultivation.

### 3.2.8 Section *Narbonensis*

**VIII. Section *Narbonensis* (Radzhi) Maxted, Kew Bull. 47(1): 129-130 (1991c). Fl. USSR., 13: 473.**

Annual; erect; stem stout. Stipules semi-sagittate; 7-28 x 4.5-25 mm; edge with 1-12 teeth. Leaf 7-126 mm; apex tendrilous; 2-12 leaflets per leaf; leaflets (8-)19-70 x 7-45 mm; asymmetric; margins entire, serrate or incised. Peduncle 1-29; with 1-6 flowers. Calyx mouth oblique; lower tooth longer than upper; base not gibbous; pedicel 1-4. Flowers 14-36 mm; all petals approximately equal length; standard cream, blue or purple; shape platonychioid; claw bowing absent; upper standard surface glabrous. Wing marking absent or present; wing limb with slight basal folding. Legume 27-75 x 7-20 mm; rectangular or rhomboid; round in cross-section or laterally flattened; sutures straight; valves pubescent; hairs tuberculate; septa absent or present; 2-9 seeds per legume. Seeds 4-8 x 4-8 mm; round; not laterally flattened; hilum less than quarter of seed circumference; lens positioned near hilum; testa surface smooth.

**Number of taxa:** 14

**Chromosome number:** 14.

**Geographical distribution:** Europe, North Africa and West Asia east to Pakistan.

Map 30. Distribution of *V. bithynica*.

**Geographical notes:** Sect. *Narbonensis* is composed of four species which are restricted to Southwest Asia and three species which are more widely distributed throughout Europe, West Asia and North Africa. The section's centre of diversity and possible origin is Southwest Asia. This hypothesis is supported, at least for *V. narbonensis*, by archaeological evidence (Schultze-Motel 1972; Renfrew 1973) from neolithic levels at Beidha in Israel.

**Ecological notes:** The species are most commonly associated with dry and open disturbed habitats. They are most commonly found growing as weeds in cereals and vineyards, or among rocks. The species are relatively large and are able to stand some shading and competition. They do not appear to show any preference for a particular altitude. Three of the geographically restricted species show a preference for basaltic soils, but the more widespread species show no apparent soil preferences.

**Taxonomic notes:** Sect. *Narbonensis* is composed of the seven species collectively known as the *V. narbonensis* complex, which are divided into two series. One species, *V. eristaloides*, is a distinct, peripheral member of the *V. narbonensis* complex. To reflect this isolation ser. *Rhombocarpae* Maxted (1991c) was erected to include this species (Maxted, 1991c). The other six species form a more closely related group and are included in ser. *Narbonensis*. These two series can be distinguished primarily by the difference in legume shape. *V. eristaloides*, like *V. bithynica*, has a rhomboid shaped legume, as opposed to the linear-rectangular legume of the ser. *Narbonensis* species. The inter-relationship of the seven species of this complex is discussed by Maxted *et al.* (1991).

**A. Series *Rhombocarpae* Maxted, Kew Bull. 47(1): 129-130 (1991c).**

**Number of taxa:** one.

**Chromosome number:** 14.

**Geographical distribution:** Turkey.

**31. *V. eristaloides* Maxted, Notes Roy. Bot.Gard. Edinburgh, 45(3): 454 (1989a).**

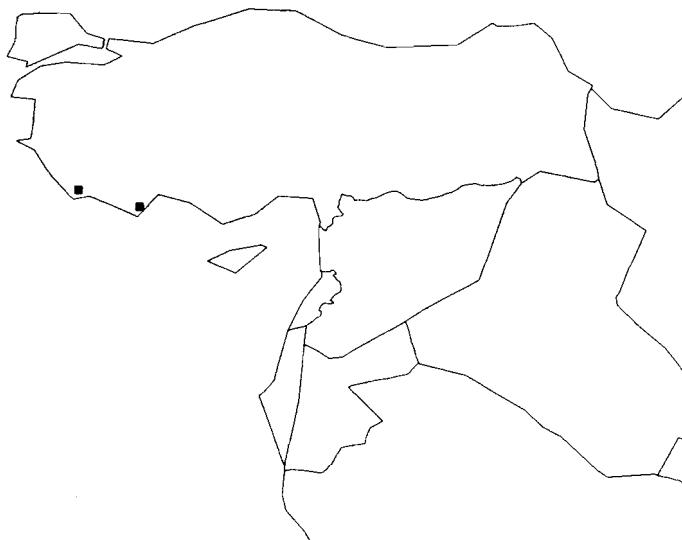

**Phenology:** April-May

**Chromosome number:** 14.

**Geographical distribution:** TUR, (endemic to Southwest Turkey). Map 31.

**Ecology:** Alt. 550-700 m; Soil, red mediterranean; Hab. limestone pavement, disturbed land and agricultural margins.

**Taxonomic notes:** *V. eristaloides* was linked by Maxted (1991) in the protologue to *V. galilaea*, *V. johannis* and *V. kalakhensis*. The flower colour and legume shape are similar to those of *V. bithynica*. The close relationship between *V. bithynica* and the other sect. *Faba* *sensu* Kupicha (1976) had recently been questioned by Maxted and Khattab (unpublished), but the discovery of *V. eristaloides* has strengthened the link between *V. bithynica* and the *V. narbonensis* complex. There are still sufficient differences between *V.*

**Map 31.** Distribution of *V. eristaloides*.

*eristaloides* and *V. bithynica*, however, to warrant their separation into distinct sections.

**B. Series Narbonensis** (Radzhi) Maxted, Kew Bull. 47(1): 129-130 (1991c). Fl. USSR., 13: 473.

**Number of taxa:** 13

**Chromosome number:** 14

**Geographical distribution:** Europe, North Africa and West Asia east to Pakistan.

**Taxonomic notes:** As discussed by Maxted *et al.* (1991) *V. narbonensis*, *V. serratifolia* *V. johannis*, *V. galilaea* are very closely related, while *V. kalakhensis* and *V. hyaeniscyamus* are both slightly more remote. The close affinity of these six species makes specific identification very difficult unless all the diagnostic characters are present. Many of the diagnostic characters are cryptic and are often obscured by the process of specimen drying (e.g. flower colour, which fades on dried specimens), which makes herbarium specimen identification difficult.

32. *V. kalakhensis* Khattab, Maxted & Bisby, Kew Bull. 43(3): 536 (1988).

**Phenology:** March-June

**Chromosome number:** 14.

**Geographical distribution:** SYR (endemic to Homs province, possibly spreading across the border into Lebanon). Map 32.

**Ecology:** Alt. 270-305 m; Soil, heavy black (basalt); Hab. moist meadows and scrubby hillside pasture.

**Taxonomic notes:** While attempting to locate *V. hyaeniscyamus* at its type location near Tel Kalakh, Homs, Syria in 1986 a novel member of the *V. narbonensis* complex was found and was subsequently described as *V. kalakhensis* by Khattab *et al.* (1988). They ally *V. kalakhensis* most closely to *V. johannis* and *V. galilaea*, and more remotely to *V. eristaloides*.

**Map 32.** Distribution of *V. kalakhensis*.

33. *V. johannis* Tamamschjan in Karyagin, Fl. Azerbaidzhan, 5: 495 (1954).

**Phenology:** March-July

**Chromosome number:** 14.

**Geographical distribution:** AFG, ALB, AUT, BGR, CHE, CYP, DEU, ESP, FRA, GRC, IRN, ITA, LBY, PAK, POL, ROM, SAU, SUN, SYR, TUR, YUG. Map 33.

**Ecology:** Alt. 30-1150 m; Hab. maquis, disturbed agricultural land and open woodland.

**Taxonomic notes:** Plitmann (1967) does not recognise the existence of *V. johannis*, referring instead to transition forms between other *V. narbonensis* complex taxa. However, Birch *et al.* (1985) concluded that *V. johannis* was a clearly separable taxon within the *V. narbonensis* complex. Field observation of this taxon has led me to concur with this view.

i. *V. johannis* var. *ecirrhosa* (Popov) H. Schäfer, Kulturpflanze 21: 261 (1973).

**Phenology:** May

**Chromosome number:** N.A.

**Geographical distribution:** SUN, (endemic to Tashkent, Uzbekistan).

**Ecology:** Weed in mountain cereal crops.

ii. *V. johannis* var. *procumbens* H. Schäfer, Kulturpflanze 21: 261 (1973).

**Phenology:** March-June

**Chromosome number:** 14.

**Geographical distribution:** GRC, IRN, ITA, SAU, SYR, TUR, YUG.

**Ecology:** Alt. 100-1350 m; Hab. maquis, disturbed agricultural land and open woodland.

iii. *V. johannis* var. *johannis* Tamamschian in Karyagin, Fl. Azerbaidzhan, 5: 495 (1954).

**Phenology:** March-June

**Chromosome number:** 14.

**Geographical distribution:** ALB, IRN, SUN, SYR, TUR.

**Ecology:** Alt. 20-2050 m; Hab. maquis, disturbed agricultural land and open woodland.

34. *V. galilaea* Plitm. & Zoh. in Plitm., Isr. J. Bot., 14: 91 (1965). Fl. Pal., 2: 209; Fl. Tur., 3: 323; Illust. Fl. Pal., 2 (plates): 298.

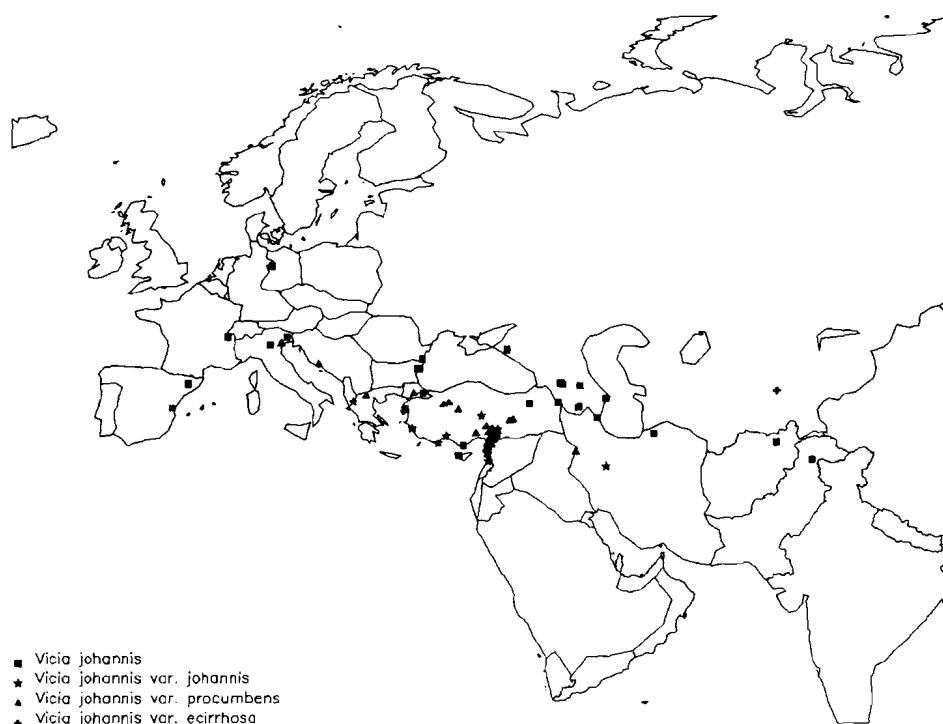

**Phenology:** March-July

**Chromosome number:** 14.

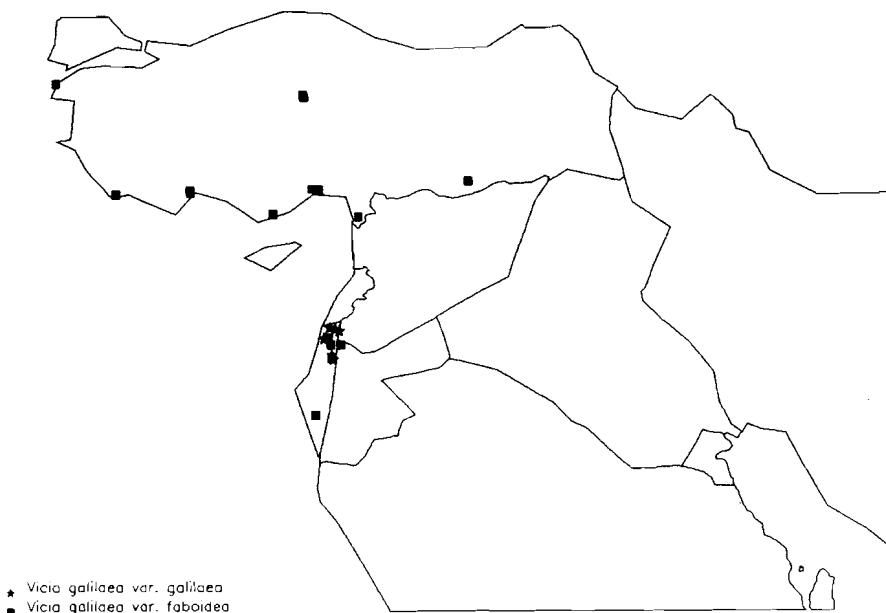

**Geographical distribution:** ISR, JOR, TUR. A rather disjunct distribution, but no specimens have yet been recorded from Lebanon or Syria. Map 34.

**Ecology:** Alt. 30-1300 m; Hab. maquis, open woodland, disturbed agricultural land.

**Taxonomic notes:** Plitmann (1965) and Zohary & Hopf (1973) tentatively

Map 33. Distribution of *V. johannis*.

suggest that *V. galilaea* is the closest ally of the fababean on the basis of morphological characters. Yamamoto *et al.* (1982) undertook a karyotypic, isozyme polymorphism, morphological and hybridization study of sect. *Faba* *sensu* Kupicha (1976) and reached the same conclusion. Each of these authors, however, stresses that in their opinion *V. galilaea* was not the progenitor of *V. faba*.

i. *V. galilaea* var. *galilaea* (Plitm. & Zoh. in Plitm.) H. Schäfer, Kulturpflanze 21: 265 (1973). Fl. Pal., 2: 209.

**Phenology:** March-July

**Chromosome number:** 14.

**Geographical distribution:** ISR.

**Ecology:** Alt. 100 m; Soil, Basalt; Hab. maquis, open woodland, disturbed agricultural land.

ii. *V. galilaea* var. *faboidea* (Plitm. & Zoh. in Plitm.) H. Schäfer, Kulturpflanze 21: 265 (1973). Fl. Pal., 2: 209.

**Phenology:** March-July

**Chromosome number:** 14.

**Geographical distribution:** ISR, JOR, LBN, SYR, TUR.

**Ecology:** Alt. 30-1300 m; Hab. maquis, open woodland, disturbed agricultural land.

35. *V. serratifolia* Jacq., Fl. Austr. 5: 30 (1778). Fl. Iran., 56; Fl. Iraq, 3: 542; Fl. Pal., 2: 208-209; Fl. Syr., 2: 407; Fl. Tur., 3: 322; Fl. USSR., 13: 474.

**Phenology:** February-September

**Chromosome number:** 14.

**Geographical distribution:** AUT, BEL, BGR, CSK, DEU, DZA, EGY, ESP, FRA, GBR, GRC, HUN, ISR, IRQ, IRN, ITA, JOR, MAR, PRT, ROM, SUN, TUR, YUG. Map 35.

**Ecology:** Alt. 60-1100 m; Hab. disturbed and agricultural land, more rarely open woodland.

**Taxonomic notes:** Some authors believe that *V. serratifolia* is insufficiently distinct from *V. narbonensis* to warrant specific status (Rouy 1899; Ascherson & Graebner 1909; Plitmann 1967; Ball 1968; Kupicha 1976 and Chrtkova-Zertova 1979). However, Khattab (1987) lists several characters, which were correlated with the difference in leaflet margin serrations and these can be used to distinguish these two species.

**Map 35.** Distribution of *V. serratifolia*.

Intermediate specimens with characteristics of *V. narbonensis* and *V. serratifolia* are rarely found; five specimens were seen during the current study (Al Eisawi 1311, RNG; Maxted, Ehrman et Khattab 2561 SPN; Simpson 467, K; Dinsmore 13090, K and Adamson s.n., BM). All five of these specimens have upper leaflets with more than six margin serrations, but also have lower leaflets with a crenate margin. Although upper leaflet serrations are common in all *V. narbonensis* complex species, only *V. serratifolia* is thought to have more than six margin serrations per leaflet (Khattab 1987).

**36. *V. narbonensis* L.**, Sp. Pl. 2: 737 (1753). Fl. Eur., 2: 135; Fl. Iran., 55-56; Fl. Iraq, 3: 540-542; Fl. Pal., 2: 208-209; Fl. Syr., 2: 406; Fl. Tur., 3: 321-322; Fl. USSR., 13: 473-474; Illust. Fl. Iran., Tab. 36, fig. 1; Fl. Pal., 2 (plates): 297.

**Phenology:** March-July

**Chromosome number:** 14.

**Geographical distribution:** ALB, AUT, BEL, BGR, CHE, CSK, CYP, DEU, DZA, EGY, ESP, FRA, GBR, GRC, HUN, ISR, IRQ, IRN, ITA, JOR, LBN, LBY, MAR, PAK, POL, PRT, ROM, SUN, SYR, TUN, TUR, UGA(I), YUG. Map 36

**Ecology:** Alt. 14-2100 m; Hab. disturbed and agricultural land, and more rarely open woodland.

**Taxonomic notes:** This species is a common wild and minor cultivated forage and fodder plant in North Africa and West Asia (Enneking & Maxted 1994). ICARDA (1988) are promoting the use of *V. narbonensis* as a replacement for fallow in the traditional barley-fallow rotation in the Eastern Mediterranean.

*V. narbonensis* is considered by many authors (Ball 1968; Davis & Plitmann 1970; Hanelt *et al.* 1972; Schäfer 1973; Kupicha 1976; Maxted *et al.* 1991) to be the morphological closest wild relative of the fababean. A detailed discussion of inter-taxon relationships between *V. narbonensis* and *V. faba* is provided in Maxted *et al.* (1991).

i. *V. narbonensis* var. *salmonea* (Mout.) H. Schäfer, Kulturpflanze XXI 253-254 (1973).

**Phenology:** February-May

**Chromosome number:** 14.

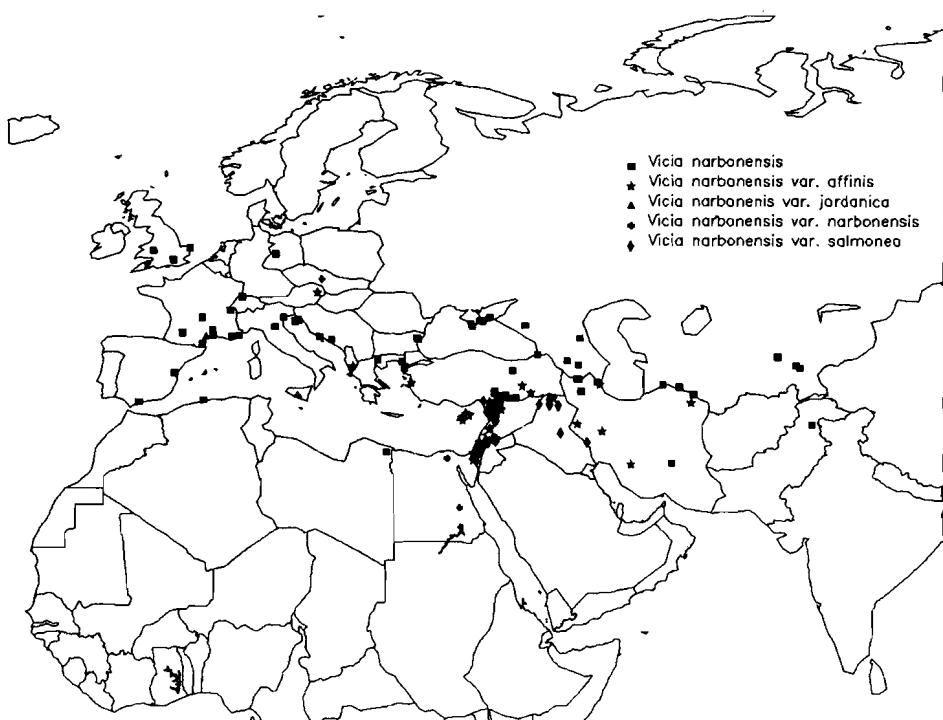

**Geographical distribution:** CYP, CSK, EGY, FRA, GRC, ISR, IRQ, JOR, SYR, TUR.

**Ecology:** Alt. 20-1510 m; Hab. disturbed and agricultural land, and more rarely open woodland.

ii. *V. narbonensis* var. *jordanica* H. Schäfer, Kulturpflanze 21: 251 (1973).

**Phenology:** March-May

**Chromosome number:** 14.

Map 36. Distribution of *V. narbonensis*.

**Geographical distribution:** CYP, FRA, ISR, IRN, ITA, JOR, SYR, TUR.

**Ecology:** Alt. 180-1320 m; Hab. disturbed and agricultural land, and more rarely open woodland.

iii. *V. narbonensis* var. *affinis* Kornhuber ex Asch. & Schweinf. Mem. Inst. Egypt, 2: 756 (1889).

**Phenology:** February-May

**Chromosome number:** N.A.

**Geographical distribution:** ALB, AUT, CYP, EGY, GBR, ISR, IRQ, IRN, JOR, PRT, SYR, TUR.

**Ecology:** Alt. 30-1510 m; Hab. disturbed and agricultural land, and more rarely open woodland.

iv. *V. narbonensis* var. *aegyptiaca* Kornhuber ex Asch. & Schweinf., Mem. Inst. Egypt 2: 756 (1889).

**Phenology:** April-May

**Chromosome number:** 14.

**Geographical distribution:** EGY, FRA, SYR.

**Ecology:** Alt. 40-1430 m; Hab. disturbed and agricultural land, and more rarely open woodland.

v. *V. narbonensis* var. *narbonensis* L., Sp. Pl., 2: 737 (1753).

**Phenology:** March-April

**Chromosome number:** 14.

**Geographical distribution:** CYP, EGY, ISR, SYR, TUR.

**Ecology:** Alt. 360-820 m; Hab. minor cultivated crop in Middle East. Weed of disturbed and agricultural land, and more rarely open woodland.

37. *V. hyaeniscamus* Mout., Bul. Soc. Bot. Fr., 108: 314 (1961). Fl. Syr., 2: 408.

Figure 3.11.

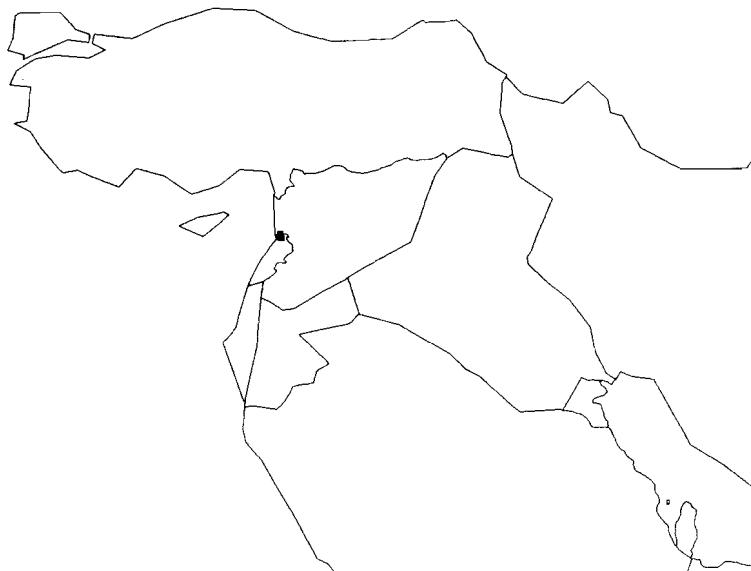

**Phenology:** March-May

**Chromosome number:** 14.

**Geographical distribution:** LE, SYR. Map 37.

**Ecology:** Alt. 270-370 m; Soil, basalt, Heavy black & terra rossa Heavy black (basalt); Hab. disturbed agricultural land and open woodland.

**Taxonomic notes:** Khattab *et al.* (1988) attempted to clarify the confusion in the literature concerning the specific distinction of *V. hyaeniscamus* from the other species of the *V. narbonensis* complex. An attempt was made by Maxted, Khattab & Bisby to relocate *V. hyaeniscamus* at its type locality and five populations with the unique character combination described by Mouterde were located. Recently (Maxted 1989a) found a further three populations North of Tel Kalakh.

**Map 37.** *Vicia hyaeniscyamus*.

### 3.2.9 Section *Faba*

**IX. Section *Faba*** (Miller) Ledeb., Fl. Ross., 1: 664 (1842). Fl. Iran., 56; Fl. Iraq, 3: 540; Fl. Tur., 3: 321; Fl. USSR., 13: 474.

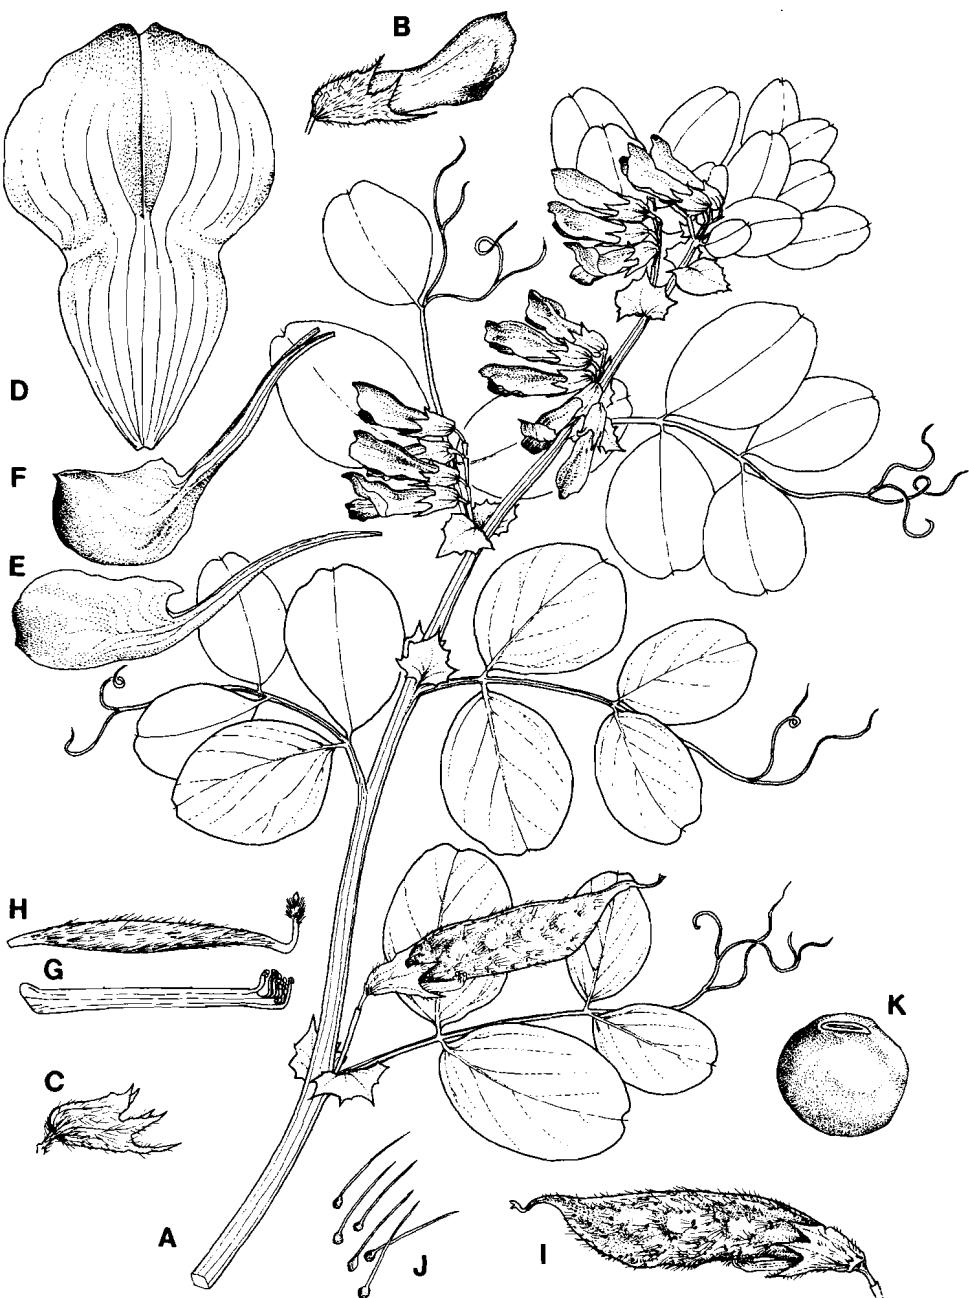

Annual; erect; stem stout. Stipules semi-hastate or semi-sagittate; 6.5-24 x 6-15 mm; edge with 1-8 teeth. Leaf 22-110 mm; apex mucronate; 2-8 leaflet per leaf; leaflets 22-90 x 9-47 mm; symmetric; margins entire. Peduncle 3-30 mm; with 2-10 flowers. Calyx mouth oblique; lower tooth longer than upper; base not gibbous; pedicel 1-3 mm. Flowers 20-33 mm; all petals approximately equal length; standard white; shape platonychioid or stenonychioid; claw bowing absent; upper standard surface glabrous. Wing marking present; wing limb with slight basal folding. Legume 22-140 x 6-23 mm; rectangular; laterally flattened; sutures straight; valve pubescent; hairs simple; septa present; 1-10 seeds per legume. Seeds 8-30 x 6-17.5; oblong; laterally flattened or not laterally flattened; hilum less than quarter of seed circumference; lens positioned near hilum; testa surface smooth.

**Number of taxa:** four.

**Chromosome number:** 12.

**Geographical distribution:** Cultivated species unknown in the wild.

**Geographical notes:** Maxted *et al.* (1991) discuss the cultivated distribution

**Figure 3.11.** *Vicia hyaeniscyamus*: A habit x 0.5; B flower x 1; C calyx x 1.25; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 0.75; J hairs on legume value x 18; K seed x 3, A-K from Maxted 1767.

of *V. faba*. Cultivation of the fababean is undertaken throughout the Northern Temperate zone and at higher altitudes in some subtropical regions. The largest areas are currently cultivated in China and the Middle East.

**Ecological notes:** Crop plant

**Taxonomic notes:** Many researchers undertaking a taxonomic study of sect. *Faba* have attempted to locate the closest ally of *V. faba*. Approaching the problem from this aspect they have found the fababean's closest allies to lie in the *V. narbonensis* complex of species. This has resulted in them classifying *V. faba* with the *V. narbonensis* complex, in a single section. For a clear view of the relationship between *V. faba* and other *Vicia* species a broader approach must be taken. This broader approach would give scale to the allocation of series, section and generic rank and so would allow the position of *V. faba* to be more 'naturally' defined. *V. faba* is clearly distinct from the sect. *Narbonensis* species on numerous characters, e.g. plant habit, gross morphology, leaflet size and shape, whether their hairs are tubercular, flower colour and size, legume and seed shape and size. This led Maxted *et al.* (1991) to conclude that *V. faba* was more isolated from its closest morphological allies than had been generally appreciated. Maxted (1993b) places *V. faba* in the monospecific section *Faba* (Miller) Ledeb.

**38** *V. faba* L., Sp. Pl. 2: 737 (1753). Fl. Eur., 2: 135-136; Fl. Iran., 57; Fl. Iraq, 3: 542-544; Fl. Syr., 2: 408-409; Fl. Tur., 3: 324; Fl. USSR., 13: 474-475; Illust. Fl. Iran., Tab. 36, fig. 2. Figure 3.12. **Chromosome number:** 12, (14).

i. *V. faba* subsp. *paucijuga* Murat, Bull. App. Bot. Leningrad, Supp. 50, 73 (1931).

**Figure 3.12.** *Vicia faba* subsp. *faba* var. *faba*: A habit x 0.5; B flower x 0.75; C calyx x 1.5; D standard petal x 2; E wing petal x 2; F keel petal x 2; G stamen x 2; H ovary, style and stigma x 2; I fruit x 0.5; J seed x 1.5. A-H and J from Khattab 100, I from Khattab 202.

## 4. DISCUSSION

### 4.1 Introduction

The discussion of the ecogeography of the subgenus can practically be split in two, ecology and geography. There is less information available on the ecology of subgenus *Vicia* than on its phytogeography, but the information that is available will be discussed. The discussion of subgenus *Vicia* phytogeography will be further subdivided into three sections: firstly, prior phytogeographical studies, where the information available from the literature will be reviewed; secondly, phytogeography of *Vicia faba*, which is only known as a cultivated plant and therefore the distribution is directed by man; thirdly, the present phytogeographical study. Present conservation activities and genebank holdings of *Vicia* subgenus *Vicia* are reviewed. The final section identifies future *ex situ* and *in situ* conservation priorities and suggests appropriate conservation strategies.

### 4.2 Ecology of *Vicia* subgenus *Vicia*

The failure of the many botanical collectors to record ecological provenance data on specimen labels would make the drawing of firm ecological conclusions based on specimen label data alone unsound. So the following discussion is based partially on observations of the plant populations observed during field collection missions and partially on specimen label data.

The majority of the thirty-eight species of subgenus *Vicia* occupy similar niches in dry, open areas of disturbed ground and are commonly considered weeds of cultivation or disturbed land on the margins of cultivation. The exception to this rule are the species of the perennial section, *Atossa*. The species of this section have a clear preference for more moist, stable, closed communities in or on the margins of shaded woodland. They, except for *V. sepium*, are commonly found at higher altitudes ( $> 1500$  m) in wetter conditions than are other species of the subgenus. The other two species which show a preference for more moist conditions are *V. dionysiensis* and *V. esdraelonensis*, which are both restricted endemic species.

*V. dionysiensis* shares, together with *V. galilaea*, *V. hyaeniscyamus* and *V. kalakhensis*, a preference for basaltic soils, but the other species do not appear to exhibit any clear edaphic preferences. The response of the species to plant competition varies but, in general, as might be expected, the larger more robust and the perennial plants of sections *Atossa*, *Vicia* and *Narbonensis* and of series *Hyrcanicae* are better competitors.

Generally, the species do not respond well to grazing, with the exception

of the forage species *V. sativa* and *V. noeana*. However, it should be noted that the two species of sect. *Wiggersia* are commonly found in heavily grazed areas. This may, perhaps, be explained by the diminutive stature of these plants, which rather than recovering readily from grazing damage, may actually avoid the initial damage.

#### **4.3 Prior phytogeographic studies of *Vicia* subgenus *Vicia***

The genus *Vicia* is primarily Euro-Asiatic, with other distributional centres in North America, South America, East Africa and Hawaii (Kupicha 1976; Hanelt & Mettin 1989). A detailed study of the phytogeography of *Vicia* was undertaken by Kupicha (1974). She discusses *Vicia* phytogeography using distributional and isoflor maps. In both cases she does not discuss the details of individual species, but rather sections as defined in her classification. Her sectional distribution map for the five sections of subgenus *Vicia* that she recognizes is shown in Figure 4.1. For her treatment she includes taxa only if they are wild or fully naturalized in part of their range, i.e. she does not draw distributional maps for *V. faba* (which is not known in the wild) or *V. sativa* in the Americas or Africa (where it is not native). She states that over half the North American species of *Vicia* are introductions from the Old World (these include *V. oroboides*, *V. sepium*, *V. lathyroides*, *V. sativa*, *V. grandiflora*, *V. lutea*, *V. pannonica*, *V. narbonensis* and *V. faba*).

The distribution of the five sections of *Vicia* subgenus *Vicia* sensu Kupicha (1976) (Figure 4.1) centres on the Northeast Mediterranean, with the highest concentration of species found in the fertile crescent countries of Turkey, Lebanon, Syria, Soviet Asia, Iran and Iraq. The distribution of sect. *Peregrinae* is essentially restricted to this area. The other four sections, *Hypechusa*, *Faba*, *Vicia* and *Atossa*, are more geographically dispersed, covering Europe, North Africa and spreading across to the extreme northeast of Asia. It should be noted that in the case of sections *Vicia* and *Atossa*, there are two pan-temperate species, *V. sativa* and *V. sepium*, which greatly extend the distributional area covered by their sections as a whole.

Three publications, Schäfer (1973), Khattab (1987) and Maxted *et al.* (1991), have specifically studied the distributional pattern of *V. faba* and its allies in an attempt to clarify the centre of origin of *V. faba*. Schäfer (1973), following a study of the *V. narbonensis* complex (sect. *Narbonensis* sensu Maxted, 1993a), concluded that *V. faba* and the complex are distributed throughout the Mediterranean region, but that there is a concentration of species in the Near East. Khattab (1987) pointed out that *V. bithynica*, *V. serratifolia* and *V. narbonensis* have the widest distributions from Britain through Europe and the Mediterranean Basin to Iran and Afghanistan, although Plitmann (1967) suggested

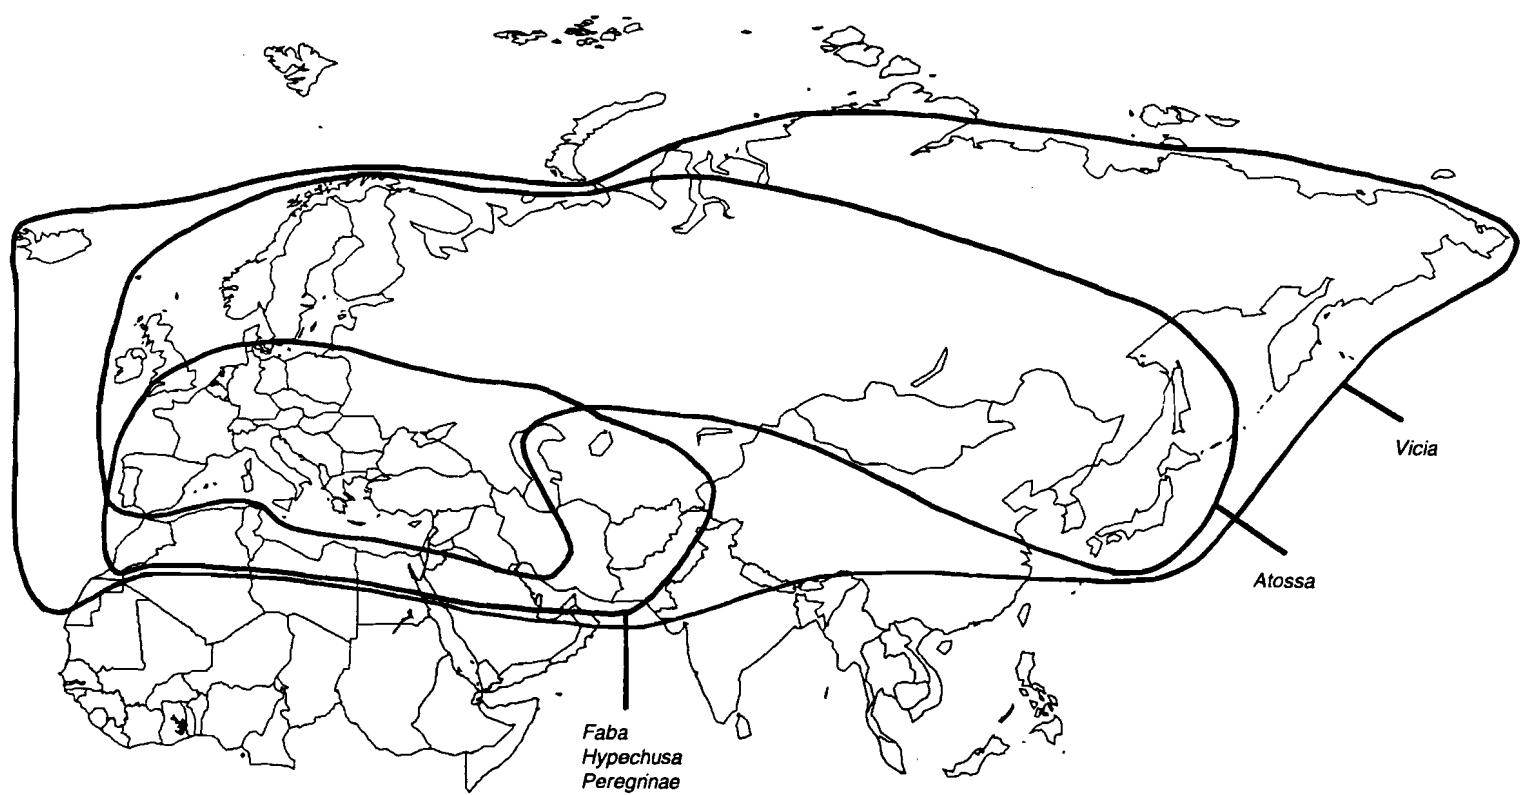

Figure 4.1. Sectional distribution map for the five sections of subgenus *Vicia* sensu Kupicha (1976).

*V. bithynica* may have been introduced to Afghanistan.

The distribution of *V. johannis* is more restricted and is concentrated in the Northern Mediterranean countries. Khattab records a few specimens from Poland and Afghanistan, both of which he regards as "introductions or casuals". However, large populations of *V. johannis* have been observed on the Soviet-Afghanistan border (Maxted 1991), which appeared to be native. Field observation suggests that this species is distributed throughout West Asia and during visits to West Asian herbaria, it became apparent that numerous *V. johannis* specimens had been misidentified as *V. narbonensis*. It is difficult to separate these two species unless flowering specimens are seen.

The remaining species are more restricted endemics of the Near East, *V. galilaea* to Turkey and Israel, *V. hyaeniscyamus* to Syria and Lebanon and *V. kalakhensis* to Syria (and most likely Lebanon). The existence of *V. eristaloides* was not known to Schäfer or Khattab, but this sect. *Narbonensis* species is a narrow endemic of Southwest Turkey.

Maxted *et al.* (1991) and Maxted (1993b) concluded that the current distribution of the section *Narbonensis* taxa is not helpful when trying to suggest a centre of origin for the fababean. They point out that the species of the *V. narbonensis* complex are not as closely allied to *V. faba* as was believed by previous authors. However, the four most geographically restricted species of section *Narbonensis* (*V. galilaea*, *V. hyaeniscyamus*, *V. kalakhensis* and *V. eristaloides*) have all been discovered since 1960 and there is a possibility that further new species, allied to *V. faba*, may still be located and identified. Until the complete Fertile Crescent countries have been collected more systematically, it is difficult to draw firm conclusions about the ancestry of the fababean or the phytogeography of sect. *Narbonensis*.

#### 4.4 Phytogeography of *Vicia faba*

Maxted *et al.* (1991) discuss the current cultivated distribution of *V. faba*. The fababean (subsp. *faba*) is not known in the wild but is currently cultivated throughout the Northern Temperate zone and at higher altitudes in some subtropical regions. The distribution of the smaller seeded subspecies, *paucijuga*, was shown by Muratova (1931) to be restricted to Afghanistan, Pakistan and India. Further detailed study of the current distribution of the two subspecies and three varieties of *V. faba* is required.

Archaeological evidence suggests *V. faba* was introduced into agriculture either in the neolithic (Renfrew 1973) or the mid to late bronze age (Schultze-Motel 1972). Zohary and Hopf (1973) question the validity of the former record because it is based on one early site and they believe the identification may have been confused with a sample of section *Narbonensis* material (possibly *V. narbonensis*).

The earliest forms of *V. faba* were small seeded, and so would currently be classified as subspecies *faba* var. *minor* or subspecies *paucijuga*. The earliest form of the broad bean (*V. faba* subspecies *faba* var. *faba*) was located in Iraq and dated from 1000 AD (Zeven and de Wet 1982). Cultivation of the small-seeded forms is thought to have originated in southwestern Asia, between Afghanistan and the Eastern Mediterranean (Muratova 1931; Hanelt *et al.* 1972; Cubero 1974; Zohary & Hopf 1973; Zohary 1977) and then radiated to Europe, China and the Mediterranean (Muratova 1931; Zeven & de Wet 1982).

Ladizinsky (1975) and Cubero and Suso (1981) argue that the taxon within *V. faba* which shows least advancement, and which they consider closest to the ancient form, is subspecies *paucijuga*. This subspecies has a relatively restricted distribution in comparison with subspecies *faba*. Ladizinsky suggests a detailed study of its distribution could locate its centre of diversity and point to possible locations to search for the progenitor. However, Zohary (1977) points out the fababean was probably domesticated in the fifth millennium BC, which was before agriculture reached Afghanistan. So material from Afghanistan could not then have been available to early agriculturalists at the time of its proposed domestication. Cubero (1984) attempts to explain the presence of these early forms in Afghanistan by hypothesising that *V. faba* was carried to Afghanistan early in its development and there did not undergo further domestication. While in comparison, the material in the centre of origin was bred extensively and the original forms were eliminated.

Trabut (1910) described the new species, *Faba pliniana*, from Algerian material and suggested it could be a progenitor of *V. faba*. Trabut (1911) hypothesises a two-centre evolution for *V. faba*, south of the Caspian sea and in southern Algeria. The specific distinction of *V. pliniana* was questioned by Muratova (1931) and Hanelt *et al.* (1972). The latter considered *V. pliniana* a primitive landrace of *V. faba*. Perrino (pers. comm.), while collecting in southern Algeria, encountered populations that fitted the description of *V. pliniana*, but considered them to be *V. faba* subspecies *faba* var. *minor*. As a consequence of the sinking of *V. pliniana* in *V. faba*, the idea of a second centre of fababean origin in southern Algeria has not been taken up by subsequent authors.

Maxted (1993b), while surveying and collecting forage legume material from the Central Asian republics of the former Soviet Union, located some aberrant *V. narbonensis* L. specimens with introgressive characteristics of *V. faba*. These specimens do not in themselves represent the progenitor, but their discovery suggests that greater effort should be focused on the collection, characterisation and conservation of *Vicia* material from Soviet Central Asia.

#### 4.5 Phytogeography of *Vicia* subgenus *Vicia*

The worldwide distribution of 32 species of subgenus *Vicia* is detailed by Allkin *et al.* (1983). This has been amended to include the six species not known to Allkin *et al.* and is summarized in Table 4.1. The distributional information published by Allkin *et al.* is taken from the Vicieae Project Database which contains only native records, excluding distributional information for wholly cultivated species and aliens. The species distribution data for the specimens seen during the course of the study is summarized in Appendix IV. It can be seen that the distribution of the species of subgenus *Vicia* is primarily Euro-Asiatic, with extensions into North Africa. The distribution of the eight sections containing wild species is drawn in Figure 4.2 and the distribution patterns of the 18 supraspecific taxa of subgenus *Vicia* are summarized in Table 4.2. The six isoflor maps for the six multi-taxon sections are drawn in Figures 4.3 to 4.8.

Isoflor maps do not show actual species distributions, but each line is a contour delimiting a greater or lesser concentration of species. The species distributions for each species is plotted onto one sectional map, then contours are drawn around areas of similar species concentration. The isoflor maps are intended to indicate patterns of distribution concentration, rather than actual distributional patterns. The three monospecific sections, *Microcarinae* (*V. dionysiensis*), *Bithynicae* (*V. bithynica*) and *Faba* (*V. faba*), have not had isoflor maps drawn as this is not possible for a single taxon.

The sections of the subgenus have their centre of diversity in Southern Europe and West Asia, with extensions into Northern Europe, Northern Asia and North Africa. The highest concentrations of taxa, and thus diversity, are found in the fertile crescent countries of Turkey, Lebanon, Syria, the Caucasus, Central Asian, Iran and Iraq. Most sections and series can be seen to be distributed throughout Europe, West Asia and North Africa, though it should be noted that this picture is distorted by the presence of single widespread species among more restricted taxa. Two monospecific supraspecific taxa are very restricted, because the one species included in each is a very restricted endemic, section *Microcarinae* (*V. dionysiensis* from the Djebel Druze, Syria) and series *Rhombocarpae* (*V. eristaliooides* from southwest Turkey).

Isoflor maps can be used to indicate the centre of diversity of a group of taxa. The isoflor map for sect. *Atossa*, Figure 4.3, indicates dual centres of diversity concentrated in Northern Yugoslavia and the Caucasus. Within the section, the three series have quite distinct distributions. Ser. *Pseudovicilla* is centred on Middle Europe, ser. *Truncatulae* on the Caucasus and ser. *Atossa* is much more widely distributed in Europe and North Asia. The differences, in distributional centres, underline the taxonomic distance (based on morphological characteristics) between these three series. The level and pattern of

**Table 4.1. Geographical distribution of *Vicia* subgenus *Vicia* species.**

Sect. <i>Narbonensis</i>	Europe, West Asia & North Africa
Ser. <i>Rhombocarpae</i>	Turkey (endemic)
Ser. <i>Narbonensis</i>	Europe, West Asia & North Africa
Sect. <i>Faba</i>	Only known in cultivation

intrasectional variation suggests that the three series are, taxonomically, relatively remote.

The isoflor map for sect. *Hypechusa*, Figure 4.4, shows that the centre of diversity is focused on the fertile crescent countries of Southwest Asia. The distributional pattern of two series within sect. *Hypechusa* is also centred on Southwest Asia, although ser. *Hypechusa* stretches more westerly, to encompass Southern Europe, than ser. *Hyrcanicae*. The section seems, both morphologically and geographically, to form a cohesive taxonomic unit.

A similar position is indicated by the isoflor map, Figure 4.5, for sect. *Peregrinae*. The distribution of the three species included is concentrated in Southwest Asia, with *V. aintabensis* and *V. michauxii* restricted to this area. One species, *V. peregrina*, is much more widespread than the others and extends the distribution of the section to Europe and North Africa.

The two species of sect. *Wiggersia*, whose isoflor map is shown in Figure 4.6, shows a similar distribution pattern and centre of diversity to the two sections discussed previously. *V. cuspidata* is restricted to Southeast Europe and Southwest Asia and *V. lathyroides* broadens the distribution of the section to include North Africa and Western Europe.

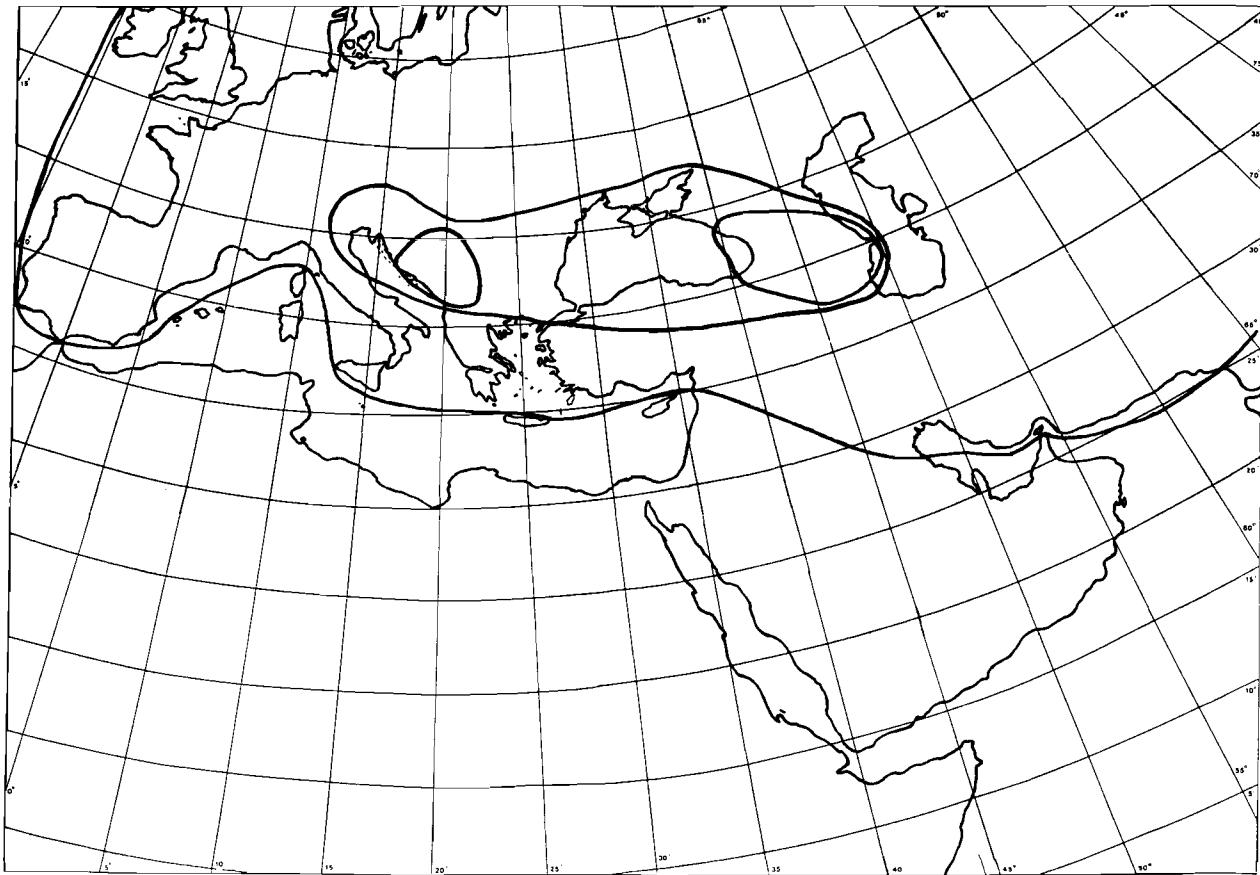

Figure 4.3. Isoflor map for *Vicia* sect. *Atossa*.

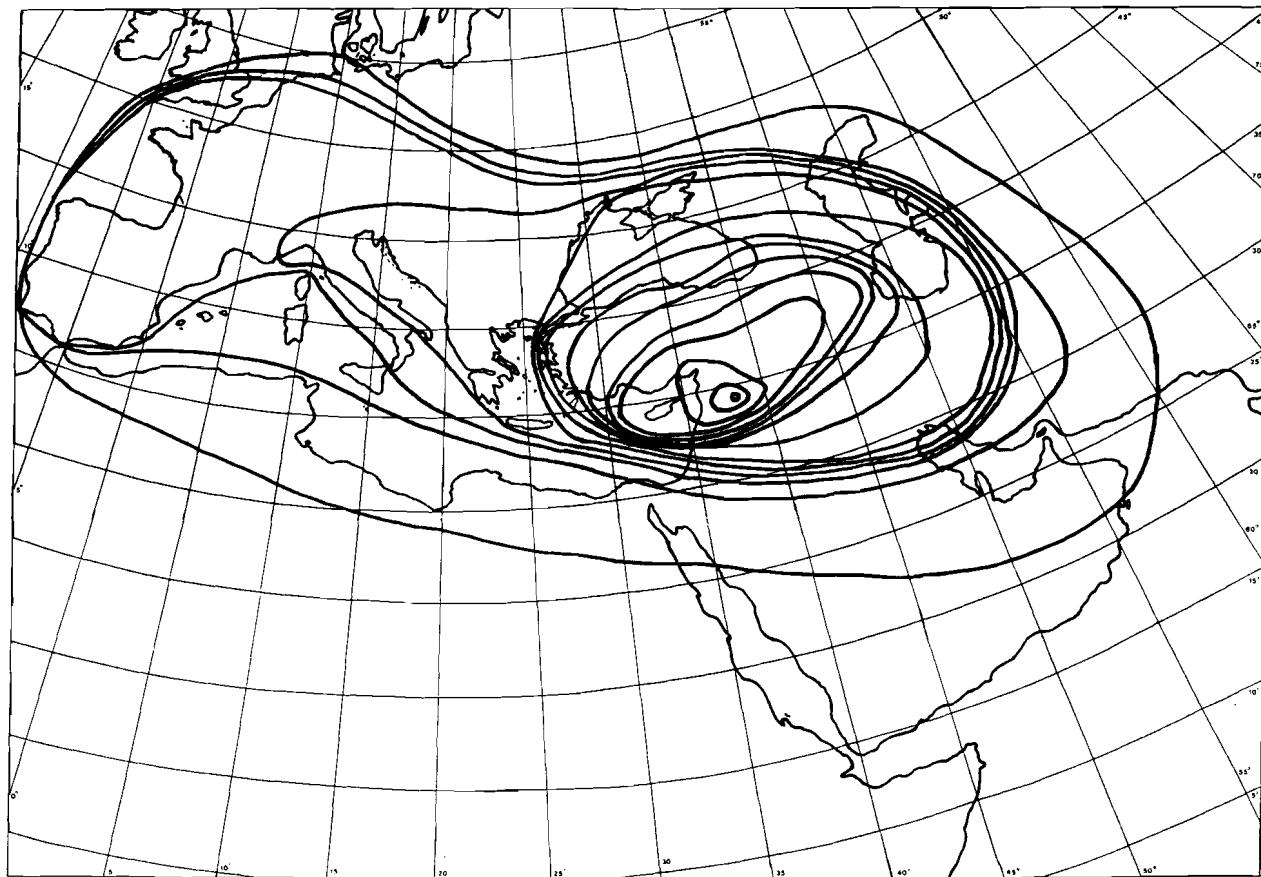

Figure 4.4. Isoflor map for *Vicia* sect. *Hypechusa*.

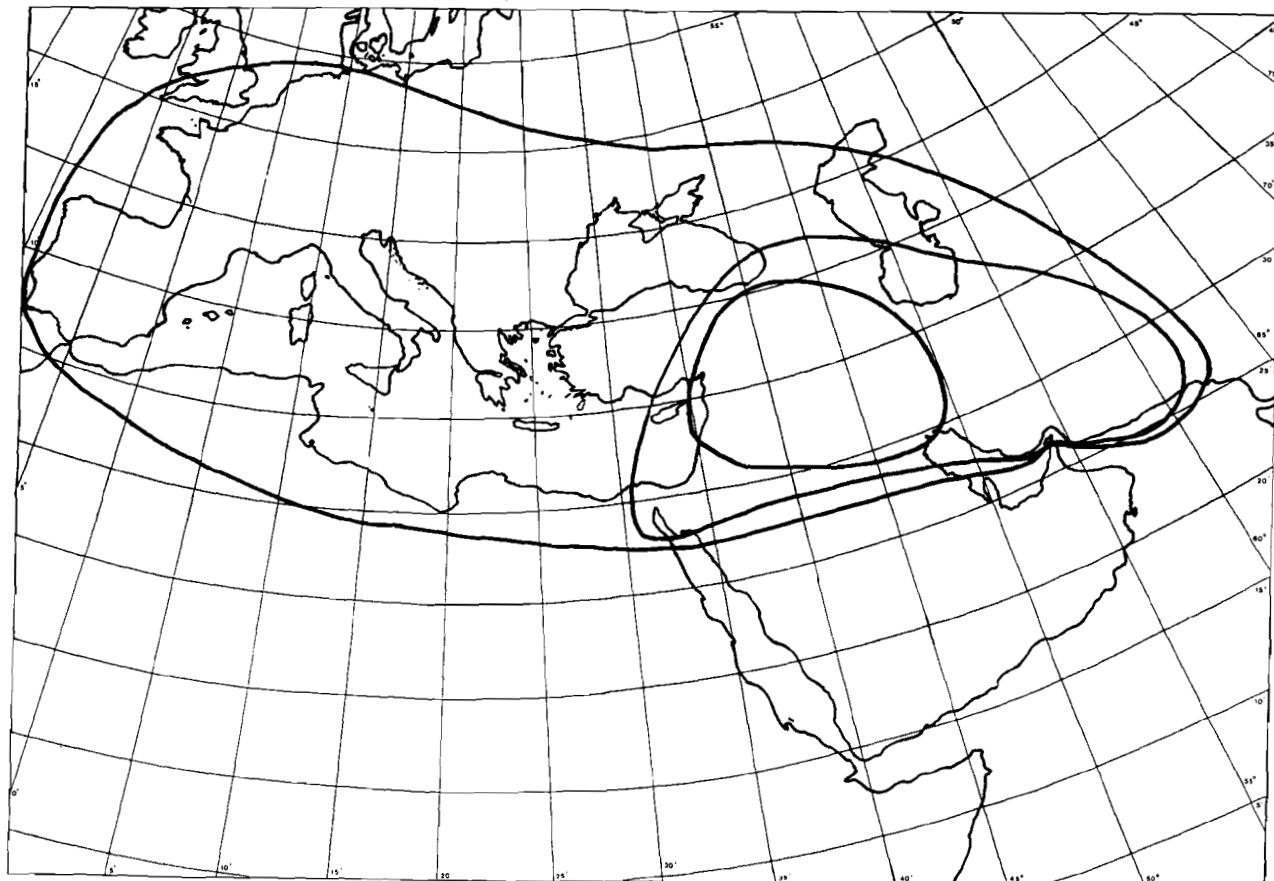

Figure 4.5. Isoflor map for *Vicia* sect. *Peregrinae*.

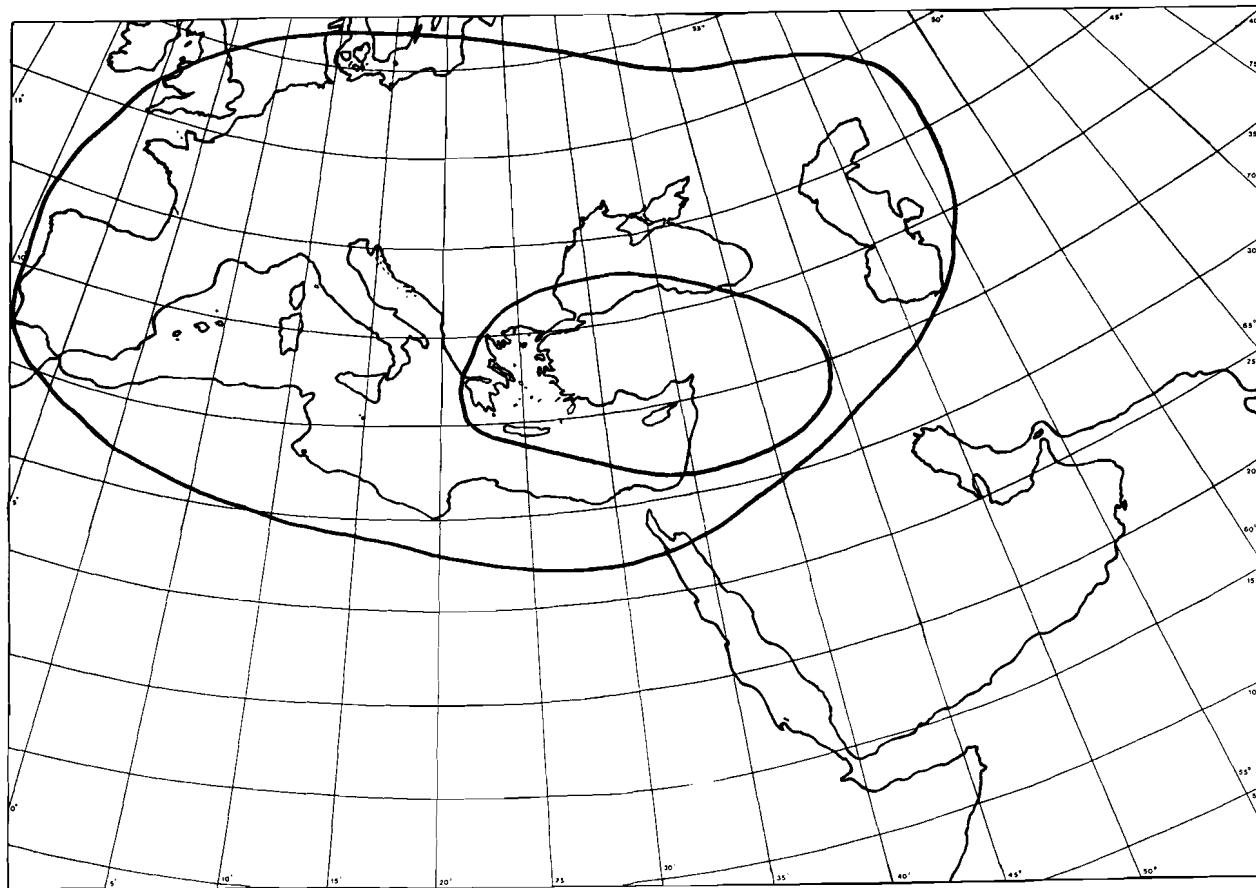

Figure 4.6. Isoflor map for *Vicia* sect. *Wiggersia*.

Section *Vicia sensu* Maxted (1993) is composed of five species, one of which is the pan-temperate and semitropical weed common vetch or tare, *V. sativa*. The discussion of the distribution of this section is dominated by the distribution of *V. sativa*. As *V. sativa* is distributed widely, the precise native distribution of the species is unknown. However, based on the distributional pattern for the subgenus as a whole and, particularly, for sect. *Vicia*, *V. sativa* seems most likely to have originated in Southern Europe or Southwest Asia. Support for this hypothesis is provided by the distribution of three of the subspecies of *V. sativa* (*amphicarpa*, *incisa* and *macrocarpa*), which are all endemic to this region.

The isoflor map for sect. *Vicia*, Figure 4.7, indicates that the centre of distribution is Southeast Europe and Southwest Asia, with two restricted species (*V. pyrenaica* and *V. qatmensis*) forming isolated pockets of distribution in the Iberian Peninsula and Syria. The discontinuous distribution of these four species could suggest that they have evolved separately from a widely distributed *V. sativa*-like form. This would explain the distribution of *V. pyrenaica*, the only *Vicia* subgenus *Vicia* species to be endemic to the Iberian Peninsula. The morphological similarity between this species and *V. sativa* suggests that it is simply a form of the latter that has evolved sufficiently to warrant specific distinction, possibly due to geographic isolation resulting from its restriction to high alpine habitats.

Sect. *Narbonensis* is composed of four species which are restricted to Southwest Asia and three species which are more widely distributed throughout Europe, West Asia and North Africa. So not surprisingly, the isoflor map for the section, Figure 4.8, indicates that the section's centre of diversity and possible origin is in Southwest Asia. This hypothesis is supported, at least for *V. narbonensis*, by archaeological evidence (Schultze-Motel 1972; Renfrew 1973) from neolithic levels at Beidha in Israel.

The sectional distribution and distributional concentrations, described above, provide limited assistance in clarifying subgenus *Vicia* phytogeographical relationships, as all nine sections have overlapping distribution patterns with roughly the same centre of diversity. The sectional distributional pattern does, however, indicate that the subgenus *Vicia* sections are more closely related to each other than they are to some of the sections of the second *Vicia* subgenus, *Vicilla*, which has sections whose distribution is endemic to the Americas, e.g. *Americanae*, *Leucophaeae* and *Australes*.

The natural distribution of subgenus *Vicia* species is restricted to Europe, North and West Asia and North Africa. In interpreting this distribution, it is worth noting the remarks of Brenan (1965):

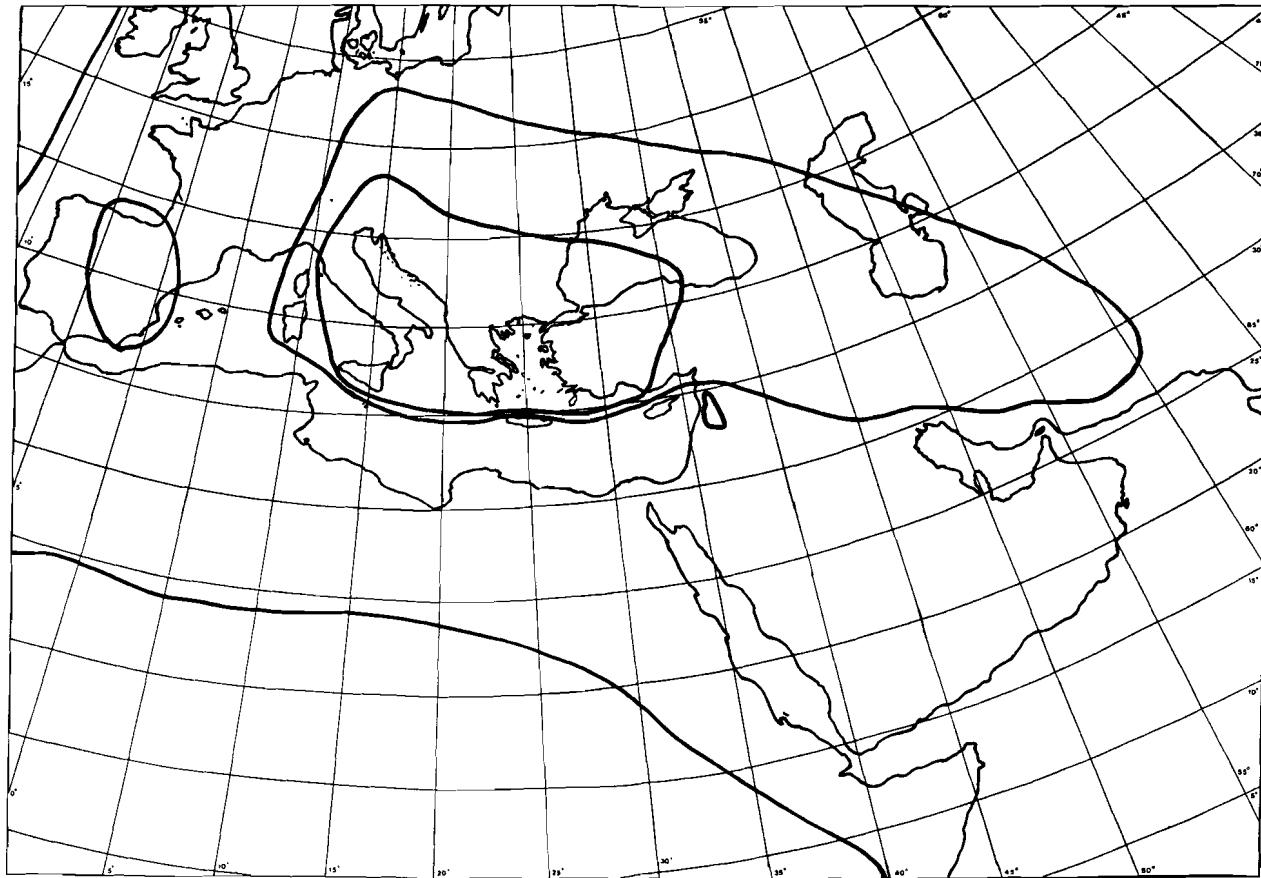

Figure 4.7. Isoflor map for *Vicia* sect. *Vicia*.

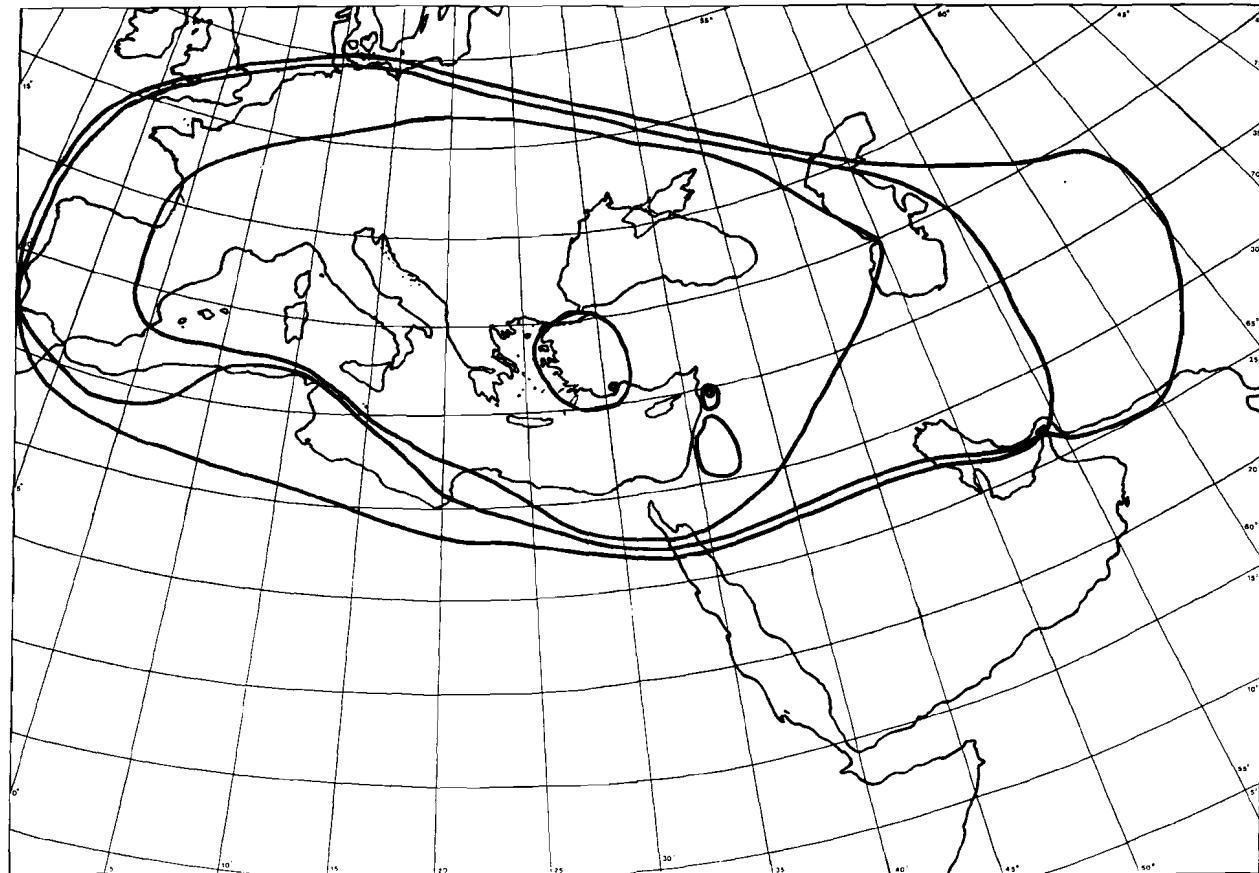

Figure 4.8. Isoflor map for *Vicia* sect. *Narbonensis*.

"The genus is a particularly useful unit for studies of this sort (Phytogeographical), since the number of species of a given genus occurring in different parts of the world often indicate its centre of origin and directions of spread."

The derivation of centres of origin are just as likely to be reflected in the distribution of subgeneric taxa. Thus it can be argued on the basis of relative species concentrations (as indicated by the iso flor maps) that the centre of origin for subgenus *Vicia* is Southeastern Europe and Southwestern Asia. Over half of the included taxa are endemic to these areas. Taxa of the subgenus have subsequently spread west and north, and, to a lesser extent, east and south from this area.

This region is very important floristically as it is at the cusp of three major temperate phytogeographical regions, Euro-siberian, Mediterranean and Irano-turanian (Takhtadjan, 1969). Stebbins (1967) points out that if regions with different environmental and floristic characters are juxtaposed, it may act as a catalyst to evolution. Subgenus *Vicia* would appear to provide a good example of a taxon evolving in such a 'melting pot'.

There is evidence, however, that taxa with centres of distribution in the Balkans, Southwest and Southeast Asia are generally centred in these areas due to climatic deterioration and floristic movement from more northerly distributed Floras (Takhtadjan 1969). The Boreal-tertiary flora was driven south by the Quaternary Ice Age towards these three floristic refugia in the south. Kupicha (1974) concludes that *Vicia* (and by implication subgenus *Vicia*) evolved in the early tertiary and the centre of origin is likely to have been much further north than is indicated by contemporary concentrations of taxa.

Stebbins (1967) argues that the most genotypically and phenotypically plastic species (e.g. *V. sativa*) will have evolve rapidly away from the centre of origin, while the more primitive species will remain in the centre. On the contrary, however, Willis (1921) argues that evolution and plant dispersal occur at the same rate. Therefore the oldest and most primitive species are most widespread and are currently found on the distributional periphery, while the most recently evolved species occur at the centre of origin and are localized. It would explain the widespread distribution of *V. sepium*, which is regarded as a primitive member of subgenus *Vicia*, because of its perennial habit, relatively long peduncle and numerous flowers per peduncle. However, this hypothesis clearly offers no explanation for the distribution of *V. sativa*, which is regarded as an advanced species. The fact that three sections (*Atossa*, *Vicia* and *Narbonensis*) have a significantly wider distribution indicates that these are possibly more advanced (or more primitive if Willis' thesis is followed) than the sections which are largely endemic to the centre of

diversity of the subgenus.

#### **4.6 Present conservation of *Vicia* subgenus *Vicia***

Before establishing conservation priorities and a collection strategy for *Vicia* subgenus *Vicia*, current attempts to conserve the taxa of the subgenus must be considered.

Genetic resources may either be conserved *in situ* or *ex situ*. There are no *in situ* reserves specifically designated as reserves for the conservation of vetch germplasm, but it can be assumed that the reserves that exist in the Eastern Mediterranean, the taxon's centre of diversity, contain a broad range of vetch material. It has not been possible to quantify the amount of vetch material that is currently actively conserved *in situ*. Few reserves have checklists of the species included and the lists that have been produced are not widely distributed. It is easier, however, to assess *ex situ* holdings, as these are more commonly published as catalogues or are included in germplasm databases.

Table 4.3 summarizes the *ex situ* holdings of *Vicia* subgenus *Vicia*; cultivated material of *V. faba* is excluded as it is held so widely. The table was compiled using data provided by IPGRI, GRIN (United States Department of Agriculture-the main USDA *Vicia* collection is held at the Western Region Plant Introduction Station, Washington State University, Pullman, WA 99164-6402), the N.I. Vavilov Institute of Plant Industry, St. Petersburg, USSR) and the Vicieae Genebank at Southampton University.

The IPGRI-designated *Vicia* genebank is held by the Istituto del Germoplasma, Via G. Amendola 165/A, Bari, Italy, but no information on genebank holdings was available. The listing provided is not fully comprehensive, as there are without doubt other *ex situ* collections that contain *Vicia* subgenus *Vicia* material. The list does, however, cover four of the largest collections and so provides a sound framework for the formulation of a future conservation strategy for the subgenus.

The systematic Vicieae collecting programme, initiated by the IBPGR Forage Working Group (IBPGR 1985a) and undertaken by members of the Vicieae Database Project, Southampton, UK, has resulted in the most extensive *ex situ* collection of *Vicia* subgenus *Vicia* germplasm. The collection is nearly taxon comprehensive. It contains material of 63 of the 68 taxa in the subgenus. A complete duplicate of the material is held at the Genetic Resources Unit of the International Centre for Agricultural Research in Dry Areas. Both genebanks will freely supply germplasm with associated passport data. Each accession collected as a result of the IBPGR/Vicieae Project initiative is also duplicated in the national genebank of the country where the accession was collected.

Institute codes are detailed in Appendix V. Accession nos. refers to the number of accessions held in that genebank of that taxon. Provenance of access. refers to the number of accessions held in that genebank of that taxon for each country. Note the total number of accessions can be higher than the total number of accessions with their provenance indicated, because some accessions have an unknown provenance. Three-letter ISO country codes are used to indicate country of provenance and the number in brackets indicates the accessions from that country. Sample avail. refers to the availability of the accessions to potential users: F = freely available; R = restricted availability; N = not available. Passport avail. refers to the availability of accession passport data: A = available; P = partially available; N = not available. This table was produced by summarizing data provided by IPGRI, GRIN (United States Department of Agriculture), the N.I. Vavilov Institute of Plant Industry, St. Petersburg, USSR) and the Viciae Genebank at Southampton University.

## 4.7 Future collection and conservation priorities

Collection and conservation priorities are, at least partially, formulated on the basis of the comparative threat of genetic erosion faced by a particular plant group in a particular region. Changes in agricultural practices and industrialization have undoubtedly led to extensive genetic erosion in the Eastern Mediterranean, the centre of diversity of the subgenus. However, the fact that the majority of *Vicia* subgenus *Vicia* species are weedy, colonizing species often found in habitats disturbed by man and that there has recently been an extensive conservation programme stimulated by IPGRI, suggests that the subgenus, as a whole, is unlikely to suffer serious genetic erosion in the immediate future. However, three points should be stressed:

1. we do not know how well the accessions collected during the recent IPGRI / Vicieae Project initiative reflect the genetic composition of the *Vicia* genepool as a whole;
2. although the group as a whole is not immediately threatened by genetic erosion, certain taxa do require active conservation management;
3. if specific threats to the genepool arise (e.g. dam construction in areas of high taxon concentration or major shifts in agricultural policy, etc.) then conservation policy will need to be reviewed.

### 4.7.1 Ex situ conservation priorities

Having concluded that *Vicia* taxa are not seriously threatened by genetic erosion, the conservation and collection of *Vicia* germplasm should be encouraged within the context of international and national forage legume conservation programmes. National plant genetic resource institutes should be encouraged to undertake targeted collecting and conservation programmes for endemic, wild species and landrace material of *V. faba* subspecies *paucijuga*, *V. narbonensis* and *V. sativa*.

As a low-input, forage crop, the cultivation of *V. sativa* subspecies *sativa* is likely to increase in future years. All the taxa of *Vicia* section *Vicia* should therefore be systematically conserved because of their potential for gene transfer to the crop. There is a subspecies of *V. sativa*, subspecies *devia*, an endemic of Madeira, which is not currently conserved *ex situ* and an effort should be made to make this taxon available to breeders. The French and Spanish alpine species, *V. pyrenaica*, which is a perennial form of *V. sativa*, should also be given a higher conservation priority. *V. pyrenaica* is not immediately threatened by extinction, largely due to a habitat preference for altitudes between 1100 and 2400 m, where it is currently unlikely to be affected by anthropomorphic factors. However, germplasm of this species is not widely conserved *ex situ*. It is therefore effectively unavailable to breeders, who may be interested in a perennial form of *V. sativa*, as a potential gene

donor to the crop or for forage exploitation in its own right and so should be collected.

Material of the close relatives of *V. faba* has been thoroughly conserved *ex situ* during the recent IPGRI / Vicieae Project initiative. However, the three rarest taxa require *in situ* as well as *ex situ* conservation. One species, *V. galilaea*, was not encountered during the IPGRI / Vicieae Project initiative. This rare species is primarily located in Northern Israel and Western Turkey and it is recommended that the National Genetic Resources programmes, in both these countries, should monitor and ensure that this species is effectively conserved.

The IPGRI/Vicieae Project initiative ensured that the taxa of *Vicia* subgenus *Vicia* are well represented in international collections, but the genetic variation inherent in this conserved material could be enhanced by international collecting missions to isolated areas not previously visited. Two such missions, to Northeast and to Southeast Turkey, are suggested. Both missions should have a duration of twelve weeks so that the collection can span both the flowering and fruiting seasons. Exact timing of the mission is vital to catch both flowering and fruiting for the species in the areas to be covered, but to avoid unproductive delays or arriving at sites too late for collection purposes.

The value of each accession is diminished unless it is accurately identified and does not contain a mixture of species. This presents a particular problem when collecting *Vicia* species where several species are often found entangled together and leading at maturity to the crisp shattering plants and pods that are not easily distinguished or disentangled. Experience has shown that these problems can be overcome by visiting each site twice, first at flowering time and then again at fruiting. During the first visit, sites where *Vicia* are plentiful are located, the taxa present are identified, and rhizobia and voucher specimens are collected. During the second visit to the site, the populations encountered are familiar and so identification of the brittle plant remnants is simpler. This procedure is recommended for all *Vicia* collection missions.

#### Northeast Turkey

Species expected	<i>V. balansae</i> , <i>V. abbreviata</i> , <i>V. sepium</i> , <i>V. hyrcanica</i> , <i>V. noeana</i> , <i>V. ciliatula</i> , <i>V. pannonica</i> , <i>V. peregrina</i> , <i>V. sativa</i> , <i>V. grandiflora</i> , <i>V. johannis</i> , <i>V. narbonensis</i> and <i>V. faba</i> .
Collaboration	Aegean Agricultural Research Institute, P.O. Box 9, Menemen, Izmir, Turkey.
Vilayets covered	Samsun, Ordu, Giresun, Trabzon, Gümüşçane, Rize, Erzurum, Artvin and Kars.

Timing	May to July (precise timing will depend on individual seasons and exact plant locations).
<b><u>Southeast Turkey</u></b>	
Species expected	<i>V. assyriaca, V. hyrcanica, V. noeana, V. anatolica, V. mollis, V. hybrida, V. sericocarpa, V. michauxii, V. aintabensis, V. peregrina, V. lathyroides, V. sativa, V. grandiflora, V. johannis, V. narbonensis and V. faba.</i>
Collaboration	Aegean Agricultural Research Institute, P.O. Box 9, Menemen, Izmir, Turkey.
Vilayets covered	Diyarbakir, Mardin, Siirt, Hakkari, Van, Bitlis, Muç and Agri (starting in the dry, Southern Vilayets).
Timing	Mid-April to mid-July (precise timing will depend on individual seasons and exact plant locations).

#### 4.7.2 *In situ* conservation priorities

The phytogeographic study has shown that the highest concentration of *Vicia* subgenus *Vicia* taxa is in the Eastern Mediterranean region. This region is, however, threatened by genetic erosion (IBPGR 1985a) and there is a clear need to establish a series of *in situ* reserves throughout the region to conserve *Vicia* and other forage species. Specifically, reserves should be established or maintained in Turkey, Syria, Lebanon, Israel, Iraq, Iran and the Caucasian Republics. As noted in the conspectus, the subgenus taxa show diverse habitat preferences ranging from shaded woodland to arid steppe; the distinct ecogeographic preferences of individual taxa must be considered when considering potential sites for reserves.

These forage reserves will aid in the conservation of the full range of forage legume and grass germplasm. However, within *Vicia* subgenus *Vicia*, there are some restricted endemic taxa which show specific ecogeographic preference and, due to changing environment management, these are currently threatened with extinction. The seven most geographically restricted species are listed in Table 4.4.

The species most seriously threatened by extinction are those restricted to Syria, Lebanon, Turkey and Israel; and the highest concentration of potentially threatened taxa are located in Syria. To avoid the extinction of these species *in situ* reserves should be established, appropriately managed and the population levels of the threatened species monitored. It is recommended that four reserves should be established in Syria at: Ain Dinar, Al Hasakah (37 15 N, 42 20 E), Kessab town, Kessab (35 54 N, 35 56 E), Qal'at Al Hosn, Homs (34 46 N, 36 18 E) and Mimas, Djebel Druze (32 36 N, 36 43 E). *V. eristaloides* is largely known from the type collections made between Belin

and Cavas, Antalya province, Turkey (a single plant was found near Bodrum, Mugla province, Turkey in 1994). The type location is located within the Olimpos Beydaglari National Park. Currently extensive planting of conifers is being carried out within the reserve which will obviously threaten, if not eradicate, the type population.

**Table 4.4.** The geographically restricted species of *Vicia* subgenus *Vicia*.

Taxon	Country of origin	Localities	Ecological preference
<i>V. dionysiensis</i>	Syria	Djebel Druze	Moist meadows, heavy black soil
<i>V. esdraelonensis</i>	Israel, Syria, Turkey	Galilee, Djebel Druze, Urfa	Moist meadows, basaltic soil
<i>V. tigridis</i>	Syria	Ayn Diwar	Moist meadows, alluvial soil
<i>V. qatmensis</i>	Syria	Qatma, Kessab	Woodland margin, calcic brown and terra rossa soil
<i>V. eristaloides</i>	Turkey	Cavus, Bodrum	Limestone hillside, red Mediterranean soil
<i>V. kalakhensis</i>	Syria	Tell-Kalakh	Pasture margin, basaltic soil
<i>V. hyaeniscyamus</i>	Syria and Lebanon	Tell-Kalakh, Akkar and Andkett	Pasture margin, basaltic soil

Having established *ex situ* and *in situ* conservation priorities, there is a responsibility on the part of conservationists and plant breeders to ensure that the conserved material is fully utilized. The IPGRI / Vicieae Project initiative has resulted in availability of relatively large seed stocks of a wide range of *Vicia* species. This material is, however, currently underexploited. It is rare that such a comprehensive stock of a relatively large gene pool is available for research and utilization, especially for a group with potential to supply new ornamental, forage and fodder species, as well as the potential to supply genes to closely related, existing crop plants. The potential for utilization associated with *Vicia* germplasm has been discussed in detail by Ehrman

and Maxted (1990), Maxted *et al.* (1990), and Maxted *et al.* (1993), and some research has been stimulated, most notably at the International Centre for Agricultural Research in Dry Areas, but further utilization and exploitation is justified.

## 5. ACKNOWLEDGEMENTS

I am particularly grateful to the following:

Mr. R. Reid and Dr. T. Hodgkin for advice and discussion throughout this project. Ms. S. Oldfield, Dr. S. Hollis and Mr. R. Cornick for assistance in drawing the figures. The International Board for Plant Genetic Resources (renamed the International Plant Genetic Resources Institute) who provided financial support for the study, which involved visiting herbaria and germplasm collecting missions to Syria, Turkey, Yugoslavia and the former Soviet Union. My thanks are also due to the curators of the Herbaria listed in Appendix 1, from whom the specimens used in the project were borrowed.

## 7. APPENDICES

### APPENDIX I

#### Herbaria visited or which loaned herbarium specimens.

Herbaria addresses are preceded by their codes (Holmgren *et al.* 1990).

- BM British Museum (Natural History), Cromwell Rd, London, SW7 5BD, United Kingdom.
- CAI Herbarium, Department of Botany, Faculty of Science, Ain Shams University, Abbassia, Cairo, Egypt.
- CAIM Herbarium, Flora and Phytotaxonomy Research, Ministry of Agriculture, Dokki, Cairo, Egypt.

- E Herbarium, Royal Botanic Garden, Inverleith Row, Edinburgh, EH3 5LR, United Kingdom.
- ERE Department of Plant Taxonomy & Geography, Botanical Institute of the Academy of Science, Yerevan 63, 375063, Armenia.
- G Herbarium, Conservatoire et Jardin botaniques de la Ville de Genève, Case postale 60, CH-1292 Chambésy/GE, Switzerland.
- HUJ Herbarium, Department of Botany, The Hebrew University, Givat Ram, Jerusalem, Israel.
- K Herbarium, Royal Botanic Gardens, Kew, Richmond, Surrey, TW9 3AB, United Kingdom.
- LE V.L. Komarov Botanical Institute of the Academy of Sciences, Prof. Popov Street 2, 197022, St. Petersburg, Russia.
- MADM Herbarium, Museu Municipal do Funchal, 9000, Funchal, Madeira, Portugal.
- MEXU Herbario Nacional de México, Departamento de Botánica, Instituto de Biología, Universidad Nacional Autónoma de México, 70-367, México 20, Distrito Federal, México.
- MO Herbarium, Missouri Botanical Garden, P.O. Box 299, St. Louis, Missouri 63166, USA.
- MPU Institut de Botanique, 163 rue Anguste Broussonnet, 34000 Montpellier, France.
- OXF Fielding-Druce Herbarium, Department of Botany, University of Oxford, Botany School, South Parks Road, Oxford, OX1 3RA, United Kingdom.
- RNG Herbarium, Plant Science Laboratories, University of Reading, Whiteknights, Reading, RG6 2AS, United Kingdom.
- SPN Herbarium, Biology Department, University of Southampton, Southampton, SO9 3TU, United Kingdom.
- W Naturhistorisches Museum, Botanische Abteilung, Burgring 7, Postfach 417, A-1014, Wien, Austria.
- WIR Herbarium, N.I. Vavilov Institute of Plant Industry, Herzen Street 44, 190000, St. Petersburg, Russia.

**APPENDIX II a.*****Vicia* subgenus *Vicia* synonymized checklist.**

Key to generic codes:

Vicia	V.	Arachus	Ar.
Atossa	A.	Bona	B.
Cujunie	C.	Ervilia	E.
Ervum	Em.	Faba	F.
Hypechusa	H.	Lathyrus	L.
Orobus	O.	Phaseolus	P.
Potamogeton	Po.	Tuamina	T.
Vicioides	Vs.	Wiggersia	W.

*V. abbreviata* Fischer ex Sprengel, Pl. Min. Cog. Pug. Prim., 1(86): 50 (1813).

Syn: *V. truncatula* Fischer ex M. Bieb., Cat. Hort. Gorenk., 2: 72 (1812); *V. cassubica* M. Bieb., Fl. Taur.-Cauc., 3: 466 (1819); *V. truncatula* Fischer ex M. Bieb., Flora Taurico-caucasia, 3: 473 (1819); *O. caucasicus* Sprengel, Sys. Vege., 16(3): 261 (1826); *V. truncatula* Reichenb., Fl. Germ. Nov., 2: 250 (1832); *O. anomalus* Koch, Linnaea, 24: 96 (1851); *V. trichomera* Alef., Bonplandia, 9: 70 (1861); *V. chlorantha* Heuffel ex Nyman, Cons. Fl. Europ., 1: 209 (1878).

*V. aintabensis* Boiss. & Hausskn. ex Boiss., Fl. Orient. 2: 577 (1872). Syn: *V. peregrina* subsp. *aintabensis* (Boiss. & Hausskn. ex Boiss.) Ponert, Feddes Repert., 83(9-10): 634 (1973).

*V. anatolica* Turrill, Kew Bull., 1: 8 (1927). Syn: *V. hajastana* Grossh., Beih. Bot. Centralbl., 44(2): 224 (1930).

*V. assyrica* Boiss., Diagn. Pl. Or. Nov. ser. 1(9): 123 (1849). Syn: *V. hyrcanica* var. *brachydonta* Bornm., Beih. Bot. Central., 19: 248 (1906); *V. brachydonta* Bornm., Beih. Bot. Centralbl. 27(2): 346 (1910); *V. hyrcanica* subsp. *assyriaca* (Boiss.) Ponert, Feddes Repert., 83(9-10): 633 (1973).

*V. balansae* Boiss., Fl. Orient. 2: 569 (1872). Syn: *V. djimilensis* Koch ex Boiss., Fl. Or., 2: 569 (1872); *V. nordmanniana* Overin ex Trautv., Acta. Horti. Petropolitani, 6: 252 (1874); *V. truncatula* var. *major* Overin, Zap. Kavk. Obshch. Selsk. Khoz., 6: 252 (1874); *V. abbreviata* subsp. *balansae* (Boiss.) Stankevich, Bull. App. Bot. Genet. Pl. Breed., 117: 85-90 (1988).

*V. barbazitae* Ten. & Guss., Mem. Sulle Peregr., 165 (1838). Syn: *V. barbazitae* var. *concolor* Bornm., Symb. Fl. Anat. 208 (1940).

*V. barbazitae* var. *barbazitae* Ten. & Guss., Mem. Sulle Peregr., 165 (1838).  
Syn: *V. laeta* Cesati, Der Sudlichen Theilen von New-Greichenland, 280 (1858); *V. grandiflora* var. *laeta* (Cesati) Fiori, Nuov. Fl. Anal. Ital. 1: 923 (1923).

*V. barbazitae* var. *incisa* (Orph.) Boiss., Fl. Or., 2: 574 (1872). Syn: *V. incisa* Orph. ex Boiss., Fl Or., 2: 574 (1872); *V. thessala* Spruner ex Boiss., Fl. Or., 2: 574 (1872);

*V. bithynica* (L.) L., Syst. Nat., ed. 10(2): 1166 (1759). Syn: *L. bithynicus* L., Sp. Pl. 2: 731 (1753); *Ar. vicioides* Medikus, Vorl. Churpf. Phys.-okon. Ges. 2: 360 (1787); *V. bithynica* Schrank, Baiersche Flora, 2: 262 (1789); *V. angulosa* Gaterau, Descr. Pl. Montaub. 129 (1789); *V. bithynica* Schrank, Baier. Fl., 2: 262 (1789); *V. minuta* Moench, Supp. Meth. Pl. Marburgi Cattorum, 50 (1802); *L. tumidus* Willd., Sp. Pl., 3(2): 1082 (1802); *V. bithynica* var. *grandifolia* Pers., Syn. Pl., 2: 273-657 (1807); *L. bithynicus* Lam., Dictionnaire., 5(2): 706 (1823); *L. turgidus* Lam., Dictionnaire. 5(2): 706 (1823); *L. bithynicus* var. *sessiliflorus* Ser. in DC., Prodr., 2: 374 (1825); *V. angustifolia* Hohen., Bull. Soc. Imp. Nat. Moscow, 6: 249 (1833); *V. bithynica* var. *latifolia* Syme, English Botany 3: 100 (1873); *V. bithynica* var. *angustifolia* Syme, English Botany, 3: 100 (1873); *L. barcinonensis* Pourret, Prodr. Fl. Hisp., 3: 229 (1877); *V. bithynica* var. *major* Arcang., Comp. Fl. Ital., 1: 205 (1882); *V. bifoliolata* Nyman, Cons. Flor. Eur., Supp., 2: 103 (1889); *V. bithynica* var. *genuina* Posp., Fl. Oesterr. Kustenl., 2: 414 (1897); *V. bithynica* var. *grandifolia* Posp., Fl. Oesterr. Kustenl., 2: 528 (1898); *V. bithynica* var. *sessiliflora* Beck in Reichb., Fl. Bosne., 1(1): 1-94 (1903).

*V. ciliatula* Lipsky, Trudy Tiflissk. Bot. Sada 4: 289 in nota (1899). Syn: *V. ciliata* Lipsky non Schur, Zap. Kievsk. Obsc. Estestvoisp. 11: 46 (1891); *V. ciliata* Lipsky non Schur, Acta Horti Petrop. 13: 293 (1894).

*V. cuspidata* Boiss., Diagn. Ser. 1(2): 104 (1843). Syn: *W. cuspidata* Alef., Bonplandia, 9: 69 (1861); *Em. cuspidatum* (Boiss.) Stankevich, Trudy Prikl. Bot. Genet. Selek., 72(1): 25 (1982).

*V. dionysiensis* Mout., Flore du Djebel Druze, 140 (1953).

*V. eristaliooides* Maxted, Notes Edin. Bot. Gard., 45(3): 454 (1988).

*V. esdraelonensis* Warb. & Eig, Repert. Sp. Nov. Reg. Veg. 25: 352 (1928). Syn: *V. esdralonica* Warb. & Eig, Fedde Repert. Sp. Nov. Reg. Veg., 63(1): 113 (1931).

*V. faba* L., Sp. Pl. 2: 737 (1753). Syn: *F. vulgaris* Tragus, Strip., 617 (1552); *P. sativus* Dodoens, Hist. Pl., 472 (1578); *F. graeca* Matth., Opera. 326 (1598); *P. major* Dodoens Strip., Hist. Pempt., 513 (1616); *F. vulgaris* Moench, Meth. Pl. Hort. Bot. Marburgensis, 150 (1794); *V. esculenta* Salisb., Prodr. Strip. Chap. Allerton 1: 339 (1796); *F. vulgaris* Bernhardi, Syst. Verz. 1: 346 (1800); *F. sativa* Bernhardi, Syst. Verz. Erf., 1: 250 (1800); *F. viridis* Desf., Tabl. Bot. Mus. d'Hist. Nat., 1: 196 (1804); *O. faba* (L.) Brot., Fl. Lusitanica 2: 147 (1804); *Po. bifolius* Lapeyr., Hist. Abr. Pyr. Supp. 27. fide Benth. Cat. Pl. Pyr. (1818); *V. vulgaris* Gray, Nat. Arr. Brit. Pl., 2: 617 (1821); *V. faba* var. *humillima* Alef., Bonplandia 9: 348 (1861); *V. arcuata* Alef., Landw. Fl., 31 (1866); *F. vulgaris* var. *schlagintweiti* Alef., Fl. Landw. 30 (1866); *F. vulgaris* var. *celtica* *nana* Osw., Heer. Pfl. d. Pfahlb., 22 (1866); *F. vulgaris* var. *pliniana* Trabut, Bull. Soc. Bot. Fr., 57(5): 426 (1910); *F. vulgaris* var. *plinii* Kornicke ex Schweinf. Ges. f., Erkunde Berlin, 104 (1910); *F. cellica* var. *nana* Trabut, Bul. Soc. Bot. Fr. 57(5): 426 (1910); *F. schlagintweitii* Trabut, Bull. Soc. Bot. Fr., 58(1): 6 (1911); *V. faba* var. *schlagintweiti* (Alef.) Thell., La Flora Adventice de Montpellier, 344 (1912); *F. faba* (L.) House, New York State Mus. Bull., 254: 457 (1924); *V. pliniana* (Trabut) Murat., Bull. App. Bot. Gen. Pl. Breed., 50: 256 (1931).

*V. faba* subsp. *faba* var. *equina* Pers., Syn. pl (2): 273-657 (1807). Syn: *F. minor* var. *equina* Baub., Pinax (1623); *F. equina* Medikus, Vorles. Churpf. Ges. 2: 360 (1787); *V. equina* Steudel, Nomenclator Botanicus, 1: 881 (1821); *V. faba* var. *equina* Steudel, Nomencl. Bot., 1: 458 (1821); *V. equina* Reichenb., Fl. Germ. Excurs., 2: 532 (1832); *F. vulgaris* var. *equina* Alef., Bonplandia 9: 101 (1861).

*V. faba* subsp. *faba* var. *faba* L. Sp. Pl. 2: 737 (1753). Syn: *F. compressa* var. *major* Morison, Hist. Oxon. 2: 85 (1680); *F. major* Blackw., Herb. 1: 19 (1737); *F. major* J.A. Weinmann, Phyt. Ic. 2: 435 (1739); *F. major* Desf., Tabl. Bot. Mus. d'Hist. Nat., 1: 196 (1804); *F. vulgaris* var. *megalosperma* Alef., Bonplandia 9: 101 (1861); *V. faba* subsp. *faba* var. *major* Harz, Landw. Samenk., 2: 661 (1885); *V. faba* var. *major* Murat., Bull. Appl. Bot. Leningrad, Supp. 50, 73 (1931).

*V. faba* subsp. *faba* var. *minor* Beck, Fl. Nieder-Oesterreich, 2: 889-894 (1892). Syn: *F. minor* Desf., Tabl. Bot. Mus. d'Hist. Nat., 1: 196 (1804); *F. minor* Roxb.,

Fl. Ind., 3: 323 (1832); *F. vulgaris* var. *minuta* Alef., Bonplandia 9: 101 (1861); *F. vulgaris* var. *minor* Harz, Landw. Samenk., 2: 661 (1885).

*V. faba* subsp. *paucijuga* Murat., Bull. App. Bot. Leningrad, Supp. 50, 73 (1931). Syn: *F. vulgaris* var. *paucijuga* Alef., Fl. Landw., 31 (1866); *V. faba* var. *paucijuga* (Alef.) Asch. & Graebner, Fl. VI, 2: 988 (1909).

*V. galeata* Boiss., Diagn. ser. 1(2): 103 (1843). Syn: *V. galeata* var. *linearifolia* Zoh., Univ. of Jerusalem, Ann. Rep., A10-CR-11, 4 (1963).

*V. galilaea* Plitm. & Zoh. in Plitm., Isr. J. Bot., 14: 91 (1965). Syn: *V. narbonensis* var. *pilosa* Post, Fl. Syr. Pal. and Sin., 1: 288 (1896).

*V. galilaea* var. *faboidea* (Pitm. & D. Zoh. in Plitm.) H. Schäfer, Kulturpflanze 21: 265 (1973). Syn: *V. galilaea* subsp. *faboidea* Plitm. & Zoh. in Plitm., Isr. J. Bot., 14: 92 (1965); *V. narbonensis* subsp. *faboidea* (Pitm. & Zoh. in Plitm.) Ponert, Feddes Repert., 83: 634 (1973).

*V. galilaea* var. *galilaea* (Pitm. & D. Zoh. in Plitm.) H. Schäfer Kulturpflanze 21: 265 (1973). Syn: *V. galilaea* subsp. *galilaea* Plitm. & Zoh. in Plitm., Isr. J. Bot., 14: 92 (1965); *V. narbonensis* subsp. *galilaea* (Pitm. & Zoh. in Plitm.) Ponert, Feddes Repert., 83: 634 (1973).

*V. grandiflora* Scop., Flora Carnolica, 2: 65 (1772).

*V. grandiflora* var. *grandiflora* Scop., Fl. Carniol. ed. 2, 2: 65 (1772). Syn: *V. sordida* Willd., Sp. Pl., 3(2): 1108 (1802); *V. sordida* Waldst. & Kit., Desc. et Icon. Pl. Rar. Hungariae, 2: 133 (1805); *V. sordida* M. Bieb., Fl. Taur. Cauc., 2: 162 (1808); *V. lutea* Pallas ex M. Bieb., Flora Taur.-Cauc., 2: 162 (1808); *V. biebersteinii* Besser ex M. Bieb., Fl. Taur.-Cauc., 3: 472 (1819); *V. biebersteinii* Besser, En. Volhyn., 29 (1822); *V. grandiflora* var. *kitaibeliana* W. Koch, Syn., 1: 197 (1835); *V. grandiflora* var. *biebersteiniana* Koch, Syn. Fl. Germaniae et Helvetiae, 3(1): 170 (1835); *V. grandiflora* var. *scopoliana* Koch, Syn. Fl. Germ. Helv., 3(1): 197 (1835); *V. grandiflora* var. *sordida* (Kit.) Griseb., Sp. Fl. Rumelicae et Bithynicae, 1: 77-78 (1843); *V. grandiflora* var. *villosa* Regel, Index Seminum Hort. Bot. Imp. Petropolitanus, 40 (1856); *C. grandiflora* var. *sordida* Alef., Bonplandia, 9: 101-102 (1861); *C. grandiflora* var. *rotundata* Alef., Bonplandia, 9: 101 (1861); *V. kitaibeliana* Schur, Enum. Pl. Transs., 168 (1866); *V. grandiflora* subsp. *sordida* (Waldst. & Kit.) Dorstal, Folia Mus. Rer. Nat. Bohem. Occid. Bot., 21: 8 (1884); *V. grandiflora* subsp. *biebersteinii* (Besser) Dorstal, Folia Mus. Rer. Nat. Bohem. Occid. Bot., 21: 8 (1884); *V.*

*grandiflora* var. *typica* Beck, Fl. Hieder-Osterreich, 2: 889-894 (1892); *V. grandiflora* var. *rotundata* (Ser.) Janchen, Neue Beitr. Balk., 3: 213 (1911).

*V. grandiflora* var. *incisa* Braun & Bouche, App. Spec. Nov. et Minus Cognitarum 22 (1853). Syn: *V. grandiflora* var. *dissecta* Boiss., Fl. Or. 2: 573 (1872); *V. serrata* Pant., Oestr. Bot. Zeitschr., 23(3): 80 (1873); *V. grandiflora* var. *serrata* (Pant.) Rohlena, Sitzb. Bohm. Ges. Wiss., 38: 43 (1905).

*V. hyaeniscyamus* Mout., Bul. Soc. Bot. Fr., 108: 314 (1961).

*V. hybrida* L., Sp. Pl. 2: 737 (1753). Syn: *Vs. hybrida* Moench, Meth. Pl. Hort. Bot. Marburgensis, 136 (1794); *V. spuria* Raf., Car. Nuo. Gen. Nuo. Sp. Ani. & Pl. Sicilia, 72 (1810); *H. hybrida* Alef., Bot. Zeitung 18(19): 166 (1860); *V. hybrida* var. *spuria* (Raf.) Strobl, Obz., 37: 288 (1887); *V. agerii* Bubani, Fl. Pyrenaea Ord. Nat. Grad. Digest., 2: 541 (1899); *V. linnaei* Rouy in Rouy & Fouc., Fl. Fr., 5: 220 (1899); *V. tollenda* E.H. Krause in Sturm, Fl. von Deutschland, 2(9): 31 (1901); *V. hybrida* var. *linearifolia* Popov, Fl. U.S.S.R., 13: 460 (1948).

*V. hyrcanica* Fischer & C. Meyer, Ind. Sem. Hort. Petr. 2: 28 (1835). Syn: *V. biebersteinii* C. Meyer non Besser ex M. Bieb., Verz. Pfl. Caucas. 147 (1831); *H. hircania* Alef., Bot. Zeitung, 18(19): 166 (1860); *V. jaubertii* Boiss. & Buhse, Nou. Mem. Soc. Imp. Nat. Moscou 12: 71 (1860); *V. hyrcanica* var. *brachydonta* Bornm., B. B. C., 19: 248 (1906); *V. brachydonta* Bornm., B. B. C., 27: 346 (1910); *V. iberica* Größh. in Grossh. & Schischkin, Plantae Orientales Exsiccatae, 30 (1924); *V. formosa* Schischkin, Trans. Tomsk. St. Univ., 81: 486 (1928).

*V. johannis* Tamamschjan in Karyagin, Fl. Azerbaidzhan, 5: 495 (1954). Syn: *V. narbonensis* Roth, Bot. Abh. Beobacht., 68 (1787); *V. narbonensis* var. *platycarpos* Alef., Bonplandia, 9: 100 (1861); *V. narbonensis* var. *lutea* Freyn & Sint., Osterr. Bot. Z. 44: 66 (1894).

*V. johannis* var. *ecirrhosa* (Popov) H. Schäfer, Kulturpflanze 21: 261 (1973). Syn: *V. narbonensis* var. *ecirrhosa* Popov in Sched., Ad. Herb. Fl. As. Med., 11: 270 (1927); *V. turkestanica* Vassilk., Fl. Usb. 3: 762 (1955).

*V. johannis* var. *johannis* Tamamschjan in Karyagin, Fl. Azerbaidzhan, 5: 495 (1954). Syn: *V. procumbens* var. *violacea* H. Schäfer, Sched. Herb (1973).

*V. johannis* var. *procumbens* H. Schäfer, Kulturpflanze 21: 261 (1973). Syn: *V.*

*johannis* var. *intermedia* Scheibe, Zuchter, 6: 234 (1934); *V. procumbens* H. Schäfer, Sched. Herb (1973).

*V. kalakhensis* Khattab, Maxted et Bisby Kew Bull. 43(3): 536 (1988).

*V. lathyroides* L., Sp. Pl., 2: 736 (1753). Syn: *Em. soloniense* L. in Torner, Cent. Pl. 2: 28 (1756); *V. minima* Gilib., Fl. Lithuan., 2: 106 (1782); *W. lathyroides* Gaertner, Meyer & Schreber, Fl. Wetterau, 3(1): 34 (1801); *W. minima* Alef., Bonplandia, 9: 69 (1861); *V. olbiensis* Reuter ex Timb.-Lagr., Bull. Soc. Bot. Fr., 13: 151 (1866); *V. arenivaga* Lamotte, Prod. Fl. Plat. Cent. Fr., 1: 214 (1877); *V. praecox* Jacquem. ex Arcang., Comp. Fl. It., 2: 525 (1894); *V. olbiensis* Reuter & Shuttlew. ex Rouy, Fl. France, 5: 216 (1899); *V. lathyroides* subsp. *olbensis* (Reuter & Shuttlew.) Rouy in Rouy & Fouc., Flore France, 5: 216 (1900); *V. lathyroides* var. *olbiensis* Steudel ex Asch. & Graebner, Syn. Mitteurop. Fl., 6(2): 960 (1909); *V. lathyroides* var. *typica* Asch. & Graebner, Syn. Mittle. Fl., 6(2): 960 (1909); *V. guyoti* Beauverd, Bull. Soc. Bot. Geneve Ser. 2, 11: 133 (1919); *V. lathyroides* subsp. *olbiensis* (Reuter) Bujor., Bul. Grad. Bot. Univ. Cluj, 8: 119 (1929); *Em. lathyroides* (L.) Stankevich, Trudy Prikl. Bot. genet. Selek., 72(1): 25 (1982).

*V. lutea* L., Sp. Pl., 2: 736 (1753). Syn: *V. tridentata* Gaterau, Desc. Pl. Montauban, 129 (1789); *Vs. lutea* Moench, Meth. Pl. Hort. Bot. Marburgensis, 136 (1794); *V. hybrida* Hudson, Fl. Anglic, 3: 319 (1798); *W. lutea* Gaertner, Meyer & Scherber, Fl. der Wetterau, 3(1): 36 (1801); *V. hirta* Balbis ex Pers., Synopsis Plantarum 2: 308 (1806); *V. lutea* var. *pallidiflora* Ser. in DC., Prodr., 2: 363 (1825); *V. flavidia* Schur, Sertum Florae Transsilvaniae, 4(8): 20 (1853); *V. ciliata* Schur, Sertum Florae Transsilvaniae, 4(8): 20 (1853); *H. lutea* Alef., Bot. Zeitung, 18(19): 166 (1860); *V. lerchenfeldiana* Schur, Enum. Pl. Transs., 168 (1866); *V. lentiformis* Schur, Enum. Pl. Transs., 168 (1866); *V. baetica* Schousboe ex Willk. & Lange, Prodr. Fl. Hisp., 3: 298 (1880); *V. cavanillesii* Martinez, Bol. Soc. Esp. Hist. Nat., 29: 410 (1929); *V. lutea* subsp. *cavanillesii* (Martinez) Romero, Lagascalia, 14: 141 (1986).

*V. lutea* subsp. *lutea* L., Sp. Pl., 2: 736 (1753). Syn: *V. laevigata* Smith, English Botany, 7: 483 (1798); *V. lutea* subsp. *lutea* var. *laevigata* (Smith) Boiss., Voy. bot. Esp., 194 (1838).

*V. lutea* subsp. *vestita* (Boiss.) Rouy, Fl. Fr. 5: 219 (1899). Syn: *V. hirta* Balbis ex DC., Syn. Pl. Fl. Gall. 360 (1806); *V. lutea* var. *hirta* (Balbis ex DC.) Loisel., Fl. Gall., 462 (1807); *V. lutea* var. *muricata* Ser. in DC., Prodr., 2: 263 (1825);

*V. vestita* Boiss., Elench. Pl. Nov., 39 (1838); *V. vestita* D. Clos, Hist. Chile Bot. Ser. 2: 134 (1847); *V. vestita* var. *tuberculata* Willd, no further details available (1877); *V. boetica* Schousboe ex Nyman, Conspl. Fl. Europ., 1: 209 (1878); *V. lutea* subsp. *muricata* (Ser.) Guinea, Est. Bot. Vezas Esp. 57 (1953).

*V. melanops* Sibth. & Smith, Fl. Graec. Prodri., 2: 72 (1813). Syn: *V. bicolor* Willd., Enum. Pl. Hort. Berolinensis Supp., 51 (1813); *V. tricolor* Sebast. & Mauri, Flora Romanae Prodromus, 245 (1818); *V. triflora* Reichenb., Fl. Germ. Excur., 2: 531 (1832); *V. melanops* Sibth. & Lindley, Fl. Graeca, 8: 701 (1833); *H. tricolor* Alef., Bot. Zeitung, 18(19): 166 (1860); *V. pichleri* Huter, Ostr. Bot. Zeitschrift, 55(2): 82 (1905); *V. melanops* var. *tricuspidata* Bornm., Symb. Fl. Anat., 208 (1940).

*V. melanops* var. *melanops* Sibth. & Smith, Fl. Graec. Prodri., 2: 72 (1813).

*V. melanops* var. *loiseaui* Alleiz., Bull. Soc. Bot. Fr., 105: 360 (1958).

*V. michauxii* Sprengel, Mant. Fl. Halens.: 48 (1807). Syn: *V. persepoltana* Boiss., Diagn. Ser. 1(6): 48 (1846); *T. michauxii* Alef., Bonplandia, 9: 102 (1861); *V. carnea* Kotschy in Unger & Braumuller, Die Insel Cypern, 386 (1865); *V. michauxii* var. *stenophylla* Boiss., Fl. Or., 2: 577 (1872); *V. aintabensis* (Boiss. & Hausskn. ex Boiss.) Blakelock, Kew Bull., 3: 424 (1948); *V. peregrina* subsp. *persepoltana* (Boiss.) Ponert, Feddes Repert., 83(9-10): 634 (1973); *V. peregrina* subsp. *michauxii* (Sprengel) Ponert, Feddes Repert., 83(9-10): 634 (1973).

*V. mollis* Boiss. & Hausskn. ex Boiss., Fl. Or. 2: 576 (1872). Syn: *V. benthamiana* Ali, Bot. Notiser., 120: 51 (1967); *V. camptopoda* Townsend, Kew Bull., 21: 452 (1967); *V. sericocarpa* subsp. *mardinica* Ponert, Feddes Repert., 83: 634 (1973); *V. sericocarpa* subsp. *mollis* (Boiss. & Hausskn.) Ponert, Feddes Repert., 83: 634 (1973); *V. sericocarpa* subsp. *urfiae* Ponert, Feddes Repert., 83: 634 (1973).

## APPENDIX V

### Some institutes holding *Vicia* subgenus *Vicia* *ex situ* collections

Gene bank code	Gene bank name and address
ALB007	Forage Research Institute, Fushe-Kruja, Albania.
AUS006	South Australia Department of Agriculture, P.O. Box 1671, 25 Grenfell Street, Adelaide, South Australia.
BGR001	Institute of Introduction and Plant Genetic Resources, Sadovo, Plovdiv District, Bulgaria.
BRA010	National Research for Livestock, Campo Grande/MS C.C. 154, Rodovia Br 262, Brasil.
BRA021	Empresa Catarinense de Pesquisa Agropecuaria, Florianopolis - Santa Caterina C.C. D-20, Estr. Geral Itacorub, Brasil.
CSK003	Research Institute of Plant Production, Praha 6, Ruzyne Drnovska 507, Czechoslovakia.

CSK090	Research and Breeding Institute of Technical Crops and Legumes, Sumperk - Temenice, Czechoslovakia.
CSK091	Research and Breeding Institute for Fodder Plants, Troubsko, PBS, Ceske Budejovice Svamberk, Czechoslovakia.
CYP001	Agricultural Research Institute, P.O. Box 2016, Nicosia, Cyprus.
DEU001	Institut für Pflanzenbau und Pflanzenzuchtung, Braunschweig Bundesallee 50, Germany.
DEU146	Institut für Genetik und Kulturpflanzenforschung, Corrensstrasse 3, Gatersleben, Germany.
ESP002	Instituto Nacional de Investigaciones Agrarias, Jose Abascal 56, Madrid, Spain.
ESP004	Centro de Conservacion de Recursos Fitogeneticos (INIA), Alcala de Henares, Madrid, Apartado de Correos 1045, Spain.
ESP007	CSIC, Estacion Experimental de "Aula Dei", Zaragoza Apartado 202, Montanana 177, Spain.
ESP011	Ramon Batlle Vernis, S.A., Bell-Lloch (Lerida) Carretera Nacional 11, s/n, Spain.
ESP020	Centro Reg. de Invest. Agron. de Andalucia, Est. de Cult. de Los Gran., Sevilla, Avda, Borbolla 1, Spain.
ETH013	International Livestock Centre for Africa, P.O. Box 5689, Addis Ababa, Ethiopia.
FRA043	INRA - Station de Genetique et d'Amelioration des Plantes, Dijon Cedex B.P. 1540, France.
FRA051	INRA - Domaine Pluridisciplinaire de Magneraud, P.O. Box 52, Surgeres, France.
GBR001	Vicieae Database Project, Department of Biology, Medical and Biological Sciences Building, University of Southampton,

	Southampton SO9 3TU, United Kingdom.
GBR004	Royal Botanic Gardens, Wakehurst Place, Ardingly, Haywards Heath RH17 6TH, United Kingdom.
GRC005	Greek Gene Bank, North Greece Agricultural Research Centre, P.O. Box 10514, Thessaloniki, Greece.
GRC006	Fodder Crops and Pastures Institute, Theophrastu St., Larissa, Greece.
HUN002	Research Institute for Vegetable Crops, Ujmajor / Budapest Park u. 2 Pf. 95, Hungary.
JPN003	Department of Genetic Resources, National Institute of Agrobiology Resources, Tsukuba-gun, Ibaraki-ken 305, 1-1 Kannondai, Japan.
PRT005	Genetics Department, Estacao Agronomica Nacional, Oeiras Quinta do Marques, Portugal.
ROM007	Suceava Gene Bank, Agriculture Research station, Boulevar du 1 Mai, Nr. 17, Suceava, Judetul Suceava, Romania.
SUN001	N.I. Vavilov All-Union Scientific Research Institute of Plant Industry (VIR), 42-44 Herzen Street, St. Peterberg, Russia.
SWE002	Nordic Gene Bank, P.O. Box 41, Alnarp, Sweden.
SYR003	Genetic Resources Unit-Scientific Agriculture Research Directorate, P.O. Box 133, Douma, Damascus, Syria.
USA005	National Seed Storage Laboratory USDA-ARS, Colorado State University, Fort Collins, Colorado 80523, USA.
USA022	Western Regional Plant Introduction Station USDA-ARS, Washington State University, Johnson Hall, Pullman, WA 99164-6402, USA.
ZAF001	Division of Plant and Seed Control, Department of Agricultural and Technical Services, Private Bag X179, Pretoria, South Africa.

## 8. INDEX TO TAXA

	Taxon code	Page nos.
Sect. <i>Atossa</i>	-	20
Sect. <i>Bithynicae</i>	-	71
Sect. <i>Faba</i>	-	84
Sect. <i>Hypechusa</i>	-	29
Sect. <i>Microcarinae</i>	-	28
Sect. <i>Narbonensis</i>	-	72
Sect. <i>Peregrinae</i>	-	49
Sect. <i>Vicia</i>	-	58
Sect. <i>Wiggersia</i>	-	54
Ser. <i>Atossa</i>	-	26
Ser. <i>Grandiflorae</i>	-	65
Ser. <i>Hypechusa</i>	-	39
Ser. <i>Hyrcanicae</i>	-	32
Ser. <i>Narbonensis</i>	-	75
Ser. <i>Pseudovicilla</i>	-	21
Ser. <i>Rhombocarpae</i>	-	74
Ser. <i>Truncatulae</i>	-	23
Ser. <i>Vicia</i>	-	59
<i>V. abbreviata</i>	650	26
<i>V. aintabensis</i>	010	52
<i>V. anatolica</i>	020	40
<i>V. assyriaca</i>	030	32
<i>V. balansae</i>	040	24
<i>V. barbazitae</i>	050	65
var. <i>barbazitae</i>	750	65
var. <i>incisa</i>	730	65
<i>V. bithynica</i>	060	72
<i>V. ciliatula</i>	070	40
<i>V. cuspidata</i>	080	54
<i>V. dionysiensis</i>	670	29
<i>V. eristaliooides</i>	710	74
<i>V. esdraelonensis</i>	090	33
<i>V. faba</i>	100	86
subsp. <i>faba</i>	-	86
var. <i>equina</i>	120	86
var. <i>faba</i>	110	86

<i>V. minor</i>	130	86
subsp. <i>paucijuga</i>	140	86
<i>V. galeata</i>	150	36
<i>V. galilaea</i>	160	77
var. <i>faboidea</i>	170	79
var. <i>galilaea</i>	180	79
<i>V. grandiflora</i>	190	69
var. <i>grandiflora</i>	760	69
var. <i>incisa</i>	740	71
<i>V. hyaeniscyamus</i>	200	83
<i>V. hybrida</i>	210	46
<i>V. hyrcanica</i>	220	37
<i>V. johannis</i>	230	77
var. <i>ecirrhosa</i>	240	77
var. <i>johannis</i>	250	77
var. <i>procumbens</i>	260	77
<i>V. kalakhensis</i>	660	76
<i>V. lathyroides</i>	270	57
<i>V. lutea</i>	280	47
subsp. <i>lutea</i>	290	49
subsp. <i>vestita</i>	310	49
<i>V. melanops</i>	320	39
var. <i>loiseauii</i>	340	40
var. <i>melanops</i>	330	39
<i>V. michauxii</i>	350	50
<i>V. mollis</i>	360	43
<i>V. narbonensis</i>	370	81
var. <i>aegyptiaca</i>	380	83
var. <i>affinis</i>	390	83
var. <i>jordanica</i>	400	81
var. <i>narbonensis</i>	410	83
var. <i>salmonea</i>	420	81
<i>V. noeana</i>	430	38
subsp. <i>megalodonta</i>	450	38
subsp. <i>noeana</i>	440	38
<i>V. oroboides</i>	460	23
<i>V. pannonica</i>	470	45
subsp. <i>pannonica</i>	480	46
subsp. <i>striata</i>	490	46
<i>V. peregrina</i>	500	53
<i>V. pyrenaica</i>	510	59

<i>V. qatmensis</i>	680	65
<i>V. sativa</i>	520	60
subsp. <i>amphicarpa</i>	530	60
subsp. <i>devia</i>	720	64
subsp. <i>incisa</i>	550	64
subsp. <i>macrocarpa</i>	560	65
subsp. <i>nigra</i>	570	60
subsp. <i>sativa</i>	590	64
<i>V. sepium</i>	600	27
var. <i>eriocalyx</i>	700	28
var. <i>montana</i>	620	28
var. <i>sepium</i>	610	28
<i>V. sericocarpa</i>	630	47
<i>V. serratifolia</i>	640	80
<i>V. tigridis</i>	690	33
