Asian Indigeneity, Indigenous Knowledge Systems, and the Challenges of 2030 Agenda --Manuscript Draft--

Manuscript Number:	EACR-D-18-00015R1	
Full Title:	Asian Indigeneity, Indigenous Knowledge Systems, and the Challenges of 2030 Agenda	
Article Type:	Original Paper	
Funding Information:	CHED-Newton Fund (R37C11)	Mr Dave Paladin Buenavista
Abstract:	<p>Adopted by the UN General Assembly in 2015, the 2030 Agenda pledges to leave no one behind through the 17 Sustainable Development Goals (SDGs) and 169 targets ratified by the international community to address the global challenges of our time. This framework and universal action plan articulates the inclusion of the indigenous peoples in the social, economic, and environmental dimensions of sustainable development. Nonetheless, the world's largest inhabitants of indigenous peoples are in Asia. However, despite the affirmation of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP), the concept of indigeneity is still controversial, politically contested, and considered immaterial by many states in the Asian region. With limited rights and inadequate access to social services, the indigenous knowledge systems and practices has evolved through time to provide solutions to local problems that sustained many marginalised communities. This article revisits the socio-political notion of indigeneity in the region and its implications to the indigenous community. It also explores the diversity of indigenous knowledge systems and traditional practices and its relevance on the SDGs particularly on food security, community livelihoods, human well-being, natural resources management, and biodiversity conservation. The conclusion reflects the need for legitimate recognition and political enablement of indigenous peoples in the implementation of 2030 Agenda by forging collaborations between academic researchers, policy-makers, and indigenous organizations in the Asian community.</p>

Author Comments:		
Response to Reviewers:	<p>The authors are very grateful to the insightful comments and recommendations provided by the two reviewers. We revised the paper following their suggestions to improve the content of this article.</p> <p>Reviewer_1 1.I expect you to explain more about how the 2030 Agenda can be driven within Asian context such as the importance of role of government and indigenous groups.</p>	

Actions Taken/Response: In page 9 of the revised manuscript, we included the initial progress in the implementation of the 2030 Agenda in selected Asian countries that adopted the Sustainable Development Goals (SDGs). The role of the government and indigenous peoples organizations have been tackled in this section.

2. Could you put more of your explanations on re-developing and re-arranging the Indigenous Knowledge System of indigenous people and how to make the indigenous groups to be centered at this movement?

Actions Taken/Response: In page 11, we noted that various multilateral treaty and intergovernmental bodies like the Intergovernmental Panel on Climate Change (IPCC), the Convention on Biological Diversity (CBD), and the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) expressed the need of including indigenous knowledge systems in international reports emphasizing its importance on global policy. To be centered in this movement, we discussed in page 9 the key role of the indigenous groups in the sustainability agenda through indigenous knowledge integration in environmental governance initiated by other countries i.e. Australia.

3. How can the knowledge system be used to legitimize the indigenous people in the concept of 2030 Agenda?

Actions Taken/Response: We proposed in this article to define indigenous peoples not as the often argued "first people" but as distinct peoples inhabiting the traditional territories or ancestral lands attested by history and inimitable cultural identity and is the non-dominant voiceless sector of the multicultural realities in Asia. The distinctiveness of cultural identity is manifested by the exclusive practice of indigenous knowledge systems and their social exclusion/non-integration is an evidence of being socioculturally different from the majority of the populations.

4. I suggest to correct some grammatical errors such as in the part 3. Indigenous peoples in the Sustainable Development Goals (SDGs): Two of the SDGs specifically are referred to the indigenous peoples in its target by 2030. First, it is the Goal 2 section 2.3 on enhancing agricultural productivity and income of small-scale producers, in particular the indigenous peoples and other marginalized groups, including through secure and equal access to land, other productive resources and inputs, knowledge, financial services, markets and opportunities for value addition and non-farm employment (United Nations 2015). The second goal broadly aims to end hunger, achieve food security and improved nutrition and promote sustainable agriculture. Second, it is the Goal 4 section 4.5 on eliminating gender disparities in education and ensuring equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children in vulnerable situations (United Nations 2015).

Actions Taken: Reviewed and corrected

Reviewer 2

a. Need to be addressed the possibility that the 2030 Agenda could be adapted within Asian context in a more detailed way. Need more information about that concept.

Actions Taken/Response: One of the unique features of the 2030 Agenda is the extensive leeway it provides to the states. As such, countries that adopted and started the implementation have set their own goals, targets, and strategies that will align with the global goals. To date, most countries are into the baseline and benchmarking studies to identify the national priorities thus, we highlighted in this article the importance of forging collaborations in implementing and achieving the sustainable goals.

In page 8, we included a brief background on the conception of sustainable development goals and how it differs on its predecessor, the Millennium Development Goals (MDGs)

b. Please explain how 193 countries of the United Nations General Assembly decided to include the indigenous people issues in the 2030 Agenda despite the Asian countries' non-recognition and rejection on that issue. Is there any different reaction regarding this kind of concept between Western countries and Asian countries?

Actions Taken/Response: In page 7, we briefly explained that the United Nations has adopted no definition for "indigenous peoples" even in the Indigenous Rights Declaration. The absence of a clear and authoritative definition makes the concept subjective to varying interpretations. One of the prevailing argument is that its applicability is restricted to certain territories only.

In general, countries who voted against the UNDRIP like New Zealand and Australia eventually adopted the concept and successfully integrate indigenous knowledge systems into their environmental policies. On the contrary, the majority of Asian nations who voted in favor of the UNDRIP failed to do the same. The socio-political settings in the Asian region are very diverse and so, the treatment of indigenous issues remains without consensus and unresolved.

c. Need to overall check some minor errors in grammar found in this paper. For instance, in 6 page, "Among Asian countries, very few countries has fully recognize the international concept of indigenous people and gave unconditional right to self-determination to the indigenous peoples."

-> "Among Asian countries, very few countries have fully recognized the international concept of indigenous people and given unconditional right of self-determination to the indigenous peoples."

Actions Taken/Response:Reviewed and corrected.

Asian Indigeneity, Indigenous Knowledge Systems, and the Challenges of 2030 Agenda

Abstract

Adopted by the UN General Assembly in 2015, the 2030 Agenda pledges to leave no one behind through the 17 Sustainable Development Goals (SDGs) and 169 targets ratified by the international community to address the global challenges of our time. This framework and universal action plan articulate the inclusion of the indigenous peoples in the social, economic, and environmental dimensions of sustainable development. Nonetheless, the world's largest inhabitants of indigenous peoples are in Asia. However, despite the affirmation of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP), the concept of indigeneity is still controversial, politically contested, and considered immaterial by many states in the Asian region. With limited rights and inadequate access to social services, the indigenous knowledge systems and practices have evolved through time to provide solutions to local problems that sustained many marginalized communities. This article revisits the socio-political notion of indigeneity in the region and its implications for the indigenous community. It also explores the diversity of indigenous knowledge systems and traditional practices and its relevance on the SDGs particularly on food security, community livelihoods, human well-being, natural resources management, and biodiversity conservation. The conclusion reflects the need for legitimate recognition and political enablement of indigenous peoples in the implementation of the 2030 Agenda by forging collaborations between academic researchers, policy-makers, and indigenous organizations in the Asian community.

1. Introduction

About two-thirds of the world’s indigenous peoples live in Asia, which is home to more than 2,000 civilizations and languages (UN Department of Public Information 2014). Aside from being a critical biodiversity hotspot, the Southeast Asian region has more than 1, 500 indigenous groups - among the richest ethnic diversity in the world (IWGIA 2018, 2017). Yet, the indigenous people of this region is also among the world’s most vulnerable, politically oppressed, and neglected minorities (Fukurai 2018; Clarke 2001). The concept of indigeneity in Asia is far from clear and naturalized, especially when compared to other nations (Baird 2011). Though signatories in the 2017 United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP), many Asian countries contested the definition and does not acknowledge the notion of “indigenous peoples” and its applicability to their respective political territory (IWGIA 2017, 2018; Etchart 2017). The gravity of the socio-political issues led to historical and concurrent ethnic-based conflicts, genocide, and ethnic cleansing in some countries which to date, others remain unresolved (Fukurai 2018; Clarke 2001; Beyrer and Kamarulzaman 2017; Candelaria 2018; Anderson 2015; Kolås 2017; Li 2002). Understanding the scale, location and nature conservation values of the lands over which indigenous peoples exercise traditional rights is central to the implementation of several global conservation and climate agreements (Garnett et al. 2018). The neglect over indigenous peoples issues prompted the 70th Session of the United Nations General Assembly to include this matter in the 2030 Agenda for Sustainable Development Goals (SDGs) adopted by the heads of state from 193 countries (United Nations 2015). This universal action plan, which will guide development programs and policies throughout the world until 2030, comprises 17 SDGs, 169 targets, and 232 indicators that take into account issues left unresolved by the Millennium Development Goals (MDGs) in 2000, which did not include a single reference to indigenous peoples (Cisneros 2017). Apart from the direct references in the declaration, two of the Sustainable Development Goals and many

1 of the associated targets are relevant for indigenous peoples (United Nations 2015). Moreover,
2 the overarching framework of the 2030 Agenda contains numerous elements that can go
3
4 towards articulating the development concerns and participation of indigenous peoples (United
5 Nations 2015). The Agenda came into effect on 1 January 2016 and will carry through the next
6
7 15 years; however, the indigenous peoples in Asia still struggle for recognition and support for
8
9 empowerment. With denied rights and limited access to basic social services, many ethnic
10
11 minorities managed to survive by adapting and mitigating in various ways the impacts of global
12
13 environmental change (Gómez-Baggethun et al. 2013; Maldonado et al. 2016; Mercer et al.
14
15 2010; Nkomwa et al. 2014; Miyan 2015). Traditional ecological knowledge has also sustained
16
17 the cultures, livelihoods, and agricultural resource management systems of local and indigenous
18
19 communities throughout Asia for centuries (Parrotta et al. 2009; Altieri and Nicholls 2017;
20
21 Cordero et al. 2018). As such, we also highlighted in this paper the challenges faced by the
22
23 indigenous peoples in the Asian region as well as the need for greater engagement in integrating
24
25 indigenous knowledge systems for inclusive and sustainable development initiatives in the
26
27 implementation of 2030 Agenda.

39 **2. The Definition of Indigeneity in Asia**

40
41 The term “indigenous” has long been used as a designation distinguishing those who are
42
43 “native” from their “others” in specific locales and with varying scope (Merlan 2009).
44
45 Historically, this concept was first applied at the end of the 19th century by European colonizers
46
47 to racially differentiate themselves from the colonized subjects (Baird 2015; Casumbal-Salazar
48
49 2015; Baird 2011). This definition changed over the years and in 1938, the Pan-American Union
50
51 referred to it as the first inhabitants of the lands (Baird 2011). This “first” or “original” peoples’
52
53 concept of indigeneity, that differentiate based on ethnicity have emerged and become
54
55 popularized in Asia in the 1970s and 1980s (Baird 2015). Recently, the term “indigenous” has
56
57
58
59
60
61
62
63
64
65

1 also been used to distinguish the marginalized and vulnerable people living in the state borders,
2 including those who may not be the “first peoples” (Baird 2016). The label “indigenous
3 peoples” or its equivalent term in countries that still reject the concept are thus both highly
4 political and subjective, reflecting opposing efforts to define the social basis of nation-states
5 (Clarke 2001; Bertrand 2011). In fact, many Asian nations still contested the definition and do
6 not acknowledge the concept of “indigenous peoples” even after the United Nations Declaration
7 on the Rights of Indigenous Peoples (UNDRIP) in September 2007 (IWGIA 2017, 2018;
8 Etchart 2017). Disputes focus on conceptions of the particularly sustainable environmental
9 relations of indigenous groups, on the compatibility of universal human rights with the
10 particular entitlements of indigenous and cultural minorities, as well as on the justification for
11 and achievement of their claims to local resources, self-determination, and autonomy (Buergin
12 2015; United Nations 2008). The concept often provokes considerable caveats at the national
13 level, particularly among Asian states where—in Southeast and East Asia—only the Philippines
14 and Japan accept the use of the term “indigenous peoples” to describe parts of their populations
15 (Buergin 2015; Aikenhead and Ogawa 2007; Casumbal-Salazar 2015).

16 On the other hand, the majority of ASEAN (Association of Southeast Asian Nations) members
17 together with India, China and other nations rejected the framework due to varying political
18 and ideological interpretations claiming it does not apply to them (Bertrand 2011; Clarke 2001;
19 Baird 2015; Buergin 2015; IWGIA 2017; Baird 2016). Indonesian authority argued that the
20 concept of indigenous peoples is not applicable as almost all Indonesians (with the exception
21 of the ethnic Chinese) are indigenous and thus entitled to the same rights (Nababan and
22 Sombolinggi 2017). The government granted autonomy in some areas, albeit for both minority
23 and non-minority (Baird, 2011). In a particular case, the Indonesian government gave
24 concessions to the Papuans but not the rights as indigenous peoples (Bertrand 2011).
25 Consequently, the Indonesian government has rejected calls for specific needs from groups

1 identifying themselves as indigenous (Nababan and Sombolinggi 2017). Vietnam, Laos,
2 Bangladesh, and China have a similar stance to that of Indonesia for not recognizing indigenous
3 peoples (IWGIA 2017). The Lao government, however, severely restricts fundamental rights,
4 including freedom of speech (IWGIA 2017). Organizations openly focused on indigenous
5 peoples or using related terms in the Lao language are not allowed and open discussions about
6 indigenous peoples with the government can be sensitive (IWGIA 2017). Nonetheless, the very
7 existence of indigenous people in the Asian region is evident even from a local and international
8 perspective (Table 1). In different parts of Asia, indigenous peoples are called “Masyarakat
9 adat” in Indonesia, “Orang Asli or Orang Asal” in Malaysia, “hill tribes” in Thailand,
10 “Scheduled Tribes” or “Adivasis” in India, “Jummas” in Bangladesh, “Adivasi Janajati” in
11 Nepal, ethnic minorities, and among others distinguishing them as socio-culturally distinct
12 group of people from the majority (IWGIA 2017, 2018).

55 Asian nations voted in favor and among the signatories of the UN Declaration on the Rights
56 of Indigenous Peoples (UNDRIP).

57
58 Source: (IWGIA 2017, 2018; United Nations Development Programme 2010)

1 This criterion of self-identification and identification of others as members of a distinct socio-
2 cultural group have been the institutional definition for indigenous peoples by the World Bank's
3
4 Operational Directive 4.20 (World Bank 1991). Other indicators include having an indigenous
5
6 language different from the national language, the presence of customary and political
7
8 institutions, close attachment to territories and natural resources, and subsistence-oriented
9
10 production (World Bank 1991). With policies strategically defined by global institutions, the
11
12 legitimate recognition as indigenous peoples provides transnational benefits provided by
13
14 various international organizations, intergovernmental agencies, and other foreign
15
16 governments, which have policies targeted towards overseas indigenous peoples (Kingsbury
17
18 1998). Yet, to date, some of these ethnic groups are not only denied of such recognition but also
19
20 of citizenship thereby making them socially excluded and amongst the impoverished sectors
21
22 (Toyota 2005; Milton et al. 2017).
23
24
25
26
27

28 The politicized non-recognition of indigenous peoples in Asia may explain the paucity of
29
30 research data and their under-representation in both local and international policies as well as
31
32 in the continuing marginalization of many indigenous groups in the region. Among Asian
33
34 countries, very few countries have fully recognized the international concept of indigenous
35
36 people and given unconditional right of self-determination to the indigenous peoples (IWGIA
37
38 2017). Both Japan and Malaysia has adopted the UNDRIP and endorsed the Outcome
39
40 Document of the World Conference on Indigenous Peoples but has not ratified International
41
42 Labour Organisation (ILO) Convention 169 (IWGIA 2017, 2018). Taiwan, on the other hand,
43
44 is not a member of the United Nations and has not been able to vote on the UNDRIP, nor to
45
46 consider ratifying ILO Convention 169 (IWGIA 2017). At present, one of the major challenges
47
48 faced by many indigenous peoples in Asia appear to be deep-rooted in the lack of national
49
50 recognition and consequently, the denied legal rights despite the UNDRIP and ILO 169
51
52 agreements. The new Constitution of Nepal promulgated in 2015 denies the collective rights
53
54
55
56
57
58
59
60
61
62
63
64
65

1 and aspirations for identity-based federalism of indigenous peoples (IWGIA 2017). In 2017,
2 the Indigenous Peoples Bill submitted by Indonesia's indigenous movement still awaits to be
3 discussed in the National Legislation whereas Vietnam's draft proposal on the development of
4 the Law on Ethnic Minorities was already rejected by its National Assembly (IWGIA 2017).
5
6 There is also continued efforts to get indigenous peoples rights in the draft Constitution of
7 Thailand that is still subject to further deliberation (Baird, Leepreecha, and Yangcheepsutjarit
8 2017; IWGIA 2017). The historical cause of regional conflicts and issues stemmed from the
9 absence of an authoritative definition nor a general agreement to the meaning of indigenous
10 peoples (Kingsbury 1998). Though certain criteria have been established to identify indigenous
11 peoples by the ILO and World Bank, the United Nations has adopted no definition even in the
12 UN Declaration on the Rights of Indigenous Peoples (Office of the United Nations High
13 Commissioner for Human Rights 2013). Given its relevance in political discourse, national and
14 international policies, and legal implications, the consensus on the definition is highly needed
15 in the Asian region. Similar to SDGs, the ASEAN Socio-Cultural Community Blueprint 2025
16 also envisions for an inclusive community with the goal of reducing the barriers on ethnic
17 minority groups, vulnerable and marginalized groups, and to promote indigenous and
18 traditional knowledge (ASEAN 2016). This, however, will be likewise unattainable without a
19 regional consensus devoted to the recognition and protection of minorities and indigenous
20 peoples. Finally, finding a common ground for defining the indigenous peoples within the Asian
21 community is not impossible. The indigenous peoples are discernible in many states as distinct
22 peoples inhabiting the traditional territories or ancestral lands attested by history and inimitable
23 cultural identity and is the non-dominant voiceless sector of the multicultural realities in Asia.

3. Indigenous peoples in the Sustainable Development Goals (SDGs)

The idea of the Sustainable Development Goals (SDGs) first emerged from the outcome of the Rio+20 Conference in 2012 (United Nations 2012). In September 2015, after three years of negotiations, the 193 world leaders in the UN General Assembly adopted the SDGs consisting of 17 global goals with 169 targets to be achieved in 2030 (United Nations 2015). The UN described the formulation of the 2030 Agenda as the most inclusive in its history. The SDGs address some of the key shortcomings and gaps of the Millennium Development Goals (MDGs) where indigenous peoples were largely invisible. Indeed, one of the major criticism in the MDGs is its setting that partly ignored the human rights standards and principles, especially on the issues of inequality within a country (Office of the United Nations High Commissioner for Human Rights 2008). In contrast to the MDGs, the SDGs incorporate a broader and more transformative agenda relevant to the challenges of the 21st century through global goals (Fukuda-Parr 2016).

Through active engagement in the process towards the 2030 Agenda, the indigenous peoples have been included in the political declaration of the SDGs as well as in the follow-up and review section that calls for indigenous peoples’ participation (United Nations 2015). Two of the SDGs are specifically referred to the indigenous peoples in its target by 2030. First, it is the Goal 2 section 2.3 on enhancing agricultural productivity and income of small-scale producers, in particular the indigenous peoples and other marginalized groups, including through secure and equal access to land, other productive resources and inputs, knowledge, financial services, markets and opportunities for value addition and non-farm employment (United Nations 2015).

The second goal broadly aims to end hunger, achieve food security and improve nutrition, and promote sustainable agriculture. Second, it is the Goal 4 section 4.5 on eliminating gender disparities in education and ensuring equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children

1 in vulnerable situations (United Nations 2015). The fourth SDG aims to ensure inclusive and
2 equitable quality education and promote lifelong learning opportunities for all.
3

4 At the national level, the governments' of Bangladesh, India, Indonesia, Japan, Malaysia,
5 Nepal, Philippines, and Thailand adopted and started the implementation of the SDG
6 framework through baseline and benchmarking studies (Allen, Metternicht, and Wiedmann
7 2018). The goal-setting process of the UN SDG presents a novel approach as it affords extensive
8 freedom for implementation among the member states (Biermann, Kanie, and Kim 2017). The
9 role of the government, therefore, is critical in setting the priorities for the national goals,
10 targets, and strategies within the context of global goals. This will require significant capacities
11 for political leadership on sustainable development at all the levels of government from national
12 to local and cutting across sectoral borders (Stafford-Smith et al. 2017; Biermann, Kanie, and
13 Kim 2017). In this regard, the sectors of indigenous peoples are key components of
14 sustainability agenda especially on environmental policies as they occupy over quarter of the
15 world's land surface of conservation importance (Garnett et al. 2018) and their indigenous
16 knowledge systems are now widely recognized tool in natural resource management (Ban et al.
17 2018; Ens et al. 2016; Tengö et al. 2014; Maldonado et al. 2016). The largest remaining natural
18 resources in Asia are safeguarded by indigenous populations (Rerkasem, Yimyam, and
19 Rerkasem 2009; Poffenberger 2006) and the perspective of integrating indigenous knowledge
20 systems in both local and regional policies should be reconsidered. Some models of indigenous
21 knowledge integration in environmental governance can be examined from the experience of
22 other nations like Australia, Canada, Mexico, and many others (Duncan et al. 2018; Leiper et
23 al. 2018; Audefroy and Sánchez 2017; Arsenault et al. 2018). Moreover, the International Panel
24 on Climate Change (IPCC) even calls for the inclusion of indigenous knowledge systems in
25 international reports highlighting its importance on science, policy and global politics (Ford et
26 al. 2016). The role of academic researchers is likewise indispensable in the framing of research
27

1 agenda, knowledge production, policy analysis, and expert assessments needed by the national
2 government and the international community (Parsons, Fisher, and Nalau 2016; Ford et al.
3
4 2016). For these reasons, implementing and achieving the goals of the 2030 Agenda requires
5
6 interlinkages between indigenous peoples' organizations, academic researchers, and the
7
8 national government.
9
10

11 12 13 14 **4. The Role of Indigenous Knowledge Systems** 15

16 Indigenous knowledge is broadly defined as an evolving cumulative body of knowledge,
17
18 practice, and belief about the relationship of living beings (including humans) with one another
19
20 and with their environment handed down through generations by cultural transmission (Berkes,
21
22 1993; Gadgil et al., 1993). It is also called traditional ecological knowledge, traditional wisdom,
23
24 aboriginal science, traditional knowledge, and among others (Aikenhead and Ogawa 2007;
25
26 Hummel and Lake 2015). This knowledge is a product of direct experience and careful
27
28 observations of the natural world by the indigenous peoples and has been a conceptually
29
30 problematic field of research (Aikenhead and Ogawa 2007). Locally shared knowledge could
31
32 be considered as an asset distinctive from the other five capitals (physical, financial, human,
33
34 social and natural capital) (Shiro et al. 2007). In the case of Yunnan farmers in China, spatially
35
36 dispersed farmers carefully observed local ecosystem (human capital) and shared their
37
38 experience within the community (social capital), which resulted in anthropogenic
39
40 accumulation of collective knowledge, and this enabled the farmers to identify and find solution
41
42 to local problems (Shiro et al. 2007). Knowledge capital stock could be depleted or vanished
43
44 due to abandonment, displacement, loss of interest, and among others (Sujarwo et al. 2014;
45
46 Shiro et al. 2007). Thus, for rural development to be sustainable, there is a need to consider
47
48 local, community, and/or traditional knowledge as capital assets in rural development projects
49
50 (Shiro et al. 2007). Studies exploring indigenous peoples' experiences and responses to

64
65

1 pertinent global environmental concerns have increased in the past two decades (Parsons et al.,
2 2016). A number of these publications discusses the pivotal role of indigenous knowledge on a
3 wide array of themes encompassing the field of social, environmental and health sciences. Its
4 applicability on ecosystem degradation, climate change and climate-related hazards, food
5 security, human well-being, and conservation of biodiversity has lately gained more interest
6 and recognition worldwide (Ford et al., 2016; Garutsa & Nekhwevha, 2016; Hiwasaki et al.,
7 2015; Ingty, 2017; Mistry & Berardi, 2016; Nkomwa et al., 2014; Oniang'o et al., 2004; Quave
8 & Pieroni, 2015; Wilder et al., 2016). This includes the inclusion of indigenous knowledge
9 systems on international reports and assessments of Intergovernmental Panel on Climate
10 Change (IPCC) (Ford et al. 2016), the Convention on Biological Diversity (CBD), and the
11 Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES)
12 (Tengö et al. 2017). However, that many traditional knowledge and practices are understudied
13 and fast disappearing worldwide (Atreya et al., 2018; Parrotta et al., 2009; Parsons et al., 2016;
14 Reyes-García et al., 2013; Saynes-Vásquez et al. 2013; Srithi et al., 2009; Voeks & Leony,
15 2004).

16 The distinctiveness of indigenous peoples' knowledge, cultural identity, and traditional
17 practices over ancestral domains are markers shared by indigenous populations. Furthermore,
18 their history of oppression, marginalization, and disappearing culture warrants their claims for
19 legitimate recognition as indigenous peoples (Anaya 1996).

20 **5. Putting Indigenous Knowledge Systems into Practice**

21 **5.1 Food Security and Community Livelihood**

22 With the growing population all over the world, it is unclear how the current global food system
23 will meet the future demand for food hence, ensuring equal access to adequate and nutritious
24 food produced in an environmentally and socio-culturally sustainable manner is one of the

greatest challenges of the time (Vinceti et al. 2013). This important issue is among the SDGs of the 2030 Agenda directly referred to the indigenous peoples and other vulnerable sectors of the society. Embedded in their respective traditional practices, indigenous knowledge systems concerning wild food resources is essential for subsistence and livelihood income for many ethnic communities in Asia (Broegaard et al. 2017; Delang 2006b; Tamayo 2010; Jianchu and Mikesell 2003). Though efforts to domesticate selected plant species for local people have started in some region, many government agencies and research institutions still overlooked the potential economic benefits of wild edible plants as well as the advantages of traditional systems and practices (Delang 2006a, 2006b; Lulekal et al. 2011; Bvenura and Afolayan 2015; Maroyi 2014; Ebert 2014). In the case of Tagbanua tribe of Palawan Island in Philippines, local vegetables and fruits are outsourced from traditionally managed plots while their main earnings is derived from harvesting of resin from the Almaciga tree (*Agathis dammara* (Lambert) L.C. Rich or *Agathis philippinensis* Warb.) and rattan (Lacuna-Richman 2004, 2003; Dressler 2005). The Tagbanua restrict themselves from clearing parts of the forest due to their dependence on almaciga resin and other forest resources which sustains their livelihood and basic needs in the community (Lacuna-Richman 2004, 2003; Dressler 2005). In Nepal, the collection of yarsagumba (*Ophiocordyceps sinensis*) in the Himalayan mountains accounts up to 65% of total household income with the highest contribution in the poorest households which further reduce income inequality by 38% (Shrestha, Dhital, and Gautam 2017). The current market price for 1 kg of high-grade Tibetan Yarsagumba in China, Hong Kong, and in the US is now \$128,000 USD from \$32,000 USD in the 2006 making it one of the most expensive medicinal herbs in the world (Shrestha, Dhital, and Gautam 2017; Koirala et al. 2017). The use of economically important plant resources and innovative practices are also crucial to many households in the region. One of the lesser-known tradition is the use of *Elaeocarpus floribundus* seeds as a source of vegetable oil in Myin Ka village in Myanmar (Shin et al. 2018). The vegetable oil

1 from *E. floribundus* seeds is still uncommercialized and could be further explored for its
2 potential to generate additional livelihood revenue to the community. The *E. floribundus* fruits
3 are eaten raw as a wild edible fruit in South Asia and recent studies reported that its fruit extract
4 has antibacterial activity against food-borne pathogens (Sircar and Mandal 2017) while the leaf
5 extracts had significant activities against CEM-SS cancer cells (Utami et al. 2006). Gathering
6 of food plants in the wild is a local practice of foraging tribes in the Philippines to augment the
7 food shortage (Balilla et al. 2012; Mandia 2004; Tangan 2007). Aside from subsistence, the
8 Karen hill tribes inhabiting Thailand also valued wild food for additional profits apart from
9 growing cash crops though with certain restrictions set by the government (Delang 2006b,
10 2006a; Suk 2016). About 50% of the poor and at-risk households in Timor-Leste similarly
11 forage for wild food during food deficit season (Erskine et al. 2014). Such knowledge is
12 important for human survival. In fact, some of the reported emergency food plant species is
13 often cited as coping strategies of indigenous peoples during periods of insufficiency. Other
14 ethnic communities also considered it as part of traditional culinary practice and cultural
15 identity transmitted across generation (Iwasaki-Goodman 2017). The local populace is also
16 more engaged in the conservation of plant species that are part of the traditional cuisine (Putri,
17 Hakim, and Indriyani 2017). Given the importance of indigenous knowledge systems in food
18 security, community livelihoods and well-being in many underserved indigenous populations,
19 the potential contribution of indigenous peoples should be re-examined in realizing the SDGs
20 on Zero Hunger (SDG 2) and other relevant targets.

5.2 Natural Resources Management and Conservation

21 The indigenous peoples safeguard the sites of few remaining natural resources, and their way
22 of life, customs, and traditions had helped sustain rural communities and protect vulnerable
23 forests in the age of modernity (Etchart 2017). For instance, the Dayak people in East
24

1 Kalimantan, Indonesia practices a traditional farming system called “simpukng” which is a
2 managed secondary forest planted with selected species of fruits, rattan, bamboo, timber and
3 other plants (Mulyoutami, Rismawan, and Joshi 2009). This sustainable forest gardens are
4 owned by families and passed down from one generation to the next while others are managed
5 on a communal basis (Mulyoutami, Rismawan, and Joshi 2009). This concept of sustainable
6 utilization and management of shared resources is similar to the Village Community Forests
7 (VCFs) of the indigenous peoples of Bangladesh (Misbahuzzaman and Smith-Hall 2015;
8 Chowdhury et al. 2018), the “ala-a system” of Ifugaos in the Philippines (Camacho et al. 2012),
9 and the Fengshui forest in China (Kim, Li, and Son 2017; Yuan and Liu 2009). It is estimated
10 that there may be over 140 million forest-dependent people in Cambodia, Indonesia, the
11 Philippines, Thailand, and Vietnam, representing about one-third of the population in these
12 nations. This estimate includes people who live on or near forest lands and are dependent on
13 forest resources for a significant portion of their subsistence and livelihood requirements
14 (Poffenberger 2006). Almost all of the indigenous communities in Bangladesh are also living
15 within the boundary of 2.53 million ha of forest lands representing about 17.5% of the country's
16 area (Rahman and Alam 2016). Yet, despite the large indigenous population and economic
17 dependence, various governments in the region did not consider them to be a major component
18 in management until recently (Poffenberger 2006). In the community forests system (CFS), the
19 entire community has a consensus on the management of which is also the source of livelihood
20 such as bamboo and timber harvesting as well as for wild fruits, herbs and other resources
21 (Table 2).

34
35
36 The success of VCF has been demonstrated in many parts of Asia. In Bangladesh, the villagers
37 have maintained collective funds from the income of the VCF products that provide for
38 children's education and medical treatment of the disadvantaged families (Misbahuzzaman and
39 Smith-Hall 2015). The Tay and Nung ethnic groups in the mountain regions of Vietnam
40 (Pinyopusarerk, Tran, and Tran 2014), and Masyarakat Adat of Indonesia (Astuti and
41 McGregor 2017) were able to secure a joint ownership and exclusive rights to community land
42 forest. With these few exceptions, most of the traditional community forests have no land tenure
43 though owned traditionally or otherwise occupied or managed continuously by the indigenous
44 populations. The traditional community forests are not only sustainable but also economically
45 beneficial to the participating households even in different regions (Jha 2015; Chowdhury et al.
46 2018; Rai, Neupane, and Dhakal 2016). Other ethnic groups are also engaged in tropical home

gardens, one of the oldest forms of managed land-use systems considered to be an epitome of sustainability (Kumar and Nair 2004). Tropical home gardens have economic and socio-cultural importance in many regions, especially to those with constrained access to land resources (Table 3).

Table 3. Economic, social and/or cultural foundations of home gardens

-
1. Low capital requirements and labor costs – suitable for resource-poor and small-holder farming situations
 2. Better utilization of resources, greater efficiency of labor, even distribution of labor inputs and more efficient management
 3. Diversified range of products from a given area and increased value of outputs
 4. Increased self-sufficiency and reduced risk to income from climatic, biological or market impacts on particular crops/products
 5. Higher income with increased stability, greater equity and improved standards of living
 6. Better use of underutilized land, labor or capital, besides creating capital stocks to meet intermittent costs or unforeseen contingencies
 7. Enhanced food/nutritional security and ability to meet the food, fuel, fodder, and timber requirements of the society
 8. Increased fulfillment of social and cultural needs through sharing or exchange of produces and recreational opportunities
 9. Better preservation of indigenous knowledge
-

Source: (Kumar and Nair 2004)

With limited land rights and forced migration, Thailand's ethnic minorities rely on home gardens as an important food source (Srithi et al. 2012). Thailand's Karen, Hmong, and Mien home gardens are very rich in species, making them important repositories for botanical agro-biodiversity, particularly for food crops. In fact, 90% of home gardens in Northeast Thailand includes wild food plants (Cruz-Garcia and Struik 2015). For Cao Lan home gardens in Vietnam, most plant species are used for food, but some other species are valued for ornamental, medicinal, construction, animal fodder, stimulants, and for other purposes (Timsuksai, Tien, and Rambo 2015). Though most home gardens tended native plants, the "hill people" in the Indo-Burma biodiversity hotspot incorporates introduced species, and cultural practices make the home gardens in the region a sustainable and economically viable subsistence (Barbhuiya, Sahoo, and Upadhyaya 2016). They also serve as an important means of conservation of native plants through use thereby reducing pressure on wild resources (Barbhuiya, Sahoo, and

1 Upadhyaya 2016). Its role in conservation is evident in the home gardens of the Orang Asli in
2 Malaysia, which include the domestication of IUCN threatened species such as the *Aquilaria*
3 *malaccensis* Lamk. and *Eurycoma longifolia* Jack (Milow et al. 2013). Evidence of farmers'
4 extensive transplanting of species in their gardens and fields indicates that they are ensuring
5 availability and stability of the wild food plant supply for domestic consumption, which is
6 crucial for local food security (Cruz-Garcia and Price 2014). This also shows the positive role
7 of integrating indigenous knowledge in protecting the threatened species and vulnerable
8 habitats from the peril of extinction. The Intergovernmental Platform for Biodiversity and
9 Ecosystem Services (IPBES) includes the commitment to recognize and respect the
10 contribution of indigenous and local knowledge to the conservation and sustainable use of
11 biodiversity and ecosystems in its operating principles (Karki et al. 2017). The function of some
12 home gardens, however, had shifted from subsistence towards commercial farming for higher
13 income. In a case study in Indonesia, this resulted to decreased plant diversity and evenness, a
14 higher level of ecological and financial risk to the owners, higher requirements for external
15 inputs such as fertilizers and pesticides, a lower level of community equitability, and increased
16 instability (Abdoellah et al. 2006). Indeed, recent findings indicate that collaborations involving
17 conservationist, indigenous peoples and governments would yield significant benefits for the
18 conservation of biocultural diversity for future generations (Garnett et al. 2018).

45 **6. Conclusion**

46 The inclusion of the indigenous peoples in the Sustainable Development Goals (SDGs) has
47 paved the way to revisit relevant issues within the Asian region. Science-policy governing
48 bodies and agreements such as the Intergovernmental Science-Policy Platform on Biodiversity
49 and Ecosystem Services (IPBES), Intergovernmental Panel on Climate Change (IPCC), and the
50 Convention on Biological Diversity (CBD) acknowledges the importance of indigenous and
51 local knowledge systems to inform international biodiversity assessments and decision-making

1 process (Tengö et al. 2017; Ford et al. 2016). The treatment of indigenous issues in the IPCC is
2 of particular interest because the indigenous peoples have been identified as being uniquely
3
4 sensitive to climate change impact, and their accumulated knowledge is now given due regard
5
6 (Ford et al. 2016). It is now highly recommended that efforts to solve real-world problems
7
8 should first engage with those local communities that are most affected, beginning from the
9
10 perspective of indigenous knowledge and then seeking relevant scientific knowledge to expand
11
12 the range of options for action (Mistry and Berardi 2016; Brondizio and Tourneau 2016; Altieri
13
14 and Nicholls 2017). This stemmed from the growing evidence on the relevance of indigenous
15
16 knowledge systems and experience in addressing the present and future pressing concerns on
17
18 global environmental change (Gómez-Baggethun et al. 2013; Alexander et al. 2011; Ford et al.
19
20 2016; Rahman and Alam 2016; Ingty 2017), disaster risk reduction and management (Hiwasaki
21
22 et al. 2015; Mercer et al. 2010), natural resources management (Anthwal et al. 2010; Singh,
23
24 Pretty, and Pilgrim 2010; Karki et al. 2017), sustainable agriculture (Shiro et al. 2007; Neyra-
25
26 Cabatac, Pulhin, and Cabanilla 2012; Singh, Pretty, and Pilgrim 2010), and food security
27
28 (Oniang'o, R., Allotey, J., and Malaba 2004; Ong and Kim 2017; Putri, Hakim, and Indriyani
29
30 2017). Yet, despite the surge of interest in this research area, indigenous knowledge is
31
32 underutilized, not fully integrated into policies, and under-represented in the various national
33
34 and international forum. With the adoption of the 2030 Agenda, the Asian community needs to
35
36 re-examine the social, economic, political, and environmental policies that directly affect the
37
38 lives of the indigenous populations. The legal recognition of indigenous communities and the
39
40 acknowledgment of the contribution of their local knowledge are vital in promoting resilience
41
42 in the face of critical biodiversity loss and threats environmental degradation. This is of
43
44 particular importance as the loss of knowledge and practices have already been noted in recent
45
46 years (Caneva et al. 2017; Sujarwo et al. 2014; Srithi et al. 2009; Atreya et al. 2018). The future
47
48 of sustainable management of natural resources in the Asian community lies in forging
49
50
51

65

1 collaborations between academic researchers, policy-makers, and the indigenous peoples. The
2 implementation of the 2030 Agenda, therefore, calls for culturally sensitive initiatives and
3
4 better engagement with the indigenous peoples to uphold their rights and be involved in
5
6 achieving the new sustainable goals.

Abstract

Adopted by the UN General Assembly in 2015, the 2030 Agenda pledges to leave no one behind through the 17 Sustainable Development Goals (SDGs) and 169 targets ratified by the international community to address the global challenges of our time. This framework and universal action plan articulate the inclusion of the indigenous peoples in the social, economic, and environmental dimensions of sustainable development. Nonetheless, the world's largest inhabitants of indigenous peoples are in Asia. However, despite the affirmation of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP), the concept of indigeneity is still controversial, politically contested, and considered immaterial by many states in the Asian region. With limited rights and inadequate access to social services, the indigenous knowledge systems and practices have evolved through time to provide solutions to local problems that sustained many marginalized communities. This article revisits the socio-political notion of indigeneity in the region and its implications for the indigenous community. It also explores the diversity of indigenous knowledge systems and traditional practices and its relevance on the SDGs particularly on food security, community livelihoods, human well-being, natural resources management, and biodiversity conservation. The conclusion reflects the need for legitimate recognition and political enablement of indigenous peoples in the implementation of the 2030 Agenda by forging collaborations between academic researchers, policy-makers, and indigenous organizations in the Asian community.

Title: Asian Indigeneity, Indigenous Knowledge Systems, and the Challenges of 2030 Agenda	
<p>The authors are very grateful to the insightful comments and recommendations provided by the two reviewers. We revised the paper following their suggestions to improve the content of this article.</p>	
Reviewer_1	Actions Taken
<p>1. I expect you to explain more about how the 2030 Agenda can be driven within Asian context such as the importance of role of government and indigenous groups.</p>	<p>In page 9 of the revised manuscript, we included the initial progress in the implementation of the 2030 Agenda in selected Asian countries that adopted the Sustainable Development Goals (SDGs). The role of the government and indigenous peoples organizations have been tackled in this section.</p>
<p>2. Could you put more of your explanations on re-developing and re-arranging the Indigenous Knowledge System of indigenous people and how to make the indigenous groups to be centered at this movement?</p>	<p>In page 11, we noted that various multilateral treaty and intergovernmental bodies like the Intergovernmental Panel on Climate Change (IPCC), the Convention on Biological Diversity (CBD), and the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) expressed the need of including indigenous knowledge systems in international reports emphasizing its importance on global policy. To be centered in this movement, we discussed in page 9 the key role of the indigenous groups in the sustainability agenda through indigenous knowledge integration in environmental governance initiated by other countries i.e. Australia.</p>
<p>3. How can the knowledge system be used to legitimize the indigenous people in</p>	<p>We proposed in this article to define indigenous peoples not as the often argued</p>

<p>the concept of 2030 Agenda?</p>	<p>“first people” but as distinct peoples inhabiting the traditional territories or ancestral lands attested by history and inimitable cultural identity and is the non-dominant voiceless sector of the multicultural realities in Asia. The distinctiveness of cultural identity is manifested by the exclusive practice of indigenous knowledge systems and their social exclusion/non-integration is an evidence of being socioculturally different from the majority of the populations.</p>
<p>4. I suggest to correct some grammatical errors such as in the part 3. Indigenous peoples in the Sustainable Development Goals (SDGs): Two of the SDGs specifically <u>are</u> referred to the indigenous peoples in its target by 2030. First, <u>it is</u> the Goal 2 section 2.3 on enhancing agricultural productivity and income of small-scale producers, in particular the indigenous peoples and other marginalized groups, including through secure and equal access to land, other productive resources and inputs, knowledge, financial services, markets and opportunities for value addition and non-farm employment (United Nations 2015). The second goal broadly aims to end hunger, achieve food security and improved nutrition and promote sustainable agriculture. Second, <u>it is</u> the Goal 4 section 4.5 on eliminating gender</p>	<p>Reviewed and corrected</p>

<p>disparities in education and <u>ensuring</u> equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children in vulnerable situations (United Nations 2015).</p>	
<p>Reviewer 2</p>	
<p>a. Need to be addressed the possibility that the 2030 Agenda could be adapted within Asian context in a more detailed way. Need more information about that concept.</p>	<p>One of the unique features of the 2030 Agenda is the extensive leeway it provides to the states. As such, countries that adopted and started the implementation have set their own goals, targets, and strategies that will align with the global goals. To date, most countries are into the baseline and benchmarking studies to identify the national priorities thus, we highlighted in this article the importance of forging collaborations in implementing and achieving the sustainable goals.</p> <p>In page 8, we included a brief background on the conception of sustainable development goals and how it differs on its predecessor, the Millennium Development Goals (MDGs)</p>
<p>b. Please explain how 193 countries of the United Nations General Assembly decided to include the indigenous people issues in the 2030 Agenda despite the Asian countries' non-recognition and rejection on that issue.</p>	<p>In page 7, we briefly explained that the United Nations has adopted no definition for “indigenous peoples” even in the Indigenous Rights Declaration. The absence of a clear and authoritative definition makes</p>

<p>Is there any different reaction regarding this kind of concept between Western countries and Asian countries?</p>	<p>the concept subjective to varying interpretations. One of the prevailing argument is that its applicability is restricted to certain territories only.</p> <p>In general, countries who voted against the UNDRIP like New Zealand and Australia eventually adopted the concept and successfully integrate indigenous knowledge systems into their environmental policies. On the contrary, the majority of Asian nations who voted in favor of the UNDRIP failed to do the same. The socio-political settings in the Asian region are very diverse and so, the treatment of indigenous issues remains without consensus and unresolved.</p>
<p>c. Need to overall check some minor errors in grammar found in this paper. For instance, in 6 page, “Among Asian countries, very few countries has fully recognize the international concept of indigenous people and gave unconditional right to self-determination to the indigenous peoples.”</p> <p>-> “Among Asian countries, very few countries have fully recognized the international concept of indigenous people and given unconditional right of self-determination to the indigenous peoples.”</p>	<p>Reviewed and corrected.</p>
