

CHROMOSOME NUMBERS IN COMPOSITAE FROM PAKISTAN¹

Zeenat A. Razaq,² Ahsan A. Vahidy,³
and S. I. Ali²

ABSTRACT

Chromosome numbers of 82 taxa, belonging to 48 genera in ten tribes of the family Compositae, are reported from Pakistan. The chromosome numbers of 13 taxa are reported for the first time, including one new generic count (for *Grantia*) and a new base number ($x = 10$) in *Sonchus*. The new counts are as follows: $n = 6$ for *Launaea tomentella*; $n = 7$ for *Pulicaria gnaphalodes*; $n = 8$ for *Cephalorrhynchus picridiformis*; $n = 9$ for *Artemisia salsoloides*, *Conyza stricta* var. *pinnatifida*, *Grantia aucheri*, *Heteropappus altaicus* var. *canescens*, *Launaea oligocephala*, and *Phagnalon pycnophyllum*; $n = 10$ for *Blumea bovei* and *Sonchus lacocephalus*; and $n = 14$ for *Scorzonera koelpinioides* and *Scorzonera tortuosissima*. The chromosomal counts for 31 other taxa are new for the flora of Pakistan.

Compositae comprise approximately 20,000 species and about 40% of these have been investigated cytologically (Solbrig, 1977). Very little cytological research has been carried out on the family in Pakistan, where to date chromosome number for only 65 (i.e., ca. 11.0%) of the ca. 604 native species (Ali, 1978) for the family have been counted (Baquar & Askari, 1970; Khatoon & Ali, 1988; Razaq et al., 1988). The present contribution records the chromosome numbers for 82 taxa in 48 genera.

MATERIALS AND METHODS

Meiotic material consisting of immature capitula, collected mostly in the wild (those which were cultivated are specified in Table 1), was fixed in acetic alcohol (1 : 3) for 24 hr. and stored at -4°C . The slides were prepared by conventional squash technique using aceto- or propionic-carmine. Counts were made from pollen mother cells, except in *Dysodia tenuiloba*, where both somatic and gametic counts were made.

For mitosis, root tips from germinating seeds were pretreated with 8-hydroxyquinoline for 4 hr., fixed in acetic alcohol (1 : 3) for 1 hr., hydrolysed in 1 N HCl for 6–12 min. and squashed in 1.8% aceto-orcein.

Photomicrographs were taken from temporary mounts, in all cases. Later on slides were made permanent in euparal or Canada balsam.

OBSERVATIONS AND RESULTS

A total of 140 chromosomal counts on plants representing 82 taxa belonging to 48 genera of Compositae have been determined. Counts for 13 taxa are reported for the first time, as they were not found to be reported in IPCN (Fedorov, 1974; Goldblatt, 1981, 1984, 1985, 1988; Moore, 1973, 1974; Ornduff, 1967). The classification adopted here follows that of Heywood et al. (1977).

DISCUSSION

Cytologically, Vernonieae are the least known tribe in the family, with fewer than 100 (out of 1450) species so far counted (Mathew & Mathew, 1983). Available cytological data on the genus *Vernonia* (Fedorov, 1974; Jones, 1974; Mathew & Mathew, 1976; Gill, 1978; Keil & Pinkava, 1979; Gupta & Gill, 1979) reveal that species of this genus are based on $x = 9$, 10, and 17. Two of the four species of *Vernonia*, the only genus of Vernonieae in Pakistan (Stewart, 1972), were examined. According to Jones (1977), Old World *Vernonia* have $x = 9$ or 10 and a little polyploidy.

¹ We thank M. Qaiser, S. Khatoon, A. Ghafoor, and R. Y. Hashmi of the University of Karachi for their help in identification of vouchers. We also thank A. Ghafoor, S. Omer, T. Ali, N. Ahsan, M. Moinuddin, and B. Jahan of the University of Karachi for collecting cytological material. This paper is a part of the work supported by National Science Foundation grant INT 8510318.

* Count new to flora of Pakistan.

** Count new to science.

Our counts for *V. cinerascens* (*n* = 20) and *V. cinerea* (*n* = 9) confirm the above statement.

The basic number for various members of Asteraceae is reported to be *x* = 9 with polyploidy (Raven et al., 1960; Solbrig et al., 1964, 1969;

Anderson et al., 1974). Out of eight taxa of Asteraceae studied, chromosome counts of all the species except *Myriactis wallichii* are based on *x* = 9. All the species of the genus *Myriactis* are reported to have *n* = *x* = 18.

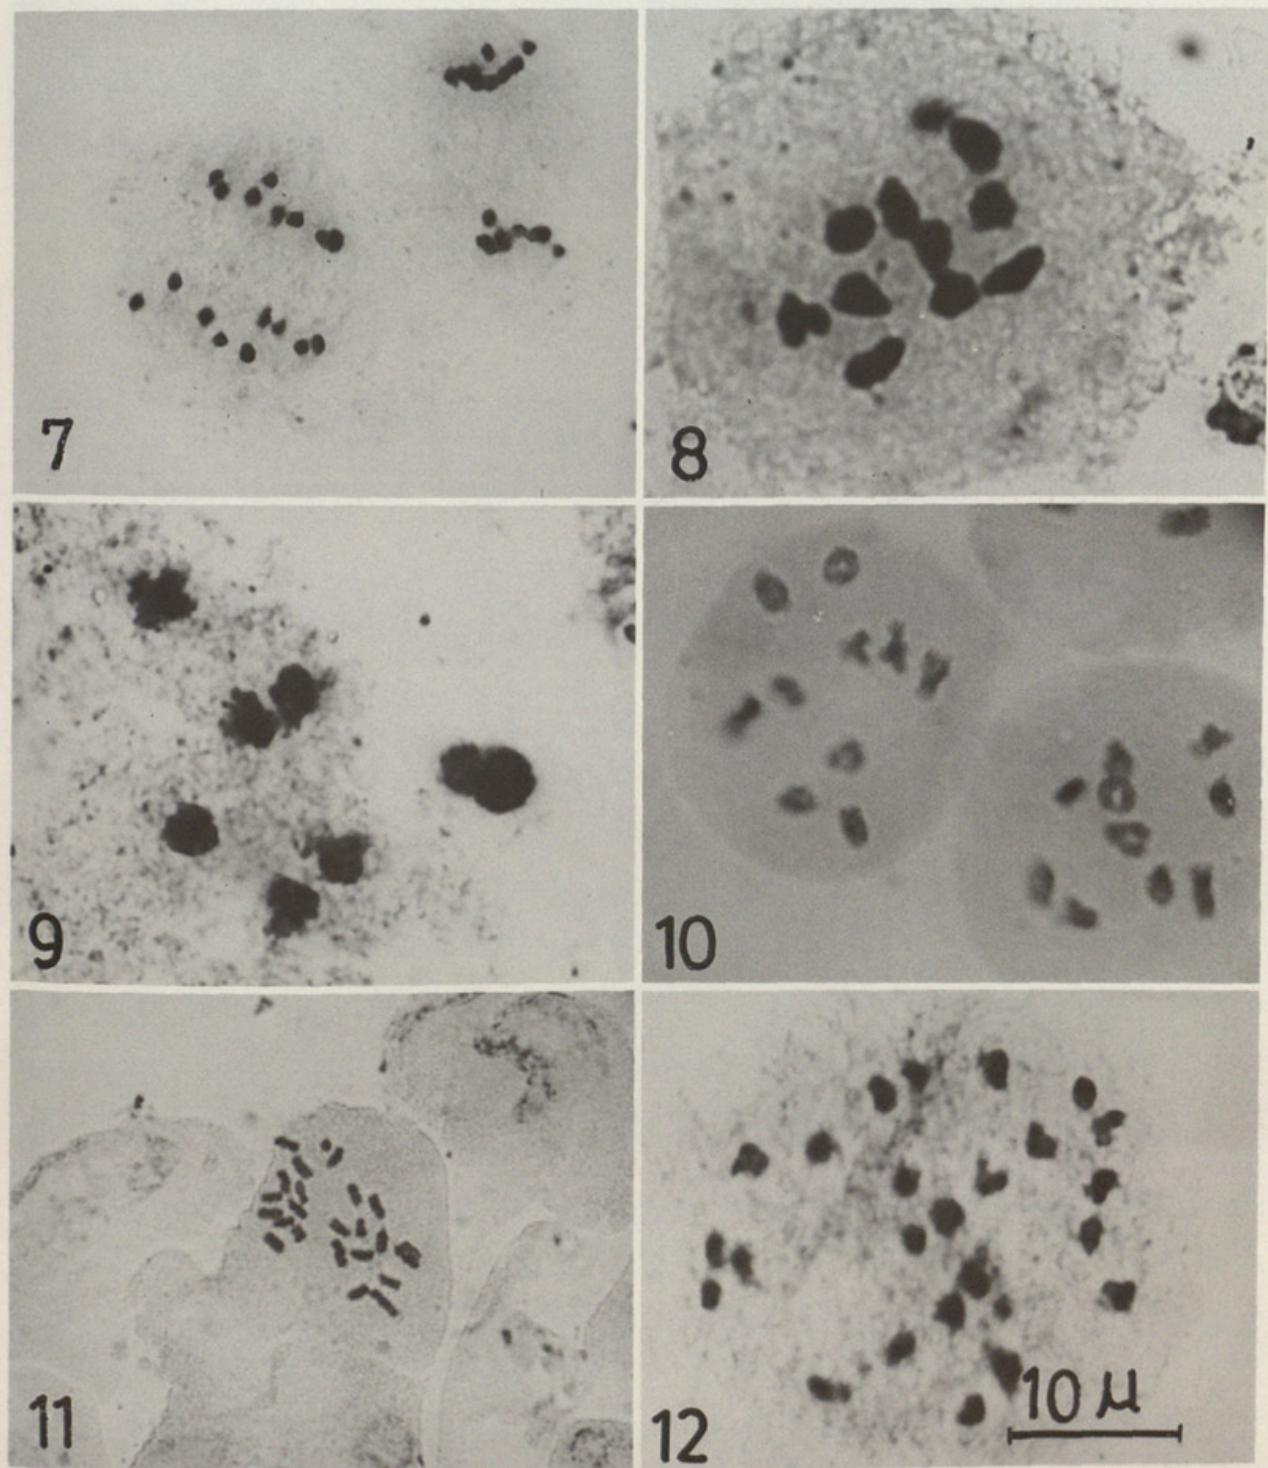

FIGURES 1-6. Chromosomes in members of Compositae.—1. *Ageratum conyzoides* (Ghafoor 4311), diakinesis, $n = 10$.—2. *Heteropappus altaicus* (Ghafoor 2324), metaphase-I, $n = 9$.—3. *Heteropappus altaicus* var. *canescens* (Ghafoor 3224), metaphase-I, $n = 9$.—4. *Blumea bovei* (T. Ali 943), diakinesis, $n = 10$.—5. *Grantia aucheri* (Omer 2118), diakinesis, $n = 9$.—6. *Iphiona grantioides* (Omer 2052), diakinesis, $n = 9$.

The members of tribe Inuleae exhibit a predominance of the basic numbers $x = 9$ and 10 (Merxmuller et al., 1977). In this tribe, we have examined 15 species in eight genera. Of these, four species (belonging to two genera) are based on $x = 7$, four species (belonging to three genera) on $x = 9$, and seven species (belonging to three genera) on $x = 10$. Our data thus agree with Merxmuller et al.'s

conclusion (1977). In Senecioneae, the most frequent basic numbers are multiples of ten (Nordenstam, 1977). Our observations on the chromosome numbers of three species of *Senecio* (Table 1) are based on $x = 10$. The count for *S. krascheninnikovii*, $n = 10$, differs from the previous report of $n = 9$ (Khatoon & Ali, 1988).

Chromosome counts have been reported for about

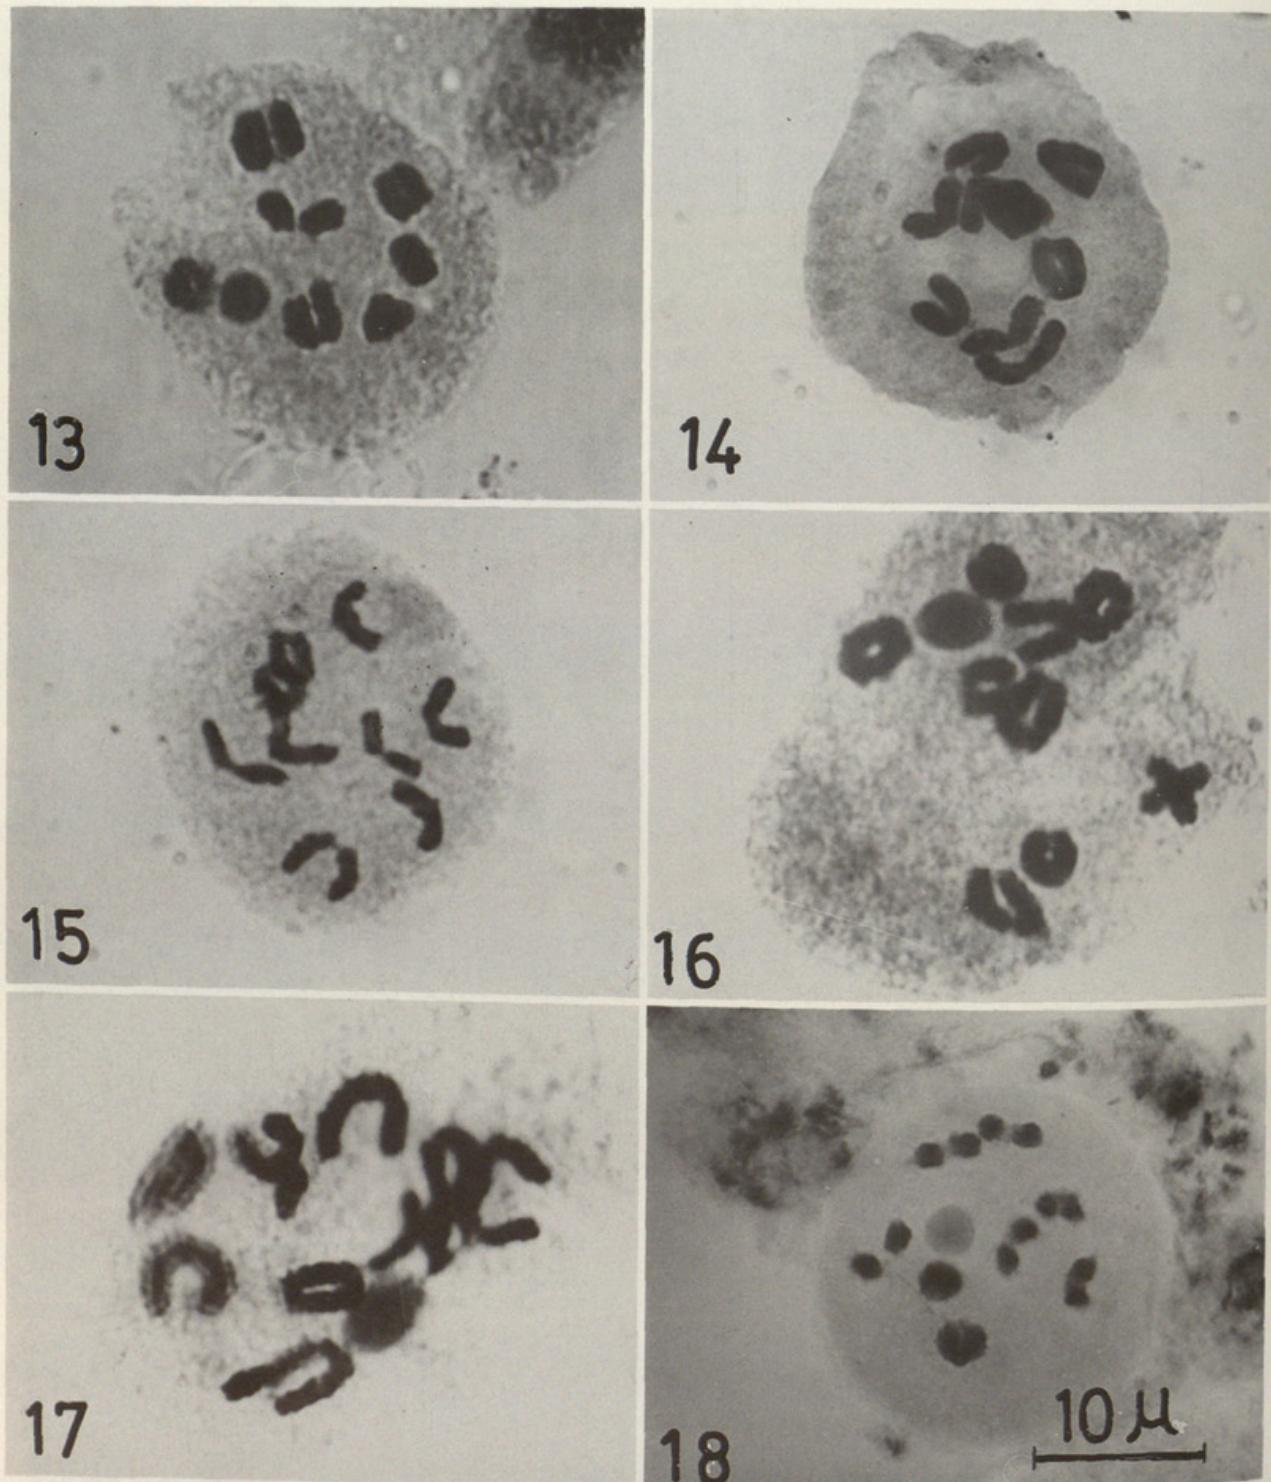

FIGURES 7-12. Chromosomes in members of Compositae.—7. *Phagnalon pycnophyllum* (Ghafoor 3157), anaphase-I, $n = 9$.—8. *Pluchea arguta* (T. Ali 877), metaphase-I, $n = 10$.—9. *Pulicaria gnaphalodes* (T. Ali 1243), diakinesis, $n = 7$.—10. *Coreopsis lanceolata* (Jahan 14), diakinesis, $n = 10$.—11. *Dyssodia tenuiloba* (Ahsan 55), mitotic metaphase, $2n = 24$.—12. *Tagetes minuta* (Ghafoor 3886), diakinesis, $n = 24$.

50% of the genera of Anthemideae (Heywood & Humphries, 1977). Ten of the 11 taxa of Anthemideae examined have $n = 9$; *Artemisia capillaris*, however, has $n = 8$ (Fig. 13), a count contrary to the earlier findings ($2n = 18$: Arano, 1965 and $2n = 36$: Peng & Hsu, 1978). The present report may represent aneuploid variation.

The most frequent chromosome number in *Artemisia* is $n = 9$ and probably the basic number for the genus was also $x = 9$ (Stahevitch & Wojtas, 1987).

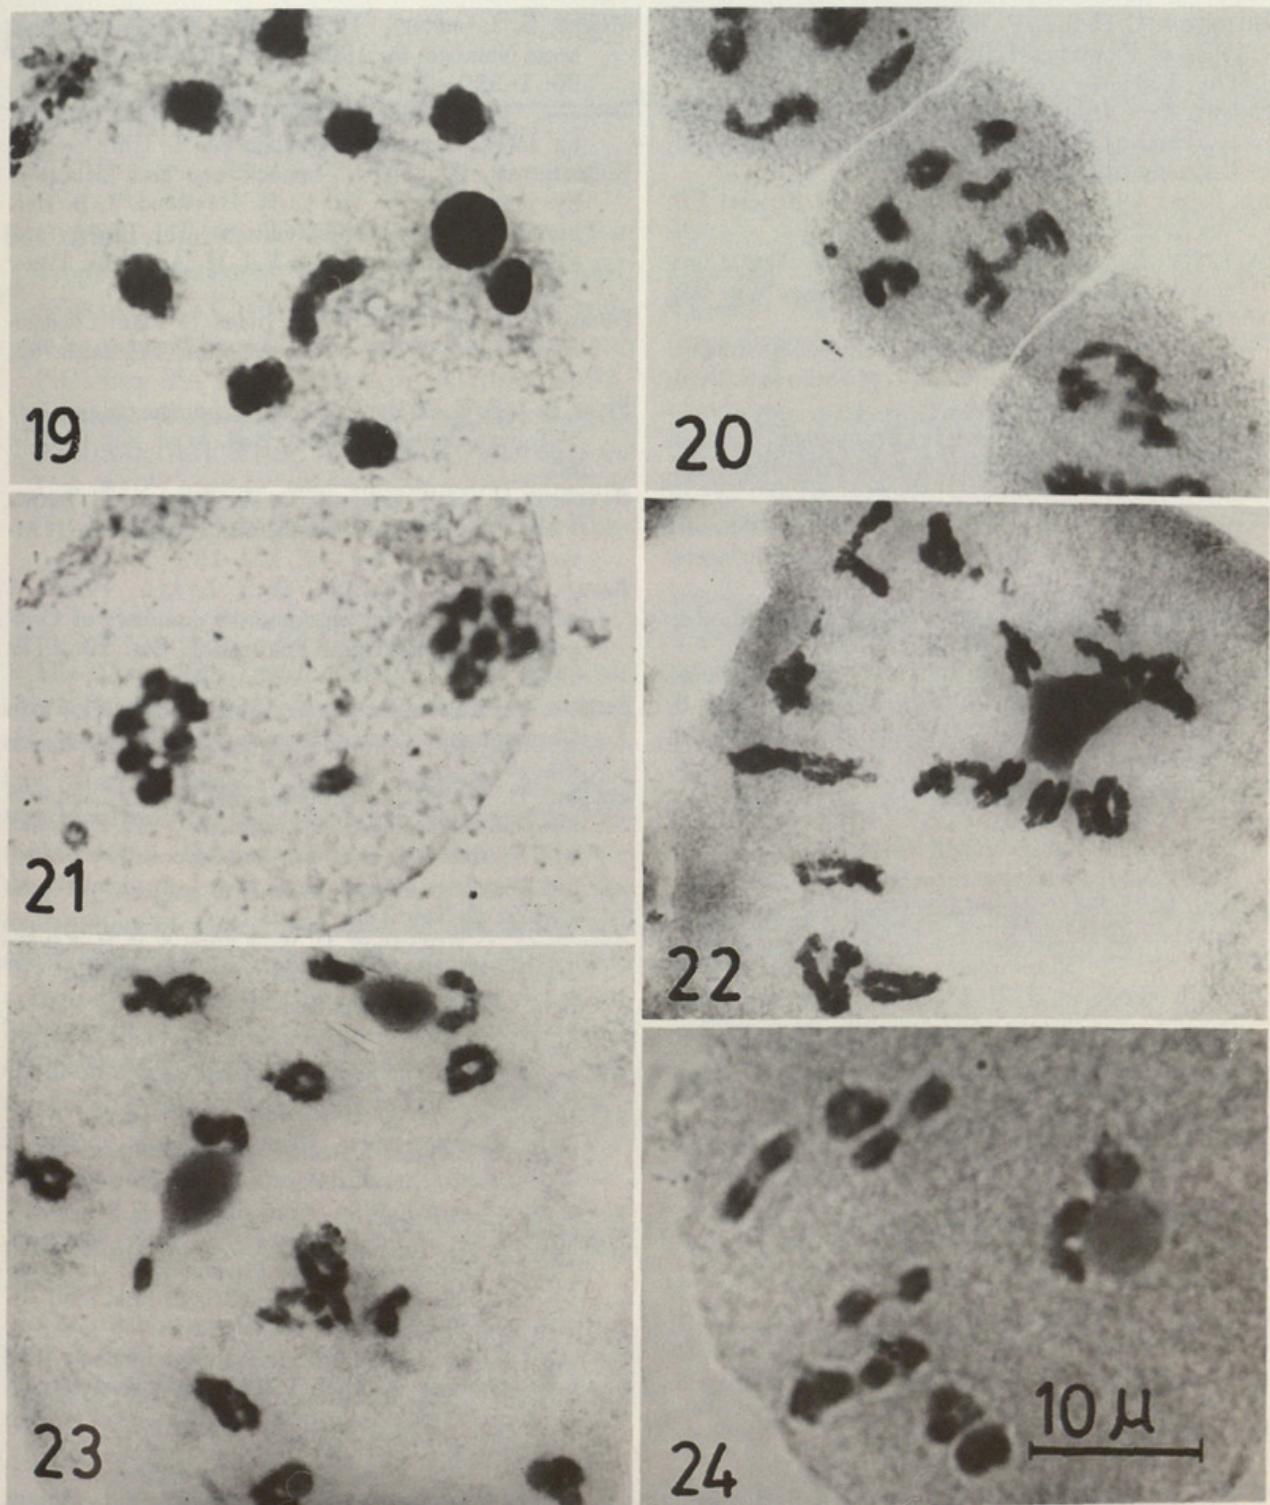

Chromosome numbers for 21 taxa of Lactuceae are reported here. The count for *Cephalorrhynchus picridiformis* ($n = 8$, Fig. 18) does not agree

FIGURES 13-18. Chromosomes in members of Compositae.—13. *Artemisia capillaris* (Ghafoor 3801), diakinesis, $n = 8$.—14. *Artemisia persica* (Ghafoor 3225), diakinesis, $n = 9$.—15. *Artemisia rutaefolia* (Ghafoor 3219), diakinesis, $n = 9$.—16. *Artemisia salsoloides* (Omer 2430), diakinesis, $n = 9$.—17. *Tanacetum fruticosum* (Omer 2548), diakinesis, $n = 9$.—18. *Cephalorrhynchus picridiformis* (T. Ali 1394), diakinesis, $n = 8$.

with basic number $x = 9$, proposed by Darlington & Wylie (1955), for this genus. In *Launaea*, $x = 6, 7, 8$, and 9 are reported. However, $n = 6$ has been reported for *L. asplenifolia* Hook. f. by Sar-kar et al. (1975). We have observed the same number for *L. tomentella* (Table 1, Fig. 21). For the genus *Sonchus*, $x = 8$ and 9 are reported. Our count of $n = 10$ for *Sonchus lachnocephalus* (Fig. 24) establishes a new basic number ($x = 10$) for

the genus. Chromosomally, the Lactuceae are perhaps the best known tribe in the family. Chromosome numbers are known for 87.0% of the genera of the tribe (Tomb, 1977). Stebbins et al. (1953) proposed $x = 9$ as the ancestral base chromosome number for the tribe, on the basis of its frequency of occurrence and presence in genera considered to be primitive. In the present study ten taxa out of 21 examined are found to be based

FIGURES 19-24. Chromosomes in members of Compositae.—19. *Launaea oligocephala* (T. Ali 953), diakinesis, $n = 9$.—20. *Launaea procumbens* (Omer 2097), diakinesis, $n = 9$.—21. *Launaea tomentella* (T. Ali 1167), metaphase-II, $n = 6$.—22. *Scorzonera koelpinioides* (T. Ali 992), diakinesis, $n = 14$.—23. *Scorzonera tortuosissima* (T. Ali 991), diakinesis, $n = 14$.—24. *Sonchus lachnocephalus* (T. Ali 174), diakinesis, $n = 10$.

on $x = 9$, whereas other taxa are based on $x = 5, 6, 7$, and 8 .
