REVISION OF THE GENUS *ANODA* (MALVACEAE)

PAUL A. FRYXELL

U.S. Department of Agriculture in cooperation with
Texas A&M University
College Station, Texas 77843

ABSTRACT

A revision of the genus *Anoda* is presented that recognizes 23 species, of which ten are described as new. The genus includes annual herbs, subshrubs, and occasionally shrubs and occurs from the southern United States to Bolivia, Argentina, and Chile. Most of this distributional range, however, is accounted for by a single species, *A. cristata*, which also occurs as an adventive in a few other parts of the world. The genus is principally Mexican, all of the species occurring within that country. *Anoda* is closely allied to the genus *Periptera*, also a Mexican genus, and the two genera share features of fruit structure. The two genera together seem to occupy a relatively isolated position within the family. *Anoda* is subdivided into six sections, and keys to the sections and to the species are presented.

Key words: *Anoda*, Malvaceae, Mexico, Neotropics, revision, taxonomy.

INTRODUCTION

The genus *Anoda* is principally Mexican in its distribution and its diversity, but it may be found from the southern United States to Bolivia, Argentina, and Chile. All of the species occur in Mexico, and only six of the 23 species occur outside of Mexico. Three species are common weeds, and one of these, *A. cristata* (L.) Schlechtendal, accounts for the entire breadth of distribution of the genus from the United States to Argentina and sometimes to other parts of the world (e.g., Mitchell 1982).

The genus has been studied taxonomically by Schlechtendal (1837), Gray (1887), Baker (1892), Garcke (1896), and Hochreutiner (1916), and the genus has been treated in various regional floras such as Kearney and Peebles (1942), Shreve and Wiggins (1964), Correll and Johnston (1970), and Wiggins (1980). The most recent comprehensive study is that of Hochreutiner (1916), whose study, however, was based on only a limited number of specimens (42 cited specimens, distributed among 14 species and 5 varieties). Numerous subsequent collections have revealed additional species or have clarified our understanding of species already known. Therefore, it is considered appropriate to present a revision of *Anoda* at this time. Ten species are described as new in the present work, and 23 species are recognized. A cytological study by Bates (1987) complements the present study.

TAXONOMY

ANODA Cavanilles, Diss. 1:38. 1785.

Lectotype: *Anoda hastata* Cavanilles. Gray (1887) reduced the three species of Cavanilles to a single species, for which he chose to use the name *A. hastata*, giving the other names as synonyms. This choice constitutes a lectotypification of the genus.

Cavanillea Medikus, Malv.-Fam. 19. 1787.—Type: *Anoda hastata* Cav.

Sidanoda (A. Gray) Wooton & Standley, Contr. U.S. Natl. Herb. 19: 427. 1915.—Based on: *Anoda* sect. *Sidanoda* A. Gray, Proc. Amer. Acad. Arts 22: 299. 1887.—Lectotype: *Anoda pentaschista* A. Gray.—Note: The assertion by Hochreutiner (1916, p. 39) that sect. *Sidanoda* is monotypic and based on *Anoda abutiloides* A. Gray is incorrect. When Wooton and Standley elevated sect. *Sidanoda* to generic rank, they narrowed Gray's concept of the taxon to the single species, *Anoda pentaschista*, an action that serves as the choice of a lectotype.

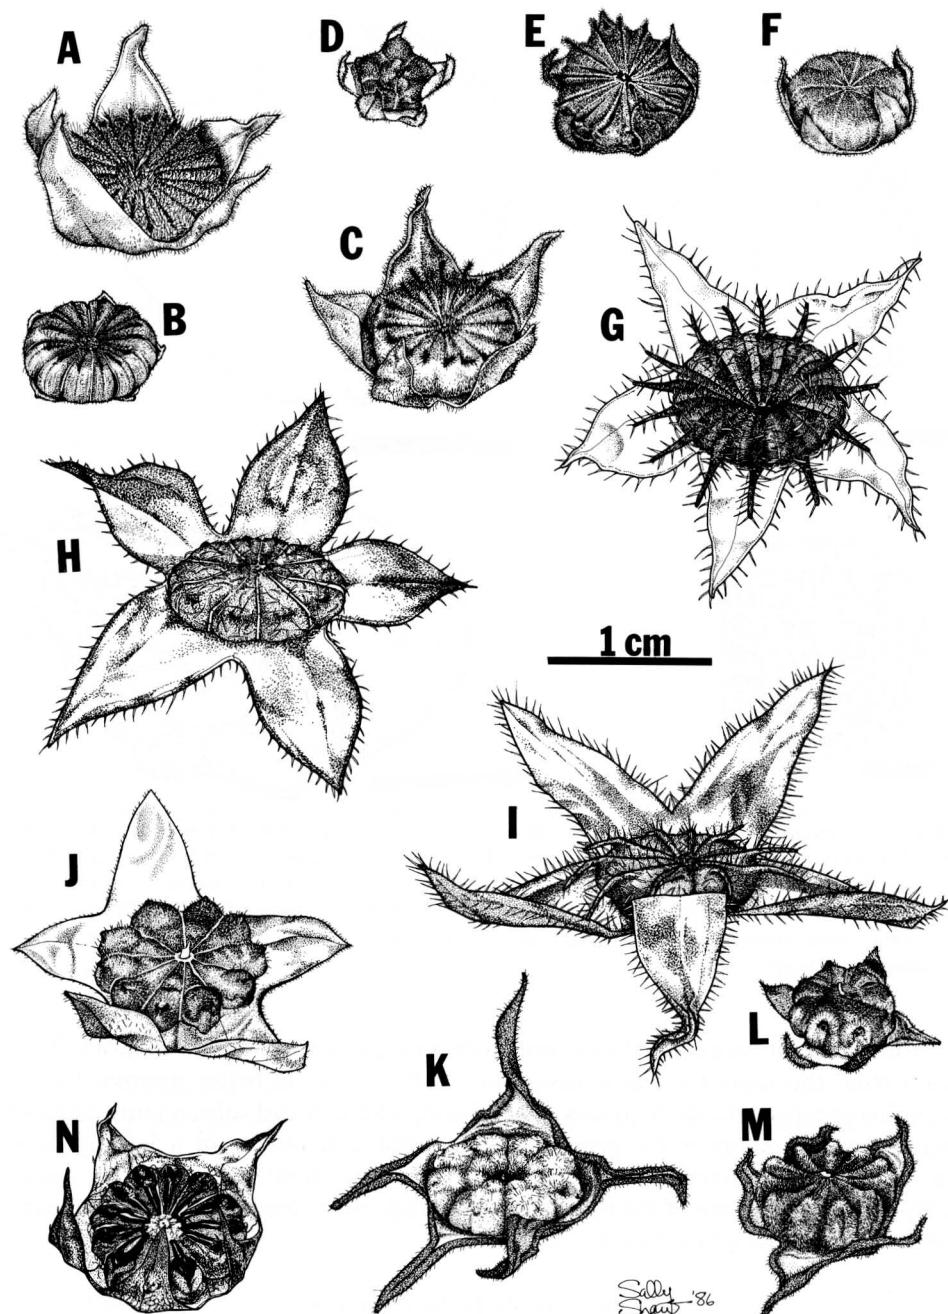

Annual or perennial herbs, subshrubs, or shrubs, erect or decumbent, hispid or stellate-pubescent or -puberulent (sometimes viscid) to glabrate. Leaves linear, lanceolate, ovate, cordate, hastately lobed or palmately parted, crenate or dentate to subentire, usually green, sometimes with an irregular purplish blotch along the midrib, sometimes canescent beneath. Flowers solitary in the axils or aggregated into open terminal racemes or panicles; involucels absent; calyces gamosepalous, 5-lobed, sometimes accrescent in fruit, rounded basally, usually 5- or 10-nerved; petals yellow, whitish, lavender, or purple; androecia shorter than to equaling the petals, usually yellowish, the columns often pubescent, the anthers sometimes lavender; pollen grains (Hashmi 1970; Heusser 1971; Sánchez 1982) with 30+ apertures (except 4–5 apertures in *A. pentaschista*); styles slender, 5–20 with the stigmas usually abruptly capitate and glabrous. Fruits (Fig. 1) oblate or disciform, schizocarpic, puberulent, tomentose, or hispid (sometimes subglabrous); mericarps 5–20, each often with (or sometimes without) a spur or spine on the dorsal angle, the lateral walls usually disintegrating at maturity; seeds usually glabrous, sometimes obscurely pubescent, solitary, sometimes enclosed in a persistent reticulate endocarp (Fig. 2). Base chromosome number: $x = 15$ (cf. Bates 1987).

One of the characteristic features of *Anoda* is that leaf form is highly variable within individual plants (e.g., Fig. 6, 7). Basal leaves, mid-stem leaves, and leaves immediately below and in the inflorescence may be very different from one another in size and form on an individual plant. It is therefore appropriate to speak of a “leaf spectrum” in relation to these plants and to keep this fact in mind when interpreting the descriptions or identifying an unknown plant. Generally, the leaves become smaller and narrower upward. This phenomenon, of course, occurs in many other genera, but its expression is relatively marked in *Anoda*.

Another characteristic feature of *Anoda* concerns its distribution. Certain species are found in the field in relatively large populations (e.g., *A. palmata* Fryx., or the weedy species such as *A. cristata* and *A. pentaschista*). Other species, on the other hand, occur as widely scattered individuals, and collectors may see only one or two individuals at a given site. The collector is thus faced with the choice of making a unicate collection or no collection at all and often opts for the latter, unless he or she has a particular interest in the genus. Thus, some of the species of *Anoda* are probably under-represented in herbaria as a result of this characteristic of scattered distribution.

The name *Anoda* is derived from the vernacular Ceylonese name “anoda” given to a species of *Abutilon*, a name that was noted by Burman (*Thesaurus Zeylanica*) and adopted by Cavanilles.

Schlechtendal (1837) divided the species of *Anoda* into two sections, but he did not give the sections names. Various subsequent authors (Gray 1887; Baker 1892; Hochreutiner 1916) have also divided *Anoda* into sections. More recently, Kearney (1951) noted the practical difficulties of applying the distinctions among these

Fig. 1. Fruits of representative species of *Anoda*.—A. *A. polygyna* (Breedlove 19033).—B. *A. leonensis* (Fryxell et al. 1697).—C. *A. paniculata* (Koch and Fryxell 82247).—D. *A. pentaschista* (Waterfall 6210).—E. *A. pedunculosa* (Hernández et al. 734).—F. *A. reticulata* (White 3618).—G. *A. cristata* (Gentry 1829).—H. *A. zuccagnii* (Hinton 11632).—I. *A. lanceolata* (Pringle 5454).—J. *A. guatemalensis* (Nelson 3169).—K. *A. pubescens* (Pringle 6969).—L. *A. thurberi* (Pringle 6536).—M. *A. hintoniorum* (Hinton 7229).—N. *A. pristina* (Breedlove 7546).

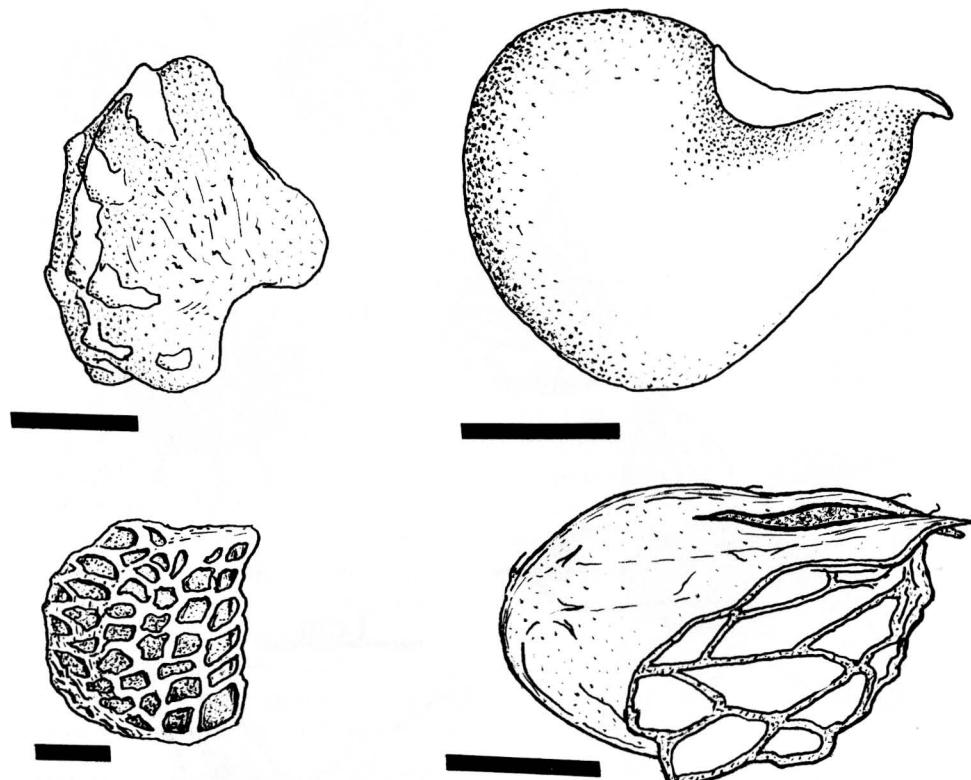

Fig. 2. Disseminules of representative species of *Anoda*.—Upper left: *A. lanceolata* (Koch and Fryxell 83148), showing seed completely enclosed by ornate endocarp.—Lower left: *A. pedunculosa* (Koch and Fryxell 78326), showing seed completely enclosed by reticulate endocarp.—Upper right: *A. cristata* (Rosas 2), showing naked seed lacking an enclosing endocarp.—Lower right: *A. pristina* (Breedlove 7546), showing entire mesocarp with zone of dehiscence (above) and persisting reticulations of lateral wall. (Scale = 1 mm)

sections, at least using the characters given as diagnostic by these authors. As is often true, the matter of such taxonomic subdivision is better approached by grouping species with more or less clear overall affinities and subsequently seeking characters that support the grouping. This approach results in a less artificial imposition of characters on taxa and more natural sections, in spite of the essentially subjective nature of the process. Such an approach leads me to the following subdivision of the genus into six sections.

KEY TO THE SECTIONS OF *ANODA*

- A. Mericarps apically dehiscent, the lateral walls a coarse reticulum at maturity (Fig. 2) *A. sect. Pseudanoda*
- A. Mericarps not apically dehiscent, the lateral walls evanescent at maturity.
 - B. Pollen grains with 4–5 apertures; calyces 3–4 mm long; fruits 4–5 mm in diam; leaves coriaceous *A. sect. Sidanoda*
 - B. Pollen grains with 30 or more apertures; calyces usually >5 mm long; fruits 6–10 mm in diam; leaves membranous.

- C. Endocarp absent (i.e., seeds naked); plants perennial *A. sect. Liberanoda*
- C. Endocarp usually present, enclosing the seed (Fig. 2); plants usually annual.
 - D. Fruits hispid, often with radiating spines; endocarp weakly developed (sometimes absent) *A. sect. Anoda*
 - D. Fruits tomentose, with short spurs or these suppressed.
 - E. Petals 5–12(–15) mm long; carpels 8–13; plants usually <1.5 m tall *A. sect. Cleistanoda*
 - E. Petals (8–)10–20 mm long; carpels 11–20; plants usually >2 m tall *A. sect. Clausanoda*

Sect. *Pseudanoda* Fryxell, sect. nov.

Anoda fructibus disciformibus, mericarpiis apice dehiscentibus, parietibus lateralibus fatiscentibus praeter reticulum grossum persistentem.

Type: *Anoda pristina* Fryxell.

Included species: *A. pristina*, *A. succulenta* Fryxell.

Distinctive characters: mericarps with apical dehiscence; lateral walls with persistent reticulum; endocarp not enclosing the seed; plants more or less glabrous.

Sect. SIDANODA A. Gray

Lectotype: *Anoda pentaschista*.

Included species: *A. pentaschista*.

Distinctive characters: calyx and fruits small with 5–8 carpels; foliage coriaceous; pollen grains with 4–5 apertures (Hashmi 1970); endocarp surrounding the seed absent.

Sect. LIBERANODA Fryxell, sect. nov.

Anoda perennis, fructibus minute tomentosis, mericarpiis 6–10, parietibus lateralibus evanescens-tibus, seminibus liberis endocarpiis persistentibus carentibus.

Type: *Anoda pubescens* Schlechtendal.

Included species: *A. pubescens*, *A. henricksonii* M. C. Johnston, *A. speciosa* Fryxell, *A. hintoniorum* Fryxell, *A. guatemalensis* Fryxell, *A. abutiloides*, *A. thurberi* A. Gray.

Distinctive characters: fruits minutely tomentose with 6–10 carpels; endocarp surrounding the seed absent; plants perennial, sometimes shrubby.

Sect. ANODA

Lectotype: *Anoda hastata* Cavanilles.

Included species: *A. cristata*, *A. zuccagnii* (Sprengel) Fryxell, *A. lanceolata* W. J. Hooker and Arnott, *A. albiflora* Fryxell, *A. hirta* Fryxell.

Distinctive characters: fruits in the form of disks with radiating spines; hispid fruits; endocarp sometimes poorly developed or absent; plants often annual (?).

Sect. CLEISTANODA A. Gray

Lectotype: Anoda parviflora Cavanilles.

Included species: *A. pedunculosa* Hochr., *A. crenatiflora* Ortega, *A. maculata* Fryxell, *A. reticulata* S. Watson, *A. palmata*.

Distinctive characters: corollas relatively small; fruits minutely tomentose with 8–13 mericarps; seeds included in a persistent endocarp; plants annual (?), often less than 1.5 m tall.

Sect. Clausanoda Fryxell, sect. nov.

Anoda fructibus plerumque pluricarpiis, seminibus in endocarpiis reticulatis persistentibus includentibus.

Type: *Anoda leonensis* Fryxell.

Included species: *A. leonensis*, *A. paniculata* Hochr., *A. polygyna* Fryxell.

Distinctive characters: carpels 11–20; seeds included in a persistent endocarp; plants large, often 2 m tall or more.

Baker (1892) proposed *Anoda* sect. *Pseudosida* E. G. Baker to include *Anoda denudata* (Nees & Martius) Schumann, but this species belongs in the genus *Briquetia*, not in *Anoda*.

The species that constitute the sections *Pseudanoda* and *Sidanoda* are sufficiently distinctive from the rest of the genus that they are clearly set apart and have no close allies. The inclusion of *A. succulenta* in section *Pseudanoda* is tentative, pending the acquisition of fruiting specimens.

Section *Liberanoda* has two clear subgroups: the one including *A. pubescens*, *A. henricksonii*, and *A. speciosa*; the other *A. hintoniorum* and *A. guatemalensis*. The affiliations of the other two species, *A. abutiloides* and *A. thurberi*, are less clear. On the basis of the cytological evidence (Bates 1987), another disposition for *A. thurberi* may be necessary.

Sect. *Cleistanoda*, as here interpreted, seems to be a very natural group. On the other hand, sect. *Clausanoda* seems less coherent and may be a heterogeneous group. In any case, all of the sections here proposed are presented in the belief that they are a reasonable interpretation of the genus, with the hope that this interpretation will provide a frame of reference (and a set of hypotheses concerning relationships) for studies in other areas, such as cytology and crossing behavior.

The genus most closely affiliated with *Anoda* is the genus *Periptera* (Fryxell 1974; Bates 1987). The two genera form an isolated group within the family (Bates and Blanchard 1970), apparently without close allies. They share various similarities, especially concerning pollen characters (Sánchez 1982), fruit structure, and plant habit. In both cases the fruits are oblate disciform schizocarps, each mericarp often with a spur (or spine) on the dorsal angle and with the lateral walls evanescent at maturity. The seeds are solitary, and in some species (at least of *Anoda*) the seeds are completely enclosed in a persisting reticulate endocarp, a feature not known elsewhere in the Malvaceae. In those species with a persisting endocarp, the dispersal unit is the seed and enclosing endocarp; in those species lacking the endocarp, the seed alone is the dispersal unit.

Anoda and *Periptera* are distinguished principally on chromosome number (Bates 1987) and floral characters. In *Anoda* the corollas are purplish to pale lavender, white, or yellow, and the disposition of the petals is campanulate to rotate. In *Periptera*, on the other hand, the petals are usually some shade of red (or orange-red), and the petals are erect and often narrowly spatulate, forming a tubular corolla similar to that of *Malvaviscus*, though on a smaller scale. In addition, the genitalia are included within the corolla in *Anoda*, but are manifestly exserted in *Periptera*. The two genera apparently also differ in the form of the stigmas, which are abruptly capitate in *Anoda* (with the possible exception of *A. thurberi*) and more or less clavate in *Periptera*. Cytologically, *Anoda* is characterized by a base number of $x = 15$ (with the exception of *A. thurberi*) and *Periptera* by $x = 13$.

Future studies may indicate the desirability of combining these two genera, but for the present they are maintained as distinct because of their different chromosome number, stigma structure, and floral aspect, the latter presumably related to pollinator adaptation. Even if *Anoda* and *Periptera* were to be combined, it would still be appropriate to distinguish them in subgeneric or sectional rank, so that the question becomes one of the level at which to distinguish them. There does not appear to be any advantage to recognizing the distinction between these two groups in infra-generic rank rather than generic rank, and so no such change is proposed here.

The following key to the species of *Anoda* is an artificial key that does not follow the sectional breakdown previously discussed but is presented to facilitate the identification of specimens. In the subsequent treatment of individual species, specimens are cited according to the conventional herbarium acronyms with the exception of the lower-case "pf," which refers to the author's herbarium.

KEY TO THE SPECIES OF *ANODA*

- A. Petals pale to bright yellow.
 - B. Mericarps (and styles and stigmas) 5–8; endocarp absent; corolla yellow but sometimes fading pale reddish.
 - C. Calyces 3–5 mm long; mericarps 5–8; fruits 4–5 mm in diam; leaves coriaceous, discolorous, often narrowly linear 15. *A. pentaschista*
 - C. Calyces 5–7 mm long; mericarps 5; fruits 6 mm in diam; leaves membranous, concolorous, broadly ovate-acuminate 1. *A. abutiloides*
 - B. Mericarps (and styles and stigmas) 8–15; endocarp usually present; corollas drying yellowish.
 - D. Endocarp absent; stems and petioles notably hirsute 8. *A. hirta*
 - D. Endocarp present (unknown in *A. succulenta*); stems and petioles tomentose or puberulent to subglabrous.
 - E. Stems and petioles nearly glabrous; stems succulent 21. *A. succulenta*
 - E. Stems and petioles tomentose or puberulent; stems not succulent.
 - F. Mericarps (and styles and stigmas) 8–13; midstem leaves palmately lobed 12. *A. palmata*
 - F. Mericarps (and styles and stigmas) 10–16; midstem leaves ovate to hastate.
 - G. Upper leaf surfaces with simple appressed hairs; endocarp usually well developed with marked excrescences; fruits with radiating spines (Fig. 1I); mericarps 10–12 9. *A. lanceolata*
 - G. Upper leaf surfaces sparsely stellate-pubescent to glabrate; reticulate endocarp lacking excrescences; mericarps crested or with short spurs.
 - H. Petals 8–12(–20) mm long, bright yellow; mericarps 12–16, crested but spurs virtually absent (Fig. 1B); plants 1–2 m tall 10. *A. leonensis*

- H. Petals 6–8 mm long, pale yellow; mericarps 10–14, with spurs 1–2 mm long; plants seldom more than 1 m tall.
 - I. Corollas with dark center, the androecium reddish or purplish; hairs at base of calyx to 1 mm long 11. *A. maculata*
 - I. Corollas without dark center, the androecium pallid; hairs at base of calyx 0.1–0.3 mm long 3. *A. crenatiflora*
- A. Petals purplish or pale lavender to white.
 - J. Petals 4–7 mm long (barely exceeding calyx), blue-purple.
 - K. Mericarps 6–8, with spurs to 1 mm long (Fig. 1L); leaves ovate to hastate to triangular; endocarp absent 22. *A. thurberi*
 - K. Mericarps 10–11, with rounded dorsum, the spurs completely absent (Fig. 1F); climax leaves with 3 narrow linear lobes; endocarp present 19. *A. reticulata*
 - J. Petals 8–28 mm long, purplish to pale lavender to white.
 - L. Androecium subequal to petals; endocarp absent.
 - M. Flowering calyces 12–15 mm long; petals 22–28 mm long; staminal columns ca. 20 mm long 20. *A. speciosa*
 - M. Flowering calyces 6–12 mm long; petals 7–17 mm long; staminal columns 7–15 mm long.
 - N. Petals 7–14 mm long, uniformly lavender, except where whitish on claw; dorsal spur of mericarp up to 0.5 mm long 18. *A. pubescens*
 - N. Petals 11–17 mm long, lavender, often with microscopic purple lines distally; dorsal spurs of mericarp ca. 1.5 mm long 6. *A. henricksonii*
 - L. Androecium shorter than the petals; endocarp present or absent.
 - O. Upper leaf surface stellate-pubescent.
 - P. Mericarps ca. 10; endocarp absent; calyx 7 mm long in flower, accrescent to 10 mm in fruit 5. *A. guatemalensis*
 - P. Mericarps 12–20; reticulate endocarp present; calyx not accrescent.
 - Q. Mericarps 12–13 (Fig. 1E); calyx 4–6 mm long; petals 6–15 mm long, pale lavender to white; leaves sparsely pubescent 14. *A. pedunculosa*
 - Q. Mericarps 17–20 (Fig. 1A); calyx 9–11 mm long; petals 15–23 mm long, pale lavender; leaves densely pubescent 16. *A. polygyna*
 - O. Upper leaf surface with appressed simple hairs or glabrate.
 - R. Mericarps 12–13, apically dehiscent (Fig. 1N), with persisting lateral reticulations (Fig. 2) 17. *A. pristina*
 - R. Mericarps 7–18, indehiscent but the lateral walls disintegrating at maturity.
 - S. Plants erect, sometimes shrubby; corollas white or lavender.
 - T. Upper leaf surface glabrate; endocarp present 13. *A. paniculata*
 - T. Upper leaf surface with appressed simple hairs; endocarp absent.
 - U. Petals white, 20–25 mm long; mericarps ca. 15 2. *A. albiflora*
 - U. Petals pink or lavender, 14–18 mm long; mericarps 8–10 7. *A. hintoniorum*
 - S. Plants frequently decumbent, herbaceous; corolla usually purplish.
 - V. Mericarps 10–19, with a horizontal dorsal spine 1.5–4 mm long (Fig. 1G), the suture between the mericarps depressed; lower leaves frequently triangular or hastate 4. *A. cristata*
 - V. Mericarps 7–11, the dorsal spur absent or vestigial, rarely to 1.5 mm long (Fig. 1H), the suture between the mericarps not depressed, the fruits therefore seemingly inflated; lower leaves frequently ovate to palmately lobed 23. *A. zucagnii*

1. ANODA ABUTILOIDES A. Gray, Proc. Amer. Acad. Arts 22:300. 1887.

Type: UNITED STATES. ARIZONA: Santa Catalina Mountains, 7 June 1882, Pringle s.n. (holotype: GH; isotypes: CM, F, MO, NY, PENN, US, VT, WIS). This binomial is incorrectly attributed to S. Watson in *Index Kewensis*.

Sida caudatifolia Robinson & Greenman, Proc. Amer. Acad. Arts 29:382. 1894.—*Type:* MEXICO. JALISCO: Barranca of Tequila, Pringle 5445 (ARIZ, CAS, F, GH, K, MEXU, MICH, MO, NY, RM,

SMU, UC, VT).—*Anoda caudatifolia* (Robinson and Greenman) Robinson and Greenman, Contr. U.S. Natl. Herb. 5:172. 1899.
Anoda urophylla Riley, Kew Bull. 110. 1923.—Type: MEXICO. SINALOA: El Rincón de la Casadera, 670 m, May 1921, González-Ortega 888 (holotype: K; isotype: MEXU).

Erect subshrubs ca. 1 m tall, branching principally in the inflorescence, the stems with simple spreading hairs 0.5–1 mm long and with shorter more or less glandular hairs. Leaves long-petiolate, orbicular-ovate, cordate, dentate, caudate-acuminate, to 12 cm long, gradually reduced and much narrower upward, minutely and softly tomentose, essentially concolorous. Flowers sometimes solitary in the leaf axils but usually in open terminal panicles; pedicels 1–5 cm long, without articulation, with pubescence like that of the stem; calyces 5–7 mm long, the lobes broadly triangular, more or less acuminate, shorter than the tube, with the midrib dark-pigmented; petals pale yellow (drying rose), ca. 1 cm long, prominently bearded on the claw; staminal columns ca. 6 mm long, with recurved hairs, the filaments 3–4 mm long; styles 5, slender, slightly exceeding the androecium, subequal to the petals, pallid, the stigmas abruptly capitate, sometimes reddish. Fruits oblate, ca. 6 mm in diam, minutely pubescent; mericarps 5, dorsally rounded; seeds solitary, 3 mm long, with minute appressed hairs, lacking an endocarp surrounding the seed. Chromosome number: $2n = 30$ (Bates 1987).

Specimens examined.—UNITED STATES. ARIZONA: Santa Catalina Mts., 17 May 1881, Pringle s.n. (F, GH, NY), 7 Jun. 1882, Pringle s.n. (CM, F, GH, MO, NY, PENN, US, VT, WIS), 17 Jun. 1884, Pringle s.n. (MO, NY); Baboquivari Mts., Goodding 4718 (ARIZ), Jones 24927 (NY), Kearney and Peebles 14950 (ARIZ), Kearney 10378 (ARIZ, MICH), Kearney 10414 (ARIZ, MICH), Gould et al. 2711 (ARIZ, NY), Clark 12556 (OKL); Sabino Canyon, Kearney 10339 (UC); Sycamore Canyon near Ruby, Darrow and Haskell 2224 (ARIZ, MO, UC); Sycamore Canyon, Pajarito (Atascosa) Mts., Toolin 1688 (ARIZ); Holden Canyon, 0.6 mi NNW of Bartlett Mt., 29 Oct. 1981, VanDevender and Toolin s.n. (ARIZ, ASU); base of Rincón Mts., Saguaro Nat. Mon., Turner 75-96 (ARIZ, SD); Fresnal, Papago Country, Thackery 2010 (ARIZ).—MEXICO. SONORA: N end of the Sierra de la Cebollita, 1.2 mi NW of Nuri, Sanders et al. 2690 (UCR, pf); Cañon de la Gallina, región Río de Bavispe, White 3518 (MICH); Canyon Sapopa, Río Mayo, Gentry 1083 (DES, F, GH, MO, WIS); Quiricoba, Distr. Alamos, Gentry 821 (MICH).—CHIHUAHUA: Barranca de Batopilas, near La Bufa, Bye 10054 (COLO, MEXU, pf); Sierra de las Papas (Son.-Chih. border), Gentry 660 (MICH).—SINALOA: El Rincón de la Casadera, González-Ortega 888 (K, MEXU), González-Ortega 706 (MEXU); Río del Fuerte, 22 km E of Agua Caliente, Moran 7594 (SD, pf).—JALISCO: Barranca de Tequila, Pringle 5445 (ARIZ, CAS, F, GH, K, MEXU, MICH, MO, NY, RM, SMU, UC, VT), Fryxell and Bates 2136 (BH, pf).

Distinctive characters of *Anoda abutiloides* include the uniformly 5-carpelled fruits and the leaves with caudate apices. The pollen grains of this species have been described by Sánchez (1982, as *A. urophylla*).

2. *Anoda albiflora* Fryxell, sp. nov.

Type: MEXICO. JALISCO: Jocotepec, cultivated; half-shrubby 2 m high; flowers white; said to be native, Jan 1978, Lape s.n. (holotype: MICH; isotype; pf).

Herbae erectae, caulibus folisque sparsim pubescentibus, pilis praecipue simplicibus, foliis infra late ovatis sursum gradatim parvioribus angustioribusque; calycibus 8–10 mm longis; petalis albis, 20–25 mm longis; fructibus disciformibus hispidus, radiatim spiniferis; mericarpiis ca. 15, endocarpiis reticulatis destitutis.

Herbs or subshrubs up to 2 m tall, the stems sparsely hirsute (the hairs simple, spreading, 1–2 mm long) to glabrate. Leaf blades broadly ovate below (3–7 cm long), smaller and narrower upward, sometimes hastately lobed, basally truncate

or cuneate, crenate-dentate, acute, sparsely hirsute on the upper surface (the hairs principally simple, appressed, ca. 1 mm long), the pubescence on the lower surface similar but denser, especially on the nerves; petioles half as long as the blades or less, with pubescence like that of the stems; stipules subulate, 3–5 mm long, hirsute, persistent. Pedicels solitary in the leaf axils with pubescence like that of the stems, slender, 1.5–6.5 cm long (equaling or exceeding the subtending leaves), more or less aggregated apically, where the subtending leaves are greatly reduced; calyces 8–10 mm long, prominently hirsute especially on the nerves (the hairs 1–2 mm long), more than half-divided, the lobes ovate to narrowly lanceolate, acute or acuminate; petals 2–2.5 cm long, 1–1.5(–2) cm wide, white, prominently hirsute on the margins of the claw, otherwise glabrous; staminal columns ca. 4 mm long, pallid, glabrous basally, hirsute distally, with filaments arising apically; filaments 2–3 mm long, the anthers and pollen pallid; styles ca. 15, slender, pallid, glabrous, the stigmas abruptly capitate, ultimately exceeding the androecium. Fruits oblate, disciform with radiating spines; mericarps ca. 15, sparsely hispid, with a spine on the dorsal angle 1.5 mm long, the lateral walls evanescent, the seed not enclosed in a reticulate endocarp; seeds solitary, 2.6–2.8 mm long, minutely warty, otherwise glabrous.

Paratype examined.—MEXICO. CHIHUAHUA: Ciudad de Chihuahua, Col. Mirador, ornamental en jardín, alt. 1500 m, 30 Oct. 1974, Valdés 838 (pf).

Anoda albiflora is currently known only as a garden plant. It may some day be found in nature, but as yet this has not been reported.

3. ANODA CRENATIFLORA Ortega, Nov. Rar. Pl. Hort. Matrit. Dec. 8:96. 1798.

Type: in Madrid Botanical Garden (holotype: MA).—*Sida crenatiflora* (Ortega) Persoon, Syn. Pl. 2:247. 1807.—*Anoda ortegae* Sprengel, Nachtr. I. Bot. G. Halle 11. 1801.—*Sida ortegae* Steudel, Nom. ed. ii. 2:578. 1841.

Anoda parviflora Cavanilles, Icon. 5: 19. t.431. 1799.—*Type:* MEXICO, Pavón s.n. (G, P; as photo F-23684).—*Sida parviflora* (Cavanilles) Willdenow, Enum. Pl. 726. 1809 (non Sessé & Mociño 1894).

Anoda crenatiflora Ortega var. *glabrata* Rose, Contr. U.S. Natl. Herb. 5:172. 1899.—*Type:* MEXICO. ZACATECAS: near San Juan Capistrano, 20 Aug. 1897, Rose 2444 (lectotype, here designated: US; isolectotypes: BM, GH).

Annual erect herbs to 1 m tall with few ascending branches, the stems with minute stellate hairs 0.1–0.3 mm long. Leaves petiolate, 3–9 cm long, ovate or hastate, narrowly so upwards, truncate to cordate, coarsely crenate-dentate or subentire, acute, minutely pubescent to glabrate, the margins hispid-ciliate, the lower surface with stellate hairs, the upper surface with simple, bifurcate, or stellate hairs. Flowers in terminal racemes or panicles; peduncles 2–7 cm long, articulated 0.5–1 cm below the flower; calyces 3–7 mm long in flower, accrescent to 6–8 mm long in fruit, densely short-tomentose, the lobes 1-nerved; petals pale yellow, 6–8 mm long, ciliate on claw (hairs 0.5–1 mm long); staminal columns ca. 2 mm long, pallid, glabrous or with a few hairs apically, the anthers few (up to 10), yellowish, subsessile; styles and stigmas slightly exceeding the androecium, the stigmas abruptly capitate. Fruits 7–9 mm in diam, densely stellate-pubescent; mericarps 10–13, with a dorsal spur 1–2 mm long, the lateral walls evanescent;

seeds solitary, completely enclosed in a persistent reticulate endocarp. Chromosome number: $2n = 60$ (Bates 1987).

- Anoda populifolia* Philippi, Linnaea 28:613. 1856.—*Type*: Chile, cerca de Quillota, Germaine 41048 (holotype: SGO; isotype: W as photo F-32643).
- Anoda arizonica* A. Gray, Proc. Amer. Acad. Arts 22:298. 1887.—*Holotype*: Arizona, Lemmon 599 (GH).
- Anoda acerifolia* (Zuccagni in Roemer) DC. var. *minoriflora* Hochreutiner, Annuaire Conserv. Jard. Bot. Genève 20:51. 1916.—*Type*: Bolivia, Cotañi ad Illimani, 2450 m, Buchtien 207 (GH).

Erect or decumbent, annual or perennial herbs, the stems usually hispid, the hairs spreading or retrorse. Leaves variable, ovate, hastate, or palmately lobed, crenate to subentire, acute, sparsely pubescent above and beneath, the hairs principally simple and appressed, often with a purple blotch along the midrib, sometimes also on the margins, the petioles hispid. Flowers solitary in the leaf axils with long peduncles; calyces 5–10 mm long in flower, accrescent to 12–20 mm long in fruit, hispid; petals lavender or purple, rarely white or white with purple veins, 8–26(–30) mm long; androecia included, the columns pubescent. Fruits (Fig. 1G) in the form of a flattened disk, 8–11 mm in diameter (excluding the spines), densely hispid; mericarps (8–)10–19, indehiscent, with radiating spines, 1.5–4 mm long on the dorsal angle, the lateral walls evanescent; seeds glabrous, 3 mm long, usually naked (Fig. 2) or sometimes with an endocarp surrounding the seed (or sometimes with only a coarse reticulum persisting). Chromosome number: $2n = 30, 60, 90$ (Bates 1987).

Anoda cristata is the most common and widely distributed species of the genus, being a notorious weed (cf. Beckner 1968; Chandler and Oliver 1979) in many areas. It is reported as an occasional adventive in Malesia (Borssum Waalkes 1966) and elsewhere. The pollen grains of this species have been described by Hashmi (1970) and Sánchez (1982). The distinction between this species and *A. zuccagnii* is sometimes problematical and is discussed under the latter species.

5. *Anoda guatemalensis* Fryxell, sp. nov.

Fig. 1J, 3

Type: GUATEMALA. Los Robles bridge, border of Sololá and Chimaltenango Depts., alt. 1800 m, common in forest clearing, fls. purple, “malvilla,” 21 Sep. 1971, *Molina and Molina* 26698 (holotype: ENCB; isotypes: EAP, F, MICH).

Herbae erectae, caulibus sparsim scabrellis, foliis palmatim 3-lobatis sparsim stellato-pubescentibus; calycibus 7–10 mm longis; petalis lavandulis, 11–14 mm longis; fructibus oblati, stellato-pubescentibus; mericarpiis ca. 10, dorsaliter calcaratis, endocarpiis reticulatis destitutis.

Erect herbs ca. 1 m tall, the stems scabridulous, the older stems sparsely so, the hairs ca. 0.2–0.4 mm long, some stellate and some simple, the simple hairs robust and conical and apparently liquid-filled. Leaf blades basally cordate, from

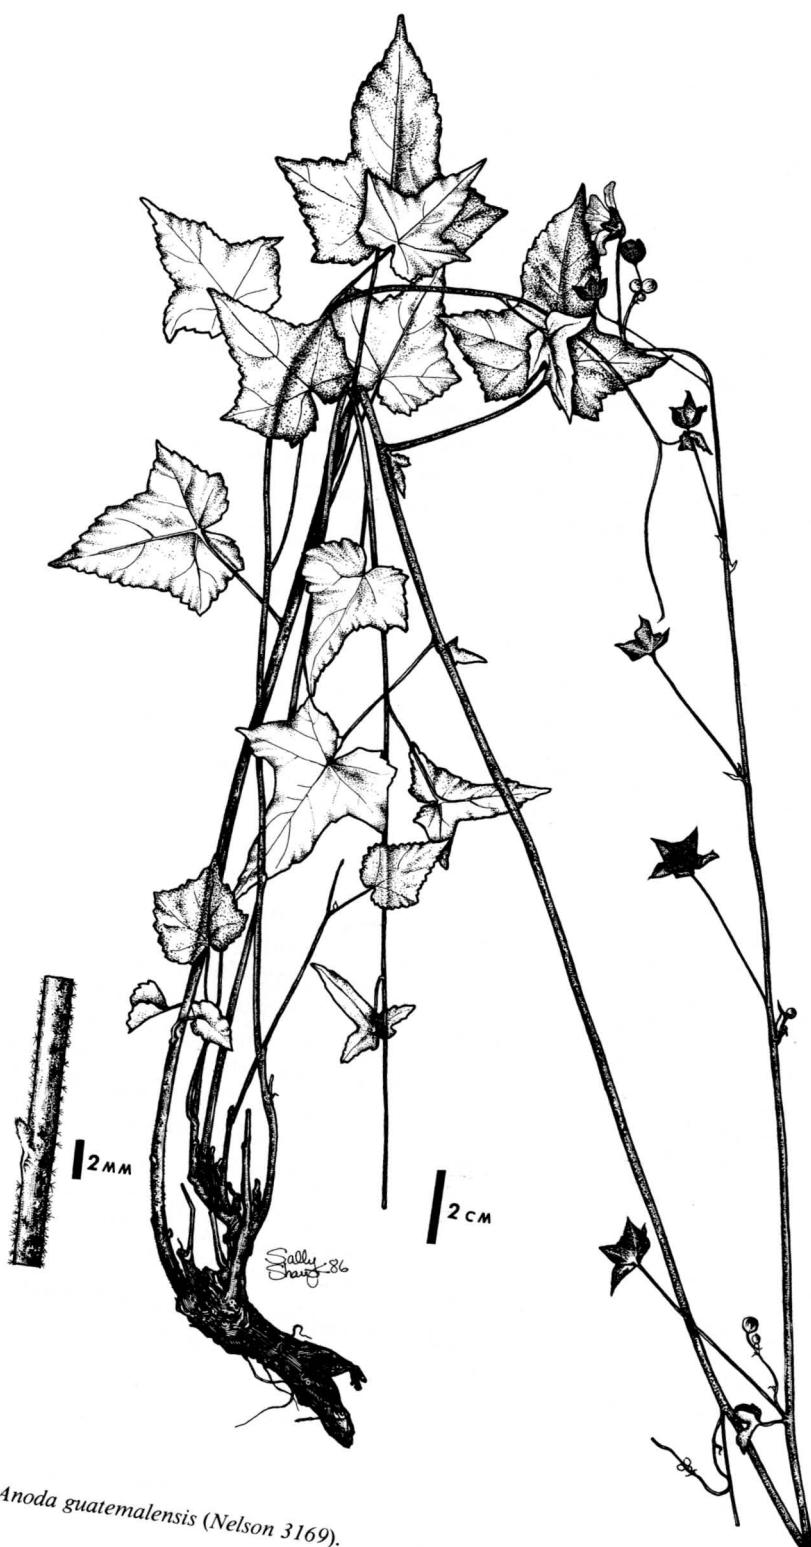

Fig. 3. *Anoda guatemalensis* (Nelson 3169).

palmately 3-lobed to pedately 5-lobed, with the central lobe the largest, lanceolate-ovate, crenate, acute to acuminate, concolorous, uniformly, sparsely, and minutely pubescent with stellate hairs on both surfaces or with simple hairs above; petioles half as long as to subequal to the leaf blades, with pubescence like that of the stem. Flowers in the leaf axils or somewhat aggregated apically; pedicels 2–3 cm long in flower, increasing to 4–13 cm long in fruit, sometimes equaling or exceeding the subtending leaf, obscurely articulated 4–10 mm below the flower, scabridulous like the stem; calyces 7 mm long in flower to 10 mm long in fruit, obscurely 10-nerved, minutely and uniformly pubescent with stellate hairs, half-divided or more, the lobes rounded-apiculate with evident midribs; petals 11–14 mm long, ca. 6 mm wide, obovate, lavender or purple; staminal columns 7 mm tall, pallid, densely hispid throughout the column, the filaments 1.5 mm long, the anthers ca. 30, sometimes purplish, with yellow-orange pollen; styles 10, glabrous, the stigmas abruptly capitate, rounded. Fruits (Fig. 1J) oblate, with stellate hairs 0.5–0.9 mm long; mericarps 10, each with a dorsal spur ca. 0.5 mm long, the lateral walls evanescent; seeds solitary, 3 mm long, without an endocarp surrounding the seeds.

Paratypes examined.—MEXICO. CHIAPAS: along road between Tenejapa and Yajalon, 3000–5000 ft, 13 Oct. 1895, Nelson 1466 (US); near San Cristóbal, alt. 7000–8000 ft, 18 Sep. 1895, Nelson 3169 (GH, US); Sierra de Salsipuedes, S side of valley of San Cristóbal de las Casas, Breedlove 41257 (CAS, MO).—OAXACA: Santa Inez del Monte, 8000 ft, 27 Oct. 1894, Pringle 5646 (GH, VT); Valley of Oaxaca, 20 Sep. 1894, Nelson s.n. (GH-fragment).

6. *Anoda henricksonii* M. C. Johnston, Phytologia 53:451. 1983.

Type: MEXICO. ZACATECAS: Sierra de Astillero (24°37'N, 101°08'W) in small ravine NW of summit, alt. 2000 m, 22 Sep. 1973, Henrickson 13305 (holotype: LL).

Erect branched herbs ca. 0.5 m tall, the stems densely pubescent (becoming sparsely pubescent), the hairs principally stellate, 0.2–0.5 mm long. Leaf blades hastate-deltate below to hastate-lanceolate above, deeply cordate, serrate, acute, somewhat discolored, stellate-pubescent; petioles with pubescence like that of the stems. Pedicels 2–4 cm long in flower, accrescent to 6 cm long in fruit, slender, articulated ca. 5 mm below the flower; calyces 9–12 mm long, densely and minutely stellate-tomentose, deeply 5-lobed, the lobes lance-oblanceolate, more or less apiculate; petals 11–17 mm long, rose or lavender (often with microscopical purplish lines distally); androecia subequal to the petals. Fruit oblate, densely and minutely stellate-pubescent; mericarps 10, with dorsal spurs ca. 1.5 mm long; seeds solitary, lacking (?) an endocarp surrounding the seed.

Specimens examined.—MEXICO. ZACATECAS: Pico de Teyra (24°34'N, 102°11'W), northwest slope in ravine, alt. 2050 m, 23 Sep. 1978, Henrickson 13405b (LL); Sierra de Astillero (24°37'N, 101°08'W), Henrickson 13305 (LL); near Concepción del Oro, Palmer 377 (GH, NY, US).

Anoda henricksonii is closely allied to *A. pubescens*, being distinguished from it by the characters given in the key and by geographic distribution. Both occur at relatively high elevations.

7. *Anoda hintoniorum* Fryxell, sp. nov.

Fig. 1M, 4

Type: MEXICO. MICHOACÁN: S. Torricillas, Distr. Coalcomán, 2500 m, 17 Dec. 1938, Hinton et al. 12778 (holotype: US; isotypes: BM, BR, DS, GH, K, MICH, NY, RSA, UC, pf).

VOLUME 11, NUMBER 4

Fig. 4. *Anoda hintoniorum* (Hinton 12778).

Frutices erecti, caulis sparsim stellato-pubescentibus vel glabratibus, saepe purpurascens; foliis anguste triangularibus, supra pilis simplicibus, infra pilis stellatis; calycibus 7–11 mm longis, interdum apice purpurascens; petalis lavandulis, 14–18 mm longis; fructibus oblates, stellato-puberulis et pilis glandulosis; mericarpiis 10–12, dorsaliter calcaratis, endocarpiis reticulatis destitutis.

Erect shrubs 0.5–2.5(–4) m tall, the stems sparsely and minutely stellate-pubescent or glabrate and often with purplish pigmentation. Leaf blades narrowly ovate-lanceolate or triangular, sometimes weakly 3-lobed and 2–3 times as long as wide, mostly 4–8 cm long, basally truncate or subcordate, crenate-serrate, narrowly acute, palmately 5–7-nerved, with appressed simple hairs 0.4–0.5 mm long above and stellate hairs ca. 0.3 mm long beneath, almost concolorous; petioles less than half the length of the blade, minutely pubescent, often purplish; stipules subulate, inconspicuous, early caducous. Flowers solitary in the leaf axils but usually aggregated apically or at the tips of short lateral branches 5–10 cm long forming dense inflorescences of a few to a dozen flowers; pedicels (1)–2–3.5(–7) cm long, slender, sparsely and minutely stellate-pubescent, articulated 2–4 mm below the flower; calyces 7–11 mm long, uniformly pubescent with a mixture of stellate and glandular hairs, half-divided, the lobes with evident midribs, acuminate, sometimes purplish; petals lavender, 14–18 mm long, hirsute on the claws and with a few glandular hairs on the distal margins, otherwise glabrous; staminal columns pallid, ca. 4 mm long, apically pubescent, the filaments 3 mm long, apically inserted, the anthers yellow; styles ca. 10, lavender (in contrast to the pallid filaments), glabrous, the stigmas rotund-capitate, subequal to the anthers. Fruits (Fig. 1M) 8–9 mm in diam, oblate, minutely stellate- and glandular-puberulent; mericarps 10–12, with a short (0.5 mm) dorsal spur, the lateral walls evanescent; seeds solitary, 2.5 mm long, minutely scabridulous, lacking a reticulate endocarp.

Paratypes examined.—MEXICO. MICHOACÁN: Distr. Zitácuaro, Zitácuaro-C. Aguila, Hinton et al. 13554 (GH, K, NY, US); 2 mi W of Las Peras (ca. 22 mi E of Morelia), Frye and Frye 3098 (GH).—EDO. MÉXICO: Distr. Temascaltepec, Los Hornos, 10 Feb 1935, Hinton et al. 7229 (ARIZ, ASU-2, BM, CAS, DES, F, GH, K, LL, NY, US, pf); Cajones, Hinton et al. 3036 (BM, F, GH, K, NY).—MORELOS: km 6–7, supercarretera Cuautla, Vázquez 1843 (MEXU).

A majority of the specimens of this species have annotations saying *Anoda pubescens*, from which it is clearly distinct. *Anoda hintoniorum* is found principally between elevations of 2500–2800 m. Since it is known principally from collections of “Hinton et al.” it is therefore appropriate to dedicate this species to George and James Hinton, father and son, whose contributions to our knowledge of Mexican botany have been great (Hinton and Rzedowski 1972, 1975).

8. *Anoda hirta* Fryxell, sp. nov.

Type: MEXICO. TAMAULIPAS: 27 km SE of Miquihuana on road to Palmillas, varied vegetation of large shrubs, small trees, and herbs. Fls. orange, elev. 2025 m (23°37'N, 99°39'W), 13 Aug. 1941, Stanford, Rutherford, and Northcraft 878 (holotype: MO; isotypes: ARIZ, DS, NY, UC).

Herbae vel suffrutices erecti, caulis valde hirsutis, foliis triangularibus vel hastatis pilis simplicibus adpressis supra et pilis stellatis infra; calycibus 5–7 mm longis; petalis flavidis 8–9 mm longis; fructibus oblates dense pubescentibus, mericarpiis ca. 13, dorsaliter spiniferis, endocarpiis reticulatis vix evolutis.

Erect herbs or subshrubs of unknown height, the stems green, the young stems

densely yellowish hirsute becoming sparsely hirsute late, the hairs polymorphic, including simple slender hairs 2–4 mm long, rigid scabrid hairs ca. 1 mm long (on younger stems), with understory pubescence of short stellate hairs and a few glandular hairs. Leaf blades triangular or hastate, to 8 cm long, basally truncate, obscurely crenate, acute, slightly discolored, with appressed simple hairs 0.5–1 mm long above, uniformly and minutely stellate-pubescent beneath, the pubescence denser and yellowish on the nerves; petioles almost as long as the blades, with pubescence like that of the stems; stipules filiform, 5–6 mm long, hirsute. Pedicels 2–3 cm long in flower, accrescent to 6–8 cm long in fruit, with pubescence like that of the stem, solitary in the leaf axils, more or less aggregated apically; calyces 5–7 mm long in flower, accrescent to 7–9 mm long in fruit, 10-ribbed, densely yellowish pubescent, approximately half-divided; petals 8–9 mm long, pale yellow when dry (orange according to collectors' notes), prominently hirsute on margins of claw, otherwise glabrous; staminal columns ca. 4.5 mm long, pallid, densely hirsute, the anthers ca. 20, the filaments 1–1.5 mm long; styles glabrous, the stigmas capitate. Fruits oblate, 9–11 mm in diam, densely pubescent; mericarps 13–16, with a dorsal spur ca. 1 mm long, the lateral walls evanescent, the reticulate endocarp poorly developed and not enclosing the seed; seeds glabrous, ca. 2.3 mm long.

Paratypes examined.—MEXICO. BAJA CALIFORNIA: Saucito, 14 Oct. 1890, *Brandegee s.n.* (UC).—UNITED STATES. ILLINOIS: Fountaintdale, *Bebb s.n.* (in cultivation) (F).—MISSOURI: M.B.G. [Missouri Botanical Garden] no. 27/10/10, Aug. 1911, *Craig s.n.* (in cultivation) (MO).

The disjunction between the two Mexican specimens cited is notable and remains to be explained, but the two collections appear to represent the same species and are so dealt with here. Future collections may reveal a continuous distribution across northern Mexico. The provenience of the cultivated specimens of M. S. Bebb (1833–1895) or of Moses Craig (1859–1913) is unknown.

9. ANODA LANCEOLATA. W. J. Hooker & Arnott, Bot. Beech. Voy. 411. 1838.

Fig. 1I, 2

Type: [MEXICO. NAYARIT:] Tepic to San Blas [1828, *Lay s.n.*] (holotype: K).—*Sida unidentata* D. Dietrich, Syn. Pl. 4:858. 1847.

Anoda wrightii A. Gray, Smiths. Contr. Knowl. 5 (Pl. Wright. 2):22. 1853.—*Type:* UNITED STATES. NEW MEXICO: on the summit of mountains near the copper mines, Oct. 1851, *Wright* 894 (holotype: GH; isotypes: BM, K, MO, NY, PH, US).

Erect herbs, minutely and roughly pubescent. Leaf blades mostly 3–7(–12) cm long, variable in form, the lower leaves triangular, smaller and narrower upward, lanceolate, truncate, or cuneate basally, obscurely dentate or subentire, more or less discolored, with simple appressed hairs (0.3–1 mm long) above, with short stellate hairs beneath; petioles with pubescence like that of stem, to 10.5 cm long on lower leaves but usually less than 1 cm long; stipules inconspicuous. Pedicels solitary in the leaf axils (up to 6.5 cm long, subequal to the subtending leaves) or more commonly aggregated apically into leafless racemes, articulated 5 mm below the flowers; calyces 6 mm long in flower, accrescent to 8 mm in fruit, minutely stellate-pubescent, approximately half-divided, the lobes with prominent midribs, triangular in flower, the margins somewhat recurved in fruit; corollas yellow (sometimes reddish at base), 8–16 mm long, the petals densely ciliate on the

margins of the claws; staminal columns densely pubescent, the hairs stellate, more or less retrorse. Fruits (Fig. 1I) oblate, 9–11 mm in diam, densely stellate-pubescent, the hairs 0.5–1 mm long; mericarps 10–12, each with a dorsal spur ca. 1 mm long, the lateral walls evanescent; seeds solitary, minutely verruculate, 3 mm long, the endocarp usually well developed with excrescences on the margin (Fig. 2).

Specimens examined.—UNITED STATES. NEW MEXICO: mountains near the copper mines, Wright 894 (BM, GH, K, MO, NY, PH, US); Mogollon Mts., Rusby 52 (F, MO).—TEXAS: El Paso, Jones 4343 (ARIZ, F, NY, UC).—MEXICO. BAJA CALIFORNIA: Sierra San Francisquito, 1 Oct. 1899, Brandegee s.n. (NY, UC); San Francisquito Mts., Brandegee 48 (UC).—SINALOA: Mpio. de Sinaloa y Vela, Sierra Surutató at El Alamo, along road from Mocorito to Surutató, Breedlove and Thorne 17903 (CAS, RSA, pf).—CHIHUAHUA: N end of San Luis Mts. (extreme NW corner of state), Spellenberg 6859 (COLO, MEXU, NMC, NY, pf); Carretas, White 912 (ARIZ, MICH).—COAHUILA: without locality, Purpus 5014 (UC).—NAYARIT: Tepic, Palmer 2021 (BM, GH, NY, US), Jones 22854 (CAS, NY, WIS); Tepic to San Blas, Mina Esperanza a Rosa Morada, González-Ortega 6678 (CAS, US), Lay s.n. (K).—MICHOACÁN: 4 mi W of Apatzingán, Leavenworth and Hoogstraal 1368 (F, MICH); Aguaje, Distr. Apatzingán, Hinton et al. 15328 (TEX, pf); 4 mi W of Apatzingán, McVaugh 17899 (MICH).—JALISCO: Mpio. de La Huerta, Estac. Biol. Chamela, Vereda Tejón, Lott 1425 (MEXU, pf); mts. near Lake Chapala, Pringle 4352 (COLO, DS, F, GH, MEXU, MIN, MO, NY, PH, US, VT, WIS); Ocotlán, Cervantes s.n. (IBUG). Barranca of Tequila, Pringle 5454 (GH, MEXU, VT).—SAN LUIS POTOSÍ: Sierra de San Miguelito, cañon arriba de Terrero, alt. 2100 m, Rzedowski 4387 (ENCB).—GUERRERO: Mpio. de Petatlán, terracería a El Camalote, 2 km al NE del entronque con la carr. Petatlán-Zihuatanejo, Koch and Fryxell 83148 (BH, CHAPA, ENCB, F, MEXU, pf); Pungarabato, Distr. Coyuca, Hinton 7113 (GH).

Anoda lanceolata has a superficial resemblance to *A. cristata*, but differs most notably in its yellow corolla and in the elaborately developed endocarp surrounding the seeds. The pollen grains of this species have been described by Hashmi (1970).

10. *Anoda leonensis* Fryxell, sp. nov.

Fig. 1B, 5

Type: MEXICO. Nuevo León: between Linares and Iturbide, near K36, by large bas-relief on cliffside, alt. 4000 ft, 15 Oct. 1969, Fryxell 1207 (holotype: MEXU; isotypes: BH, CTES, MICH, US, pf).

Herbae erectae, caulis foliisque sparsim stellato-pubescentibus vel glabratibus, laminis foliorum ovatis vel hastatis, sursum deminutis; calycibus 5–8 mm longis; petalis luteis, 8–12(–20) mm longis; fructibus oblatis hirsutis; mericarpiis 12–16, calcaribus dorsalibus vestigialibus, endocarpiis reticulatis persistentibus semen solitarium involventibus.

Erect herbs 1–2 m tall with spreading branches, the stems minutely stellate-pubescent, the hairs 0.1 mm long. Leaves long-petiolate, mostly 4–9 cm long, somewhat heteromorphic, the lower leaves more or less ovate-cordate but the leaves commonly hastate or hastately 3-lobed, reduced upwards, minutely stellate-pubescent on the veins, sparsely pubescent to glabrate above and beneath, concolorous or slightly discolored, coarsely crenate. Inflorescences of racemes or open panicles; pedicels slender, 2–6.5 cm long, articulated 4–11 mm below the flower, with pubescence like that of the stems; calyces 5–6(–8) mm long, obscurely 10-nerved, densely and minutely yellowish pubescent, approximately half-divided; petals 8–12(–20) mm long, yellow or orange-yellow, prominently ciliate on the claws, otherwise glabrous; staminal columns 2–3(–5) mm long, pallid, with setae 0.5–1 mm long disposed in 5 vertical rows; filaments 1–2(–4) mm long, the anthers yellowish; styles 12–16, slender, glabrous, pallid, slightly exceeding the

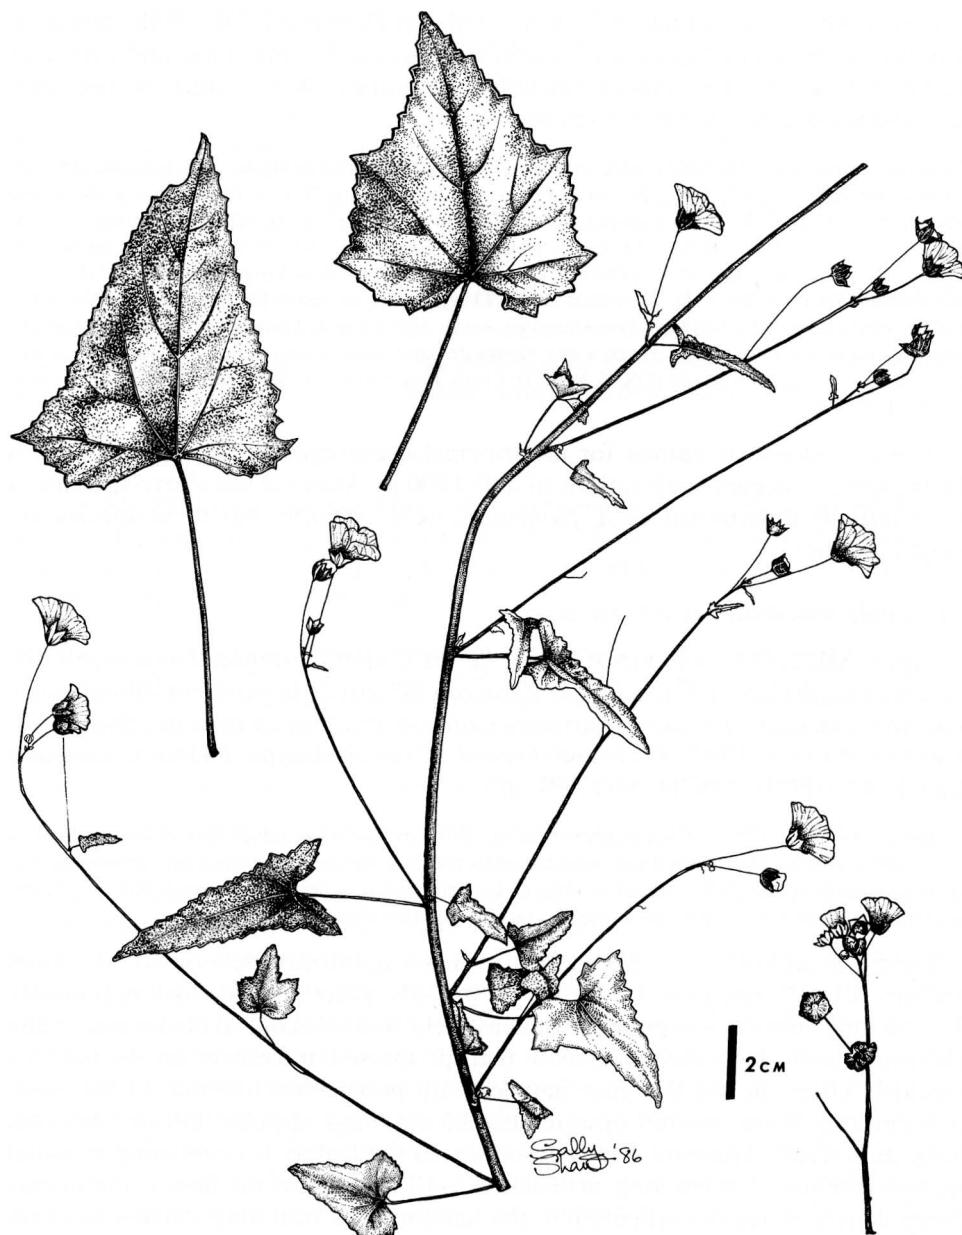

Fig. 5. *Anoda leonensis* (Fryxell 1207).

androecium, the stigmas abruptly capitate, glabrous, pallid or reddish (?). Fruits (Fig. 1B) oblate, 8–9 mm in diam, densely hirsute (the hairs 0.3–0.7 mm long, the longest hairs at the apex); mericarps 12–16, dorsally rounded (crested but lacking spurs), the central rib or crest with dark pigmentation in the immature fruit, the lateral walls evanescent; seeds solitary, each with a persistent reticulate endocarp surrounding the seed 2.5 mm long. Chromosome number: $2n = 30$ (Bates 1987).

Larger flowers are found on *Pringle 3016* and *Dorr et al. 1999* with calyces to 8 mm long, petals to 20 mm long, staminal columns 4–5 mm long, and filaments to 4 mm long. In other respects (including geography) they conform to the other specimens cited below for *A. leonensis*.

Paratypes examined.—MEXICO. NUEVO LEÓN: between Linares and Iturbide, near K32, alt. 2800 ft, 15 Oct. 1969, Fryxell 1212 (pf); 28 km W of Linares, alt. 2000 ft, 20 Oct. 1970, Fryxell, Bates and Blanchard 1697 (BH, K, pf); Cascada Cola de Caballo (Horsetail Falls), SE of Monterrey, 22 Oct. 1981, Dorr *et al.* 1999 (MEXU, TEX, pf); Cañon El Novillo, ca. 10 km S of Iturbide on road to Cuevas, 27 Oct. 1982, Dorr *et al.* 2606 (MEXU, TEX, pf); 6.9 mi W of Linares on Hwy. 58 (Linares-San Roberto Jct.), 23 Oct. 1981, Dorr *et al.* 2035 (TEX); in canyon above El Diente, Monterrey, 4000 ft, Oct. 1961, Smith M580 (TEX); Los Alamillos, Lacás 520 (F); near Monterrey, *Pringle 3016* (GH), Mueller and Mueller 76 (GH).—TAMAULIPAS: Sierra de San Carlos, Cerro de los Armadillos near San José, alt 3100 ft, Bartlett 10168 (DS, F, MICH); Cerro Tres Vetas near San José, alt. 2700 ft, Bartlett 10378 (F, MICH).

Anoda leonensis is named for its principal occurrence in the state of Nuevo León, where it occurs at elevations of 500–1500 m. Many of the above specimens were initially determined as *A. paniculata* or *A. wrightii*, but these species are amply distinct.

11. *Anoda maculata* Fryxell, sp. nov.

Types: MEXICO. GUERRERO: Mpio. de La Unión, carretera Zihuatanejo-Cd. Altamirano, 40 km de Vallecitos de Zaragoza (89 km de la carretera Zihuatanejo-Lázaro Cárdenas). Orilla de la carretera bajo construcción en zona de sabana. Alt. 1300 m, 25 Oct. 1982, Koch and Fryxell 82191 (holotype: CHAPA; isotypes: ENCB, F, MEXU, MICH, MO, US, pf).

Herbae erectae, caulibusstellato-puberulentibus, foliis ovatis vel angulatis fere glabris, praeter in marginibus ciliatis; calycibus 6–8 mm longis; petalis 6–8 mm longis, cremeis maculis atro-sanguineis ad basim; androecis rubellis; fructibus oblates, hirsutis, radiatim spiniferis; mericarpiis ca. 10, endocarpiis reticulatis persistentibus semen solitarium involventibus.

Erect annual herbs to 1.5 m tall, the stems uniformly puberulent, the hairs stellate, 0.1–0.2 mm long. Lower leaves broadly ovate (as wide as long), mostly 3–7 cm long, more or less palmately to hastately 3(–5)-lobed; leaf blades essentially glabrous above, subglabrous beneath (except sparsely pubescent on the nerves), minutely ciliate on the margins; petioles with pubescence like that of the stem, to 6 cm long below, shorter upwards (to 0.5 cm long); stipules filiform, 2–5 mm long, pubescent, caducous. Pedicels solitary in the leaf axils or forming terminal leafless racemes, 2–8 cm long, articulated 5–10 mm below the flower, the pubescence denser above the articulation, the hairs up to 1 mm long; calyces 6–8 mm long, approximately half-divided, prominently stellate-hirsute, especially on the veins and the margins, and lobes ovate with a prominent midrib; corollas 6–10 mm long, cream-colored with a red center, the petals densely ciliate on the claws, otherwise glabrous; staminal columns ca. 2 mm long, prominently ribbed, reddish, glabrous (except with a few hairs at the apex), the filaments purplish, the anthers 20–25, reddish, the pollen yellow-orange; styles slender, pallid, glabrous, the stigmas abruptly capitate, yellowish. Fruits oblate, 7–8 mm in diam, hirsute, with radiating spurs; mericarps ca. 10, the lateral walls disintegrating, the dorsal spurs ca. 1 mm long; seeds totally enclosed in a reticulate indurate endocarp ca. 3 mm long.

Paratypes examined.—MEXICO. GUERRERO: Mpio. de La Unión, carretera Zihuatanejo-Cd. Altamirano, 84 km al N del entronque con carr. Zihuatanejo-Lázaro-Cárdenas. Bosque sabanoide de encino con elementos tropicales; suelo franco. Alt. 1550 m, 23 Oct. 1982, Koch and Fryxell 82161 (CHAPA, ENCB, MEXU, US, pf).—DURANGO: 12 mi E of Cd. Durango, Shreve 9164 (ARIZ, GH).—PUEBLA: just W of Acatlán de Osorio, in road-cut on Hwy 190, 31 Jul. 1979, J. Fryxell 189 (ENCB, MEXU, pf); SE of Izucar de Matamoros, Fryxell 1137 (BH, CTES, DS, GH, MICH, NY, UC, US, pf).—QUERÉTARO: camino arriba de la Cañada, unos 30 kms, alt. 1950 m, 17 Aug. 1980, Arguelles 1434 (ENCB, MEXU).—JALISCO: Barranca de Tequila, Pringle 4575 (ARIZ, ASU, CM, COLO, F, GH, LL, MEXU, MICH, OKLA, NY, UC, US, VT, pf); 1.5 mi W of Atotonilco El Alto, McVaugh 17333 (MICH).

Anoda maculata, as the specific epithet indicates, is distinctive for the dark center of the flower. It is similar to *A. crenatiflora* in many particulars, but the two species may be distinguished by pubescence (especially that of the calyces and pedicels), perhaps by leaf shape and anther number, and by other characters.

12. *Anoda palmata* Fryxell, sp. nov.

Fig. 6

Type: MEXICO. GUERRERO: Mpio. de Coahuayutla de Guerrero, 44–45 km al W de La Unión, terracería a Coahuayutla, alt. 570 m, en bosque caducifolio, 14 Nov. 1983, Koch and Fryxell 83144 (holotype: CHAPA; isotypes: BM, CTES, ENCB, F, MEXU, MICH, MO, pf).

Herbae erectae, late effusae, caulis stellato-pubescentibus et interdum pilis longis simplicibus; superficiebus infernis foliorum stellato-pubescentibus, superficiebus superis foliorum pilis stellatis et pilis simplicibus adpressis, laminis palmatim 3–5-lobatis, latitudinibus loborum sursum decrescentibus; calycibus 5–8 mm longis; petalis flavis, 6–12 mm longis; fructibus oblates, dense stellato-pubescentibus, mericarpis 8–13, dorsaliter calcaratis, temporibus maturationibus parietibus lateribus evanescentibus sed endocarpis reticulatis persistentibus semen solitarium involventibus.

Erect annual herbs 1–1.5 m tall, freely branched, the stems with stellate hairs, 0.2–0.5 mm long and a few very short glandular hairs and sometimes also with long simple hairs 2–3 mm long. Leaf blades mostly 3–8(–10) cm long, the young leaves ovate or slightly lobed, truncate or cordate, coarsely dentate, upwards deeply palmately 5-lobed and ultimately 3-lobed, the lobes becoming narrowly linear-lanceolate, obscurely dentate to entire, acute, essentially concolorous, with stellate hairs 0.5–2 mm long and sometimes also appressed simple hairs above, with 6–8-rayed stellate hairs ca. 0.5 mm in diam uniformly distributed beneath, rarely with irregular purplish blotch along midvein; petioles to 8 cm long (half the length of the blade to equaling the blade), with pubescence like that of the stems; stipules filiform, 3–5 mm long, caducous. Flowers solitary in the leaf axils, forming open terminal racemes more or less exceeding the leaves; pedicels 2–5 cm long, slender, minutely stellate-pubescent, articulated 5–8 mm below the flowers; calyces 5–8 mm long (not accrescent), basally rounded and yellowish or brownish, densely covered with stellate and glandular hairs, half or more divided, the lobes ovate-apiculate, 1-ribbed, with lanate margins; petals yellow, 6–12 mm long, ciliate on the margins of the claws, otherwise glabrous, staminal columns 2–3 mm long, pallid, basally glabrous, prominently hirsute apically (the hairs 0.5 mm long), the filaments 1–2 mm long, the anthers and pollen yellow; styles slender, pallid, glabrous, slightly exceeding the androecium, the stigmas abruptly capitate, 0.3–0.5 mm in diam (at least 3 times the diameter of the style). Fruits oblate, 8–9 mm in diam, densely stellate-pubescent (the hairs 0.5–1 mm long); mericarps 8–13, each with a dorsal spur 0.5–1 mm long, the lateral walls disintegrating at

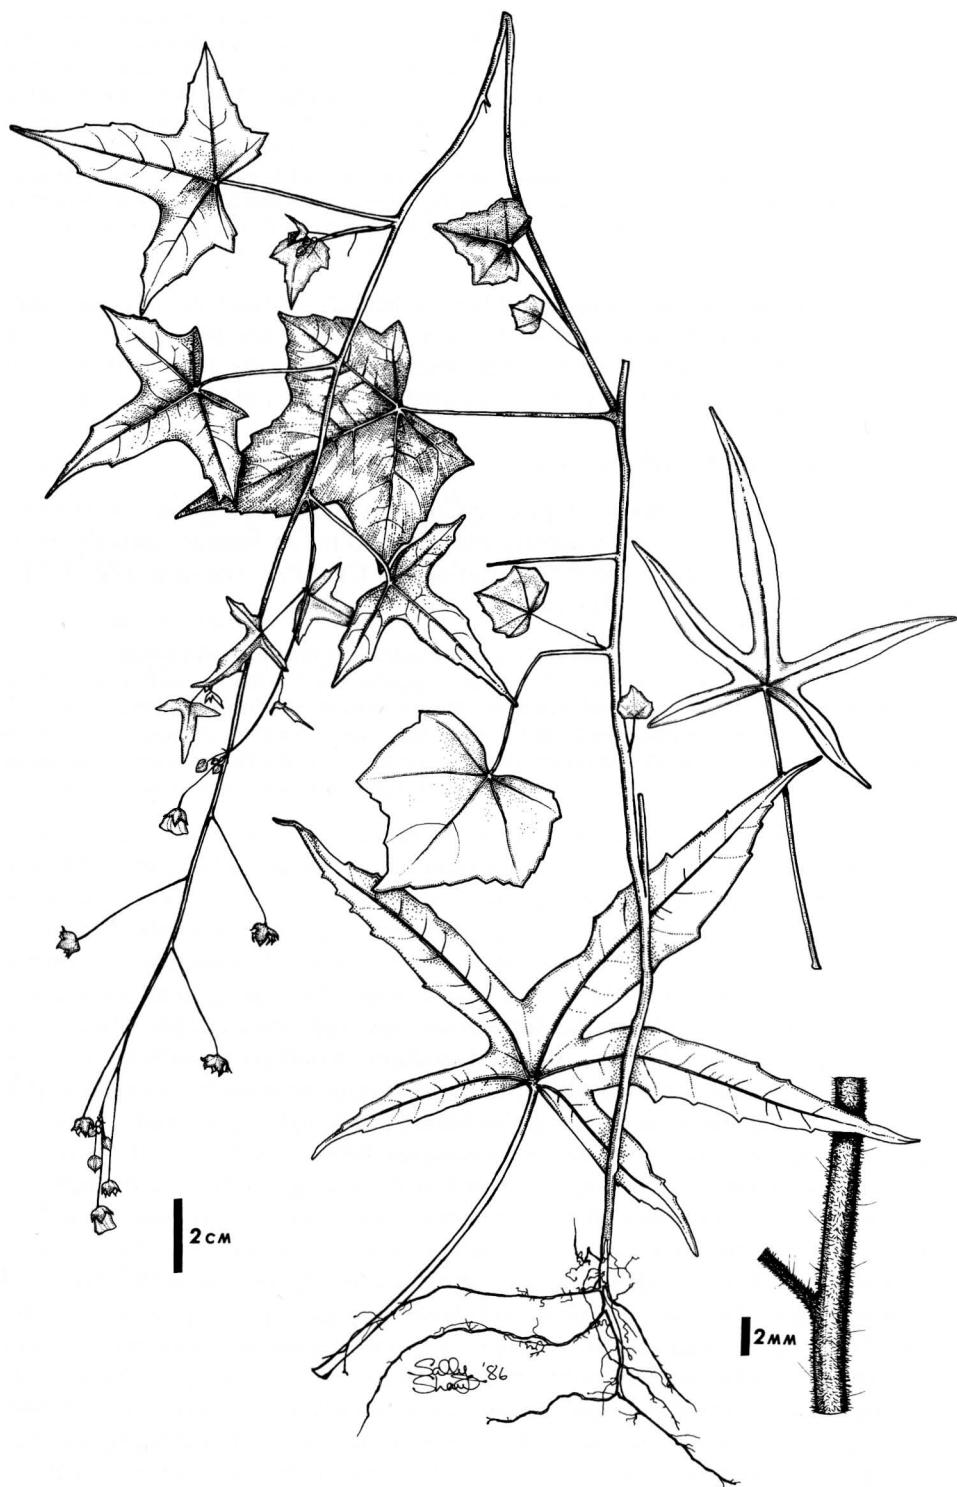

Fig. 6. *Anoda palmata* (plant: Koch et al. 79278; larger separate leaf: Koch and Fryxell 83144; smaller separate leaf: Fryxell et al. 1631).

maturity, leaving a black reticulate endocarp 2.5–3 mm long completely enclosing the solitary seeds. Chromosome number: $2n = 30$ (Bates 1987).

Paratypes examined.—MEXICO. BAJA CALIFORNIA: 28.7 km N of Cabo San Lucas on road to Todos Santos (near $23^{\circ}5'N$, $110^{\circ}5'W$), alt. 500 ft, 16 Dec. 1982, Sanders et al. 3437 (UCR, pf); arroyo near the sea, about 10 mi S of Mission Dolores near $25^{\circ}0'N$, $110^{\circ}47'W$, 5 Dec. 1959, Wiggins, Carter, and Ernst 315 (DS, MICH, US); Arroyo de León, N of road to Los Planes, 22 mi SE of La Paz, elev. ca. 1560 ft, 11 Dec. 1959, Wiggins, Carter and Ernst 502 (DS, MEXU, US, pf); “El Pulpito” del Arroyo de las Parras, W of Loreto, Carter and Kellogg 3160 (CAS, DS); Arroyo Quisapol, E of La Presa along trail to Laguna Caquihui, Wiggins 15571 (CAS, DS); Cape Region, Purpus 338 (UC); Cape Region, ca. 4.5 km of road W from La Palmilla, Moran 7064 (CAS, DS, GH, SD); Cape Region, 11 km N of Santa Anita, Moran 6924 (DS, SD); Cape Region, 1 km E of Arroyo de los Pozos, Moran 6892 (DS, SD); 15 mi SE of La Paz, Wiggins 15658 (CAS, DS); San José del Cabo, 4 Oct 1890, Brandegee 49 (GH, PH, UC).—NAYARIT: near Jesús María, elev. 600–700 m, Feddeema 1228 (MICH).—JALISCO: 7 mi SW of Unión de Tula, alt. 4200 ft, on roadside and rocky hillsides, Fryxell, Bates and Blanchard 1598 (BH, pf, + 6 additional duplicates to be distributed).—MICHOACÁN: Puente Marqués, in Cañon del Marqués, ca. 7 mi S of Gabriel Zamora, alt. 1600 ft, 13 Oct. 1970, Fryxell, Bates and Blanchard 1631 (BH, pf); Mpio. de La Huacana, 0.5 km al S de la Presa Zicuiran, 32 km al E de Nueva Italia, por la carretera a Ario de Rosales, alt 250 m, 13 Nov. 1977, Koch and Fryxell 77520 (CHAPA, pf); Mpio. de Tuzantla, 27 km al S de Tuzantla por la carr. a Huetamo, puente “Las Pilas,” alt. 540 m, 9 Nov. 1983, Koch and Fryxell 8375 (CHAPA, ENCB, F, MEXU, XAL, pf); Mpio. de Huetamo, en Opecuario, 10 km al NW de Santiago Conguripo, Soto-Núñez and Silva 3220 (MEXU); Mpio. de Arteaga, 0.5 km al N de Las Juntas, 16 km al N de Arteaga por la carr. a Nueva Italia, alt. 560 m, 20 Nov. 1983, Koch and Fryxell 83215 (CHAPA, MEXU, MICH, MO, RSA, pf); Mpio. de Aquila, a 10 km al E de Maruata, alt. 120 m, Soto-Núñez, García, and Vidal 11256 (MEXU, pf).—GUERRERO: Mpio. de Petatlán, carretera Acapulco-Zihuatanejo, 28 km al SO de Zihuatanejo, alt. 35 m, 22 Oct. 1982, Koch and Fryxell 82151 (BM, CHAPA, CTES, ENCB, MEXU, MICH, MO, TEX, pf).

Anoda palmata is characterized by notably lobed leaves, as the specific epithet indicates, and bright yellow flowers. It is a plant relatively common in Guerrero, Michoacán, Jalisco, Nayarit, and Baja California, at times growing in large populations. It occurs from sea level to 1500 m elevation.

13. ANODA PANICULATA Hochreutiner, Annuaire Conserv. Jard. Bot. Genève 20: 53. 1916.
Fig. 1C

Type: MEXICO. GUERRERO: Iguala Canyon, 3000 ft, 13 Oct 1906, Pringle 10323 (holotype: G; isotypes: BM, CM, DS [fragment], F, GH, K, MEXU, MIN, MO, NY, PH, UC, US, VT).

Robust erect herbs to 2 m tall, the stems little branched, minutely and uniformly tomentose. Leaf blades variable, the lower leaves more or less simple, angled or slightly lobed, mostly 6–8 cm long, as wide as long, basally cordate or truncate, coarsely serrate or undulate to entire, acute, scabridulous on the margins and the veins beneath, otherwise glabrous, essentially concolorous, sometimes with an irregular purplish blotch along the midrib, the upper leaves becoming more deeply palmately lobed (the sinuses rounded) and finally narrowly hastately lobed; petioles minutely pubescent like the stem (the hairs 0.1–0.2 mm long), one-third as long as blade to equaling the blade. Inflorescences of open terminal racemes; pedicels 1–3.5(–6.5) cm long, with pubescence like that of stem, articulated 3–10 mm below the flower; calyces 6–9 mm long in flower, accrescent to 12 mm long in fruit, 10-ribbed, minutely and densely yellowish stellate-pubescent, ca. half-divided; petals 10–19 mm long, prominently ciliate on the claws with hairs ca. 1 mm long, otherwise glabrous, white or rose drying to pale rose or purple with the claws remaining white; staminal columns whitish, 3–5 mm long, glabrous basally, prominently hirsute apically with hairs ca. 1 mm long, the filaments 3–4 mm

long, the anthers and pollen yellowish; styles slender, pallid glabrous, the stigmas abruptly capitate. Fruits (Fig. 1C) oblate, 8–9 mm in diam, stellate-tomentose; mericarps 11–15, with dorsal spurs 0.5–1 mm long, the lateral walls disintegrating; seeds solitary, each totally enclosed in a persistent black reticulate endocarp 2.5–3 mm long.

Specimens examined.—MEXICO. MICHOACÁN: Mpio. Benito Juárez, 39 km al S de Zitácuaro por la carr. a Huetamo, alt. 1120 m, 8 Nov. 1983, Koch and Fryxell 8357 (CHAPA, F, MEXU, pf).—Edo. MÉXICO: Mpio. de Tejupilco, 0.5 km al SO de la desv. a Luviano (13 km al SO de Tejupilco), carr. Cd. Altamirano-Tejupilco, alt. 1150 m, 30 Oct. 1982, Koch and Fryxell 82247 (CHAPA, CTES, ENCB, MEXU, MICH, MO, TEX, US, pf); El Zapote, carr. Tejupilco-Bejucos, alt. 1000 m, 20 Oct. 1978, Guizar 249 (ENCB); Tejupilco, Distr. Temascaltepec, 1340 m, 30 Sept. 1932, Hinton 1926 (F, MEXU); Cañitas, Distr. Temascaltepec, Hinton 5025 (GH, NY).—GUERRERO: Mpio. de Acapetlahuaya, 32 km al O de Teloloapan por la carr. a Arcelia, alt. 1150 m, 29 Oct. 1982, Koch and Fryxell 82238 (CHAPA, CTES, ENCB, MEXU, MICH, MO, TEX, US, pf); Río Balsas, Pringle 13694 (GH, MICH, US, VT-2); Distr. Aldama, Temisco, Barranca de la Julia, 320–350 m, 1 Nov 1937, Mexia 8726 (ARIZ, CAS, F, GH, LL, MO, NY, UC, US); Iguala Canyon, Pringle 10323 (BM, CM, F, G, GH, K, MEXU, MO, NY, PH, UC, US, VT), Pringle 13691 (GH).

Anoda paniculata is found in the Río Balsas Depression from northern Guerrero to the southern part of the state of México, at elevations of 300–1300 m. It is a robust plant with glabrous foliage and a variable corolla color—the petals may be white, lavender, or rose, generally drying to lavender or purple, with the claws remaining white.

14. ANODA PEDUNCULOSA Hochreutiner, Annuaire Conserv. Jard. Bot. Genève 20:60. 1916

Fig. 1E, 2

Type: MEXICO. HIDALGO: near Tula, 5 Oct. 1896, Pringle 6541 (CAS, CM, F, GH, K, MASS, MEXU, MICH, MIN, MO, NY, PH, UC, VT, WIS).

Erect annual herbs or subshrubs 0.5–1.5 m tall, the stems minutely and uniformly stellate-pubescent. Leaf blades 3–7 cm long (often smaller), ovate (young leaves) to hastately 3-lobed, becoming narrower upwards, obscurely crenate, acute, minutely and sparsely stellate-pubescent, sometimes with an irregular purple blotch along the midrib. Flowers solitary in the leaf axils, long-pedunculate, often grouped apically in terminal racemes or panicles more or less exceeding the leaves; calyces 4–6 mm long, not accrescent, puberulent, half-divided; petals whitish or lavender, 6–15 mm long, prominently ciliate on the margins of the claws; androecium included, the columns pallid, with long transparent hairs apically; anthers and pollen yellow; styles glabrous, 12–13, sometimes reddish, the stigmas abruptly capitate. Fruits (Fig. 1E) oblate, 8–9 mm in diameter, whitish-pubescent, the 12–13 mericarps each with a short dorsal spur, the lateral walls disintegrating at maturity; seeds solitary, each completely enclosed in a blackish reticulate endocarp (Fig. 2). Chromosome number: $2n = 30$ (Bates and Blanchard 1970, as *A. reticulata*; Bates 1987).

Specimens examined.—MEXICO. Erect annual subshrubs 0.5–2 m tall, freely branched, the stems stellate-scabridulous. Leaf blades highly variable in form: early (juvenile) leaves relatively broad, triangular-ovate to weakly hastately lobed or rarely suborbicular, later leaves usually narrowly linear, 1-nerved, often much longer than wide, short-petiolate, discolorous, subentire, minutely stellate-pubescent beneath. Inflorescences of openly branched terminal panicles, the pedicels slender, 1–4 cm long, often scabridulous and somewhat viscid above; calyces 3–4 mm long, minutely pubescent, half-divided, the lobes 1-nerved, apiculate; petals 8–10 mm long, yellow, sometimes drying pale lavender, ciliate on the margins of the claws; androecium pallid, glabrous or sparsely scabridulous apically, the anthers yellowish, sometimes only 5; styles 5–8, pallid, glabrous, the stigmas capitate. Fruits (Fig. 1D) oblate, 4–5 mm in diam, more or less pubescent, 5–8-angled; mericarps 5–8, each with a dorsal spur; seeds solitary, without a persistent endocarp surrounding the seed, but the seeds sometimes adnate to the dorsal wall. Chromosome number: $2n = 30$ (Bates and Blanchard 1970; Bates 1987).

Anoda pentaschista occurs widely through many parts of Mexico and extends into the southern parts of Texas, New Mexico, and Arizona. It sometimes becomes weedy in agricultural fields, roadsides, and disturbed ground. The pollen grains of this species have been described by Hashmi (1970).

16. *Anoda polygyna* Fryxell, sp. nov.

Fig. 1A, 7

Type: MEXICO. SINALOA: Mpio. de Sinaloa y Vela, Sierra Surutató at El Alamo, along road from Mocorito to Surutató, at mouth of Cañon de Tarahumares, alt. 1500 ft, 3 Mar. 1971, *Breedlove* 19033 (holotype: CAS; isotypes: ENCB, pf).

Herbae vel suffrutices erecti, caulibus foliisque dense stellato-pubescentibus, laminis angulatim ovatis vel hastatis vel palmatim lobatis; calycibus 9–11 mm longis; fructibus oblatis, dense hirsutis, mericarpiis 17–20, dorsaliter calcaratis endocarpiis reticulatis persistentibus semen solitarium involventibus.

Erect annual herbs or subshrubs, little branched, the stems densely yellowish tomentose with stellate hairs 0.5 mm long and also with glandular hairs. Leaf blades 3–6 cm long, angularly ovate to hastately or palmately 3-lobed, basally truncate or cordate, obscurely serrate or subentire, sometimes with reddish margins, usually acute, up to 6 cm long, somewhat discoloredous, stellate-pubescent

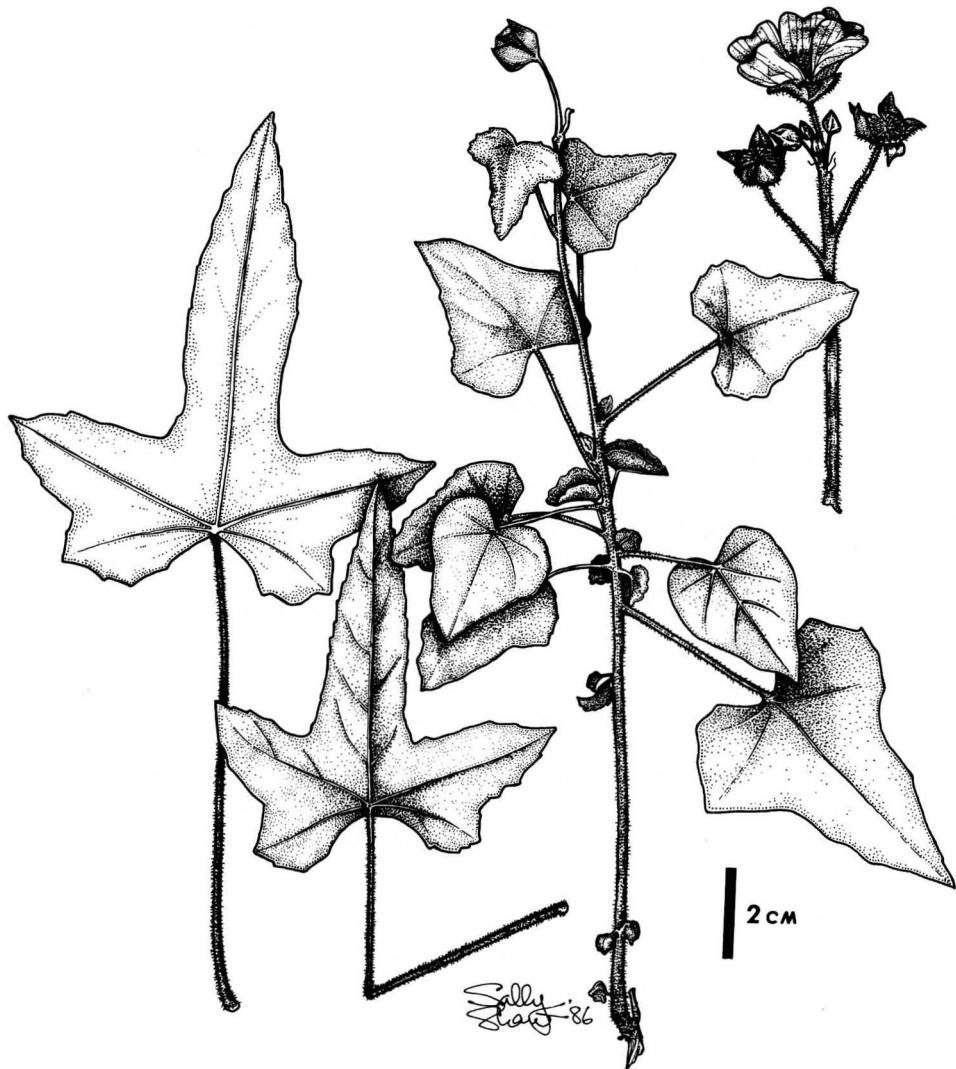

Fig. 7. *Anoda polygyna* (Breedlove 19033).

above and beneath, densely so beneath; petioles shorter than to longer than the blade, with pubescence like that of the stems; stipules filiform, pubescent, 3–4 mm long, caducous. Inflorescences more or less leafless terminal racemes; pedicels 2–5.5 cm long, ascending, with pubescence like that of stems, articulated 2–6 mm below the flower; calyces 9–11 mm long, not accrescent, densely yellowish tomentose and also with glandular hairs, half-divided, the lobes 1-nerved; petals pale lavender, 15–23 mm long, sometimes apically notched, densely ciliate on the claw, the hairs 1 mm long, otherwise glabrous; staminal columns ca. 5 mm long, pallid, prominently hirsute, the hairs simple, ca. 1 mm long, somewhat retrorse; filament 3–4 mm long; anthers yellowish; styles 17–20, pallid, glabrous, the stigmas abruptly capitate, reddish, glabrous. Fruits (Fig. 1A) oblate, 8–9 mm in diam, densely hirsute (the hairs to 1 mm long); mericarps 17–20, each with a

dorsal spur 0.5–1 mm long, the lateral walls evanescent at maturity; seeds solitary, glabrous, with a black reticulate endocarp completely enclosing the seed.

Paratypes examined.—MEXICO. SONORA: Cañon Salitrero, Río Mayo, Gentry 1234 (MICH, SMU).—DURANGO: 20 mi W of Laguna del Progreso (120 mi W of Durango), gorge of Río Ventana, Hurd 56 (MICH).

Anoda polygyna is characterized by having the greatest carpel number (17–20) of any species of the genus (as the specific epithet indicates), by having relatively dense stellate pubescence, and by having relatively large flowers.

17. *ANODA PRISTINA* Fryxell, Syst. Bot. 4:253, Fig. 1. 1979.

Fig. 1N, 2

Type: MEXICO. CHIAPAS: Mpio. de Tenejapa, paraje de Kulak'tik, in the barrio of Chana', alt. 4800 ft, Breedlove 7546 (holotype: DS; isotype: MICH).

Perennial herbs or subshrubs, the stems hollow (?), reddish, with short pungent hairs and a few glandular hairs, becoming glabrate. Leaf blades 7 cm long, 10 cm wide (smaller upwards), palmately 3(–5)-lobed, subentire, acute, glabrate except where appressed-ciliate on the margins, discolorous; petioles to 5 cm long, with antrorse hairs; stipules filiform, 2–3 mm long. Pedicels solitary in the leaf axils, articulated 5–8 mm below the flower, uniformly hispid, the hairs 0.5–1 mm long, more or less antrorse; calyces 5–6 mm long in flower, accrescent to 12–14 mm long in fruit, almost glabrous, with 10 relatively prominent nerves, half-divided; petals purplish, 7–9 mm long, glabrous; androecia pallid, ca. 4 mm long, the filaments more or less grouped in 5 fascicles; styles slender, the stigmas capitate. Fruits (Fig. 1N) oblate, 10–13 mm in diam, subglabrous; mericarps (Fig. 2) 12–13, apically dehiscent, the lateral walls evanescent but with a coarse reticulum persisting; seeds solitary, 3 mm long, with short appressed pubescence (appearing glabrous).

The distinctive characters of mericarp structure set *A. pristina* apart from all other members of the genus: mericarps that are apically dehiscent and that have a persisting reticulum in the lateral walls. In overall habit, the plant shows some resemblance to the common *A. cristata* but may prove to be allied to *A. succulenta* when both are better known. At present *A. pristina* is known only from the type collection.

18. *ANODA PUBESCENS* Schlechtendal, Linnaea 11:218. 1837

Fig. 1K

Type: MEXICO. HIDALGO: Mineral del Monte, Ehrenberg s.n. (HAL?).

Periptera grandiflora Fryxell, Bol. Soc. Bot. México 33:42. 1974. *Type:* MEXICO. Edo. MÉXICO: Mpio. de Texcoco, Cerro de Purificación, 11 Nov. 1951, Gold s.n. (holotype: MEXU).

Perennial herbs 0.5–1.5 m tall, the stems sparsely scabridulous, the hairs stellate, 0.2–0.4 mm long. Leaf blades broadly ovate below to narrowly triangular or hastately 3-lobed above, deeply cordate, 3–8 cm long, serrate, acute or acuminate, minutely and sparsely stellate-pubescent above and beneath, essentially discolorous; petioles with pubescence like that of the stems, to 6 cm long but shorter upwards. Pedicels 1–5 cm long in flower, somewhat longer in fruit, articulated 2–4 mm below the flowers; calyces 6–12 mm long, densely stellate-tomentose, deeply 5-lobed, the lobes lanceolate-oblong, 1-nerved, more or less apiculate; petals 7–

14 mm long, lavender (whitish on the claw), ciliate on the margins of the claws, otherwise glabrous; staminal columns whitish, ca. 7 mm long, stellate-pubescent apically, the filaments ca. 2 mm long, the anthers lavender, subequal to the petals, the pollen yellow; styles slender, the stigmas capitate. Fruits (Fig. 1K) oblate, 7–8 mm in diam, densely and minutely stellate-pubescent; mericarps 8–10, each with a dorsal spur up to 0.5 mm long, the lateral walls evanescent; seeds solitary, glabrous, 3 mm long, not enclosed in an endocarp. Chromosome number: $2n = 30$ (Bates 1987).

Specimens examined.—MEXICO. SAN LUIS POTOSÍ: *Parry and Palmer* 78 (GH, MO-2, NY); Sierra de San Miguelito, cerca de El Capulin, alt. 1400 m, Rzedowski 3991 (ENCB).—HIDALGO: 5.5 km N of Pachuca, 8100 ft, Fryxell, Bates and Blanchard 1675 (BH, pf); near Pachuca, 8000 ft, Pringle 6969 (CM, F, GH, MASS, MEXU, MIN, MO, NY, UC, US, VT, WIS, pf); Ixmiquilpán, Aug. 1905, Purpus s.n. (UC). 6 km W de Pachuca, 2450 m, Rzedowski 22952 (ARIZ, ENCB, LL, MICH, pf); 20 km al NE de Zimapán, alt. 2100 m, Rzedowski 23321 (ENCB, pf); 6 km al NE de Pachuca, alt. 2700 m, Rzedowski 26848 (ENCB, LL, pf); Cerro Grande, 2 km al WNW de Epazoyucan, alt. 2550 m, Rzedowski 29472 (ENCB, pf); extremo NW de Pachuca, 2600 m, Medina 1808 (ENCB, MEXU, MICH, pf); Mpio. de Tolcayuca, Valle de El Borrego, alt. 2500 m, Ventura 3671 (ENCB, MEXU, pf); Mpio. de Tepeapulco Cerro Xihuingo, alt. 2700 m, Ventura 360 (ENCB, MEXU, SD, pf); Mpio. de Tlalnalapa, Cerro de Tepan, alt. 2600 m, Ventura 266 (ENCB, MEXU, pf); Pachuca, Purpus 1685 (F, GH, MO, NY, RSA, UC); Hacienda Pitayas, 10 km al SW de Pachuca, alt. 2350 m, Rzedowski 24278 (ENCB).—EDO. MÉXICO: Cerro de Purificación, Gold s.n. (MEXU).—PUEBLA: Cerros near San Luis Tultitlanapa, Purpus 2610 (F, GH-2, MO-2, NY-2, UC, pf).

Anoda pubescens is clearly allied to *A. henricksonii*, from which it differs morphologically (see key) and geographically. Fresh flowers show a slightly geniculate staminal column, but this feature is poorly if at all preserved in a dried specimen, so it does not enter into the preceding description. The pollen grains of this species have been described by Sánchez (1982).

19. ANODA RETICULATA S. Watson, Proc. Amer. Acad. arts 17:368. 1882.

Fig. 1F

Type: UNITED STATES. ARIZONA: Santa Catalina Mountains, May 1881, Lemmon and Pringle s.n. (holotype: GH).—*Note:* Pringle 284 (GH) and Pringle s.n. 16 May 1881 (VT) were presumably collected at the same time and place as the type.

Erect herbs ca. 1 m tall, the stems scabridulous (the hairs <0.5 mm long, rigid, simple, bifurcate, or stellate) and with some glandular hairs. Leaves petiolate, ovate when young but later leaves deeply 3-lobed (rarely 5-lobed), the lobes narrowly linear, 1–5 mm wide, the central lobe mostly 3–6 cm long, the lateral lobes 2–4 cm long, reduced upwards to filiform leaves and ultimately in the inflorescences to stipuliform bracts; the larger leaves serrate to subentire, with an irregular purple blotch along the midrib, minutely stellate-pubescent above and beneath, more densely so beneath. Pedicels solitary in the leaf axils or forming terminal (essentially leafless) racemes, slender, up to 8.5 cm long, articulated 4–8 mm below the flowers, with pubescence like that of the stems, the hairs scabridulous and often somewhat antrorse; calyces ca. 5 mm long (not accrescent), densely stellate-pubescent, half-divided, the lobes with prominent midribs, apiculate; petals 5–8 mm long (slightly longer than the calyces), lavender or purple, ciliate on the claws; staminal columns ca. 2 mm long, pallid, glabrous or with a few hairs, the filaments purplish, the anthers yellowish; styles and stigmas clavate,

yellowish, recurved. Fruits (Fig. 1F) oblate, 6–7 mm in diam, 3–4 mm tall, stellate-pubescent (the hairs ca. 0.5 mm long); mericarps 10–11, the dorsum of each rounded (the spur totally absent), the lateral walls evanescent, the solitary seeds completely enclosed in a black reticulate endocarp 2.5 mm long.

Specimens examined.—UNITED STATES. ARIZONA: Santa Cruz Co., Sycamore Canyon near Ruby, elev. 3500–3700 ft, 24 Sept. 1939, “petals dull purplish red,” Kearney and Peebles 14453 (ARIZ-fragment); Santa Catalina Mtns., May 1881, Lemmon and Pringle s.n. (GH), 16 May 1881, Pringle s.n. (VT), Pringle 284 (GH).—MEXICO. SONORA: San Bernardo, Río Mayo, 26 Feb. 1935, Gentry 1355 (ARIZ, F, MICH, MO, WIS); 21 mi NE of Ures, Drouet and Richards 3728 (F); 15 mi from Ures on road to Baviácaro, elev 2860 [ft], 21 Sept. 1934, Wiggins 7373A (DS); Quiricoba, Distr. Alamos, palm-oak assoc., 14 Nov. 1933, Gentry 818 (DS, MICH); Cañon Estrella, Distr. Alamos, Gentry 433 (MICH); región de Bavispe, Cañon del Agua Amarga, White 3618 (GH, MICH, US); about La Nopalera, Mpio. de Nacore Chico, Muller 3674 (GH).—SINALOA: Cerro Colorado, 5 Nov. 1904, Brandegee s.n. (UC).

The distinctive features of *A. reticulata* are the total absence of spurs on the fruits and the distinctive trilobed leaves with linear lobes, at least on well-grown mid-stem leaves. It is sometimes confused with *A. thurberi* because of the similar small, bluish flowers, but these two species differ markedly in fruit characters (cf. Figs. 1F and 1L) and in leaf shape. The pollen grains of this species have been described by Sánchez (1982, as *A. thurberi*).

20. *Anoda speciosa* Fryxell, sp. nov.

Fig. 8

Type: MEXICO. Edo. MÉXICO: hills [N of] Toluca, 9000 ft, 23 Sept. 1900, Pringle 9249 (holotype: VT; isotypes: GH, US).

Herbae vel suffrutices erecti, caulis uniformiter stellato-scabridiusculis; foliis hastato-trilobis, profunde cordatis ad basem, minute stellato-pubescentibus; calycibus 12–15 mm longis; petalis lavandulis, 22–28 mm longis; columna staminali 20 mm longi, fere glabri; fructibus ignotis.

Herbs or subshrubs of unknown height, the stems uniformly scabridulous (the hairs stellate), sometimes purplish on one side. Leaf blades hastately 3-lobed, deeply cordate at the base, crenate-dentate or subentire, to 10 cm long (smaller and narrower upwards), acute or acuminate, somewhat discolored, minutely stellate-pubescent throughout; petioles to 6.5 cm long, $\frac{1}{4}$ – $\frac{3}{4}$ as long as the blade, with pubescence like that of the stems; stipules 6–9 mm long, filiform. Pedicels solitary in the leaf axils, usually exceeding the subtending petioles, up to 5.5 cm long, more or less aggregated apically into racemiform inflorescences, with pubescence like that of the stems; calyces in flower 12–15 mm long, minutely stellate-pubescent, $\frac{2}{3}$ -divided, the lobes lanceolate-acuminate, 1-nerved; petals 22–28 mm long, 15–18 mm wide apically, tapered to a narrow claw, ciliate on the margins of the claws; staminal columns ca. 20 mm long, essentially glabrous but with a few minute hairs, pallid, bearing filaments apically; filaments 3–5 mm long, the anthers ca. 40, lavender (?), the pollen yellow-orange; styles and stigmas not seen. Fruits unknown.

The specific epithet is chosen in reference to the large and showy flowers. This species is characterized by an androecium subequal to the corolla (in common with *A. pubescens* and *A. henricksonii*), but with a larger corolla and larger staminal column than in these species. All three occur at relatively high elevations.

Fig. 8. *Anoda speciosa* (Pringle 9249).

21. *Anoda succulenta* Fryxell, sp. nov.

Type: MEXICO. CHIHUAHUA: La Cienegita, Río Mayo, canyon, Upper Sonoran, flower yellow, 10 Sep. 1936, *Gentry* 2638 (holotype: DES).

Herbae erectae caulis succulentis, fere glabris sed in petiolis pedicellisque seriebus angustis pilorum debilium et aliquot pilis pungentibus; foliis palmatim lobatis sinibus rotundatis prominentibus; pedicellis solitariis, folium consociatum subaequantibus; calycibus 10–12 mm longis, glabris vel in marginibus pilis perpaucis pungentibus; petalis 15–16 mm longis luteolis; fructibus ignotis.

Erect succulent herbs, 1.5 m tall, with thick hollow stems that are essentially glabrous. Leaf blades palmately 3–5-lobed, palmately 7-nerved, up to 11.5 cm long, about as wide, basally cordate-hastate (the sinus narrowly acute), entire, acute, the central lobe broadly ovate, narrowed at the base making the sinuses characteristically rounded, glabrous above and beneath and on the margins; petioles subequal to the blades, with a narrow line of weak hairs on the adaxial side and a few spinescent hairs 0.5–1 mm long, otherwise glabrous, sometimes purplish on the adaxial side; stipules 5–7 mm long, ciliate, caducous. Pedicels in the leaf axils, to 13 cm long (subequal to the subtending leaves at anthesis), with a narrow line of hairs and sometimes purplish on the adaxial side, otherwise glabrous; calyces 10–12 mm long, externally glabrous or with a few pungent hairs on the margins, internally wooly, half-divided or more, the lobes lanceolate, acute, 1-nerved; petals yellowish, 15–16 mm long, densely bearded on the margins of the claws (hairs 1 mm long), otherwise glabrous; staminal columns pallid, ca. 3 mm long, with a few hairs apically; filaments 2–3 mm long, the anthers yellowish, numerous; styles slender, pallid, the stigmas capitate (of uncertain number). Fruits unknown.

Paratypes examined.—MEXICO. SINALOA: Sierra Surotató, Quebrada de Mansana, oak forest, 4000–4500 ft, in rocky clearing, succulent hollow-stemmed herb 1.5 m high, fls. yellow, 10–11 Sep. 1941, *Gentry* 6518 (DES).

As the specific epithet indicates, *Anoda succulenta* is distinctive (indeed apparently unique in the genus) for its hollow, succulent stems. It also has a leaf form (palmately lobed, with broad rounded sinuses) that is distinct within the genus. It may be allied to *A. pristina*.

22. *ANODA THURBERI* A. Gray, Proc. Amer. Acad. Arts 22:299. 1887. Fig. 1L

Lectotype: MEXICO. CHIHUAHUA: Sta. Eulalia Mtns., “along the railroad, just below Sta. Eulalia Station,” 3 Oct. 1885, *Pringle* 283 (lectotype: GH; isolectotypes: BM, BR, COLO, DS-2, F, K, MASS, MO, NY-2, PENN, PH, RSA, UC, US, VT, WIS, pf). The lectotype was designated by Hochreutiner (1916).

Erect herbs ca. 1 m tall, the stems minutely pubescent with stellate and glandular hairs 0.2–0.4 mm long. Leaf blades 5–8 cm long, heteromorphic (the lowermost leaves ovate-cordate, mid-stem leaves hastately 3-lobed, the uppermost narrowly hastate or triangular), sometimes with an irregular purple blotch along the midrib and sometimes also with purple margins, obscurely or manifestly serrate, moderately or sparsely pubescent above and beneath, the hairs minute and stellate or rarely simple on upper surface; petioles half length of blade to subequal to the blade. Flowers solitary in the leaf axils or more commonly forming terminal racemes or open panicles more or less exceeding the leaves, the pedicels slender,

1–3 cm long, articulated 1–4 mm below the flower, with pubescence like that of the stems; calyces 3.5–6 mm long in flower, accrescent to 6–8 mm long in fruit, stellate-pubescent, half-divided or more, the lobes with a pronounced midrib, acute or apiculate, somewhat revolute in fruit; corollas 4–7 mm long, bluish lavender, often with dark centers, ciliate on the claws, otherwise glabrous; staminal columns 1.5–2(–4) mm long, stellate-pubescent, pallid or lavender, the filaments <1 mm long, the anthers few (10–20), lavender, the pollen orangish; styles and stigmas barely exceeding the androecium, minutely clavate, yellowish. Fruits (Fig. 1L) oblate, 6–8 mm in diam, minutely pubescent (the stellate and glandular hairs to 0.5 mm long); mericarps 6–8, with dorsal spurs very short (or up to 1 mm long), the lateral walls evanescent; seeds solitary, 2–2.5 mm long, glabrous, the endocarp incomplete and fragile or absent. Chromosome number: $2n = 26, 28$ (Bates 1987).

Specimens examined.—UNITED STATES. ARIZONA: Chiricahua Mtns., Paradise, 5500 ft, 28 Sept. 1907, Blumer 1670 (ARIZ, F, NY), Blumer 1730 (ARIZ, DS, F, GH, MO, NY); Cochise Co., S of Tombstone (Hwy 80), 4200 ft, 24 Sept. 1940, Grimes s.n. (ARIZ); plain near Ft. Huachuca, 23 Oct. 1926, Peebles, Harrison and Kearney 3381 (ARIZ); near Ft. Bowie, Lemmon 515 (GH, UC); 2.9 mi SW of Bisbee city limits, 4600 ft, Sanders et al. 5175 (UCR, pf).—MEXICO. SONORA: Bisore, Lloyd 372 (GH).—CHIHUAHUA: Sta. Eulalia Mts., Pringle 2349 (MO), Pringle 283 (BM, BR, COLO DS-2, F, GH, K, MASS, NY-2, PENN, PH, RSA, UC, US, VT, WIS, pf); 10 km S of Progreso, just W of Coahuilan border, along Sierra Seca, Stewart 2296 (GH, LL); Arroyo de Fierro, 35 mi SE of Camargo, 4600 ft, 24 Sept. 1938, Shreve 8869 (ARIZ, GH, UC)—COAHUILA: ca. 26 air mi SE of Torreón in Sierra de Jimulco, 5800 ft [25°12'N, 103°16'W], Henrickson 13245 (LL); cerca de Piedras Negras, Paray 2558 (ENCB); Sierra del Pino, ca. 25 km NW of La Noria, Stewart 1261 (GH).—DURANGO: ca. 20 km SW of Torreón near village of Chocolate, Fryxell and Bates 2066 (BH, pf); 87 mi NE of Durango between Guadalupe Victoria and Cuencame, 6000 ft, Rollins and Tryon 58286 (LL).—AGUASCALIENTES: near city of Aguascalientes, 9 Oct. 1903, Rose and Painter 7744 (US).—GUANAJUATO: Taboada, cerca de Balneario, Arguelles 1997 (MEXU, pf).—TAMAULIPAS: between Palmillas and Mi-quihuana, alt. 5000 ft, Fryxell, Bates and Blanchard 1694 (BH, pf).—SAN LUIS POTOSÍ: Los Amoles, Mpio. de Guadalcazar, alt. 1650 m, Rzedowski 6768 (ENCB); 15 km al NW de Ciudad del Maíz, alt. 1200 m, Rzedowski 9442 (ENCB).—QUERÉTARO: km 11, carretera a Celaya, Arguelles 832 (CAS, MEXU); Camino a Celaya, pasando a Balvandera, Arguelles 548 (MEXU).—HIDALGO: near Tula “vicinity of Dublan Station,” 6800 ft, Pringle 6536 (CAS, CM, F, GH, MASS, MICH, MIN, MO, NY, US, VT, WIS, pf).—JALISCO: ca. 10 km NW of Huejuquilla El Alto, Dieterle 3076 (MICH).—MICHOACÁN: Mpio, Benito Juárez, 43 km al S de Zitácuaro por la carr. a Huetamo, alt. 910 m, Koch and Fryxell 8356 (CHAPA, MEXU, pf).—MORELOS: Cerro Acatlipa, Vázquez 2067 (MEXU).—GUERRERO: Mpio. de Buena Vista de Cuellar, 8 km al N de Iguala, alt. 890 m, Koch, Fryxell and Wendt 7983 (pf); between Taxco and Iguala, alt. 4700 ft, Fryxell and Bates 2164 (BM, pf).—PUEBLA: SE of Izucar de Matamoros, alt. 4200 ft, Fryxell 1138 (BH, CTES, pf); near San Luis Tultitlanapa, Purpus 4187 (F, GH, MO, NY, UC).—OAXACA: Monte Albán, near Oaxaca City, Smith 641 (F, MO, NY).

Anoda thurberi is a widespread species that is distinct for its small, blue-purple flowers, a characteristic it shares with *A. reticulata*, with which it is sometimes confused. These two species are clearly distinguished by leaf shape and fruit characters, however, and need not be confused. Bates (1987) has shown cytogenetic affinity of *A. thurberi* with *Periptera punicea*. Further study is needed to clarify the generic relations of *Anoda* and *Periptera* and the placement of *A. thurberi*.

23. *Anoda zuccagnii* (Sprengel) Fryxell, comb. nov.

Fig. 1H

Basionym: *Sida zuccagnii* Sprengel, Syst. 3:121. 1826, based on: *Sida acerifolia* Zuccagni in Roemer, Collect. 148. 1809 [non (Cavanilles) Medikus, 1787].—*Type:*

in cultivation from seeds from J. Bianchi, Zuccagni s.n. (FI-lost).—*Anoda acerifolia* (Zuccagni in Roemer) DC. Prodr. 1:459. 1824.—*Sida quinqueloba* DC. Prodr. 1:459. 1824, pro syn.

Annual or perennial herbs or subshrubs, erect or decumbent to prostrate, the stems prominently or obscurely hispid with the hairs spreading and retrorse, or almost glabrous. Leaves petiolate, palmately lobed below to narrowly hastate above, subentire, acute, sparsely pubescent to glabrate, sometimes with an irregular purple blotch along the midrib and sometimes also purple-margined. Flowers solitary in the leaf axils, with long peduncles; calyxes 6–11 mm long in flower, accrescent to 10–15 mm long in fruit, often more or less hispid; petals purple or lavender, 12–18 mm long; androecia included, the staminal columns apically hispid, basally glabrous. Fruits (Fig. 1H) oblate, 8–11 mm in diam, without spines or with short spurs, densely hispid; mericarps 7–11, gibbous, indehiscent, the lateral walls evanescent; seeds solitary, glabrous, 2.5 mm long, lacking an endocarp surrounding each seed. Chromosome number: $2n = 30$ (Bates 1987).

Specimens examined.—MEXICO. BAJA CALIFORNIA: NW edge of Todos Santos, Moran 6991 (DS, GH, SD); Comondú, Wiggins 5493 (GH, MICH, NY, UC); floor of canyon above San José de Comondú, Carter et al. 2111 (MEXU, UC).—SONORA: 16 mi S of Hermosillo, road to La Palma, Wiggins and Rollins 196 (DS, GH, NY).—CHIHUAHUA: Southwestern Chihuahua, Palmer 234 (GH, MICH, NY, US, pf).—SINALOA: ca. 20 mi SE of Villa Unión on rt. 54, Lehto 24168 (ASU, pf); San Pedro, between Culiacán and Navolato, Fryxell 3042 (BH, CTES, pf); near Mazatlán, González-Ortega 5993 (POM); El Roble, Villa Unión, González-Ortega 6530 (GH); Cerro Tecomate, W of Pericos, Gentry 5774 (ARIZ, DES, MO); Mazatlán, Wright 1205 (F, GH, UC); vic. Anoda zuccagnii and *A. cristata* are almost impossible to distinguish without fruits. Even with mature fruits, the distinction is sometimes problematical. The

two species are recognized as distinct in this study because there appear to be two distinct morphological modes (cf. distinctions given in key and Fig. 1G and Fig. 1H), although some overlap of certain character expressions exists, and a few individuals show intermediate expressions. For example, the number of carpels in *A. zuccagnii* varies between 7 and 11 with a modal value of 9; for *A. cristata* the range is 10 to 18 with a modal value of 13. Nevertheless, I recognize that genetic, cytological, and other studies may find that the recognition of two species cannot be supported. For the present, however, they appear distinct.

ACKNOWLEDGMENTS

I am indebted to the curators of the several herbaria cited herein for the loan of specimens and in many cases for hospitality and assistance when visiting at their institutions; they are too numerous to mention individually by name. I am grateful to David M. Bates for making available his manuscript on *Anoda* cytology and for many shared thoughts on *Anoda*, although the interpretations presented here are my own responsibility. I thank Sally Shaw for her skill in preparing all of the illustrations used here except Fig. 2.

APPENDIX

Names of doubtful identity, possible synonyms, and names of species excluded from *Anoda*.

<i>Anoda angustifolia</i> Sprengel	species <i>dubia</i>
<i>Anoda arenariaeflora</i> Hort. ex Steudel	= <i>Anoda crenatiflora</i> Ortega, fide Hochreutiner (1916)
<i>Anoda decumbens</i> (St.-Hil. & Naudin) Hochreutiner	= <i>Sida jussieana</i> DC.
<i>Anoda denudata</i> (Nees & Mart.) K. Schumann	= <i>Briquetia denudata</i> (Nees & Martius) Chodat & Hassler
<i>Anoda fernandeziana</i> Steudel	= <i>Anoda hastata</i> Cav., fide Reiche (1895)
<i>Anoda hirsuta</i> Philippi	= <i>Abutilon hirsutum</i> (Phil.) Reiche, fide Reiche (1895) [non (<i>Vellozo</i>) Schumann, 1891]
<i>Anoda incarnata</i> H.B.K.	= <i>Periptera punicea</i> (Lagasca) DC.
<i>Anoda ochsenii</i> Philippi	= <i>Corynabutilon ochsenii</i> (Phil.) Kearney
<i>Anoda ovata</i> Meyen	= <i>Sida fallax</i> Walpers, fide Hochreutiner (1916)
<i>Anoda periptera</i> (Sims) Hochr.	= <i>Periptera punicea</i> (Lagasca) DC.
<i>Anoda punicea</i> Lagasca	= <i>Periptera punicea</i> (Lagasca) DC.
<i>Anoda pygmaea</i> Correll	= <i>Fryxellia pygmaea</i> (Correll) Bates
<i>Anoda rubra</i> Tenore ex Hochr.	= <i>Periptera punicea</i> (Lagasca) DC.
<i>Anoda strictiflora</i> Steudel	= <i>Modiola caroliniana</i> (L.) G. Don
<i>Anoda waltherifolia</i> (Link) Schum.	= <i>Malvastrum tomentosum</i> (L.) S. R. Hill
