ABSTRACT

The *Elaeocarpus* is considered the largest genus in the family Elaeocarpaceae. It is commonly called 'Rudraksha' in India and has a noteworthy attachment with the Indians, mostly Hindus. The plant is known for its beneficial aspects and supply of various ecosystem services, particularly in medicinal sciences. The present study provides a comprehensive review of the genus *Elaeocarpus* for its ecosystem services in the context of human wellbeing. A literature survey was conducted from 1970 to 2020 on internet scientific databases such as Scopus, Science Direct, Google Scholar, PubMed, and Web of Science using strings such as, *Elaeocarpus*, Rudraksha, medicine, conservation, tradition, and services. One hundred two publications were considered for data extraction and finalising the review. Firstly, we classified the ecosystem services under respective classes as provided by MEA (2005), and the remaining benefits that didn't fit under the classification were presented separately. It has been reported that Rudraksha delivers all categories of ecosystem services: provisioning, regulating, cultural, and supporting services. In addition, the Rudraksha plant owes a high status in medicinal science, ayurveda, and religious mythology. In the last five decades, studies were conducted on various species of *Elaeocarpus* for their beneficial aspects. It was found that *Elaeocarpus* plants have a vital role in ayurveda, pharmaceuticals, and pharmacological and astrological science. In addition, they have been used as food, firewood, timber, and the production of secondary metabolites and their role in cultural and religious dimensions are very clearly discussed. The provisioning and cultural services delivered by Rudraksha constitute only 30% and 10% of the services mentioned in MEA (2005). However, only a little research has been conducted on regulatory and supporting services provided by Rudraksha. Therefore, for a long-term sustainability and multifunctionality assessment, the extension of ecosystem services regarding individual plant's (tree) services should be highly recommended. Hence, the present review investigates the scientific knowledge about the ecosystem services of the *Elaeocarpus*.

INTRODUCTION

Elaeocarpus commonly called Rudraksha, a genus of the family Elaeocarpaceae, is a large evergreen, drought-tolerant, perennial, broad-leaved tree with a large spreading crown and attains a height of about 15.0-20.0 m (Pant *et al.*, 2013; Singh *et al.*, 2015). Rudraksha- factually means "Shiva's tears" which is believed as the seed of *Elaeocarpus* species. The word *Elaeocarpus* is derived from the Greek word *Elaeo* = olive and *carpus* = fruit (referring to olive-like fruits produced by the genus). Rudraksha's bead is obtained from seeds of several species of the genus *Elaeocarpus*. The beads are sacred to Hindus, Buddhists, and Jains since ancient times. It is deep-rooted in our belief systems. It is the heritage tree of India (<http://naturalheritage.intach.org>). According to the Hindu mythological story in Puranas, the seed of *Elaeocarpus* was created from the tears of the lord Shiva which were fallen from his

eyes after a prolonged fight with a demon called Asur. Therefore, *Elaeocarpus* beads are sacred to the Hindus, and they believe in the spirituality of the plant. The beads size ranges from the size of small peas to as large as marble. It is believed to bring good luck, sound sleep, mental stability, better memory, happy feelings, and stabilises blood pressure. *Elaeocarpus* tree is famous for its spiritual or aesthetic values and provides many other ecosystem services (Pandey, 2001; Jawla *et al.*, 2018). Ecosystem services are the benefits people obtain from nature (MEA, 2005). These benefits include provisioning, regulating, supporting, and cultural services. *Elaeocarpus* is an important medicinal plant with several medicinal uses in the traditional medication system (Singh *et al.*, 2015). It has been used to cure many health problems like stress, anxiety, depression, palpitation, nerve pain, epilepsy, migraine, lack of concentration, asthma, hypertension, arthritis, and liver diseases (Joshi *et al.*, 2012).

Arivu and Muthulingam (2017) claimed that Rudraksha beads might have exhibited multiple pharmacological activities. In the last few decades, the phytochemical composition of *Elaeocarpus* has also been studied extensively (Miller et al., 2006). Various extracts from the different *Elaeocarpus* parts have revealed the presence of alkaloids, phenolics, tannins, flavonoids, and fatty acids (Dubey, 2018). Traditionally, Rudraksha beads are believed to cure melancholia, mental disorders, convulsions, cephalgia, allergies, neurological diseases and many more severe diseases like asthma, diabetes, cancer, stress, and blood circulatory disorders (Singh et al., 2015). It is further believed that the Rudraksha tree also possesses dielectric and magnetic properties, which may impart positive changes in the human body (Prajapati et al., 2016).

The Rudraksha tree, also known for its other bioelectric properties, includes conductivity, resistivity, inductance, and dynamic polarity (Sharma et al., 2018). Prajapati et al. (2016) experimented with bio-electrical energy production with the help of Rudraksha beads and concluded that Rudraksha beads of *Elaeocarpus ganitrus* Roxb. possesses some bioelectrical energy that helps in relieving stress in humans. Similarly, Rashmi and Amrinder (2014) have classified the electrical property of Rudraksha into five categories: resistance, capacitance or dielectric property, inductance, magnetic property, and dynamic property. Furthermore, they are assumed to correlate with a concept by Kumar et al. (2013) that describes the resistance in our body as coordinated with our heartbeat and then specific impulses to generate certain biochemicals in the brain, bringing festive mood, confidence, and feeling energetic. In a similar study conducted by Swami et al. (2010), the magnetic property of Rudraksha beads affects different body elements, the poles of magnets and the body active simultaneously; thus, the passage enlarges, thus the streaming of blood circulation, suddenly, the rejuvenated feeling occurs at the side of healing, and unhealthiness disappears.

All over the world, people from different parts inspired by Indian spiritualism and belief in its healing power have adopted it as sacred. Traditionally, communities were utterly dependent on natural resources and had developed a system of sustainable use of biodiversity. This traditional knowledge system ensured the conservation of all-natural resources, including soil, water, and biodiversity. However, with changing cultural values and the reluctant connectivity of the people with nature, urbanisation, industrialisation, and modern lifestyles have quickly declined traditional conservation and sustainability practices. Conservation of species that used to come from nature worship by different indigenous communities is almost extinct except in specific tribal communities. Plants and animals that were earlier worshipped are today under threat for their very existence due to cultural ethos's dilution. Therefore, this review has been attempted to collect comprehensive information about the *Elaeocarpus* ecosystem services to humankind. It aims to answer the following questions: (i) What are the trends in *Elaeocarpus* research in the scientific field over the years? (ii) What ecosystem services are delivered by the genus *Elaeocarpus* and how can it be interpreted from the existing literature? (iii) What are the different anti-pathogenic activities

that have been tested and verified from various species of *Elaeocarpus* (iv) How this plant is linked to people's sentiments and associated with its values and (v) Which ecosystem services are needed to be explored for a complete ecosystem services assessment of the plant. To accomplish this, we have surveyed the available database and unpublished grey literature, including dissertations and theses.

Botanical Information

Elaeocarpus L. is an average-sized evergreen tree with an attractive spreading crown, found in tropical and subtropical areas at an altitude ranging from the sea coast to 2,000 meters above the mean sea level. Leaves are large and shining green on the sun-facing side and dull stringy on earth facing side. Flowers are predominantly white and appear in April-May (Garg et al., 2013). Fruits are round or oval, small, violet or blue colored, and acidic in taste. They start appearing in June and ripen near October. The ripe fruit is fleshy and has a seed with a blue shell. The inner part or bead in the seed is called 'Rudraksha' (Joshi & Jain, 2014). A Stony endocarp is a hard, globular, strong tubercle marked with longitudinal ridges (probably 1 to 21) that have been reported (Figure 1).

Ecology and Distribution

Elaeocarpus consists of 552 species (Global Biodiversity Information Facility) found worldwide, which surround tropical and subtropical regions (Table S1). It is widely distributed from Madagascar in the west through India, Southeast Asia, Malaysia, Southern China, and Japan, through Australia to New Zealand,

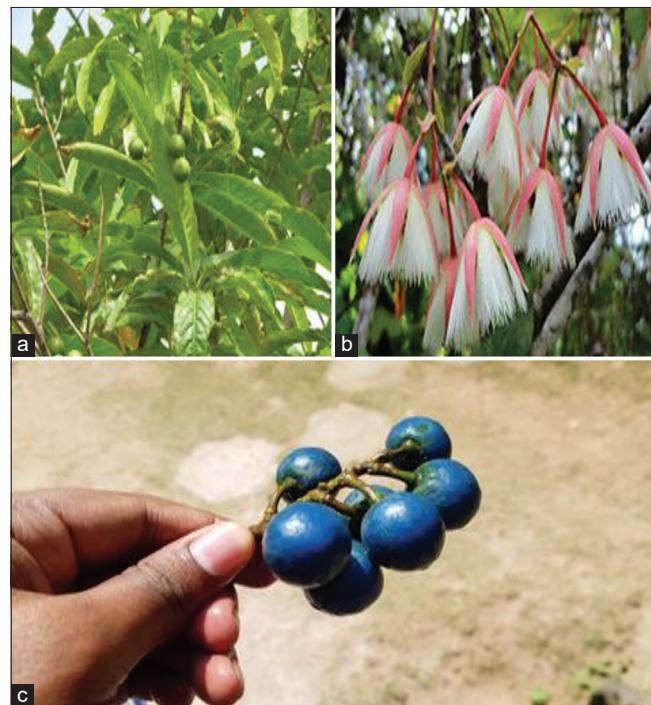

Figure 1: Morphological features of the Rudraksha tree (*E. ganitrus*)
a) Oblong-lanceolate leaves, b) Flowers with fringed petals and c) Fruit with a blue colour shell

Fiji, and Hawaii in the east (Rai *et al.*, 2018). Around 120 species of the genus, *Elaeocarpus* were reported from different parts of Asia (Figure 2). Only 25 species occur in Indian territories in states such as Uttar Pradesh, Maharashtra, Bihar, Madhya Pradesh, Assam, Arunachal Pradesh, and Meghalaya (Figure 3). The Rudraksha tree is found in all districts of Assam, though more frequent in Arunachal Pradesh. In Arunachal Pradesh, it is expected along the foothill of all districts except Tawang and Upper Subansiri, and some other high-altitude areas. Researchers have classified the forest vegetation of Arunachal Pradesh into five broad types. Rudraksha is found in the tropical evergreen forest, which is characterised by a three-tier forest structure. The emergent top canopy trees are straight bole with an average girth of 2-5 m and a height of 40-50 m. However, tropical forests of Arunachal Pradesh are being modified and degraded due to increased anthropogenic pressure. The age-old practice of shifting agriculture is one of the potent factors changing the forest microenvironment and reducing the forest cover (Ramakrishnan & Toky, 1981). Improved technology, the pattern of forest resource use, and infrastructure development have widely increased effective wood harvesting and land-clearing activities. It is believed that if the present trends continue and effective conservation measures are not implemented, most of the existing forests will be destroyed or replaced by degraded communities (Rajbonshi & Islam, 2018; Menon *et al.*, 2001).

METHODOLOGY

For the synthesis of this review, a comprehensive search of literature pertaining to *Elaeocarpus* was conducted on different web-based databases such as Web of Science, Scopus, Science Direct, Google Scholar, Mendeley, PubMed, other grey literature and some authentic reports available on the internet. We

searched for relevant data from 1970 until 2020 by using the following terms and keywords “Rudraksha”, “*Elaeocarpus*”, “*Elaeocarpus* AND Importance”, “*Elaeocarpus* AND Medicine” OR “*Elaeocarpus* AND Tradition” in the Title, Abstract, Keyword section of the reference databases. The search results vary with different databases. It yielded 500 publications in Scopus, 854 through ScienceDirect, 154 from PubMed, and 600 from Mendeley databases.

After that, the inclusion and exclusion of publications for further analysis were performed with intensive screening based on the publication’s relativity with the review topic. It was conducted by Title screening, which resulted in the finding of 550 publications. The duplicate exclusion follows it by merely checking the title similarity among different database searches to avoid overlapping articles. In order to be more specific, the publication was scrutinised with full-text screening. Therefore, the remaining 102 publications were considered for data extraction and review synthesis (Figure 4).

RESULTS

Research on *Elaeocarpus* Over the Past 50 Years (1970-2020)

Over the years, researchers have shown immense enthusiasm to work on the essential aspects of *Elaeocarpus*. The curative power of Rudraksha was explicitly written long back in some holy books, and people practically exercise it. However, all were written arguments without experimental work. The historical point from where research is being conducted was the extraction of organic acids from *E. serratus* fruits in 1932 (Yamamoto *et al.*, 1932). Around 36 years, no research was done on this plant. However, onwards 1970, the research community was

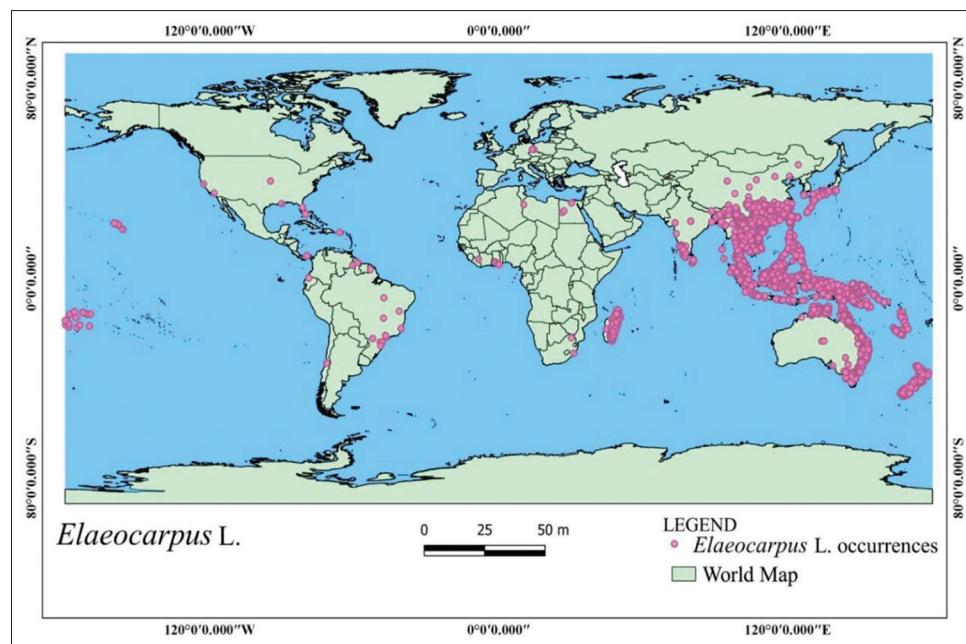

Figure 2: The distribution map of *Elaeocarpus* L. in the world (Source: Global Biodiversity Information Facility (GBIF), <https://www.gbif.org/species/4031193>)

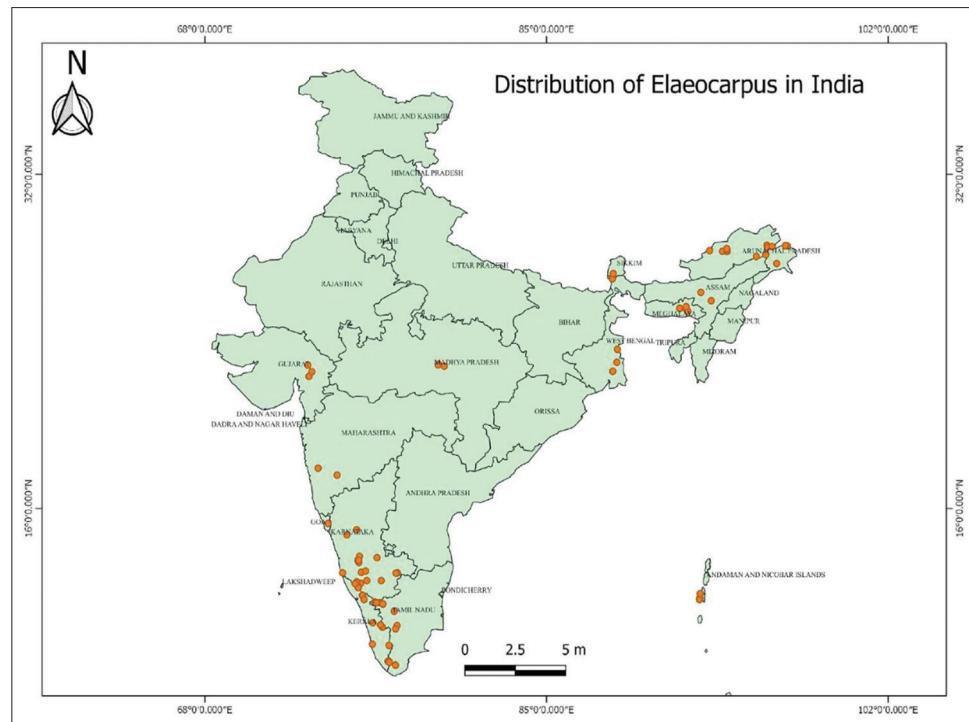

Figure 3: The distribution map of *Elaeocarpus* L. in India (Source: GBIF)

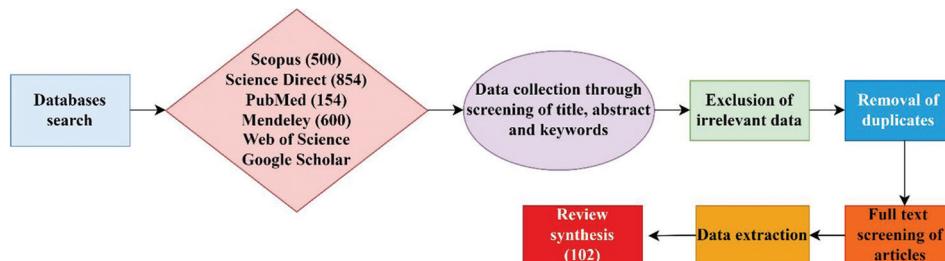

Figure 4: The search strategy was used to identify relevant papers for a comprehensive literature review

interested to know more; therefore, more research has been focused on undermining the significance of Rudraksha for human wellbeing. Due to some researchers' devotional work, over 1500 publications have come up with different sets of powerful features of *Elaeocarpus*. Thus, studies on *Elaeocarpus* have been conducted worldwide, with India topping the list with more than 120 research publications. China, Australia, Japan, New Zealand, and the United States of America (USA) have also done fabulous work on *Elaeocarpus*. A meta-analysis conducted to determine per year publication rate published from 1970 to 2020 (Figure 5). It was observed that over the years the rate of research publication has increased from 1970 to 2020; however, abrupt increase was seen after 2000. Due to substantial research, it has been found that *Elaeocarpus* has a vital role in economics, ayurveda, pharmaceuticals, and pharmacological and astrological sciences (Kumar et al., 2013). Furthermore, secondary metabolite and phytochemical production have a prominent role when accounting for ecosystem service values (Vuong et al., 2018).

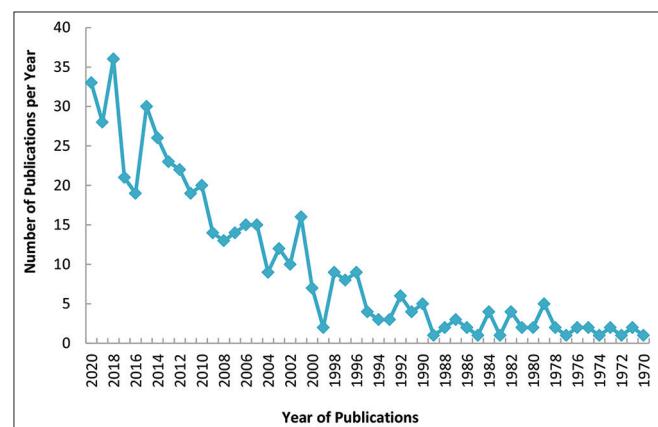

Figure 5: Representing the number of publications concerning years (1970-2020)

Based on the Scopus data, more than 150 countries have researched *Elaeocarpus*. Summarised data in Figure 6 represents

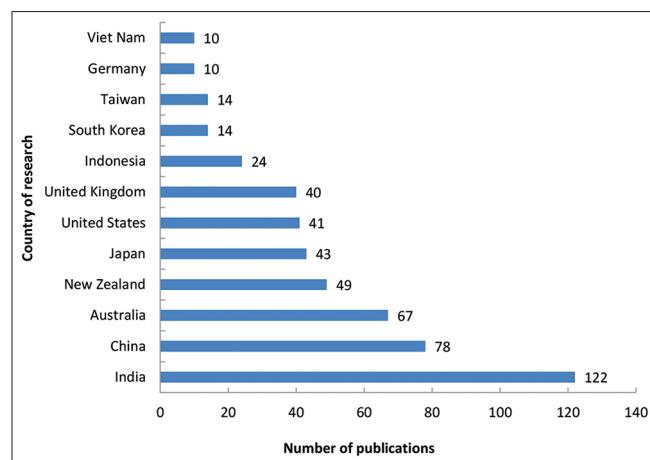

Figure 6: The geographic distribution of the publications concerning the studies on *Elaeocarpus*

only countries with higher numbers of publications on this plant.

Rudraksha and its Ecosystem Services

Despite tremendous interest in ecosystem services research in the last three decades, working on individual tree species on the same line is negligible. Researchers have stressed the ecosystem functioning and services of the whole landscape or ecosystem level (Costanza *et al.*, 1997; Kremer *et al.*, 2016). This exercise attributed a system approach analysis, but the role of an individual tree species providing specific services could not be assessed at this level; therefore, this may provide a minimal understanding of ecosystem services at the species level. Trees are arguably known for regulating extreme events, carbon sequestration (Nair *et al.*, 2010), biomass production (Cánovas *et al.*, 2018), timber, and many more ecosystem services. Like other plants, *Elaeocarpus* has been noticed to play a vital role in delivering a set of ecosystem services. However, its role in carbon sequestration, temperature and extreme events, and disease regulation is unknown due to limited research that solely focuses on providing services and cultural services. A comprehensive analysis of the literature survey was conducted to develop satisfactory findings on the ecosystem services of Rudraksha. Then the reported benefits were classified based on the Millennium Ecosystem Assessment (MEA, 2005) classification of ecosystem services.

Provisioning Services

The MEA defines provisioning ecosystem services (food, fresh water, fuelwood, timber, biochemicals, and genetic resources) as the products obtained from the ecosystems. Provisioning Ecosystem Services (ESs) play a fundamental role in human survival and well-being. Their involvement in the nation's economy is phenomenal, as evident from the recently appearing markets and valuation systems (Anand & Gupta, 2020). Work on *Elaeocarpus* identifies several provisioning services (Table 1). Although most of the services are not mentioned but are apparent to be counted. These include fuelwood, timber,

forage, fodder, litter decomposition, and shade. In this review, we considered only those available in the literature.

Timber and Food

In his book "Taxonomy of Angiosperms", Pandey (2001) mentions *E. ganitrus* Roxb. as a good quality timber-producing species. The tree's light and strong white wood were used in making aeroplane propellers during World War-I. In Nepal, wood is used as firewood and for agricultural instruments. The fruit of *E. ganitrus* Roxb. is a super miracle. There is much ancient literature where the medicinal and healing properties of this plant have been reported. According to some reports, Rudraksha's fruit also has nutritional importance (Mundaragi, 2019).

Jawla *et al.* (2018) performed an experiment in which they did an elemental analysis of pulp and bead of fruit by using a wavelength-dispersive X-ray fluorescence spectrometer. They found major minerals like calcium, magnesium, phosphorus, potassium, chlorine, sodium, and sulphur were identified in both bead and pulp. Trace elements iron, copper, zinc, molybdenum, palladium, rubidium, and silicon were also identified in both beads and pulp (Table 2). Therefore, it can be suggested to raise the production and ingestion of nutrient-rich Rudraksha fruit, which may add to the diet and relieve the risk associated with malnutrition in various parts of developing countries.

Phytochemicals and Production of Secondary Metabolites

The genus *Elaeocarpus* produces many biochemical and secondary metabolites that are vital for human well-being. Several secondary metabolites, such as terpenes, tannins, flavonoids, and alkaloids were obtained from different species of *Elaeocarpus* (Table 3). The fruit of blueberry ash contains flavonoids, proanthocyanidins, and anthocyanins (Vuong *et al.*, 2018). 1 α -hydroxy-olean-12-en-3-O- β -D-xylopyranoside and 1 α -hydroxy-olean-12-en-3-O- α -L-arabinopyranoside oleanane-type saponins were isolated from the leaves and twigs of *E. hainanensis* Oliv. (Nga *et al.*, 2018). Tectoracine, tectoraline, tectoriamidine alkaloids were extracted from the leaves of *E. tectorius* Lour. (Chinonso *et al.*, 2018). While cyanogenic glycoside (6'-O-galloyl sambunigrin) was isolated from the Australian tropical rainforest tree species foliage, *E. sericopetalus* F. (Ezeoke *et al.*, 2018). Another four secondary metabolites found in *E. grandiflorus* J.E.Sm. cell suspension cultures are alkaloids, flavonoids, phenolics, and terpenoids extracted from the cell suspension culture of *E. grandiflorus* J.E.Sm. (Anggraito *et al.*, 2020). As many as 14 alkaloids were reported from *E. angustifolius* Blume leaves (Hong *et al.*, 2019). Indolizidine alkaloids, grandisines C, D, E, F, and G isoelaeocarpiline were isolated from the leaves of *E. grandis* F. Muell. (Katavic *et al.*, 2006). *E. sphaericus* K. Schum. has been reported to possess alkaloids, glycosides, steroids, flavonoids, tannins, fatty acids, carbohydrates, and proteins (Singh *et al.*, 2000b).

	Arsenic	0.004	--

Several isomeric alkaloids of molecular formula $C_{16}H_{21}NO_2$ have been isolated from the Rudraksha tree leaves (Pant et al., 2013). These isomeric alkaloids include elaeocarpidine, elaeocarpine, isoelaeocarpine, epiisoelaeocarpiline, epialloelaeocarpiline, alloelaeocarpiline, pseudoepiisoelaeocarpiline. Besides these, species contain a crucial non-aromatic indolizidine alkaloid called rudrakine (Singh & Nath, 1999). *E. serratus* leaves contain potent polyphenols, flavonoids, and myricitrin (Chen & Yang, 2020). Callus culture of *E. grandiflora* J.E.Sm. can produce flavonoids and phenolic bioactive compounds (Habibah et al., 2020). *E. ganitrus* Roxb leaves possess flavonoids, tannin, saponin, and alkaloids (Indriatie et al., 2020). Fatty acids, diterpenoids, triterpene alcohol, fatty alcohols,

pheophytins, phytosterol, sesquiterpene, hydrocarbons have been obtained from the leaves of *E. floribundus* Blume by hexane extract (Ogundele & Das, 2019). Other phytochemicals such as trolliamide, gallic acid, urolithin, hydroquinone, 2,4-dihydroxybenzoic acid, 3,5-dihydroxy-4-methoxybenzoic acid, corilagin, chebulagic acid, and shikimic acid were extracted from the leaves of *E. tonkinensis* A. DC. (Dao et al., 2019). The leaves of *E. eumundi* F.M.Bailey have phenolic monosaccharides content (Singh et al., 2018). The seeds and leaves of *E. ganitrus* Roxb. have been reported to contain alkaloids, flavonoids, sterol, phenolic, saponin, and glycosides (Tripathi et al., 2015). The number of species identified for possessing their respective secondary metabolites is shown in Figure 7.

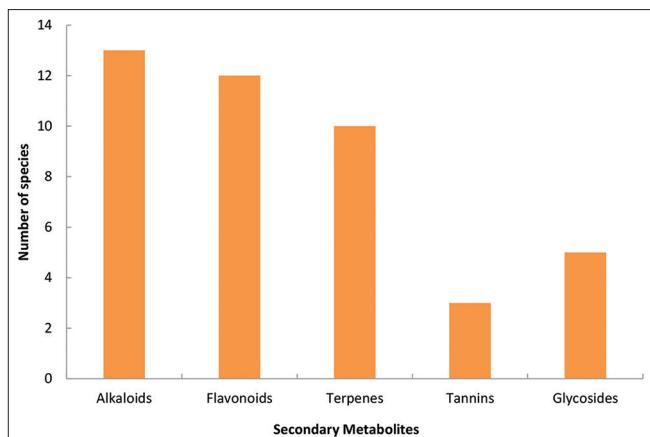

Pharmacological and Medicinal Services

Scientific advancement brought a positive approach to the Rudraksha tree systemic assessment for its healthful properties in the last 20 years. Rudraksha trees have been reported to exhibit immune-stimulatory, anti-inflammatory, antimicrobial, anxiolytic, anti-cancerous, anti-ulcerogenic, antidepressant, and antioxidant activity (Piao et al., 2009; Katavic et al., 2007). Among these, *Elaeocarpus* possess the highest antioxidant activity, followed by antibacterial activity. Several publications have addressed the pharmacological activity of *Elaeocarpus*, with *E. ganitrus* Roxb. being the highly stressed species for the pharmacological property. *E. ganitrus* Roxb. has been identified as an analgesic, anticonvulsant, anti-amphetamine, cardiac stimulant, depressor, and smooth muscle relaxant activity (Bhattacharya et al., 1975). The phenolic and flavonoid contents in the leaves of *E. ganitrus* Roxb. provided a considerable antioxidant activity (Kumar et al., 2008). At the same time, seeds have been observed to provide antifungal (Singh et al., 2010), antidiabetic (Hule et al., 2011), antianxietic (Singh et al., 2013), immunomodulatory and nephroprotective (Kakalij et al., 2014), hypoglycemic (Tripathi et al., 2015) and antibacterial properties. Furthermore, the Methanol extraction of *E. ganitrus*

Roxb. seeds stimulates both non-specific (phagocytosis) and specific (cell-mediated and humoral) arms of the immune system (Hule & Juvekar, 2010). Hexane Cucurbitacin F derived from *E. dolichostylus* Schltr. has shown anticancer activity (Fang et al., 1984). *E. sphaericus* K. Schum. fruit possesses substantial capability against bacterial disease (Singh & Nath, 1999). Furthermore, the bark extract of *E. parvifolius* Wall. (Ellagic acid rhamnosides) was considerably effective against babesial disease (Elkhateeb et al., 2005). The flavonoid content in the fruits of *E. serratus* has anxiolytic potential (Dubey, 2018). *Elaeocarpus* species are known for their antioxidant property. The plant species that are recognised to possess antioxidant properties include *E. serratus* L. (Chen & Yang, 2020), *E. mastersii* King, (Okselni et al., 2018), *E. sphaericus* K. Schum. (Sharma et al.,

**Figure 7:** The number of species identified for possessing respective secondary metabolites

2015), *E. serratus* L. (Jayasinghe et al., 2012), *E. sylvestris* var *ellipticus* (Piao et al., 2009). The leaf extract of *E. serratus* L. possessed significant antibacterial and cytotoxic properties (Biswas et al., 2012). Phenolic monosaccharides isolated from *E. eumundi* F.M.Bailey possess anti-inflammatory activity (Singh et al., 2018). The fruit of *E. tectorius* Lour. contains the essential phytochemicals that act as antioxidants and also have specific antimicrobial activity against urinary tract infection (Manoharan et al., 2019). Singh et al. (2000b) studied the benzol, crude oil ether, acetone, chloroform and ethanol extracts of edible fruit of genus *E. sphaericus* K. Schum. showed antiulcerogenic activities in the rats. Figure 8 shows the number of *Elaeocarpus* species possessing disease-inhibitory effects. Pharmacological properties with different extracts are shown in Table 4 summarises the overall significance of *Elaeocarpus* in pharmacology and medicines.

Cultural Services

A literature search mentions cultural values associated with spirituality, religion, and tradition. Cultural ecosystem services (CES) refer to the non-material benefits people obtain from the ecosystems (MEA, 2005), but it indirectly influences the quality of life. People adore services in spiritual enrichment, cognitive development, reflection, recreation and tourism, and aesthetic experiment (Table 5). These are things that are directly connected with the happiness of people. The cultural services of *Elaeocarpus* were familiar from lord Shiva's period (Khan et al., 2004). From there, people, mostly the Hindus, have a solid attachment to the Rudraksha plant.

Spiritual, Religious, and Traditional Values of Rudraksha

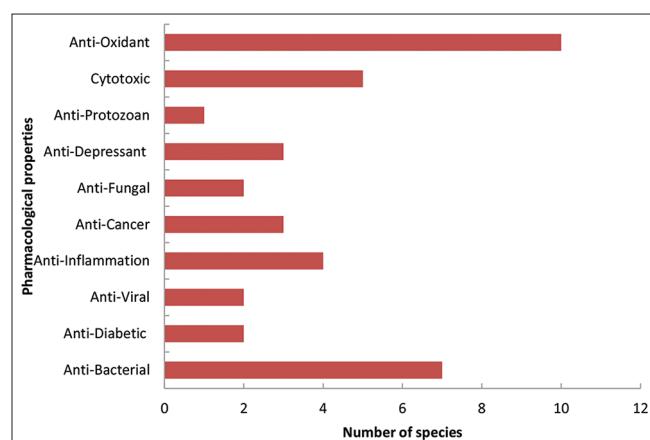

Rudraksha has been used since prehistoric time for controlling various diseases. It is used against *vata/paitikk* disease, *dahashaman* (scorching sensation) by rubbing it like sandalwood, *swasroga* (bronchial antispasmodic), *jwar* (fever), *apasmari* (epilepsy), *matisudhikara* (cure mental ailment), *manas roga* (mental syndrome) (Ayurvedic Pharmacopoeia Committee, 2001). Different parts (beads, leaves, barks) of Rudraksha are used to treat various ailments and may be worn either on the arm, wrist,

**Figure 8:** Quantitative distribution of potent species against various diseases

or other body parts (Joshi & Jain, 2014; Hardainiyam et al., 2015). Rudraksha positively affects stress, anxiety, depression, tremors, and lack of attentiveness. As per the Ayurvedic medicine system, they were wearing Rudraksha beads that relieve strain, insomnia, anxiety, lack of concentration, depression, palpitation, hypertension, rheumatism, infertility, and asthma. It has an antiaging effect also (Liyanaarachchi et al., 2018). Rudraksha has gained a special place in Hinduism, Buddhism, and Jainism. They consider Rudraksha beads sacred and holy. In the Hindu mythological book "Puranas" (holy books, 18 types), it has been scripted that the Rudraksha plant has been created from Lord Shiva's tears. According to *Shiva Purana*, the one who wears the

rosary of Rudraksha beads around his/her wrist, arm, neck, or head will be safe from any calamity. Wearing it makes the person respected and honoured by all (Chaturvedi, 2004). For centuries, Hindu believers believed one could cultivate mental, physical, and spiritual prowess to attain fearlessness and achieve ultimate enlightenment (Tripathy et al., 2016). Even morphological and microscopical studies have reported the word "OM" on the beads (Rai et al., 2016). The seeds of *E. floribundus* Blume were used to extract vegetable oil in Myin Ka village, although it was not produced commercially. The fruits are eaten raw as wild edible fruit in South Asia (Brahma et al., 2013). The beads of *Elaeocarpus* plants have a significant role in prays. They are associated with the ruling gods of Hinduism, the Beej Mantra, Planet and zodiac signs, and astrological science (Table 6). The different types of Rudraksha beads with associated significance are mentioned below (Figure 9).

DISCUSSION

Ecosystem services are something that we should not take for granted. These services are the real-life supporting system for the entire ecosystem. Although understanding the value of ecosystem services at the ecosystem and landscape level has provided some insight into the ecosystem and landscape's ability to provide various ecosystem services, the focus pertaining to individual species' contribution to ecosystem services is ignored. It should be attainable at the species level if we can evaluate and describe the ecosystem services of different ecosystems. It is familiar that trees are a fundamental and essential part of the ecosystem, despite a significant increase in ecosystem service-

Table 6: Role of Rudraksha beads associated with the ruling gods, Beej mantra, planet and zodiac sign, and astrological uses

S. No.	Types of Rudraksha	Ruling gods	Beej mantra	Planet and zodiac sign	Benefits	Astrological uses	References
1	One-faced	Shiva	Om Hreem Nama, Om Namaha Shivaya	Sun/Leo	Chronic asthma heart problems, mental anxiety, T.B., paralysis, stroke, eye problem, bone pain and headache	Enlightens the super consciousness, provides improved concentration and mental structure changes specific to renunciation from worldly affairs. The wearer enjoys all comforts at his command but remains unattached.	Hardainiyan et al., 2015
2	Double-faced	Ardhnarishwar	Om Namah, Om Shiva Shaktihi Namah	Moon/ Cancer, Scorpio	Impotency, renal failure, stress, anxiety, lack of concentration, depression, negative thinking, eye problems, mental chaos, hysteria and intestinal disorder	Blesses the wearer with 'UNITY'. It could be related to guru shishya, parents-children, husband-wife, or friends. Maintaining oneness is its Peculiarity.	Kumar et al., 2013; Rashmi & Amrinder, 2014
3	Triple-faced	Agni	Om kleem Namha	Mars/Aries, Cancer, Leo, Pisces	Cures blood defect, plague, smallpox, digestive problems, blood pressure, weakness, disturbed menstrual cycle, spontaneous abortion, and ulcer	The wearer gets free from sins or wrongs from his life and returns to Purity. Ideal for those who suffer from inferior complexes, subjective fear, guilt, and depression.	Hule et al., 2011
4	Four-faced	Brahma	Om Kleem Namha	Mercury/ Gemin, Virgo	Blood circulation, cough and brain linked illness, asthma, hesitate, memory lapse and respiratory strip problems.	The wearer gains the power of creativity when blessed. Increases memory power and intelligence.	Hardainiyan et al., 2015
5	Five-faced	Kalagni	Om Hreem Namah	Jupiter/ Aries, Scorpio, Pisces	Cures diseases related to bone marrow, liver, kidney, feet, thigh, ear, diseases of fat, and diabetes.	The wearer gains health and peace. It increases memory also.	Hule et al., 2011
6	Six -faced	Kartikeya	Om Hreem Hoom Namah	Venus/ Taurus, Gemini, Virgo, Libra, Capricorn, Aquarius	Epilepsy and gynecological problems.	It saves from the emotional trauma of worldly sorrows and gives learning, wisdom, and knowledge. It affects understanding and appreciation of love, sexual pleasure, music, and personal relationships.	Rashmi & Amrinder, 2014
7	Seven-faced	Mahalaxmi	Om Hoom Namah	Saturn/ Taurus, Libra, Capricorn, Aquarius	Helpful in diseases like colic pain, pain in bone and muscles, paralysis, long term disease, Impotency, worries and hopelessness, asthma, pharyngitis, foot-related disease, respiratory and confusion.	It should be worn by those suffering from miseries of body, finance, and mental set-up. By wearing this, the wearer can progress in business and service and spend his life happily.	Hule et al., 2011; Hardainiyan et al., 2015
8	Eight-faced	Ganesh	Om Hoom Namah, Om Ganeshaya Nam	Rahu	Protection from paralytic attack, ailments of lung, feet, skin, and eye, hydrocele etc.	Removes all obstacles and brings success in all undertakings. It gives the wearer all kinds of attainments-Riddhies and Siddhis. After wearing, foes can become a friend, i.e., his/her opponent's mind or intentions can be changed.	Hardainiyan et al., 2015
9	Nine-faced	Durga	Om Hreem Hoom Namah	Ketu	Stomach ache, stress, skin diseases and anxiety.	The wearer is blessed with a lot of energy, powers, dynamics, and fearlessness, which are useful for living a successful life.	Hardainiyan et al., 2015

(Contd...)

Table 6: (Continued)

S. No.	Types of Rudraksha	Ruling gods	Beej mantra	Planet and zodiac sign	Benefits	Astrological uses	References
10	Ten-faced	Vishnu	Om Hreem Namah		Hormonal inequality in the body, mental insecurity and whooping cough.	The wearer may contain the influence of ten incarnations and the ten directions. It works like a shield on one's body and drives evils away.	Dennis, 1993
11	Eleven-faced	Hanuman	Om Hreem Hoom Namah	Gemini	Body pain, backache, chronic alcoholism and liver diseases.	The wearer will be blessed with wisdom, right judgment, powerful vocabulary, adventurous life, fearlessness, and success. Above all, it also protects from accidental death. It also helps in meditation and removes the problems of yogic practices.	Hule et al., 2011
12	Twelve-faced	Sun	Om Drom Sarom Ram Namah, Aum Kraum Sraum Raum Namah	Sun/Leo, Sagittarius	It is recommended for the cure of several illnesses, including heart disease, lung disease, skin disease, eyesight, and hiatus of stomach, oesophagus, and bowel problems.	Wearer gets the sun's quality – to rule and to move continuously with brilliant radiance and strength. Useful for Ministers, politicians, administrators, people in business, and executives. It removes worry, suspicion, and fear, increases self-image and motivation.	Shah et al., 2010
13	Thirteen-faced	Indra	Om Hreem Namah	Venus/ Gemini, Capricorn, Aquarius	Muscular dystrophies	It showers all possible comforts of life one can ever desire. It gives riches and honor and fulfills all the earthly desires and gives eight accomplishments (Siddhis), and the god cupid (Kamadeva) pleases with the man who wears it. It is helpful for meditation and spiritual and materialistic attainments.	--
14	Fourteen-faced	Hanuman	Om Namah Shivaya	Gemini	Brain related and many other types of diseases.	Most precious divine gem - Deva Mani. It awakens the sixth sense organ by which the wearer foresees the future happenings. Its wearer never fails in his decisions. Its wearer gets rid of all the calamities, miseries, worries. It protects from ghosts, evil spirits, and black magic. It provides the wearer safety, security and riches, and self-power.	--
15	Fifteen-faced	Pashupati nath	Om Pashupataya Namah	Rahu	Skin diseases, recurring miscarriage, stillbirth, etc., can be cured.	This represents Lord Pashupati and is especially beneficial for economic progress. Its possessor is neither orphaned of wealth nor inflicted by any kinds of skin diseases.	--
16	Sixteen-faced	Hari and Shankar	Om Namah Shivaya	Ketu	Taken as a curative agent for diseases like leprosy, cor-pulmonale, tuberculosis, lung diseases etc.	It represents victory and the possessor is never affected by heat or cold. It is beneficial for the saints living in jungles. The house in which it is kept is free from fire, theft, or robbery.	Joshi & Jain, 2014

(Contd...)

Table 6: (Continued)

S. No.	Types of Rudraksha	Ruling gods	Beej mantra	Planet and zodiac sign	Benefits	Astrological uses	References
17	Seventeen-faced	Lord Viswakarma	Om Namah Shivay	Taurus	Excellent for handling conditions like memory lapse, functional body disorders etc.	Regarded the best for peace and comfort in the family. If a man worships Gauri Shankar at his worshipping place, the pain and suffering and other earthly obstacles can be destroyed and the peace and pleasure of family may increase.	Joshi & Jain, 2014
18	Eighteen-faced	Bhairav	Om Namah Shivay	Aquarius	Prevent ailments like loss of power, mental harmonisation etc.	It represents the mother earth. The possessor remains happy and healthy. It is especially beneficial for pregnant women in protecting their foetus.	Joshi & Jain, 2014
19	Nineteen-faced	Vishnu narayan	Om Namah Shivay	Mercury	Exterminate the disorders of the blood, spinal cord etc.	It represents Lord Narayana. The possessor is bestowed with all worldly pleasures. There is no scarcity in their life.	Joshi & Jain, 2014
20	Twenty-faced	Moon	Om Shri Gauri shankarey Namah	Moon	It is taken as a nullifier for the problem of eyesight and snake bites.	Regarded the best for peace and comfort in the family. If a man worships Gauri Shankar at his place, the pain and suffering and other earthly obstacles can be destroyed and the peace and pleasure of the family increase.	Arivu & Muthulingam, 2017
21	Twenty-one faced	Ganesh	Om garbha Gauriya Namah --		Eradicates gynecological disorders.	For women wanting to have children. Her motherhood gains perfection.	Singh & Nath, 1999

related research in the past two decades. There are apparent gaps in the literature about the contribution of forest and tree-based ecosystem services. Of the few studies identified, the majority used a forest distance gradient to establish the effects and edges pollinator success as an only focus (Blanche et al., 2006; Klein, 2009; Sande et al., 2009). While such studies are useful and demonstrate the importance of trees and forests for delivering a single ecosystem service, it is well-known that ecosystem services do not act in isolation (Boreux et al., 2013a, 2013b; Renard et al., 2015). Therefore, studies that examine the interactions of multiple ecosystem services are much needed. This review has primarily focused on the ecosystem services of *Elaeocarpus* - a remarkable anomalous tree. The trends in scientific research on *Elaeocarpus* over the years has increased significantly, which is caused mainly by the interested researcher because of its comprehensive benefits to the people (Brahma et al., 2013; Swati et al., 2015).

Furthermore, in earlier literature, researchers have worked on phytochemicals (Ogundele & Das, 2019), secondary metabolites (Hong et al., 2019), traditional significances (Hardainiyan et al., 2015), and other *Elaeocarpus* properties but have not linked it with ecosystem services. We collected all the earlier works on this plant and worked on its linkage with the ecosystem services. Several ecosystem services of *Elaeocarpus* have been cited, mostly under-provisioning services (30% of the overall provisioning services) and cultural services (less than 10% of cultural services). Easily accessible provisioning services such as forage and fodder, timber, fuelwood, food, and shelter for animals should be evaluated. Few or very few works have been done so far on this plant's regulatory and supporting services (Table 7). Researchers should stress these services to get a wide-ranging review of the overall services of *Elaeocarpus*. We strongly recommend that future research efforts attempt to bridge these gaps by moving beyond the ecosystem services of a particular ecosystem, as it were. This level of research is essential further to dissolve the biodiversity conservation and livelihood of the people.

CONCLUSION

The analysis of *Elaeocarpus* and its services illustrates that it provides many ecosystem services and plays a vital role in humankind's welfare. Its importance in ayurvedic science, pharmacological science, phytochemicals, mythology, and

astrology has been reported in several kinds of literature. The miracles behind disease treatment by Rudraksha was recognised even in prehistoric time. The religious value of Rudraksha beads is significant due to their higher affinity with different ruling gods and the *beej mantra* associated with the bead. This religious association would help in conserving Rudraksha from human exploitation. Despite having some reliable information regarding Rudraksha and its importance, our knowledge is still confined. The results show that provisioning and cultural services provided by Rudraksha constitute only 30% and 10% of provisioning and cultural services that were mentioned in MEA (2005). It can be concluded that researchers should focus on its regulatory and supporting services and this plant's economic and socio-culture values. It is vital to note that the considerable scale of commercial production of *Elaeocarpus* may improve the economy and beneficial community crops for local farmers and provide sufficient revenue. In the future, the trees can be suggested as a vital commercial tree species, which yields a fair amount of non-timber forest products every year. Large-scale planting of these trees inside the forest areas provides additional livestock resources to the local, tribal, and indigenous groups.

ACKNOWLEDGEMENTS

The authors are grateful to the Chairperson, Department of Botany, Panjab University, Chandigarh, for providing all the necessary facilities required for the work. The first author is supported by the University Grants Commission (UGC), Government of India, New Delhi in the form of Junior Research Fellowship [UGC Ref. No.: 453/(CSIR-UGC NET DEC. 2018)]. The second author is supported by the Council of Scientific and Industrial Research, New Delhi, Government of India in the form of Junior Research Fellowship (09/135(0884)/2019-EMR-I).

AUTHOR'S CONTRIBUTION

ANS and DVR developed the idea. SS and SH designed the methodology, SH collected and analysed the data. SS wrote the first draft of the manuscript. All authors edited the manuscript to its final version.
