

**Supplementary material for:**

**Niche evolution of the Neotropical tree genus *Otoba* in the context of global  
biogeography of the nutmeg family, Myristicaceae**

*Running title:* Biogeography of *Otoba* and Myristicaceae

**Appendix S3.** Summary of sequence data recovered for each sample for targeted and off-target (cpDNA) loci. Asterisks at sample names indicate samples that were not included in any phylogenetic analysis. Samples for which there was insufficient cpDNA data to include in phylogenetic analyses are marked with “n/a”.

Sample	Mean sequence length (bp)	# of loci	Length of ungapped cpDNA (bp)	Collection year	Annual precipitation (mm)
<i>Otoba acuminata</i> _MM2720	209.25	4	39,553	2001	3,021

**Appendix S4.** Heatmap showing the percent reference protein length recovered for all samples across all 353 loci.

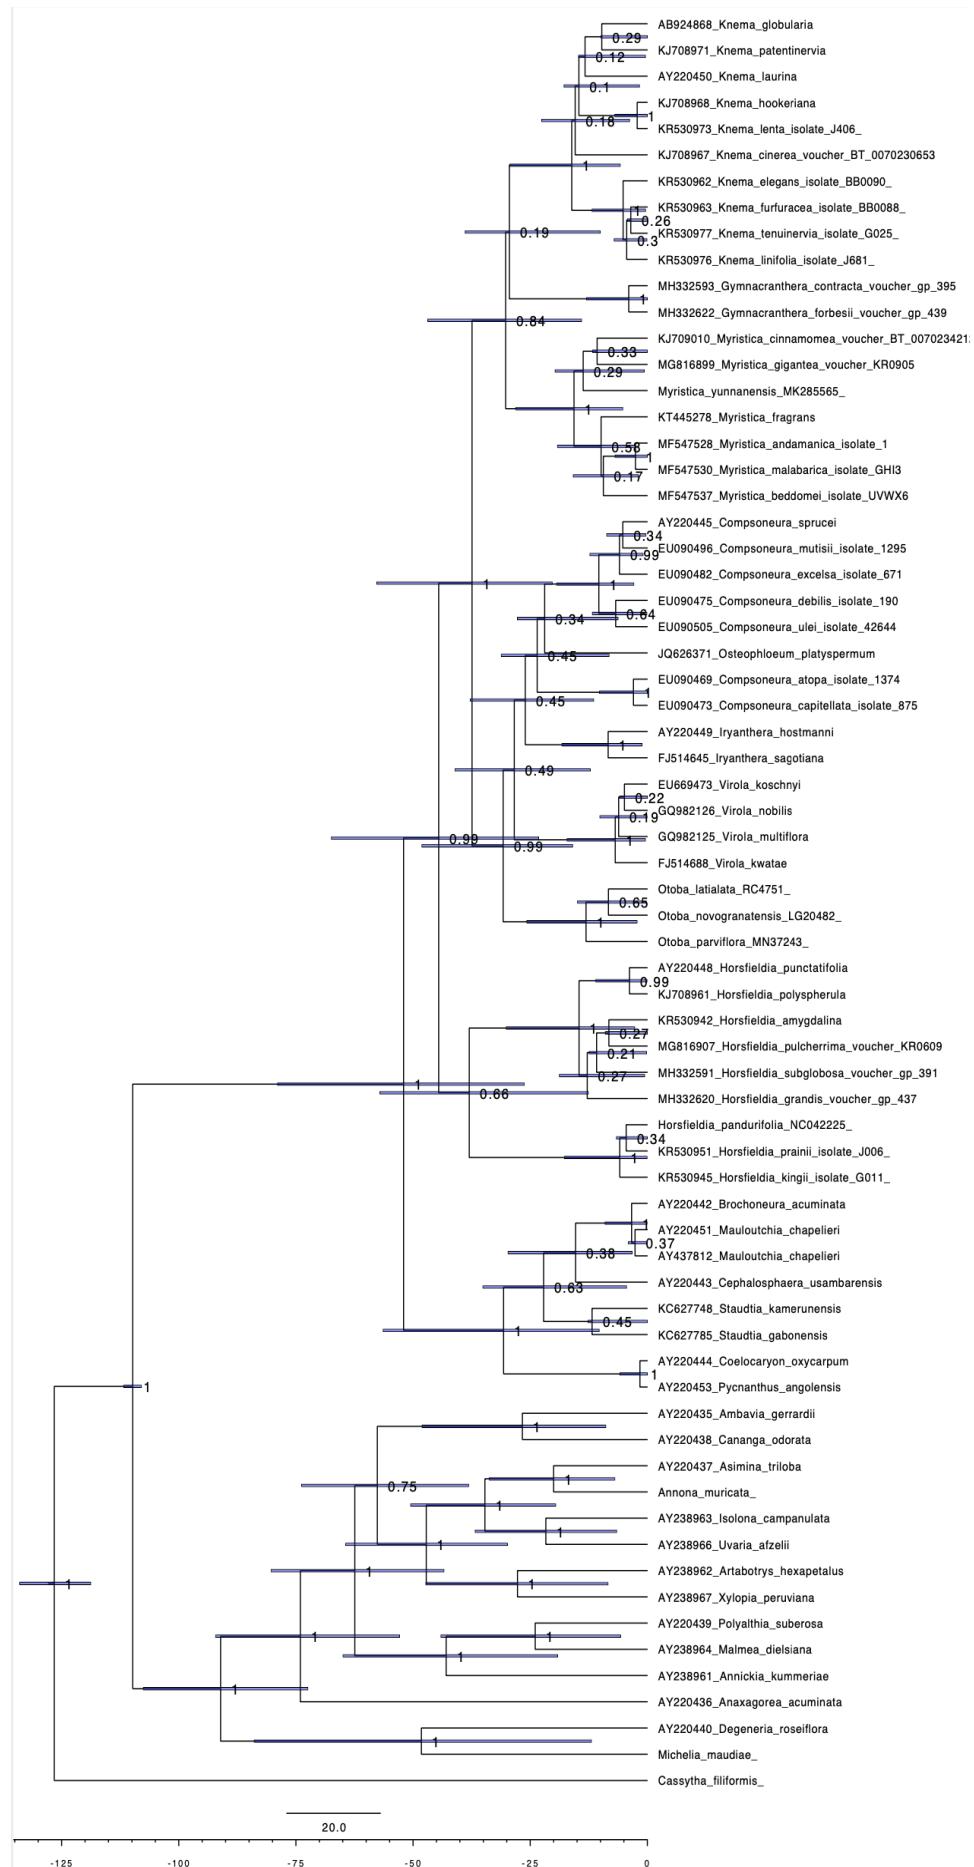

**Appendix S5.** Divergence date estimations of *Otoba* using difference calibration schema (denoted to left of phylogeny).

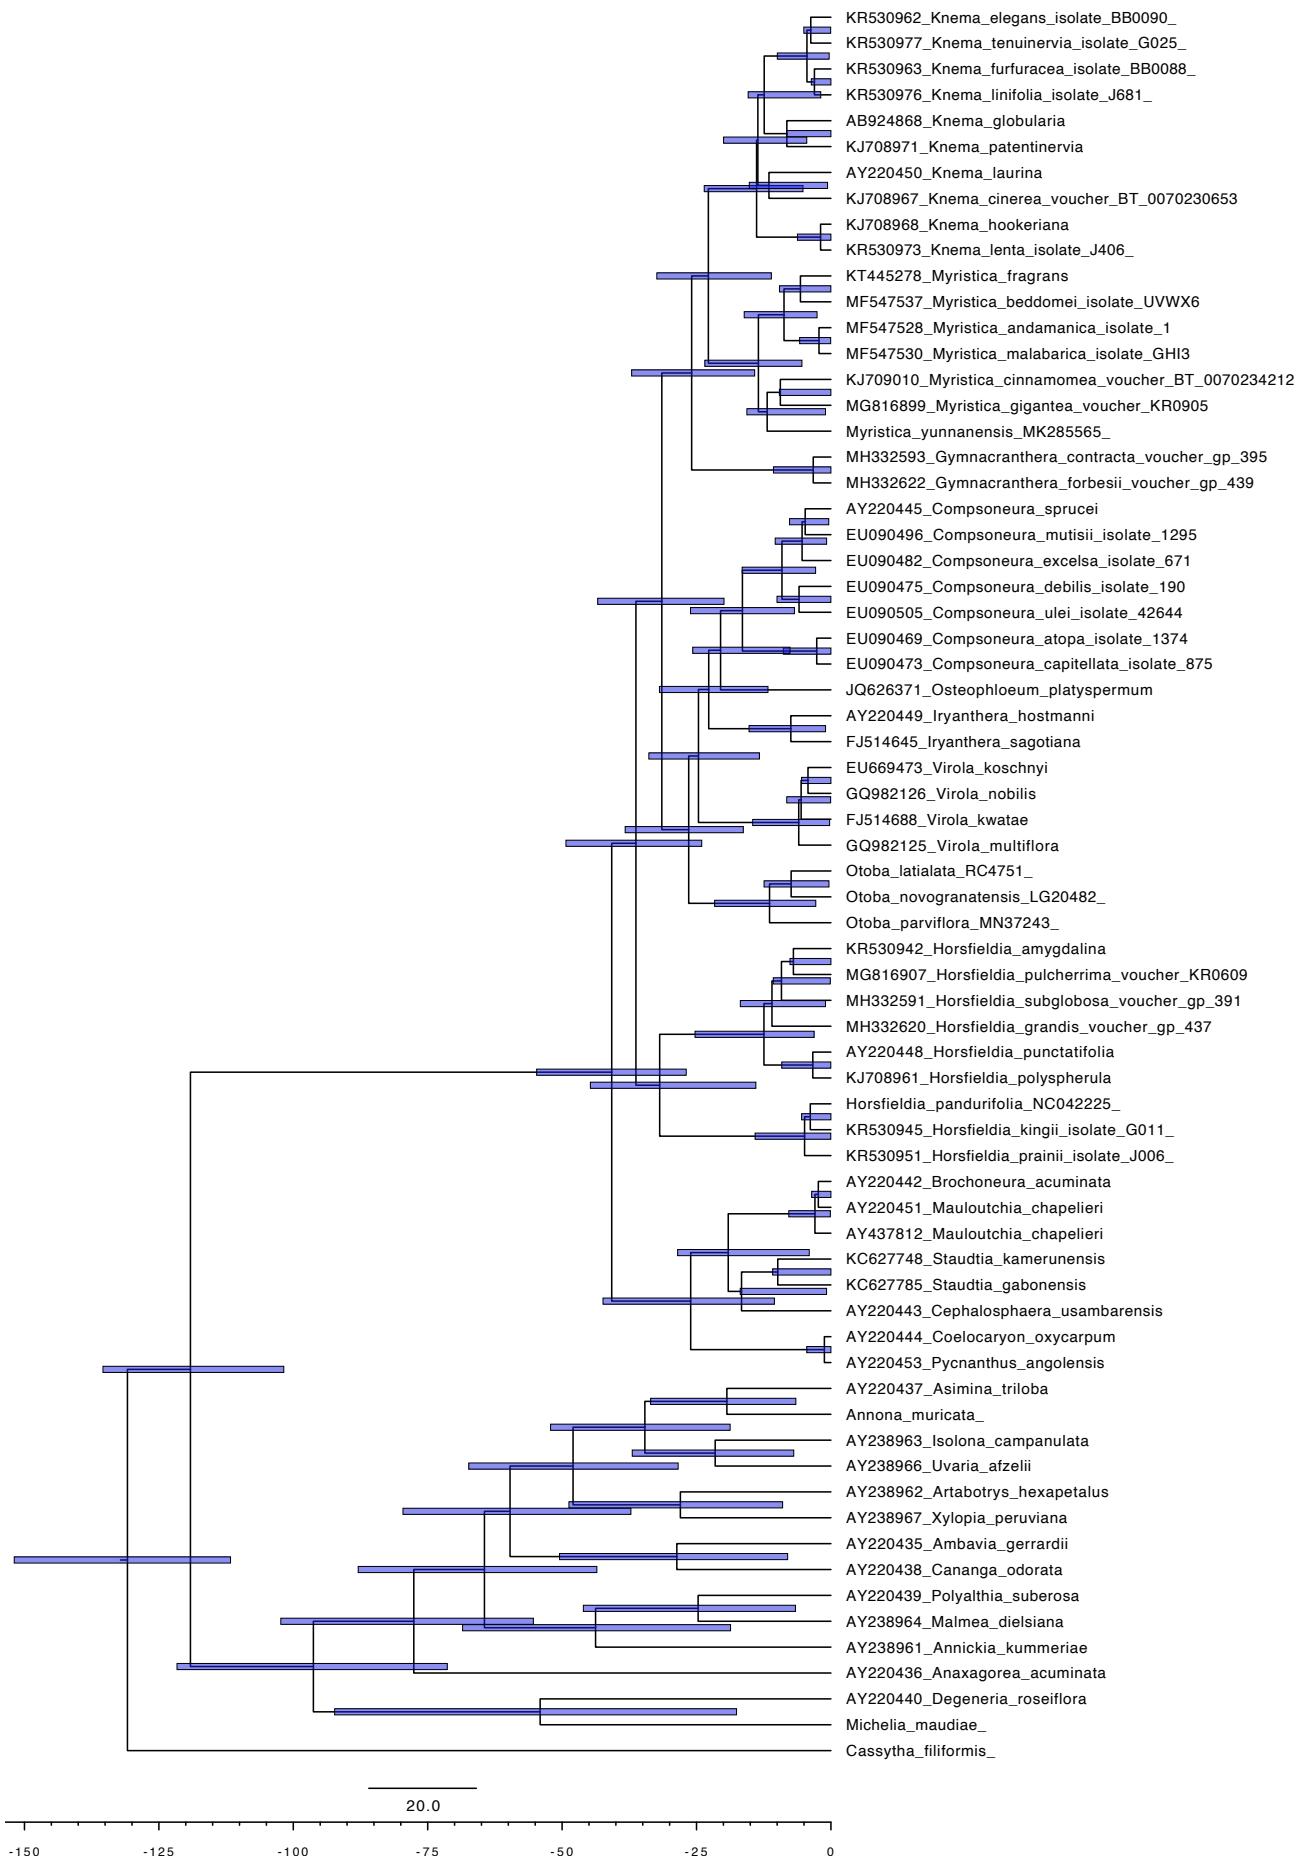

**Figure S5.** treePL divergence date estimations with different calibration schemes. a) and b) include secondary calibrations derived from Magallón et al. (2015) at the nodes corresponding to Laurales + Magnoliales, Laurales, Magnoliales, and Myristicaceae; b) additionally includes a calibration for the crown node of *Otoba* derived from our densely sampled, family-wide BEAST2 analysis of Myristicaceae calibrated with dates from Magallón et al (2015). c) and d) include secondary calibrations derived from Massoni et al. (2015) at the nodes corresponding to Laurales + Magnoliales, Laurales, Magnoliales, and Myristicaceae; d) additionally includes a calibration for the crown node of *Otoba* derived from our densely sampled, family-wide BEAST2 analysis of Myristicaceae calibrated with dates from Massoni et al (2015). Bars at nodes represent 95% confidence intervals as inferred across 100 RAxML bootstrap replicates.

**Appendix S6.** Divergence date estimation from BEAST2 analysis of Myristiaceae using the Magallón et al. (2015) calibration scheme. Values at nodes correspond to the posterior probability, while bars at nodes represented the 95% HPD on the estimated age of the node, with time scale below phylogeny in millions of years before present. (Figure on next page)

**Appendix S7.** Divergence date estimation from BEAST2 analysis of Myristicaceae using the Massoni et al. (2015) calibration scheme. Values at nodes correspond to the posterior probability, while bars at nodes represented the 95% HPD on the estimated age of the node with time scale below phylogeny in millions of years before present. (Figure on next page)

**Appendix S8.** Average values for each BIOCLIM variable and elevation in *Otoba*. A description of each bioclimatic variable can be found on the WorldClim website (<https://www.worldclim.org/data/bioclim.html>).
