Eremopyrum (Ledeb.) Jaub. & Spach, un nuevo género para la flora de Europa occidental (Península Ibérica)

Key words: Flora, Europa, Poaceae, *Eremopyrum*.

Palabras clave: Flora, Europa, Poaceae, *Eremopyrum*.

Eremopyrum (Ledeb.) Jaub. & Spach was first recognized as a taxon by Ledebour (1829), who treated it as *Triticum* sect. *Eremopyrum*. Bentham & Hooker (1883) transferred it to *Agropyron* Gaertn., leaving it as a section (Cabi & Dogan, 2010). Jaubert & Spach (1851) recognized *Eremopyrum* as a genus, distinguishing it from *Agropyron* on the basis of its annual habit [Type: *Eremopyrum orientale* (L.) Jaub. & Spach, lectotype selected by Nevski (1936)]. It is a well-circumscribed genus with an annual habit and oblong to orbicular fragile spike-like inflorescence that is used in wheat improvement (Clayton & Renvoize, 1986). The chromosomes of *Agropyrum*, as usually found within the Triticeae, are meta- or submetacentric (Schulz-Schaeffer & Jurasits, 1962), whereas the chromosomes of *Eremopyrum* are predominantly telo- or subtelocentric (Frederiksen, 1991).

To date, 18 species and many infraspecific taxa have been described, but the number of species accepted varies from four (Tzvelev, 1976; Sakamoto, 1979; Frederiksen, 1991) to nine (Löve, 1984). The Plant List (2013) currently recognizes four species and 44 synonyms: *E. buonapartis* (Spreng.) Nevski, *E. distans* (K. Koch) Nevski, *E. orientale* (L.) Jaub. & Spach, and *E. triticeum* (Gaertn.) Nevski. In the Mediterranean region, Valdés & Scholz (2009) cite the four aforementioned species and furthermore *E. confusum* Melderis, with an Algerian distribution.

Jaubert & Spach (1851) cited *E. orientale* and *E. squarrosum* Jaub. & Spach (= *E. buonapartis*) in "Iberia", probably the Caucasus, not the Iberian Peninsula. Melderis (1980) and The Plant List (2013) indicates the presence, at the European level, of only *E. distans* in eastern Europe and *E. orientale* and *E. triticeum* in south-eastern and

eastern Europe. Melderis (1980), Blanca et al. (2011), Ibn Tattou (2014) and The information system of the plants of Spain (Anthos, 2017) contains no indication of the presence of this genus in the Iberian Peninsula.

During the course of the plant collection by the authors in 2017 and 2018 in the Guadix Depression (Granada, Spain) a population of *E. orientale* (Fig. 1) was located, consisting of several thousand individuals growing on expansive clays attributed to a Triassic Keuper facies (Marchal et al., 2011), accompanied by *Astragalus guttatus* Banks & Solander, *Daucus aureus* Desf., *Rochelia disperma* (L. fil.) C. Koch subsp. *disperma*, *Plantago coronopus* L., *Echinaria capitata* (L.) Desf., *Cleonia lusitanica* (L.) L., *Moricandia moricandioides* subsp.

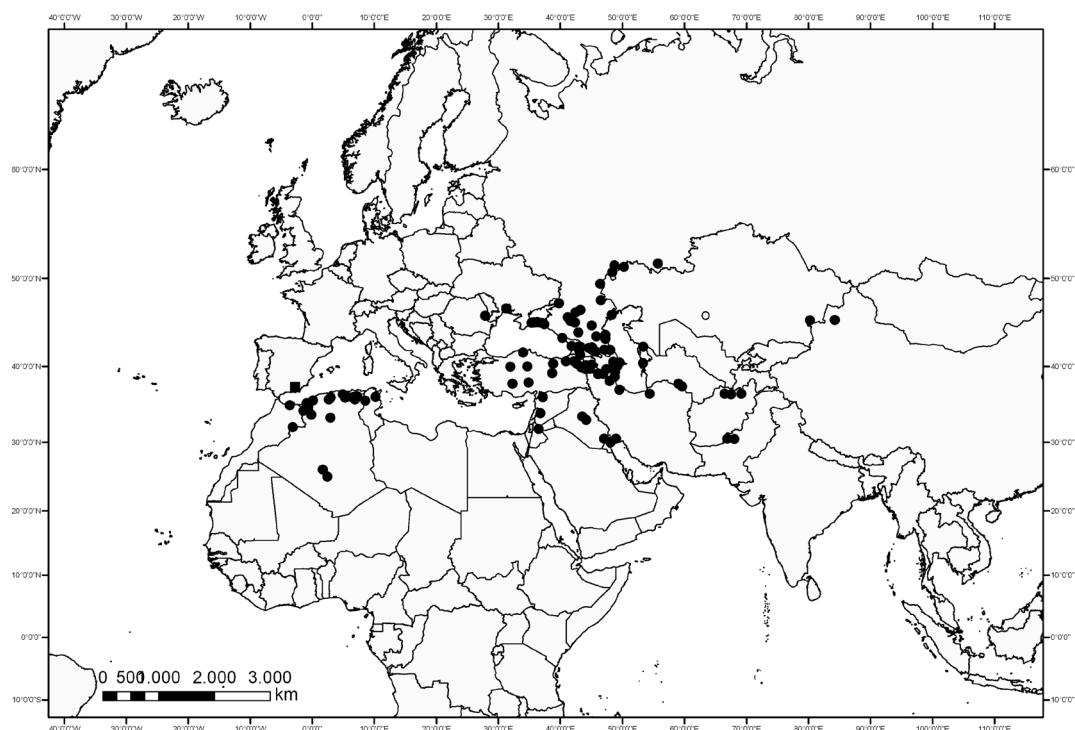

Figure 2. Known distribution of *Eremopyrum orientale* (L.) Jaub. & Spach (based in Frederiksen, 1991; Cabi & Dogan, 2010). ■: new location.

Figura 2. Distribución conocida de *Eremopyrum orientale* (L.) Jaub. & Spach (basada en Frederiksen, 1991; Cabi & Dogan, 2010). ■: nueva localidad.

baetica (Boiss. & Reut.) Sobrino Vesperinas, *Sedum sediforme* (Jacq.) Pau, *Coronilla scorpioides* (L.) W. D. J. Koch, *Echinops strigosus* L., and dispersed individuals of *Camphorosma monspeliaca* L. subsp. *monspeliaca*, forming part of communities of sub-steppe areas of grasses and annuals of *Thero-Brachypodietea* included in Habitat 6220 (considered a priority) of the European Habitat Directive (Douce, 2013). It is considered to be native taxon, not from reverting to the wild, since it is found in a territory where no human activity at all is appreciated. The reasons for its having gone unnoticed until now are primarily that it is very isolated, far from localities of botanical interest, and probably submitted to pronounced population fluctuations that support taxa that inhabit these semiarid terrains due to the irregular annual and interannual regimes of precipitation.

Sheets in the Herbaria GDA and HUAL were included. Fig. 2 shows the distribution known from the works of Frederiksen (1991) and Cabi & Dogan (2010) and the new locality. According to the IUCN (2012) categories and recommendations provided by IUCN (2017), we suggest labelling the Iberian population of *E. orientale* as endangered (EN), with the following criteria: A4ac; B1ac(i,ii,iii,iv)+2ac(i,ii,ii i,iv).

Eremopyrum orientale (L.) Jaub. & Spach, III. Pl. Orient. 4: 26 (1851)

Secale orientale L., Sp. Pl.: 84 (1753) (basionym)

Triticum orientale (L.) M. Bieb., Fl. Taur.-Caucas. 1: 86 (1808)

Agropyron orientale (L.) Roem. & Schult., Syst. Veg., 2: 757 (1817)

Costia orientalis (L.) Willk., Bot. Zeitung (Berlin) 16: 377 (1858)

Annual, caespitose, (6–)9–25(–30) cm long, densely and shortly hirsute in the lower half. Leaf-sheath somewhat inflated on the upper half, glabrous inside; auricles falcate. Ligule c. 1 mm, membranaceous, denticulate. Leaf blade 15–70 × 1–2 mm, acute, with prominent venation, scaberulous to shortly hirsute adaxially and abaxially; margins scabrous. Inflorescence a solitary and terminal spike, 13–30 × 10–15 mm, oblong or ovate, bilateral, dense, subtended by an ± inflated leaf-sheath; peduncle pubescent. Rachis fragile at the nodes, disarticulating above each spikelet; internodes oblong; rachilla tough. Spikelets crowded, sessile, somewhat canaliculate, with 2 fertile florets and 1 sterile, falling entire. Glumes 6–9 mm long including awn, similar, arranged laterally to all sides, shorter

than lemmas, lanceolate, strongly incurved and subulate-awned on the upper half, assymetrically keeled, 3–5-veined, coriaceous, densely covered by long white hairs and with scabrid veins. Lemma 7–10 mm long including awn, lanceolate, acuminate, strongly keeled above, 5-veined, coriaceous, densely covered by long white hairs and with scabrid veins; awn (0.5–)1–2 mm. Palea shorter than body of lemma, lanceolate, acute, with 2 submarginal prominent veins, 2-fid, glabrous to slightly scabridulous in the veins. Lodicles 2, ciliate. Anthers 1.6–1.9 mm long. Caryopsis c. 2.5 mm, ellipsoidal.

Distribution: South-eastern and eastern Europe and south-eastern Iberian Peninsula, North Africa, temperate and tropical Asia.

Material studied: Spain. Granada: Pedro Martínez, Hoya de Guadix, Rambla del Carril, 30SVG8346, pastizales terofíticos en colinas de margas arcillosas, 830 m, 24 April 2017, J. Fuentes & G. Blanca (GDA 62698; HUAL 26073); Fonelas, hacia El Mencal, terrenos arcillosos, 1 April 2017, J. Fuentes & G. Blanca (GDA 62633); Fonelas, entre Cortijo de Victoriano y Cortijo Nuevo, 30SVG8748, arcillas expansivas, 780 m, 31 April 2018, J. Fuentes, G. Blanca & J.M. Segura (GDA 62721); Fonelas, entre Majada del Cura y Cerro de los Pedernales, 30SVG8648, arcillas expansivas, 780 m, 31 April 2018, J. Fuentes, G. Blanca & J.M. Segura (GDA 62718); Fonelas, Cerro del Abad, 30SVG8747, arcillas expansivas, 760 m, 31 April 2018, J. Fuentes, G. Blanca & J.M. Segura (GDA 62720); Fonelas, Cabecera del Barranco de la Linde, 30SVG8747, arcillas expansivas, 770 m, 31 April 2018, J. Fuentes, G. Blanca & J.M. Segura (GDA 62719); Fonelas, proximidades del Cortijo de Victoriano, 30SVG8748, arcillas expansivas, 730 m, 11 May 2018, M. Cueto & G. Blanca (HUAL 26156, 26157).
